Including a definition of "recycling" as discussed above would also be consistent with statutory language in SB 54 that states that the "department's regulations shall encourage recycling that minimizes generation of hazardous waste, generation of greenhouse gases, environmental impacts, environmental justice impacts, and public health impacts." In 2023 scientists from the DOE's National Renewable Energy Laboratory published a peer-reviewed study that compared the technical, economic, and environmental metrics for mechanical recycling and "chemical recycling" when attempting to recycle waste plastic into new plastic.12 The study concluded that "mechanical recycling offers energy use and [greenhouse gas] emissions an order of magnitude lower than the other recycling technologies for all plastics, as well as low [energy usage], land use, toxicity, and water use." This finding by government scientists underscores that the only way the regulations can comply with SB 54 is by encouraging mechanical recycling over so-called "chemical recycling."

Response to O-62-1

CalRecycle rejects this comment for the reasons articulated below and in response to each of the comment's subparts. The proposed regulations are consistent with the requirements set forth in the Act, and the recommended changes are not necessary to the implementation or enforcement of the Act. Subsection 18980.4.1(d) and its constituent parts reasonably implement the requirement of PRC section 42041(aa)(5).

Section (1)

PRC Section 42041(aa)(5) requires that the regulations include "criteria to exclude plastic recycling technologies that produce significant amounts of hazardous waste." The section does not otherwise present any basis for what amount of hazardous waste generation is "significant." CalRecycle's regulations establish criteria that reasonably effectuate the statutory text and make it more specific as follows:

- The regulations assign meaning to "significant amounts of hazardous waste" with reference to the federal definition of hazardous waste and with consideration of whether the waste poses "a substantial risk of harm to public health, or of contamination of the environment." (18980.4.1(d)(1).) The rationale for this provision, as well as the emphasis on management and disposal of hazardous waste (18980.4.1(d)(1)(B)), is discussed further in response to the sub-comments.

- The regulations clarify the range of technologies in consideration: those that are not mechanical technologies that were in use as of the effective date of the Act. (18980.4.1(d) and (d)(1)(A).) As commenters also point out, the Act's legislative history establishes that one focus of 42041(aa)(5) is chemical-based recycling. Using mechanical recycling as practiced when the Act took effect as a baseline is appropriate because those technologies are well established as having acceptable ranges of environmental impacts, whereas the likely ranges of hazardous waste generation from emerging chemical-based technologies and mechanical ones not yet practiced in the state are unsettled.

- The regulations establish that a facility using a technology producing hazardous waste may only be considered recycling if it complies with all other requirements established in Article 4 of the regulations. (18980.4.1(d)(3).) Article 4 establishes criteria to ensure that responsible end markets operate in a manner that benefit the environment and minimize risk to public health and worker health and safety. Additionally, the technology may not be considered recycling unless it operates in a manner consistent with ISO 59014.2024, which is a document that establishes principles, requirements, and guidance for the sustainable, traceable conduct of materials recovery. Together, these provisions

ensure that facilities using a new technology operate consistent with appropriate permitting requirements and best practices.

• The regulations require a facility to submit certain information to the PRO or Independent Producer before its technology may be considered recycling. (18980.4.1(d)(4).) The information includes data related to the weight of hazardous waste generated at the facility. The facility must continue to report this data to the PRO or Independent Producer annually. (18980.4.1(d)(6).) The data allows the PRO or Independent Producer to review the quantity of hazardous waste produced by the facility, in addition to evaluating the risk its technology poses to public health and the environment.

• In its plan, the PRO or Independent Producer must justify its conclusion that use of a particular technology does not produce significant amounts of hazardous waste. (18980.4.1(d)(5).) This provision ensures that the technology is carefully evaluated, and relevant data considered, prior to the facility using the technology being determined to be recycling covered material.

Subsection (A)

CalRecycle rejects this comment. CalRecycle's proposed definition of "significant amounts of hazardous waste" in Section 18980.4.1(d)(1) is consistent with the statutory provision.

The statute does not further define the phrase "significant amount." Establishing that the statutory phrase "significant amounts of hazardous waste" must be evaluated in relation to the risk posed by the hazardous waste is reasonable. Classification of waste as "hazardous" to begin with relates to its effects on health and the environment and laws promulgated to address hazardous waste aim to avoid and reduce this risk. Therefore, without more specific direction in the statute, the risk to public health and the environment from the amount of hazardous waste generated by a technology is a logical basis for evaluating the technology. Conversely, an evaluation based purely on quantity of hazardous waste generated cannot capture the effect of small amounts of hazardous waste that nevertheless poses significant risk to public health or the environment.

Commenters assert that the following language in the statute supports their position that CalRecycle's definition of "significant amounts" is inconsistent with statute: "The department's regulations shall encourage recycling that minimizes generation of hazardous waste, generation of greenhouse gases, environmental impacts, environmental justice impacts, and public health impacts" (emphasis added.). However, only the second sentence of PRC section 42041(aa)(5) mentions the "criteria" requirement, and that requirement only concerns exclusion of "plastic recycling technologies that produce significant amounts of hazardous waste. So, CalRecycle disagrees that the reference to "minimizing generation of hazardous waste" and other environmental, environmental justice, and health impacts in the statute precludes a definition of "significant amounts of

hazardous waste" that relies on risk. In any event, the regulations implement the cited provision through section 18980.4 generally. (See, e.g. §18980.4(a)(3).). The requirement to develop criteria, not just encourage behavior, specific to hazardous waste must be considered and effectuated separately and cannot be read to incorporate the previous sentence, even assuming commenters' reading is appropriate.

Importantly, the proposed regulations do not exclude consideration of the quantity of hazardous waste. Section 18980.4.1(d)(4) enumerates certain information and data that any facility using a technology, other than a mechanical recycling technology currently in use in the state, must submit to the PRO or Independent Producer. The regulations specify that this information and data must be submitted before the technology may be considered recycling. The data includes reporting on the quantity of hazardous waste and acute hazardous waste generated per calendar month for the last twelve months at the facility. The PRO or Independent Producer will as a result have data on the quantity of hazardous waste generated by the facility available to it when it justifies its conclusion that use of a particular technology does not produce significant amounts of hazardous waste.

Lastly, revision of section 18980.4.1 is unnecessary because producer responsibility plans must address impacts like those the commenter identifies. Those plans are then subject to review and comment by the public and advisory board and must be approved by CalRecycle. For example, PRC section 42051.1(j)(1)(G) already requires the PRO's plan to include a budget that fully funds all costs necessary to ensure that plan implementation avoids and minimizes negative environmental or public health impacts on disadvantaged or low-income communities or rural areas, and PRC section 42051.1(n) further requires the PRO to ensure its plan implementation avoids or minimizes such impacts for such communities outside the state. Moreover, as explained in section 18980.8(c)(7) and (10), producer responsibility plans must include assessment of recycling technologies' environmental justice impacts and, more generally, demonstrate that the technologies satisfy the definition of "recycling" under Public Resources Code section 42041(aa). As explained in section 18980.8(a), the producer responsibility plan must satisfy all the elements of Public Resources Code section 42051.1, including the requirement that the plan demonstrate consistency with "the goals, standards, and practices required by this chapter" (42051.1(c)(5)). Therefore, CalRecycle's review of whether producer responsibility plans satisfy the requirements of that section necessarily will address the commenter's concerns.

Commenters' objections to shifting the emphasis of the requirements from production of hazardous waste to its management, specifically as a result of section 18980.4.1(d)(1)(B), are addressed in response to comment subsection (B) below.

Subsection (B)

CalRecycle rejects this comment. The proposed regulation is consistent with the statute.

As established in response to comment subsection A) above, defining "significant amounts of hazardous waste" in relation to "a substantial risk of harm to public health, or of contamination of the environment" is a reasonable effectuation of the statute by the agency tasked with promulgating the regulations. The criteria to exclude significant amounts of hazardous waste must then logically evaluate and address the risk of harm to public health or of contamination of the environment. Public agencies' primary tool for mitigation of such risks is through imposition of appropriate requirements in permits. The proposed regulations' reliance on permit compliance therefore constitutes a reasonable approach to ensuring the statutory directive is effectuated. In other words, the handling and disposal of hazardous waste in compliance with applicable permits is a key indicator that the health and environmental risks presented by the generated hazardous waste is mitigated to below a substantial risk.

This subsection also provides that the use of a technology will not be considered to cause substantial health and environmental risks based solely on minor instances of permit violations. This provision is necessary to avoid unreasonable application of the criteria set forth in subsection (d) overall. Minor violations may not, for example, relate directly to the risks presented by hazardous waste, and, more generally, violations that do not cause actual or reasonably likely harm do not logically implicate the concerns underlying the prohibition of technologies based on the generation of hazardous waste.

CalRecycle recognizes that permitting requirements differ from jurisdiction to jurisdiction. Implementing the statute and fulfilling its mandates does not require California to dictate the level of regulatory control deemed appropriate in other jurisdictions with regard to the narrow issue of whether a non-mechanical technology may constitute recycling.

Subsection (C)

CalRecycle rejects this comment. The proposed regulation is consistent with statute.

While section 42041(aa)(5) of the PRC requires CalRecycle's regulations to address hazardous waste in the context of recycling, the Act does not define hazardous waste. The subsection incorporates the federal definition of that term for two reasons.

First, the context of the Act--namely, that it concerns waste that may ultimately be processed outside of California--militates against use of the definition in Public Resources Code Section 40141. The section lies within Division 30 of the Public Resources Code, and that division is almost exclusively concerned with

the handling of solid waste within the state. Also, that section was enacted in 1989, amended in 2008. It therefore predates the addition to Division 30 of any extended producer responsibility laws, which necessarily affect businesses that operate in other states and concern waste that may ultimately be managed outside California.

Moreover, section 40141 is expressly subject to the caveat in section 40100, which states, "[u]nless the context otherwise requires, the definitions in this article govern the construction of this division," and there is no basis to conclude that the Legislature intended section 40141 to broadly apply in a context so drastically different than any that existed in 2008. In the absence of that express statutory caveat, the definition of section 40141 would have applied in the context of the Act unless the Legislature expressly stated otherwise. But the Legislature was aware that the definition of "hazardous waste" in section 40141 does include the caveat and therefore does not necessarily apply to the Act. The Legislature's silence on whether the context of the Act requires another definition therefore does not preclude that context from doing so. Especially considering the broad mandate given to CalRecycle to adopt regulations necessary to implement and enforce this chapter, the reasonable interpretation of the Act is that applying a definition of "hazardous waste" other than the one in section 40141 is an appropriate exercise of CalRecycle's regulatory authority.

Second, under 18980.4.1(d)(4)(D), facilities must account for their generation of hazardous waste. If the California definition were to apply, that accounting would be in addition to the accounting already required under federal law (using the federal definition) and, for facilities in other states, the accounting required under those states' laws, if any. By using a definition that already applies in all states, section 18980.4.1(d) avoids California policy driving the accounting that may apply in other states, which are best suited for deciding the extent to which any definition other than the federal one should apply within their borders.

Regarding the commenters' specific assertion that the proposed regulation will "allow technologies that generate wastes that are not considered federally hazardous but that are hazardous based on the California definition to count as recycling," that concern is mitigated through the proposed regulatory provisions that require such technologies to comply with permits issued to manage the public health and environmental risk posed by the technology, regardless of whether it is determined to be federal hazardous waste. Furthermore, implementing the statute and fulfilling its mandates does not require California to dictate the level of regulatory control deemed appropriate in other jurisdictions with regard to the narrow question of whether a non-mechanical technology may constitute recycling. Also, the proposed regulations impose a uniform standard of appropriate management practices through the requirement to comply with ISO 59014:2024, discussed in greater detail below.

Subsection (D)

CalRecycle rejects this comment. Requiring a facility to operate in a manner consistent with ISO 59014:2024 is consistent with statute.

As a preliminary matter, commenters are incorrect in stating that the Initial Statement of Reasons references 42041(aa)(5)'s language regarding minimizing certain impacts as the rationale for inclusion of ISO 59014:2024 in the regulations. Rather, the ISOR references the definition of "responsible end markets" under section 42041(ad). That definition requires responsible end markets to operate in a manner "that benefits the environment and minimizes risks to public health and worker health and safety." Section 42041(ad) further authorizes the Department to "establish criteria regarding benefits to the environment and minimizing risks to public health and worker health and safety." Incorporation of the requirement to operate consistently with ISO 59014:2024 helps give full effect to these statutory provisions.

The primary purpose of the proposed requirement is to establish that the use of a technology under consideration cannot be considered "recycling" unless the facility's operations are consistent with the provisions of ISO 59014:2024, which is a document that establishes principles, requirements, and guidance for the sustainable, traceable conduct of materials recovery. This requirement provides additional assurance that the use of the technology under consideration reasonably avoids risks inherent in the usage of any technology and recovers materials in a way that enables determination of the amount of materials recovered. The requirement is designed to supplement the other criteria in the section, not on its own ensure that the technology does not pose substantial risk to public health and the environment.

Subsection (E)

CalRecycle rejects this comment because the recommended changes are not necessary to the implementation or enforcement of the Act. CalRecycle appreciates the comment and agrees that there may be scenarios where reconsideration of a facility's data is advisable earlier than the five-year cycle for PRO or Independent Producer plan approval. CalRecycle also appreciates the public's interest in the submitted information. However, changes to the proposed regulations are not necessary to achieve these purposes.

The statute (PRC section 42051.2(d)(1)) limits plan validity to five years, so there necessarily will be periodic reviews of use of the technologies at issue. Also, section 18980.4.1(d)(6) requires the facility to continue to report the same information and data to the PRO or Independent Producer annually after the approval of the plan. CalRecycle has the authority to request information from the PRO and Independent Producer at any time. (See sections 18980.6.8(e); 18980.7.7(e)). Further, the PRO or Independent Producer must submit an annual report to CalRecycle that includes all information required by paragraphs (2) and (3) of subdivision (a) of section 42051.3 of the Public Resources Code. (Section 18980.9.1.) PRC 42051.3(a)(2)(D)(ii) concerns information on the "recycling

technologies and means that will be utilized to achieve recycling requirements, including demonstration that the means and technologies meet the conditions in section 42041(aa)." Consistent with this requirement, the PRO or Independent Producer will be expected to include in its annual report to CalRecycle consideration of any significant changes in the data reported by a facility pursuant to section 18980.4.1(d)(6).

The PRO and Independent Producer plans are subject to public review and comment and approved plans must be posted on the PRO or Independent Producer's website. (See sections 18980.6.1; 18980.6.3; 18980.6.4; 18980.6.7; 18980.6.7.2) The regulations also require the PRO and the Independent Producer to post annual reports on their websites. (Sections 18980.6.5(f); 18980.7.4(d).)

Further, section 18980.6.6(b) states that a PRO plan, plan amendments, annual reports, or any documents associated with these submissions, are "public documents subject to mandatory disclosure under the California Public Records Act . . . unless an exemption from such disclosure applies." (Exemptions are narrow and subject to a strict process under the same section.) The same conditions apply to Independent Producer submittals. (Section 18980.7.5 (b).) (See also section 18980.14.)

Thus, while the regulations do not explicitly require that CalRecycle obtain and make publicly available the data required by 18980.4.1(d)(4)(D) or (d)(6), the regulations ensure transparency with regard to the data and analysis supporting a justification that a technology constitutes recycling.

Subsection (F)

CalRecyle rejects this comment. The statute could have but did not categorically exclude specified chemical recycling technologies such as pyrolysis when it defined recycling in section 42040(aa). Rather, it directed CalRecycle to develop criteria to evaluate such technologies and exclude them if they produce significant amounts of hazardous waste. The criteria CalRecycle proposes in the regulations for excluding technologies that produce significant amounts of hazardous waste are consistent with statute.

The criteria recognize that recycling technologies, other than mechanical recycling technologies currently in use in the State, may have impacts on public health and the environment, as commenters assert. The criteria are designed to address those impacts and exclude technologies only if they cannot be reasonably justified as not producing significant amounts of hazardous waste. See the response to 1) above on how the criteria accomplish this directive in the statute.

Comment O-62-2

2) Recycled content and recycling rate accounting requirements should be made clearer.

In Sections 18980.3.2, 18980.3.4 and Section 18980.4, there should be clearer descriptions and specifications of what constitutes accurate accounting of both recycled content and recycling rates in order to avoid deceptive methods. Certain forms of “mass balance” accounting create misleading and inaccurate accounting of recycled content that could result in low or no recycled content in a package even when significant recycled content claims are being made.13

Under some particularly problematic methods, plastic can even be turned into fuel to generate ”recycled” content credits which are then assigned to virgin plastic and sold at a higher price point as ”recycled” plastic. This kind of creative accounting would undermine efforts to get actual recycled plastic content into products and also obscure actual recycling rates given that the weight of the inputs determines how many “recycling credits” can be generated and assigned and may not be related to the actual amount of recycled polymer that is produced from the process.

Notably, in a lawsuit filed against ExxonMobil, the California Attorney General describes mass balance accounting methods as “a false and misleading marketing scheme” used to “mislead the public into believing that products made with ‘certified circular polymers’ have significant environmental benefits or are made of plastic waste when in fact they likely contain little to no actual ‘advanced recycling' content.”14 The complaint goes onto explain how mass balance accounting methods “have been widely criticized, including by some members of the plastics industry, precisely because it is deceptive to the public.” 15

To avoid such greenwashing, which would undermine the objectives of SB 54 as well as public confidence in the recycling system, CalRecycle should specify which chain of custody models will be accepted for recycled content and recycling rate calculations to ensure that no forms of credit-based mass balance accounting are used. We suggest the following changes to the proposed regulations: Section 18980.3.2(c): “Recycling rate shall be calculated based on the weight of materials, rather than volume or number. *For material made of plastic, the calculation of the weight of materials shall be consistent with one of the following International Standards Organization (ISO) standards for chain of custody models:*
(a) ISO 22095:2020(E) 5.3.2
(b) ISO 22095:2020(E) 5.4.1
(c) ISO 22095:2020(E) 5.4.2.2.1”

Section 18980.3.4(b)(1): We suggest adding the following language at the end of this section: *The calculation of postconsumer recycled content shall be consistent with one of the following International Standards Organization (ISO) standards for chain of custody models:*
(a) ISO 22095:2020(E) 5.3.2

(b) ISO 22095:2020(E) 5.4.1
(c) ISO 22095:2020(E) 5.4.2.2.1

Section 18980.4(b)(4): We suggest that it be clearer that the intent is to use recovered plastic in the manufacturer of new plastic products in order to qualify as recycled content for the purposes of determining eligible end markets, in order to avoid loopholes that might allow for the creation of a "plastic feedstock" that is then used to produce something other than plastic products, such as fuel. We suggest the following changes to Section 18980.4(b)(4) to address these concerns: "For material made of plastic, the end market is the entity that first produces plastic feedstock that meets the quality standards necessary to be used in lieu of virgin plastic material for the creation of new or reconstituted plastic products. *An entity that produces plastic feedstocks that are not ultimately used to produce plastic is not an end market.* Such end markets include, but are not limited to, entities that create pellet."

Response to O-62-2

Comment rejected. For purposes of the alternative compliance formula authorized under Public Resources Code section 42057(a)(2)(B), section 18980.3.4(b) of the proposed regulations establishes safeguards to prevent inappropriate claims of source reduction credit. In particular, under paragraph (1), CalRecycle retains discretion to evaluate whether the formula will accurately and reliably assess the reduction in use of virgin plastic through use of postconsumer recycled content in its stead. CalRecycle rejects the suggestion that the proposed regulations should prohibit specific approaches to calculating postconsumer recycled content. Such specific restrictions are unnecessary because statute expressly authorizes use of the Association of Plastic Recyclers (APR) certification program for validation. When considering whether to approve a plan proposing any other program, CalRecycle will evaluate whether the plan

establishes how the proposed third party will provide more consistent and accurate validations than APR's program would. If the proposal fails to meet that standard, whether because the proposed third party uses "free attribution mass-balance" or otherwise, CalRecycle will not approve the proposal.

Regarding recycling rate calculations, the proposed regulations expressly require that measurement of the amount of covered material considered "recycled" exclude all material derived from material other than covered material. Prescribing application of particular standards is not necessary because CalRecycle can evaluate calculations of recycling rates on a case-by-case basis to determine whether this requirement has been met. Also, in the recycling rate context, the commenter's concerns over wrongly considering material "recycled" is only relevant when processes that have inputs, such as virgin petroleum, that are not postconsumer content and might be the chemical source for the plastic outputs. In all other cases, the "weight recycled" (the weight of the plastic output that meets the marketplace standards for being used as feedstock in lieu of virgin plastic) necessarily originated from the postconsumer plastic inputs.

No change is necessary to address the commenter's concern over greenwashing because neither SB 54 nor the proposed regulations concern whether products are labeled "recyclable." The commenter appears to mistakenly link compliance with the recycling rate requirements of Public Resources Code section 42050(c) with the concept of "recyclability" under laws prohibiting deceptive labeling. Although Public Resources Code section 42355.51 is one such law, it is only relevant to the statute implemented by the proposed regulations because it provides the standards for compliance with section 42050(b). CalRecycle determinations of compliance with 42050(b), however, do not consider how products are labeled and are not determinations of liability related to labeling practices.

Lastly, CalRecycle declines to make the recommended change in section 18980.4(b)(4) because the change is not necessary. Section 18980.4(b)(4) requires the output to be "plastic feedstock," and Public Resources Code section 42041(aa)(2) expressly prohibits most fuel production from being considered recycling, so any output sold as fuel would not be considered recycled. Moreover, the proposed change would contradict the statutory definition of "responsible end market," which states that an end market is where the "recycling and recovery of materials" occurs. It would be illogical to say that whether a particular entity has conducted recycling and recovery of materials depends on some later activity by some other entity. Whether any particular entity is an "end market" would be indefinite.

Comment O-62-3

3) Regulations should include a minimum yield threshold and provide additional specificity

The proposed draft regulations state that facilities using non-mechanical recycling technologies need to submit to the PRO a “description of the covered material to be processed and the yield of the recovered material that meets the quality standards necessary to be used for the creation of new or reconstituted products” (Section 18980.4.1(d)(4)(B)). There are two issues with this provision. First, CalRecycle has not provided any baseline threshold for yield, though it should, since processes with low yields should not be considered recycling. Second, given that plastic recycling can only result in reduced reliance on virgin plastic if it displaces virgin plastic, CalRecycle should also specify that the “new or reconstituted products” must be plastic with respect to yield calculations.

To address both of these concerns, we suggest adding the following language to section 18980.4(a)(4)(A): *The threshold recycling yield identified by a PRO or independent producer entity shall not be lower than 75%, and shall be calculated considering plastic-to-plastic recycling yield.*

15 Ibid.

Response to O-62-3

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42041(aa), 42041(ad), and 42060, and the recommended change is not necessary to the implementation or enforcement of the Act. Consistent with its authority under PRC section 42041(ad), CalRecycle has established the recycling yield requirement for responsible end markets in section 18980.4(a)(4)(A). That section requires a PRO or Independent Producer to identify a threshold recycling yield in its plan for each material type and to justify such yield, including how each yield is informed by relevant data. That section further requires a responsible end market to achieve, for each recycling process that accepts covered material, an average recycling yield that meets or exceeds this threshold recycling yield. Because they are included in the producer responsibility plan, the threshold recycling yield and its justification are subject to both review and comment by the public and advisory board and review and approval by CalRecycle. The proposed language of section 18980.4(a)(4)(A) therefore provides significant opportunity for oversight, accountability, and transparency in the designation of the threshold yield while still maintaining sufficient flexibility to allow for different threshold yields as appropriate across material types. The recommended threshold yield of 75% is unnecessarily restrictive, rigid, and arbitrary, and risks being an inappropriate threshold yield—either because it is too low or too high—for particular material types. Moreover, to the extent this comment recommends allowing only for the consideration of plastic-to-plastic yield, no such change is necessary. PRC section 42041(aa) defines "recycling" for the purposes of the Act, and section 18980.3.2(b)(2) of the proposed regulations implements this provision by clarifying how the weight of covered material recycled must be calculated. Section 18980.4(a)(4)(A)(ii) of the proposed regulations provides that, for the purposes of calculating recycling

yield, the weight of covered material recycled must be determined in accordance with section 18980.3.2(b)(2). This is necessary to ensure clear, consistent, and certain guidance to regulated parties. Moreover, section 18980.4(a)(4)(A) is primarily concerned with the identification of responsible end markets, not the reduction of virgin plastic. To the extent this comment is concerned with the reduction of virgin plastic, that topic is adequately addressed elsewhere in the Act and proposed regulations, including, for instance, PRC sections 42050(b), 42053(e)(1), and 42057 and sections 18980.3.4 and 18980.9.1(d)(2) of the proposed regulations.

Comment O-62-4

4) The definition of categorically excluded materials is overly broad and narrows state law impermissibly.

We are pleased to see the addition of language to verify claims of preemption and ensure accountability, including review by the Department.

However, as written, the exemption in proposed Section 18980.2 is still overbroad. Pursuant to proposed Section 18980.2, the exemptions exclude packaging “if it is not reasonably possible to use other packaging or packaging components to comply with regulations, rules, or guidelines issued by the United States Department of Agriculture or the United States Food and Drug Administration.” But federal “guidelines” cannot create preemption. Only federal law can, i.e. regulations and statutes; guidelines are not law. Therefore, guidelines should be removed from the list of relevant considerations throughout the section

Response to O-62-4

CalRecycle accepts this comment and has revised section 18980.2(a)(2) to address the commenter's concern over the term "guidelines" and the concern that the proposed regulation might have a broader effect than intended (to exclude packaging when compliance with the Act and federal laws would be impossible). See CalRecycle's responses to comments I-19-1 and I-59-2, explaining the revisions responsive to this and similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).[

Comment O-62-5

5) The definition of “disposal” impermissibly narrows the application of key definitions in the statute.

In the proposed regulations, the definition of disposal in Section 18980.3.5 has been changed from the previously proposed language from the March 2024 to March 2025 rulemaking process; specifically, subsection (e) from previous drafts was deleted. The deleted subsection referenced a California code section, Public Resources Code §

40192(b), that defines disposal to include “transformation.” Elsewhere in California code, Public Resources Code § 40201, “transformation” is defined, in turn, to include pyrolysis. The deleted subsection is relevant to the determination of the “recycling rate,” with the statute stating that the “recycling rate shall be calculated as the amount of covered material that is recycled in a given year divided by the total amount of covered material *disposed of, as defined in subdivision (b) of Section 40192*, and the amount of covered material recycled . . . .” (Emphasis added.) Therefore, deleting that subsection is extremely problematic. We understand the rationale that this subsection was deleted since it duplicates language already in statute. However, the proposed regulations do lay out specific considerations for identifying disposal, as in this section, and for calculating the “recycling rate.” There is no separate definition of “disposal” in the regulations as relevant to “recycling rate.” Therefore, this definition should incorporate all relevant considerations, including those relevant to recycling rate, with appropriate nuance or clarifications. This also means that, in addition to incorporating the reference to transformation and pyrolysis, CalRecycle’s definition of disposal should reflect the other aspects of disposal from the statute, such as combustion, incineration, and other factors outlines in SB 54.16 Leaving out key elements is likely to lead to confusion, errors, and noncompliance from regulated entities and undermine the requirements of the statute.

The proposed change could result in the unfortunate consequence of allowing pyrolysis and possibly other “chemical recycling” technologies to be counted as recycling and used in the determination of the recycling rate when there is inadequate oversight or guidance. This is both likely—given that the CalRecycle will likely not be looking over the PRO’s shoulder on each calculation—and contrary to the statute’s language and the intent. To clarify the requirements, and to avoid this potential mishap, the language in this subsection should be restored and given additional nuance in order to avoid duplication, as has been done with provisions (a)-(d) of proposed Section 18980.3.5, listing what constitutes disposal. It’s not clear why CalRecycle has excluded additional detail on disposal including transformation (and therefore pyrolysis), or combustion or incineration, when it has included other factors reflected in the statute, e.g. “energy generation or fuel production, except for anaerobic digestion of source separated organics.”17 Added nuance could include specific language on inclusion of pyrolysis and other “chemical recycling” technologies in the definition of disposal, and/or specifically noting which elements shall or shall not be included in the determination of the recycling rate—e.g. *disposal includes transformation for the purposes of calculating the recycling rate. Transformation includes incineration, pyrolysis, distillation, or biological conversion other than composting.* Alternatively, we recommend restoring the previous language from the March rulemaking process.

Response to O-62-5

CalRecycle rejects this comment for the reasons provided in responses to comments O-13-11 and O-9-42. Regarding the suggestion to refer to certain "chemical recycling" technologies, see CalRecycle's response to comment O-6-1. Also, the second sentence of Public Resources Code section 42041(ab)

expressly authorizes CalRecycle to adopt a methodology, via regulation, other than the one stated in that sentence.

Comment O-62-6

6) CalRecycle must provide additional guidance on how the PRO is to implement the few provisions of SB 54 that relate to toxic chemicals to give meaning to the statute's requirements.

SB 54 requires fees for PRO participants and directs that the fees be adjusted with malus fees or credits, based on various delineated factors.18 CalRecycle's proposed regulations provide detail on several of these factors, with CalRecycle explaining that "[b]y presenting a list of items, further detailed below, this subsection clearly lays out requirements related to the fee, so that a PRO and participating producers can readily understand how the PRO must assess it."19 Similar detail is required for the factors specifying malus fees and credits related to the presence of toxic heavy metals or additives in plastic that can make recycling harder or embed toxics in the recycled plastics—these factors are not addressed in the regulations. Without such detail, the PRO could choose to apply malus or credit adjustments for toxics as narrowly as even just one additive or for none at all. As others have noted, the PRO's focus is compliance at lowest cost since it is a collective of producers; it is not focused on the ultimate objectives of the law.

SB 54 states that:
(8) Certified compostable covered materials that do not contain toxic additives shall be subject to a reduced fee, as determined by the PRO.
(9) Covered material that contains toxic heavy metals, pathogens, or additives shall be subject to an increased fee.

CalRecycle must include provisions in the regulations that give greater specificity to what pathogens, heavy metals, or additives should result in credit or malus fee adjustments to give the provisions meaning. Without greater detail and clarity, these provisions of the statute could essentially be negated. While CalRecycle references chemicals listed by the Office of Environmental Health Hazard Assessment (OEHHA) pursuant to Proposition 65, that is responsive to a different factor under the statute20 and only covers certain health end points, namely cancer and reproductive/developmental toxicity. The Legislature added factors that require the consideration of toxic additives, pathogens, and heavy metals other than those regulated by OEHHA; otherwise, there would be no need for factors 8 and 9. That makes sense, given that Proposition 65 does not address other health impacts from heavy metals, pathogens, or additives, such as neurotoxicity, effects on the immune system, liver toxicity, respiratory impacts, cardiovascular impacts, or hormone disruption.

The Department of Toxic Substances Control's Candidate Chemicals List already identifies a list of potential chemicals of concern and would provide greater specificity to

these provisions.21 Other states have also identified chemicals of concern which could further inform the regulations. For instance, Washington's Toxic Pollution Law identifies different classes of chemicals, including phthalates, organohalogen flame retardants, phenolic compounds, and PCBs.22 Maine has a list of food packaging chemicals of high concern.23 NRDC proposes that the malus fee adjustments should, at a minimum, include higher fees for the chemicals of concern covered in these laws and lists. As currently drafted, the proposed regulations neglect the statute's directives for several of the factors.

16 Public Resources Code § 42041(aa)(2) (referring to "other forms of disposal" at the end of the list). 17 See Public Resources Code § 42041(aa)(2): "(2) "Recycle" or "recycling" does not include any of the
following:
(A) Combustion.
(B) Incineration.
(C) Energy generation.
(D) Fuel production, except for anaerobic digestion of source separated organic materials.
(E) Other forms of disposal."
18 Public Resources Code § 42053(e).
19 § 18980.6.7. Eco-modulated Fee and Fee Schedule (providing guidance on factors listed in Public
Resources Code § 42053(e)(4), (6), and (7).); Statement of Reasons at p. 163.

Response to O-62-6

CalRecycle rejects this comment. See the response to comment O-75-14.

Comment O-62-7

7) PRO plans should include additional information about recycling technologies.

Section 18980.8(c) should be expanded to require the PRO to include additional information regarding recycling technologies and provide references documenting the data that they provide to the greatest extent possible.

We offer the following specific recommendations about the additional information that should be required to be provided by the PRO:

- Section 18980.8(c)(3) should read "A description of the level *and type(s)* of contamination the technology is able to tolerate."
- Section 18980.8(c)(4) should read "A list of overall inputs, including *names of specific* chemicals, if applicable."
- Section 18980.8(c)(5) should read, "An account of end products, including quantities of byproducts or residuals produced by the technology, along with their disposition (i.e., further processing, landfill disposal, *hazardous waste disposal,* etc.)."

- Section 18980.8(c)(8) should read, “An evaluation of the efficiency of the technology in achieving recycling rates, *including average percentages of material retention*.” (Material retention is the quantity of recyclate obtained per weight of post-consumer material.24)

Thank you for your consideration. Please note that additional concerns are delineated in the NGO coalition letter sent by Californians Against Waste, of which we are a signatory. Please feel free to contact us to discuss any of the issues we raise above.

20 Public Resources Code § 42053(e)(4). 21 Safer Consumer Products, Candidate Chemicals, https://dtsc.ca.gov/scp/candidate-chemicals-list/. 22 RCW 70A.350.010, https://app.leg.wa.gov/RCW/default.aspx?cite=70A.350.010. 23 State of Maine, Toxic Chemicals in Food Packaging, https://www.maine.gov/dep/safechem/packaging/Listing-Criteria-for-Chemicals-in-Food-Packaging_Dec2021.pdf.

Response to O-62-7

Comment rejected. Most of the recommended changes would not have a material effect on the proposed regulations. Requiring producer responsibility plans to include a "description of the level of contamination" necessarily encompasses disclosure of the types of contamination, and a list of "chemicals" necessarily encompasses the names of those chemicals. Likewise, "hazardous waste disposal" would only be an example of the required disclosure of end products—the proposed regulation, as drafted, cannot reasonably be interpreted not to require disclosure of hazardous wastes. Regarding "average percentages of material retention," that is presented as a type of "recycling rate," confusingly suggesting some requirement that multiple "recycling rates" must be presented, not just the one described in section 18980.3.2. Moreover, there is no statutory requirement that turns on achieving a certain recycling output "per weight of postconsumer material," so it is unclear what purpose such a calculation would serve. That calculation would also be partially redundant with the conceptually similar provision in section 18980.4(a)(4)(A) concerning recycling yield. That provision requires a responsible end market to achieve the recycling yield thresholds set in a producer responsibility plan, which must set a threshold informed, if possible, by the most recent needs assessment.

O-63: National Stewardship Action Council (Heidi Sanborn)

Comment O-63-1

The National Stewardship Action Council (NSAC) is a 501(c)(4) non-profit organization comprised of governments, non-government organizations, businesses, and consumers with the vision for the United States to attain a responsible, circular economy, an economic system that designs out waste and pollution, keeps materials in use, and

regenerates natural systems. We were active participants in the SB 54 bill negotiations and want to ensure the program works as planned.

This letter is in response to the permanent regulations released on August 22, 2025. We strongly believe that **SB 54 intended to reduce the overall costs of the system and was negotiated with industry to ensure it would work for business as well.** While we recognize and appreciate the significant work CalRecycle has put into refining these rules, we remain deeply concerned that the regulations, as currently drafted, in several places, overreach statutory authority and delay progress, flatly do not follow the law as written, lack clarity, and risk undermining the carefully negotiated balance of SB 54.

To ensure the success of SB 54, in January 2023, we convened a working group with more than 200 representatives from local governments, producers, recyclers, NGOs, packaging designers, consultants, and consumers. This group has met monthly to review the statute and regulations, share perspectives, and facilitate in-depth discussions on critical sections such as local government roles, responsible end markets, covered materials, and reuse infrastructure. By fostering dialogue across sectors, we have created a platform that allows representatives to learn from one another and submit more thoughtful, robust comments. We believe CalRecycle benefits from the depth of input generated through this collaboration. If these regulations cannot be implemented as intended, industry supported SB 54 in lieu of the competing ballot measure may argue that they cannot meet the goals they themselves supported. That would have national consequences, since California's implementation is being closely watched by policymakers across the U.S.

Response to O-63-1

Comment rejected. No substantive response is required because the comment raises general concerns without stating any specific recommendation or explanation of its objections to the proposed regulations. To the extent other portions of the submission do suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-63-2

We strongly urge CalRecycle and the Governor's office to align the regulations with SB 54's legislative intent to create a fair, effective, and transparent producer responsibility program that supports affordability for consumers, prevents loopholes, and builds consumer trust.

Overarching Concerns:

1. Several provisions go beyond statutory authority, particularly enforcement against local governments, chemical "recycling", delaying eco-modulation, not including Over the Counter pharmaceuticals to be "covered products", not addressing the future application by other Producer Run Organizations (PRO), and the exclusion application process that was added to this draft.

2. Producers, local governments, and other impacted entities still lack a clear understanding of their obligations and how the money will flow, which jeopardizes program success.
3. Certain deadlines, especially for reuse and refill, are unrealistic given the lack of early staffing and preparation by the Producer Responsibility Organization (PRO).

Response to O-63-2

CalRecycle partially accepts and partially rejects this comment. Regarding analysis by Mark Dargay and the specific items listed as potentially qualifying for exclusion, CalRecycle rejects this comment for the reasons stated in response to comment I-33-3, which incorporates that analysis. Regarding the request that CalRecycle ensure that "packaging expertise is available on staff," no substantive response is necessary because that is not an objection or a suggested modification to the regulations. Even if the request was intended as a request to change the regulations, codifying CalRecycle hiring and staffing priorities is not an appropriate use of regulations, nor is any regulation required for CalRecycle to determine the staffing necessary for it to carry out its statutory obligations. CalRecycle rejects the commenter's suggestion to require "written justification" because section 18980.2(a)(2)(A) already required one (as revised, that requirement is now found in subparagraph (B)). Regarding "federal concurrence," that is not a reasonable requirement because the federal government is a separate sovereign and is not subject to any CalRecycle control. The federal legislature can only act by passing legislation, and CalRecycle cannot reasonably expect any federal agency to take the extraordinary step of exercising discretion over whether California law should consider packaging lawful. Regarding specific limitations on what exclusions section 18980.2(a)(2) may address, CalRecycle rejects the commenter's suggestion because Public Resources Code section 42060(b), which the proposed regulation implements, does not incorporate such limitations.

CalRecycle accepts this comment, however, to the extent it alleges that section 18980.2(a)(2) was unclear in scope or effect, was insufficiently clear with regard to what renders it "not reasonably possible" to resolve conflicts with federal laws, or would have been overbroad in effect due to the potential for the exclusion to be applied despite the conflicts being avoidable. See CalRecycle's response to comment I-19-1, explaining the revisions responsive to this and similar comments. The changes resolve, among other concerns, the commenter's concern that "exemptions could remain valid upon submission and persist indefinitely." See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

Comment O-63-3

1. Article 2: Covered Material and Covered Material Categories
Section 18980.2 Categorically Excluded Materials

We are concerned that the categorical exclusion framework in Section 18980.2 is overly broad and could exempt large portions of food packaging including primary, secondary, and tertiary components, simply because they serve a food safety function under FDA or FSMA standards. As Mark Dargay, Director of Regulatory Compliance at Comprehensive Food Safety, noted in his expert comments, the current language could allow barrier films, glass jars, metal lids, tamper-evident seals, kraft board boxes, and corrugated shipping cases to all qualify for exclusion, significantly limiting the scope of SB 54. To avoid this, CalRecycle should strengthen safeguards by ensuring packaging expertise is available on staff, requiring written justification and federal concurrence for exemption claims, and setting clear timelines and limits for approvals. Without these checks, exemptions could remain valid upon submission and persist indefinitely, creating loopholes, litigation risks, and unfair cost burdens on some producers. Exclusions should be limited to safety-driven packaging that is demonstrably necessary for microbial control, structural integrity, or tamper-resistance, while keeping marketing, display, and convenience-driven packaging within the program.

Response to O-63-3

CalRecycle rejects this comment for the reasons stated in responses to comments I-19-1, O-93-9, B-47-3, and O-90-3. Regarding the specific request that CalRecycle ensure that "packaging expertise is available on staff," codifying CalRecycle hiring and staffing priorities not an appropriate use of regulations, nor is any regulation required for CalRecycle to determine the staffing necessary for it to carry out its statutory obligations. Regarding "written justification," section 18980.2(a)(2)(A) requires one. Regarding "federal concurrence," that is not a reasonable requirement because the federal government is a separate sovereign and is not subject to any CalRecycle control. The federal legislature can only act by passing legislation, and CalRecycle cannot reasonably expect any federal agency to take the extraordinary step of exercising discretion over whether California law should consider packaging lawful. Regarding specific limitations on what exclusions under section 18980.2(a)(2) may address, CalRecycle rejects the commenter's suggestion because Public Resources Code section 42060(b), which the proposed regulation implements, does not incorporate such limitations.

Comment O-63-4

Section 18980.2.1. Exclusion of Reusable and Refillable Packaging and Food Service Ware (a)(4)(A) “Unless the item was delivered directly to a consumer, there is at least one location for returning the item that is either: the same location where the item was obtained or delivered; or within one mile of the location where the original item was obtained and has hours of operation that encompass, at a minimum, the hours of operation of the location where the item was obtained.”

We are concerned that the current language may unintentionally exclude curbside collection of reusable packaging from qualifying as a “convenient” return option. At least three municipalities in California are actively piloting curbside collection programs for reusable packaging, which provides a highly accessible return modality for consumers. To ensure these programs are recognized under SB 54’s convenience standards,

we recommend clarifying that participation in such curbside collection programs satisfies the return requirements.

We suggest the following language be added: *"(C) In either case, if a curbside collection program is made available by a municipality, private hauler, or other collection provider working with or on behalf of the PRO or an Independent Producer, the requirements of this paragraph are satisfied."* This clarification would explicitly allow municipalities to opt into reuse system participation while supporting the statute's intent to maximize consumer convenience.

Response to O-63-4

CalRecycle rejects this comment for the reasons set forth in response to comment O-84-3.

Comment O-63-5

S*ection 18980.2.2. Exclusion of Certain Types of Packaging "The good must be one that is not ingested, irreversibly used, destroyed, or expended through its ordinary use."* This language is confusing, particularly in the context of food packaging, since food is inherently consumed (i.e., expended). Without clarification, the regulation risks unintentionally excluding legitimate and necessary food packaging applications. We recommend rewriting this section to accurately reflect the functional realities of food product lifecycles while maintaining the intent of minimizing unnecessary packaging.

Response to O-63-5

Comment rejected. The quoted text uses plain language, with no terms that are ambiguous or uncommon. Also, the commenter's assertion that food packaging can be eligible for the exclusion for long-term storage packaging under Public Resources Code section 42041(e)(2)(F) is wrong. If that exclusion could apply to food goods, packaging that is discarded essentially immediately—because all of its contents could be used up quickly after purchase—could be exempt. Even for foods and other products that have infinite or extremely long shelf-lives—for example, honey, salt, distilled water, or vinegar—the exemption would be inappropriate because even those products may be, and usually are, used up well within five years.

Comment O-63-6

Section 18980.2.4 – Exemptions for Certain Covered Materials
The current regulations assign sole responsibility for submitting exclusion applications to the PRO. We are concerned this structure is both impractical and inconsistent with the intent of SB 54. A PRO is not structurally equipped to manage what could be thousands of exemption requests across diverse packaging materials, formats, and industry sectors. Placing the PRO as the sole "gatekeeper" creates an administrative bottleneck and forces it into the untenable role of arbitrator between producers, rather than a coordinator of system obligations. Evaluating exclusions, especially across the wide range of food and non-food packaging subject to FDA/FSMA regulation, requires

specialized technical expertise that PROs do not inherently possess. We recommend allowing an organization, such as an association, to be solely responsible for reviewing applications. This approach would simplify the submission process and reduce the administrative burden and costs to the PRO. It would also ensure that industry perspectives are represented in the review process and prevent undue concentration of authority in a single entity.

Response to O-63-6

Comment rejected. Because it would be impracticable for CalRecycle to evaluate all exemption requests in a reasonably timely manner without some mechanism to facilitate meritorious, non-repetitive applications, section 18980.2.4(a) requires applications to be submitted by a PRO on behalf of its participating producers or by an Independent Producer. Considering applications submitted by an organization would not provide the same benefit because there would be no assurance that the organization adequately represents producers it purports to represent. In contrast, a PRO necessarily represents a large number of producers, and producers are required to join a PRO or be Independent Producers. In effect, the PRO is authorized to fill the role the commenter suggests for associations. Moreover, nothing in the proposed regulations prevents any association from collaborating with a PRO regarding an exemption application.

Comment O-63-7

2. Article 3: Evaluations of Covered Material and Covered Material Categories
Section 18980.3.3 - Eligibility for Being Labeled "Compostable"
Consumer education is critical to the success of SB 54. The current draft regulations risk creating significant confusion by failing to clearly distinguish between compostable and recyclable packaging. Overly complex or contradictory rules will undermine consumer confidence and lead to "opt-out behavior," where individuals disengage rather than attempt to comply. The current language on items "associated with the recovery of desirable organic waste" is overly broad. As written, it appears to allow any product marketed, labeled, or sold for disposal in green bins, regardless of whether it is recoverable. We strongly recommend that CalRecycle adopt clear, consistent statewide messaging and education requirements to ensure consumers understand how to properly manage covered materials.

Response to O-63-7

Comment rejected. Section 18980.3.3 does not purport to govern what can be put in green bins. Rather, it interprets various provisions for eligibility to be labeled "compostable," and only for the purpose of implementing and enforcing SB 54. The proposed regulations, do not, for example, govern labeling practices or consumer behavior. Moreover, the language cited from section 18980.3.3(c) ("associated with the recovery of desirable organic waste") relates to Public Resources Code section 42357(g)(1)(E), which is only one of many criteria that

must be fulfilled for covered material to be considered eligible to be labeled "compostable."

Comment O-63-8

We are concerned that the current draft regulations create ambiguity regarding which materials qualify as “compostable” and how they are associated with the recovery of desirable organic waste. Notably, CalRecycle removed the definition of “desirable organic waste” that appeared in the October 2024 15-day draft regulations. This definition, previously used in AB 1201 and supported by the Biodegradable Products Institute, clarified that desirable organic waste includes food and green material accepted by composters. Its removal reduces clarity and may lead to inconsistent interpretation. We are concerned that the current draft regulations create ambiguity regarding which materials qualify as “compostable” and how they are associated with the recovery of desirable organic waste. Notably, CalRecycle removed the definition of “desirable organic waste” that appeared in the October 2024 15-day draft regulations. This definition, previously used in AB 1201 and supported by the Biodegradable Products Institute, clarified that desirable organic waste includes food and green material accepted by composters. Its removal reduces clarity and may lead to inconsistent interpretation.

Response to O-63-8

Comment rejected. In the composting context, the phrase "desirable organic waste" has a readily understood meaning, and there is no risk that it might be interpreted not to include the materials about which the commenter expresses concern (good and "green material accepted by composters"). Also, as the commenter points out, Public Resources Code section 42357(g)(1)(E) already explains that those materials ("food scraps and yard trimmings") are desirable organic waste.

Comment O-63-9

3. Article 4: Responsible End Markets

Section 18980.4 - Responsible End Market Criteria

We are concerned that the current regulations could allow the production of recycled plastic flakes to count as recycling, even if the material is stockpiled without being manufactured into new products. This approach risks creating “mountains of plastic” that are technically counted as recycled but do not actually displace virgin plastic in the market. The recent closure of rPlanet Earth in Vernon illustrates the fragility and volatility of California’s plastics recycling infrastructure.

To ensure that recycling metrics reflect meaningful environmental outcomes, we recommend that the regulations require incorporation of recycled feedstock into new manufactured products, rather than counting intermediate materials production such as flake or pellet. This would strengthen the integrity of SB 54’s end-market requirements and promote real progress toward a circular economy.

Response to O-63-9

CalRecycle rejects this comment. The proposed regulations are consistent with the relevant statutory provisions, including PRC sections 42041(aa), 42041(ad), and 42060, and the recommended change is not necessary to the implementation or enforcement of the Act. See the responses to comments O-56-10, B-9-1, and O-73-8.

Comment O-63-10

4. Article 8: Producer Responsibility Plan Requirements

Section 18980.8 Producer Responsibility Plan

We are concerned that the draft regulations do not adequately protect local jurisdictions from undue costs associated with SB 54 implementation.

Under subdivision (g), *"Pursuant to paragraph (1) of subdivision (g) of section 42051.1 of the Public Resources Code, the plan shall include a process for determining and paying costs that will be incurred, or otherwise would be incurred, by local jurisdictions, recycling service providers, alternative collection programs, and others due to requirements of the Act. For purposes of this subdivision, costs that the PRO and Independent Producers are obligated to pay are referred to as "covered costs." The process for determining covered costs must satisfy the following criteria",* the current language indicates that jurisdictions are only notified after a determination has been made. We recommend revising this provision so that jurisdictions are notified immediately upon submission of a cost claim, not solely after the PRO issues its determination. This change would ensure transparency and allow jurisdictions sufficient time to review and prepare responses.

Subdivision (h)(4)(E*) "Unless the parties agree otherwise, arbitration and mediation fees shall be apportioned equally among the parties. Each party shall be responsible for their own attorney's fees."* specifies that arbitration and mediation fees shall be apportioned equally among the parties, with each party bearing its own attorney's fees. This approach conflicts with SB 54's statutory intent. Per PRC §42040(b)(2)(B), the Legislature intended that local jurisdictions be made financially whole for any new costs incurred under the Act. If arbitration results in a local jurisdiction prevailing, the PRO should be required to reimburse all arbitration, mediation, and legal costs. Without this protection, arbitration would be prohibitively costly for many jurisdictions, effectively denying them a fair process. San José, LA Sanitation, and other municipalities have raised this concern repeatedly during the regulatory process, yet no changes have been made to the regulations to address this fundamental concern.

Response to O-63-10

Comment rejected. The commenter appears to be referring to cost claims submitted by entities other than local jurisdictions. The commenter does not explain, however, the purpose of the local jurisdiction having "time to review and prepare responses," or even what a "response" would be. The costs at issue would not be payable to the local jurisdiction, so the logic of the comment's recommendation is unclear. Regarding transparency, see CalRecycle's response

to comment O-13-23.
Regarding section 18980.8(h)(4)(E), CalRecycle rejects this comment for the reasons stated in response to comment O-15-6 and because the commenter does not explain what it would mean for a local jurisdiction to be the "prevailing" party. As with the scenario addressed in the response to comment O-15-6 (merely requiring the amount determined via arbitration to be greater than the cost determined by the PRO), such an approach would risk manifestly unfair or unpredictable results. For example, a local jurisdiction could bring a matter to arbitration and succeed only in having the arbitrator require a small increase over the PRO's covered cost determinations. There is no clear threshold that could be established for when such an increase would be sufficient to render the local jurisdiction to have "prevailed." This problem is particularly acute where there is a wide divergence between the PRO's determination of covered costs and the amount advocated by the local jurisdiction. It is reasonable to expect that an arbitrator would determine the appropriate amount to be somewhere between those positions, leaving neither party the clearly "prevailing" one.

Comment O-63-11

5. Article 11: Requirements, Exemptions, and Extensions for Local Jurisdictions
Section 18980.11. Requirements for Local Jurisdictions and Recycling Service Providers
The one-year update cycle for Covered Material Category (CMC) lists is impractical. Annual updates would require jurisdictions to revise bin labels, outreach materials, and public education campaigns on an unrealistic timeline. Language on enforcement raises additional risks, as jurisdictions could be fined if materials are not updated quickly enough, repeating challenges seen under SB 1383. Jurisdictions also face a compliance gap prior to 2027. CMC lists are already published, but jurisdictions lack dedicated funding until the PRO plans are approved. Expecting compliance before plans are in place creates an unfunded mandate. CalRecycle's clarification that municipalities may pause violations while exemption or extension requests are under review is helpful, but further protections and guidance are needed to ensure local jurisdictions are not penalized for delays outside of their control.

Response to O-63-11

CalRecycle rejects this comment. A period of one year balances the need to implement the Act, as a standard period longer than one year would delay the positive results expected from the change and would often exceed the period local jurisdictions reasonably require for updating their recycling programs, while a shorter period might be impracticable for a local jurisdiction or recycling service provider. Further, the ability to request an extension allows for added flexibility as CalRecycle may identify an effective date later than the publication date in cases where it anticipates those affected by the change may need a longer period to implement the update successfully.

The proposed regulations are consistent with the requirements set forth in the Act, including in sections 42060, 42060.5, and 42081 of the Public Resources

Code, and the implied suggestion to specify that local jurisdictions are not subject to enforcement prior to being provided the funding required to implement their programs is not necessary to the implementation or enforcement of the Act. While section 18980.8(g) of the proposed regulations clarifies the type and scope of costs incurred by local jurisdictions due to requirements of the Act that a PRO or Independent Producer is required to pay, nothing in the Act provides that a local jurisdiction's compliance obligation under the Act is conditioned on the local jurisdiction having received adequate support and payment from a PRO. Moreover, the commenter's concerns are adequately addressed by PRC section 42060.5(b), under which a jurisdiction is entitled to an exemption if it cannot practicably comply with 42060.5(a).

Comment O-63-12

For SB 54 to succeed for Californians, the regulations must reflect the law's intent: protecting the environment while **unlocking billions in economic benefit.** If not implemented as negotiated and passed, the regulations undermine the democratic process that created the bill, leave billions in environmental and economic benefits on the table, risk unfair markets that invite litigation, and jeopardize California's leadership, putting packaging EPR programs at risk nationwide.

Thank you again for the opportunity to comment and we appreciate all the hard work you do and for your consideration of our comments.

Response to O-63-12

Comment rejected. No response specific to the commenter's submission is necessary. This closing paragraph summarizes the commenter's recommendations, to which CalRecycle has responded separately.

O-64: Gail Delihant

Comment O-64-1

Western Growers Association appreciates the opportunity to provide comments to CalRecycle on the proposed Senate Bill SB 54 (Allen, 2022) ("SB 54" or the "Act") Plastic Pollution Prevention & Packaging Producer Responsibility Act Permanent Regulations published on August 22, 2025 ("Draft" or "Draft Regulations"). Western Growers is an agricultural trade association headquartered in California. Western Growers members are small-, medium-, and large-sized businesses that produce, pack and ship fruits, vegetables, and tree nuts from our home states of California, Arizona, New Mexico, and Colorado. Western Growers members account for roughly half the annual fresh produce grown in the United States, providing consumers with healthy, nutritious food.

We appreciate CalRecycle's continued efforts to acknowledge the need for exclusion and exemption of fresh produce packaging in the latest Draft Regulations. The fresh

produce industry remains committed to delivering safe, fresh, and affordable healthy produce to consumers. The considerations outlined in the Draft will support our ongoing efforts to develop packaging solutions that not only meet federal safety standards but also align with our sustainability goals.

US Food and Drug Administration (FDA) guidance documents provide a clear, acceptable path to compliance with legally binding statutes and regulations, such as the Food Safety Modernization Act (FSMA) and other critical food safety protective measures and guidelines. These documents have been previously reviewed and deemed acceptable by the FDA to meet these underlying legal requirements. Following FDA guideline documents, in addition to adhering to the mandated rules and regulations, represents the gold standard for operational excellence. For our members, achieving this gold standard in food safety is paramount. To illustrate their necessity, consider the pharmaceutical industry. The safety of medications and medical devices relies heavily on adherence to over 2,400 FDA guidance documents.1 Their adherence is essential to maintaining a safe drug supply. Similarly, in the food sector, these FDA guidance documents are indispensable tools for ensuring the highest level of consumer protection and public health.

The FDA has a longstanding success record of developing different tools to direct and educate the regulated community. The FDA has published extensive guidelines related to food production and food safety. FDA inspections can be performed directly by the FDA or through a contracted state agency such as the California Department of Food and Agriculture (CDFA). “FSMA PSR [FDA Food Safety Modernization Act’s Produce Safety Rule] inspectors draw from these guidance documents in interpreting and enforcing the rules, and judges may give weight to the information contained in guidance documents if a farm’s practices are under question in court. Therefore, while a producer may adopt practices not articulated in guidance, they should be aware that guidance is representative of the FDA’s current thinking and presents a good starting point for FSMA compliance.”2

The Legislature included several key provisions in SB 54 that are intended to reduce the impact of the law on growers, to avoid conflicts with federal laws, regulations, and guidance that protect food safety and decrease spoilage, to reduce greenhouse gas (GHG) emissions associated with food waste, and to reduce the extent to which the Draft Regulations may make it more difficult for disadvantaged communities to afford healthy food.

The Importance of Packaging in Protecting and Preserving Fresh Produce

Packaging helps ensure that a high-quality, consistent product is delivered to the consumer year-round despite crop variety changes, handling variability, and overall product pre-harvest and post-harvest quality challenges. It protects the health and safety of consumers by reducing the potential for food contamination. It reduces the overall cost of groceries for families by keeping their produce fresh for longer and reducing food waste. Sustainable fresh produce packaging relies on the functional design and application of packaging systems to protect and preserve fruits and

vegetables while minimizing negative impacts on the environment, economy, and society throughout the supply chain. Prioritizing the functionality of fresh produce packaging is essential because it aligns sustainability efforts with the primary purpose of packaging: to protect and preserve the food it contains.3

Life Cycle Assessment (LCA) studies show that the agricultural production phase, which requires water, land, and energy to grow, process, and transport fresh produce crops, accounts for an important portion of the total environmental footprint.4 When the packaging or supply chain fails and food becomes food loss and waste, the entire environmental investment in that food is lost. There are still significant gaps in understanding how to seamlessly integrate packaging technologies throughout the supply chain that need to be addressed to minimize food waste.5 Reducing food loss and waste along the supply chain in households and the food service industry, helps California reach its ambitious GHG emissions reduction goals by contributing to a net reduction in GHG emissions from the global food system (agricultural production, handling and storage, processing and packaging, distribution, and consumption).

Plastic is an important material used in fresh produce packaging, and provides a lightweight, moisture-resistant, and customizable barrier that helps protect produce from mechanical damage, contamination, and excessive water loss, while allowing controlled gas exchange (e.g. via micro-perforations) to slow respiration and spoilage.6 Currently, there are few materials that can match the capabilities of plastic to extend shelf life by days or more compared to unpackaged or less optimized alternatives. Research for alternatives to plastic are simply not able to keep up with the regulatory landscape. For example, the bioplastic PBAT (polybutylene adipate co-terephthalate) has shown some promise over the past decade for food packaging applications. However, the list of materials considered to be compostable is a moving target7 that has posed challenges for the innovators and investors of compostable plastic packaging alternatives.8

Further assessment of the social and environmental impacts of plastic packaging alternatives such as those derived from biomass are needed. The packaging industry is just one of the many industries vying for biomass including energy, food/feed, biofuel, and materials/carbon. 9 Each plastic package alternative option should have a cost-benefit analysis (CBA) performed prior to establishing a regulation requiring it. For example, Rui et al. highlight the issues regarding precious agricultural land use changes from food production, to producing plant based (biomass) packaging material.9 Costs associated with using agricultural soil for packaging material, a non-renewable resource that has a complex ecosystem, will result in considerable environmental and economic consequences.9

In the packaged salad industry, primary packaging serves as a barrier to protect from postprocessing contamination by microorganisms, chemicals, and foreign materials, while it also offers shelf-life extension by modifying package atmospheric gas compositions, generally oxygen and CO_2 percentages, which reduces the respiration and transpiration rate of the product, while also creating an acidic environment which inhibits microbial growth and subsequently extends shelf life.10 Plastic achieves this

shelf-life extension through intentional design, providing differing packaging options with varying oxygen transmission rates (OTR).11 With reduced oxygen and increased CO2 levels, modified atmosphere packaging (MAP) can slow the senescence of the product, inhibit enzymatic activity, and disrupt the growth of aerobic microorganisms, which can lead to spoilage and food safety risks for consumers.12

Packaging Reduces the Risk of Harmful Contamination

If history has taught us anything, working together is better than alone. Risk management for food safety is undoubtedly complex. Practical solutions are necessary to address safety risks. The California Leafy Greens Marketing Agreement (CA LGMA) founded in 2007 is a great example of an industry-state partnership to address food safety risks following the E. coli 0157:H7 outbreak in 2006 that sickened 205 people and tragically caused three deaths. The CA LGMA represents an unprecedented commitment to protecting public health and requires California farmers to follow a set of food safety practices that are assessed through mandatory government audits executed by CDFA. In 2007, Western Growers, in collaboration with CA LGMA released the first set of food safety standards to manage microbiological risk in leafy green operations. Since its inception, these food safety guidelines have continued to evolve with science through an adaptive and continual improvement process. While CA LGMA is focused on best practices for safe growing and harvesting operations, food safety practices involving packaging with appropriate materials have helped ensure food safety for consumers of fresh produce over the years.

The fresh fruit and vegetable segment, whether fresh-cut or whole fruits and vegetables, has intrinsic complexity with respect to product quality, shelf-life, and food safety risks.13While fruits and vegetables are critical for human health and nutrition, they also represent a food segment associated with multiple foodborne outbreaks and consequently require focused attention to the risks associated with each produce item and packaged product.14 For fresh-cut fruit and vegetables, packaging is a critical product design component, selected to optimize the shelf life (i.e., quality) of the items and to maintain safety for the consumer.15 Packaging is a critical element in controlling potentially harmful post-processing exposures.16 In 2023, Zwilling et al. note that, “Foodborne disease caused by bacterial pathogens causes approximately 3.6 million illnesses annually and represent 64% of the foodborne pathogen-related deaths annually in the U.S., with the remaining 36% caused by viruses and parasites.”36

Additionally, packaging protects the fresh produce from contamination that can spread from other products in the store, such as pathogens from raw poultry products or raw meats that may spread from the hands of employees or customers or from surfaces of baskets and carts. Because consumers can easily see whether packaging has been tampered with, they can protect themselves from these health risks.

Packaging Extends the Shelf Life of Produce

The U.S. Department of Health and Human Services (HHS) Healthy People 2030 project identifies the importance that fruits and vegetables have on an individual’s overall health, well-being, and onset of chronic diseases (e.g., diabetes, heart disease,

cancer) and many efforts within the Draft Regulations are aimed at increasing availability and consumption amongst U.S. consumers.17 Efficient and cost effective California agricultural production is needed more now than ever. Cuts to federal funding for food including recent proposed cuts to the federal Supplemental Nutrition Assistance Program (SNAP) and California's CalFresh funding, threaten people's access to healthy nutritious foods. In the face of federal cuts, California has been steadfast in its efforts to fight food insecurity and hunger. 18 California's fresh produce farmers, shippers, and processors are some of the most dedicated key players in this effort; always looking for creative and innovative ways to get more value from a drop of water, and a ray of sunlight.

Specialized food packaging extends the shelf life of fresh produce, making fresh produce more accessible and more affordable to consumers. Packaging options are dependent on many variables including but not limited to, distance from farm to store, plant variety, availability of packaging materials, longevity of alternative packaging supply chains, market volatility, consumer volume demand, food safety regulations, and the ever-shifting concept of "sustainability". Each package we see in the store comes with a story, and some, particularly for fresh produce, is nuanced and intricate.

The packaged fresh-cut industry has made fruit and vegetable consumption accessible to consumers, resulting in increased access and better nutrition overall. Many fresh-cut fruits and vegetable items are designed to be ready-to-eat, with little to no preparation required by the consumer. Plastic packaging serves as a structural barrier to physical damage which can accelerate tissue destruction, alter respiration rates due to damaged cells, and enhance microbial growth on the damaged plant tissues (spoilage and pathogens), all conditions that lead to reductions in shelf-life.19 As the demand for fresh-cut products has increased, packaging and material science engineers have designed more complex packaging to address the shelf-life and supply chain challenges to support the rapidly growing segment.20

The tremendous health and social benefits provided by fresh produce come with tremendous challenges such as how to protect its nutrition, safety, and the environment from farm to fork. Throughout this journey, the California agricultural industry is committed to environmental stewardship. One great example is the California berry industry's Berry Sustainable Coalition, which, prior to any regulation or law for packaging, committed to 100% recycle-ready clamshell packaging by 2025, driving circularity with inclusion of post-consumer recycled content in clamshell packaging and the recovery and reuse of clamshells, and committed to foster development of compostable paper-based packaging and to research new materials that are readily recyclable and/or compostable.21

Besides product shelf-life and food safety optimization, primary plastic packaging allows manufacturers and retailers to address food tampering, cross-contamination, and bioterrorism risks.22 Fresh produce items are unique in that they continue to respire and undergo several metabolic processes post-harvest.23 These ongoing metabolic processes require a dynamic package environment designed to control microbial growth

and plant tissue degradation by managing respiration rates when stored at the proper refrigerated temperatures.24 As one example, most field greens (e.g. lettuce) are harvested and then placed into a polyethylene bag in the field right where the product is grown. The bags serve multiple critical functions: protecting food safety, protecting the product from damage in transport, and extending shelf-life. The average field-pack lettuce bag has holes designed to provide a lower respiration rate for the produce, allowing lettuce to remain fresh for longer than it could without packaging.25 This is even more important for salad mixes, which are an increasingly important source of vegetables for consumers, but that have a shorter shelf life than whole lettuce.

Packaging Helps Reduce Global GHG Emissions from the Food System

The issue of food waste is a growing concern. Food waste is the largest single material in landfills across the U.S. and is a significant contributor to global greenhouse gas emissions. California laws such as SB 1383 (Lara, 2016) support the 2015 U.S. Environmental Protection Agency (EPA) and U.S. Department of Agriculture (USDA) national level 50% food waste reduction goals set for 2030. SB 1383 requires every jurisdiction to provide organic waste collection services to all residents and businesses. Plastic packaging for fresh produce can keep millions of pounds of organic waste out of the collection bins.

The highly relevant study performed by Oregon's Department of Environmental Quality (DEQ) provides a deep dive into the role packaging plays in reducing food waste. Their study weighed the pros and cons of food packaging with respect to food waste and determined, "In short, because of the large amount of resources that go in to producing food, efforts to reduce food waste by increasing packaging can sometimes lead to significant reductions in environmental impact, even when the environmental impact of additional packaging is taken into account."26 Results from a research project undertaken in Austria from 2016 to 2020, the "Stop Waste – Save Food" project, documented in the "Food Packaging Sustainability: A Guide for Packaging Manufacturers, food processors, retailers, political institutions & NGOs", echoed similar findings as the DEQ study. This sustainability guidance document noted, "Due to its protective function, packaging often helps to reduce food waste. If this is the case, the environmental benefit of avoided waste is usually 5 to 10 times higher than the environmental cost of the packaging."27

The DEQ and Austrian studies highlight the importance of ensuring true sustainability is achieved, not just given lip service. A great example is the misconception that carton egg containers are more environmentally friendly than egg containers made of rPET, when in fact, their lifecycle generates higher GHG emissions.26 This indicates the need to assess each package and their LCA in a case-by-case approach to accurately determine its environmental and social impacts. The absolute need to determine net environmental benefit through a case-by-case approach is supported by the research performed by The Center for Sustainable Systems at the University of Michigan on LCA's for food packaging and waste based on detailed food packaging case studies.28

The EPA recently estimated that more food reaches landfills than any other material in municipal solid waste in the U.S., making up over 24 percent of municipal solid waste sent to landfills in 2018. “Wasted food contributes to a broad range of environmental impacts, including climate change, air pollutants, water scarcity, biodiversity loss, and soil and water degradation. Communities with environmental justice concerns bear the brunt of the adverse environmental, social, and economic consequences of waste management. By preventing food loss and waste where possible, environmental impacts and impacts to underserved communities can be substantially reduced.”29 Food waste accounts for about 7 percent of global GHG emissions. “Each year, food loss and waste from farm to kitchen embodies an area of agricultural land the size of California and New York combined, enough energy to power 50 million U.S. homes for a year, and emissions (excluding landfill emissions) equal to the annual CO2 emissions of 42 coal-fired power plants.”29

Packaging is a key strategy that has been shown to be effective in the fight to prevent food waste and to reduce overall GHG emissions from the food system. A 2018 study by the American Institute for Packaging and the Environment (AMERIPEN) estimated that proper use of packaging could reduce 10 to 15 percent of food waste at the store level and 20 to 25 percent of food waste at the household level.30 Moreover, food waste and packaging are not binary choices in terms of GHG emissions. By reducing food waste, packaging can play a critical role in reducing GHG emissions attributable to the food system. 31 A recent analysis of the environmental impact of food loss waste, including evaluation of environmental impacts of the entire food system, found that cutting food waste in half would cut the total GHG emissions of the food system by 8.5 percent. A large portion of this net reduction is associated with reduced food service and household food waste. Reducing food waste from food service and households also “has the potential to reduce demand for inputs from the upstream stages including agricultural production and food processing.”32

Current State of Fresh Produce Packaging

The produce industry is invested in improving packaging sustainability, including by creating more sustainable supply chains. 33 Over the last decade, the produce packaging industry has made significant strides in reducing packaging as well as reformulating packaging to lower the environmental impact of plastics used.34However, the need for specialized food packaging that is effective in protecting and preserving fresh produce, and that is accessible, not cost prohibitive, and meets all federal requirements, creates several unique challenges for growers.

In 2023 Schmid et al. stated, “In recent years, extensive research on active food packaging has aimed to provide new materials to maintain microbial food integrity beyond traditional packaging systems (Norrrahim et al., 2021). However, many active food packaging strategies are still in their infancy, demand complex functionalization and therefore can only address single steps in the food supply chain (Azevedo et al., 2022).”35 Schmid et al.’s research on the growth and survival of in fiber-based packaging materials of *E. coli, Staphylococcus aureus, Bacillus cereus* (all of which are associated with illness and death) highlights just how critical the ratio of recycled fiber to

virgin fiber is for deterring bacterial growth, with bacterial growth unfortunately favoring the higher recycled fiber content packages. 35 In addition to the need for managing pathogens associated with fresh produce harvesting and processing, Zwilling et al. point out another worrisome source for food pathogens, biodegradable packaging.36 Zwilling et al. note, “Lignocellulosic materials are widely used for food packaging due to their renewable and biodegradable nature. However, their porous and absorptive properties can lead to the uptake and retention of bacteria during food processing, transportation, and storage, which pose a potential risk for outbreaks of foodborne disease. Thus, it is of great importance to understand how bacteria proliferate and survive on lignocellulosic surfaces. The aim of this research was to compare the growth and survivability of *Salmonella Typhimurium* and *L. innocua* on bleached and unbleached paper packaging materials.”36 Their research is yet another cautionary reminder that switching a packaging material for products we consume poses complex challenges that do not exist for non-edible product packaging changes, ESPECIALLY when it comes to packaging for raw, fresh, un-processed produce.36

Almost all clamshells today contain recycled plastic. In some categories like spinach, the clamshells are made from 100 percent rPET, or recycled polyester. By contrast, food grade post-consumer resin (PCR) for flexible packaging (e.g., bags) has only become widely available in recent years. PCR now makes up about 5 to 10 percent of every polyethylene package that some packaging companies are making. Part of the constraint is that it is expensive to set up factories to manufacture PCR, and PCR itself is also more expensive than virgin plastic by a factor of two to five depending on market conditions. Blending PCR with virgin plastic reduces the cost, which is necessary to keep fresh produce affordable. This is one reason Walmart, Inc.’s national program now uses 30% PCR plastic for its over 45 million potato bags annually. Packaging manufacturers and produce companies are working together to push for expanded availability and increased affordability of PCR for flexible packaging. We are excited that the recent efforts by the Recycling Partnership, with their launch of the Film & Flexibles Recycling Coalition (CalFFLEX initiative) in 2020, aim to tackle unique challenges and could provide the needed insights for this unique and required packaging.37

Plastic materials made from non-fossil fuel alternatives (e.g., compostable materials) are not sufficiently durable to safely preserve and protect fresh produce. Going beyond their lack of practical utility, compostable materials have other basic issues that make their wide-scale adoption infeasible. First, these materials currently are significantly more expensive than transitional plastics. This makes them unaffordable for consumers, who would see a significant increase in food costs when the cost difference is passed through38. Second, scaling production to replace plastics or even gain a significant market share will take years given the lead time necessary to build manufacturing facilities – timelines far beyond those in the Draft Regulations. Third, when produced, none of these materials compost at the rate and speed of other materials placed into industrial compost facilities. According to a 2017 report by Clean Water Fund, compostable bioplastic food ware is marketed as “green”, but little is composted in practice; almost all is landfilled. Most large compost facilities turn in 30 to 40 days, and most compostable “plastics” compost in 80 to 90 days, which means most facilities will

not take them. A 2020 paper from the University of Plymouth describes significant sourcing challenges when it comes to finding appropriate non-plastic packaging options.39 Solutions for addressing plastic pollution are available but will require coordinated action internationally and across several sectors and stakeholders. A systematic review of literature about human health effects of recycling performed by researchers in the United Kingdom note the startling low number of LCA studies globally for food and drink containers. Their research points out the need for food specific LCA's to determine an accurate account of the benefits and risks associated with different packaging materials.40

Fiber options do exist for some applications, but they currently have significant limitations over plastics.

- Fiber is very porous, an attribute that is problematic as a packaging material since fresh produce is impacted by oxygen content as well as moisture. Cardboard packaging for berries, for instance, isn't suitable for shipping long distances due to the tendency of the material to collapse, thus crushing the berries. Strawberry growers have done extensive testing on this very point. Cardboard works best with local shipment. In nearly every case, some type of lamination is necessary to reduce the porous quality of fiber. Depending on the type of lamination being used, the lamination would disqualify the fiber packaging from being considered "compostable".
- Fiber packaging is much more expensive than plastics. For example, clamshell alternatives made from liner board can also be recycled but cost 2 to 2.5 times the plastic clamshell, if viable options are even available.
- Fiber tends to weigh more than plastics, which is problematic as it adds to the cost of shipping.
- From a GHG perspective, packaging material affects transportation emissions—paper, being heavier than plastic, could increase emissions if used as an alternative for certain crops.
- The environmental footprint to grow the crop used for fiber is larger than the footprint for plastic.

While the discussion on which is the right package to use continues, Oregon's DEQ poignantly stated, "While consumers may prefer to eat food as fresh as possible, we don't all live on farms, so processing and distribution of our food is a necessary reality."26

Response to O-64-1

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process. To the extent

this comment might be read to recommend that CalRecycle perform a cost-benefit analysis before establishing any regulation requiring any plastic packaging alternative, no response is required because CalRecycle is not proposing any regulation requiring any particular plastic packaging alternative. The proposed regulations are consistent with the requirements of the Act, and no change is required for its implementation.

Comment O-64-2
Comments on Draft Regulation

Our comments below include our support and concerns for the current Draft Regulations.

Section 18980.2. Categorically Excluded Materials

We appreciate CalRecycle's efforts to align the regulation with Federal laws, regulations, and guidelines to prevent conflict between state and federal laws. We support Section 18980.2. for the purpose of maintaining the ability to comply with federal and state rules, regulations, and guidelines as they related to use of critical and required packaging for food safety. We are pleased to see CalRecycle's addition of language in this section that highlights the important role that CDFA plays in food safety and the agency's expertise in fresh food production in proposed subsection (a)(2)(B), "Following review of the information provided by the entity, and any further consultation with the entity and any state or federal government agencies (including the California Department of Food and Agriculture and the California Department of Public Health) that the Department deems advisable, the Department shall determine whether the packaging or packaging component qualifies for the exclusion."

Response to O-64-2

Comment rejected. The comment must be rejected, and no response is required, because the comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-64-3
Section 18980.2. Categorically Excluded Materials (a)(2)(B)

CalRecycle has proposed a very short 180-day window following its determination that packaging or a packaging component does not qualify for an exemption, after which the packaging or component is considered to be covered material. In many cases, it will not be reasonable possible for entities to satisfy the requirements of the Draft Regulations for those materials within 180 days.

The following information is provided to assist with understanding the financial and time commitments it takes the average sized company to switch their food packaging. For the purposes of this example, we will discuss primary (retail and Business to Business

(B2B)) packaging noting that changes to primary packaging require assessment and possible changes to secondary and tertiary packaging.

Package design as noted previously is multifaceted and includes but is not limited to the following: testing and measurement (which includes compliance with federal standards and ISO standards set by the International Organization for Standardization (ISO) for which there are more than 1,600 related to the food packaging sector) (41), material engineering and testing (which includes chemical, physical, environmental, barrier, and migration testing) (42), product-package interactions (typically takes the longest time in the new product development (NPD) process) (43), and distribution (which includes International Safe Transit Association (ITSA) standards, ASTM International standards such as ASTM D4169).(44)

Primary packaging (retail and B2B) redesign is a substantial undertaking due to its multifaceted, iterative, phased requirements in order to be as successful as possible. Note, we mention 'successful as possible' because there is no guarantee for success, even after a package prototype is developed and tested. Packaging redesign on the level that would be required for the packaging types that are currently unable to meet the Draft Regulations' requirements (i.e. not on the Covered Material Category list), would include both packaging material and form. All packaging redesigns require a backup alternative that offsets the inherent risks of changing packaging that includes functionality, sustainability of raw material market, sustainability of circular economy (raw material market, end market, consumer behavior, to name a few). It is safe to say that these factors double the design costs and increase the testing timeline. The overall redesign process for food safe packaging can exceed 18 months, and this does not include the time required to secure multi-year material supply, contracts with packaging manufacturers, or the time required for custom machine fabrication.

The importance of package testing, while absolutely critical for compliance with federal regulations, rules, and guidance to ensure consumer safety, plays an important role in the creation and maintenance of a solid and reliable food supply chain that fosters efficient and cost-effective sustainable business relationships. Consumers have come to expect a high level of consistency in their food supply via retailers, and retailers rely on farmers, processors, and shippers to get them fresh produce in a manner that is safe, meets or exceeds quality standards, and aligns with their business model which is largely driven by consumers. All entities in the food supply chain, from the time the farmer plants the seed in the soil, to when the lettuce makes its debut at the dinner table, must work together in concert.

Because the 180-day timeframe is insufficient for producers to adequately address these issues, we request that CalRecycle revise its proposal to provide that, at the time CalRecycle determines the packaging or packaging component does not qualify for an exclusion, CalRecycle will determine an appropriate timeframe after which the packaging or packaging component shall be considered covered material. In the interim, CalRecycle could require producers to implement good faith sustainability measures, including source reduction. This flexibility allows CalRecycle to account for differences

in complexity of the packaging and its purpose, allows for progress in the interim period, and avoids creating a compliance obligation that is not reasonably possible for producers to achieve.

Response to O-64-3

Comment partially rejected and partially accepted. CalRecycle declines to make the particular change suggested. The commenter ignores producers' responsibility for complying with statute to begin with. When a producer incorrectly claims that packaging is excluded from the definition of "covered material" pursuant to 18980.2(a), that producer itself procured the resulting compliance challenges. Moreover, when a change in packaging is required for any reason, including when packaging formerly excluded becomes no longer excluded because packaging that complies with federal and state law becomes available, the statute and proposed regulations provide adequate protections against unfair penalties if complying with statute is not practicable within 180 days. Corrective action plans (addressed in section 18980.13.1) may enable affected producers to avoid penalties, as would an exemption for "unique challenges" with an accompanying phase-in plan (addressed in section 18980.2.4). Nor would the commenter's suggestion that the regulation should allow CalRecycle to "determine an appropriate timeframe" on an ad hoc basis be appropriate. In contrast with the clear procedures and standards applicable to corrective action plans and exemptions, such a rule would be vague with respect to what would be "an appropriate timeframe" and thus leave regulated entities without a clear, predictable framework for understanding and anticipating their compliance obligations. See, also, response to comment I-63-6, which also suggests a change to the 180-day period.

CalRecycle accepts this comment, however, to the extent it suggests that the proposed regulations should reduce the potential for businesses to have to change their packaging within 180 days of a Department determination. The regulation has been revised to more clearly establish a process to prevent unmeritorious claims from being added to the database described in the regulation (in new subparagraph (D)), thereby reducing the likelihood a business

will rely on such claims only to have the Department deem the claim improper and thus subject to the 180-day period.[

Comment O-64-4

Section 18980.2.3. Exemption for Specific Material with Demonstrated Recycling Rates & 18980.2.4. Exemption for Certain Types of Packaging

We appreciate the Draft Regulations' alignment with statute, as noted in both Section 18980.2.3. and 18980.2.4., in which participating producers directly apply to CalRecycle for applicable packaging exemptions pursuant to Public Resources Code section 42060(a)(3) or (4). For producers who rely on materials that cannot comply with the Act, which includes plastic packaging that is critical to ensuring the safety of fresh produce in compliance with federal laws and guidelines, the ability to obtain an exemption from the requirements of the Act is paramount.

While not an exhaustive list of federal regulations that pertain to fresh produce and its packaging, we provide a few examples to highlight the ways in which federal fresh produce packaging regulations protect the public. In general, Title 21 federal regulations include numerous risk-based preventative controls for handling, processing, and transporting fresh produce that must be legally adhered to including but not limited to "Subchapter B – Food for Human Consumption". Packaging is designed to address a multitude of concerns and needs along the entire supply chain. One example of this is the Title 21 CFR Part 110 Subpart E Section 110.93 regulation that requires transportation and storage of fresh produce be done in a manner that will, "protect food against physical, chemical, and microbial contamination as well as against deterioration."45

The material and design of fresh produce packaging plays a critical role in food safety and the FDA regulations assist with ensuring consumers are free from unnecessary risk or harm. For example, when addressing the unique elements of fungi and other fresh produce that require packaging that allows the plant material to respire, the FDA guidance "Standards for the Growing, Harvesting, Packing, and Holding of Produce for Human Consumption: Guidance for Industry" published in 2018 states, "You must package covered produce in a manner that prevents the formation of *Clostridium botulinum toxin*…"46 Switching packaging for certain produce from a "custom-designed-to-meet-the-needs-package" such as breathable film plastic to an oxygen impermeable film can create the ideal environment for *C. botulinum* to grow. Title 21 CFR Part 117 Subpart B can be referenced for further details on FDA regulated food packaging materials. Regulatory language that impairs the ability of growers to comply with the Act or that unnecessarily increases compliance costs runs contrary to the state's public policy goals, including improving access to safe and affordable food.47

It is important to note that the cost of redesigning a package material and form48 further adds to SB 54 compliance costs and, as a result, increases consumer food costs. These costs are in addition to the average compliance costs that CalRecycle's June 2025 Standardized Regulatory Impact Assessment (SRIA) estimates producers will

each pay on average: $457,114.00 US dollars annually.49 Our members take great pride in their work and the benefits that they bring to people by way of healthy affordable fresh food. Sadly, California farmers have only experienced increasing regulatory costs (highest in the nation), with an astonishing 1,366% increase since 2006.50 Many California specialty crop commodities are operating on thin or negative profit margins.51 For some California farmers, these additional SB 54 regulatory costs will be the proverbial straw.

45 United States Food and Drug Administration (FDA). 1986, last amended 2025. 21 CFR Part 110 Subpart E -- Production and Process Controls. Available at https://www.ecfr.gov/current/title-21/chapter-I/subchapter-B/part-110/subpart-E.

Response to O-64-4

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-64-5

Section 18980.2.3. Exemption for Specific Material with Demonstrated Recycling Rates, 18980.2.4. Exemption for Certain Types of Packaging, and Section 18980.13. Compliance Evaluation and Determination

The regulations should clearly provide that penalty accrual is stayed while CalRecycle considers an application for an exemption under Public Resources Code Section 42060(a)(3) and (4). SB 54 acknowledges that, for some covered material, compliance with the Act's requirements will be uniquely challenging or impossible, and those materials should be exempt from the requirements of the Act. (Pub. Res. Code, § 42060(a)(3), (4).) For these covered materials, it is impossible for a producer of a product using that covered material to comply with SB 54, and the Legislature did not require this impossibility.

The Draft's proposed exemption application process conflicts with and undermines the purpose of Public Resources Code section 42060(a)(3) and (4) by providing for an application review period of indeterminate length that begins after the effective date of the Act and the regulations. It proposes for an exemption to be valid "upon approval," which leaves a period of time before it is valid where the producer applicant, who cannot comply with the Act's requirements,52 is still subject to them. It takes the ability to avoid penalties out of the hands of the producer. Penalties of up to $50,000 per day could accrue for however long CalRecycle spends evaluating the application.53 (Pub. Res. Code, § 42081.) In just a month, penalties could balloon to $1,500,000.

This result is incompatible with the language, purpose, and intent of the statutory exemptions. To remedy this problem, the proposed Section 19890.2.4 must clearly state that, while an application for an exemption pursuant to Public Resources Code section 42060(a)(3) or (4) is under review: (1) accrual of penalties related to the producer's use of the covered material is stayed, and (2) upon approval, the exemption is deemed effective as of the date of the application. CalRecycle has already proposed to provide a

stay on penalty accrual for recycling service providers in the draft Article 13 Section 18980.13(j).54 We urge CalRecycle to extend this accommodation to producers applying for an exemption or categorical exclusion pursuant to Public Resources Code section 42060(a)(3) or (4).

48 Package redesign costs depend on a variety of factors including raw material accessibility and market demand, intended functionality, geographic location of product operation (e.g., farm or processing facility), location of packaging manufacturer, number of intermediary companies in the supply chain, shelf life of the package (e.g., materials age, susceptibility to storage conditions including temperature and moisture can negatively impact structural integrity, microbial growth prevention), and consumer preference just to name a few.

49 CalRecycle, Proposed Regulations for the Plastic Pollution Prevention and Packaging Producer Responsibility Act, Standardized Regulatory Impact Assessment (SRIA) (Jun. 2025), p. 38 [estimating annual compliance costs for producers of covered materials that have gross annual sales of products that use covered material within California greater than $1 million].

Response to O-64-5

Comment rejected. The commenter mistakenly asserts that the statute requires CalRecycle to grant an exemption when compliance would be impossible. That interpretation is nonsensical: Compliance with the law would become merely optional because, instead of complying, producers could intentionally procure the inability to comply. Absurdly, covered material that is impossible to recycle or compost would necessarily be exempt from the requirement to be recyclable or compostable. More sensibly, statute only states that CalRecycle "may exempt," not that it "must" exempt, materials identified as presenting "unique challenges" or that cannot comply for health and safety reasons.

CalRecycle also rejects the suggested change because it would enable any

producer to avoid penalties altogether by serially submitting exemption requests, and statute provides ample safeguards against unfair imposition of penalties. For one, penalties do not accrue until thirty days after CalRecycle issues a notice of violation. For another, PRC section 42081(b) allows CalRecycle to consider a corrective action plan, under which the non-compliant producer would avoid penalties altogether. Also, the penalty amounts cited in the comment are the maximum penalties; they do not indicate that CalRecycle must impose any penalties, much less penalties of any particular amount. Rather, the factors listed in PRC section 42081(c) require CalRecycle to consider a wide range of circumstances when determining an appropriate amount of penalties. A good faith effort to secure a statutory exemption, based on a plausible application of the law, in a timely manner would be relevant to multiple, if not most, of those factors.

Comment O-64-6

Section 18980.5. Producer Compliance

We strongly recommend greater flexibility for first-time producers registering with the Producer Responsibility Organization (PRO) than what is required in subsection (a) and (d) of Section 1890.5. The complexity of this regulation may leave certain entities unsure of their status as "producers" under the Act, insufficient time to comply. A 30-day registration mandate following the Draft Regulations' publication is too short for entities to fully grasp how these new requirements affect their specific operations. This compressed timeline risks leading to the submission of unnecessary and potentially inaccurate data to both the PRO and CalRecycle, creating an undue burden. This concern is amplified by the fact that the requirement involves submitting sensitive data from private companies to the PRO, which is a non-governmental entity.

CalRecycle, as they have done with other CalRecycle EPR programs, should provide additional resources and technical assistance for California businesses to determine whether they must comply with the SB 54 regulations. The PRO should have greater flexibility to set an onboarding schedule for new producers that work for both parties, thereby ensuring the submitted data is accurate.

Additionally, mandating complete 2023 data may be problematic for many producers. The proposed regulation requires a level of detail that may exceed the comprehensive record-keeping practices maintained by many producers in 2023. Existing systems were not designed to track data for this regulatory purpose. In addition, producers may not have retained these older records under their ordinary document retention schedules. While producers are fully committed to meeting these requirements, to maximize participation in the registration process and ensure a more realistic, workable solution for producers, we recommend requiring producers to submit the 2023 data they have available in good faith, acknowledging that this data may be incomplete or may not exist. Inclusion of the "good faith" efforts requirement in the regulation for the initial reporting cycle is necessary to formally acknowledge the inherent challenges.

Western Growers is concerned about the potential for confusion or disagreement between producers, the PRO, and/or CalRecycle regarding the scope of data producers must provide to the PRO, particularly historic data, and the PRO's obligation to provide data to CalRecycle without modification. To clarify these obligations, we ask that CalRecycle include language in the proposed regulation to clarify that: (1) with the exception of the 2023 data needed for CalRecycle's determination of the baseline, producers are not required to provide the PRO with any other historic data; and (2) the PRO is required to provide CalRecycle with the 2023 data it received from the producers, without modification, for CalRecycle's use in deriving the 2023 baseline.

Western Growers also asks that CalRecycle revise its proposed Section 18980.5(d) to require that a producer submit to the PRO, at the time it applies to become a participant of the PRO, the producer's supply data for the prior calendar year. The current proposal to require producers to provide 2023 data is addressed elsewhere in section 18980.5, and its duplication in subsection (d) is not required by and is not consistent with the Act. Public Resources Code section 42057(c)-(e) requires producers to provide the PRO with specified data, including supply data, necessary for the PRO to meet its reporting requirements, including for annual reporting. Where the Legislature intended to require producers to provide data for a specific year, it clearly stated this intent in the statutory language. Notably, nothing in these sections requires producers to provide supply data from 2023 or any past year. Instead, these sections appear to be requesting data for comparison *against* a 2023 baseline, which indicates that the Legislature intended to require new participant producers to provide their current supply data to the PRO.

52 CalRecycle's approval of the exemption application is clear proof that a producer of a product that uses the exempt covered material is not able to comply with the Act's requirements related to that exempt covered material.

53 The Draft Regulation proposes for the exemption application review and decision making to be performed by the PRO. For the reasons explained above, CalRecycle's proposed delegation of its agency decision making authority to the PRO is not permitted by the Act and would violate producers' Constitutional rights to petition the government for redress and to due process.

54 Proposed section 18980.13(j) provides: "No penalty may be imposed against a recycling service provider during the pendency of a request for an extension for, or exemption from, a requirement of subdivision (a) of section 42060.5 asserting that compliance with the requirement is not practicable for a specific identified covered material."

Response to O-64-6

CalRecycle rejects this comment for the reasons stated in I-62-4, I-62-8, and B-1-1, as well as to the extent the latter portion of the commenter's submission concerns proposed changes or objections already addressed in response to other portions of the submission, and further does not request any specific

changes to these referenced regulatory sections, no further response is necessary here.

Comment O-64-7

Section 18980.6.7. Eco-Modulated Fee and Fee Schedule

Guidelines are needed to ensure individual participating producer fees are based on requirements applicable to that producer. Public Resources Code section 42053(b) requires the PRO to determine a fee schedule for "each producer" during the first two years of operation and during preparation of the plan developed pursuant to section 42051.1. These producer-specific fee schedules must be "based on estimated costs of implementing the plan, operating costs, the costs of completing the needs assessment, the costs to cover environmental mitigation requirements of Section 42064, and the costs to reimburse the Department." In the third year and thereafter, the annual fee that applies to each producer must also be individualized and based, in part, on the costs to ensure each covered material meets the requirements of the Act.

While Section 18980.6.7. in the Draft does list out some individual factors the PRO must consider when setting a fee base rate for a particular covered product, several important considerations are missing from the list. For example, the Draft Regulations do not require the PRO to consider whether CalRecycle has exempted the covered product from the requirements of the Act. A PRO and CalRecycle have fewer obligations with respect to exempt material, which should be taken into account to reduce the base rate for those products. The regulations also do not require CalRecycle to consider the statutory provisions that eliminate compliance obligations for certain covered products, such as the statutory prohibition on requiring post-consumer content in food packaging. The PRO should be required to consider the fact that there are fewer compliance obligations with respect to food packaging to set a lower base rate for those products.

Finally, Section 18980.6.7.(i) in the Draft Regulations must be amended to make clear to the PRO that exempt material is not subject to malus fees. (See Pub. Res. Code, §§ 42041(o), 42053(e).) Nothing in the Act permits a malus fee to be assessed on exempt covered material, even if that material contains a chemical on Proposition 65 list.

Response to O-64-7

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42051.1, 42053, and 42060, and no change is necessary to the implementation of the Act. PRC section 42053(a) makes clear that the PRO is responsible for establishing and developing a producer fee schedule, including fees that are adjusted using malus fees or credits based on the factors specified in PRC section 42053(e). Sections 18980.6.7(b), (e), and (f) of the proposed regulations implement these requirements by clarifying the individual assessments that will be charged under PRC section 42053(c)(1) and the eco-modulation adjustments under PRC section 42053(c)(2). To the extent this comment recommends including additional considerations, such as exemptions and specific compliance

obligations, to the calculation of the base fee rate under section 18980.6.7(e), no change is necessary. PRC section 42053(d) already provides that individual assessments must reflect the costs to ensure that covered materials meet the requirements of the Act, which would necessarily include costs associated with exemptions and fewer compliance obligations. Moreover, to the extent this comment recommends clarifying that exempt material is not subject to malus fees, no change is necessary. Nothing in the Act precludes exempted covered materials from being subject to malus fees. Rather, under PRC section 42053(e), the PRO must adjust producer fees using malus fees or credits when the specified conditions are met, and the PRO retains discretion as to the appropriate amount of adjustments. Section 18980.6.7(f) implements PRC section 42053(e) and reserves the appropriate level of discretion over eco-modulated fees to the PRO. Therefore, no change to the proposed regulations is necessary.

Comment O-64-8
18980.13.2. Administrative Civil Penalties (a)

The Act allows a producer to comply with its obligations under the Act and CalRecycle's implementing regulations by either (1) participating in the PRO's plan, or (2) individually, without participating in the PRO's plan, if the producer can demonstrate to the Department that it meets specified criteria. (Pub. Res. Code, § 42051.) Producers that elect to comply with SB 54 regulations by participating in a PRO's plan, and that are complying with their individual obligations under the Act and the implementing regulations (i.e., that are not the cause of the PRO's noncompliance), are reasonably relying on the PRO to comply as required by Public Resources Code sections 42051 and 42051.1. The PRO's violations are beyond the control of the participating producers. Imposing penalties on participating producers under these circumstances does not protect public health and safety or the environment because the participating producers have no control over any mitigating actions. Only the PRO has the ability to timely and voluntarily report the violation to CalRecycle, to correct the violation or conditions giving rise to the violation, and to prevent it from recurring. The Act requires CalRecycle to consider these factors when determining whether to assess a penalty under Section 42051. (See Pub. Res. Code § 42051(c).)

CalRecycle's proposal to impose penalties on participating producers for the conduct of the PRO, when the producer is individually in compliance with all legal requirements, conflicts with the letter and spirit of the Act. Imposing penalties on parties that have no reasonable ability to avoid the violation or to mitigate its effects is inconsistent with the minimum penalty factors established by the Legislature in Section 42051(c). It creates an incentive for individual producers to choose to separately comply with the SB 54 Act, without participating in a PRO, in order to have control over their own compliance and avoid penalties, which undermines the purpose of the legislation's PRO structure and increases compliance burdens for producers and for CalRecycle. And critically, it is inconsistent with the Act's prohibition on the PRO's use of funds it collects from participating producers to pay administrative penalties assessed against it. (Pub. Res.

Code, § 42051.1(j)(2).) By requiring the PRO to satisfy any administrative penalties imposed against it for its noncompliance, SB 54 incentives the PRO to comply with the law, regulations, and its plan. CalRecycle's proposal gives CalRecycle discretion to shift the financial responsibility for the PRO's noncompliance away from the PRO to individual participating producers, directly conflicting with the SB 54 Act's requirement that the PRO, and the PRO alone, bear responsibility to pay administrative penalties resulting from its noncompliance. Modifying the Legislature's allocation of responsibility for SB 54 noncompliance is outside the scope of CalRecycle's regulatory authority granted by SB 54. Accordingly, CalRecycle must revise this proposed regulation to eliminate the conflicting language.

In closing, Western Growers supports the state's goal of reducing environmental harm and human health impacts associated with plastic pollution and we look forward to continuing to collaborate with CalRecycle on this goal. Thoughtful and careful implementation of the statutory requirements in the SB 54 Draft Regulations is critical to advance the policy goals of the law in a cost-effective way. Thank you for your time and consideration of our concerns. We look forward to further engaging with you on this issue.

Response to O-64-8

CalRecycle rejects this comment. See the response to comment I-60-4.

O-65: Household & Commercial Products Association (Molly Blessing)

Comment O-65-1

The Household & Commercial Products Association (HCPA) 1 appreciates the opportunity to provide input on the implementation of California Senate Bill 54 (SB 54), the Plastic Pollution Prevention and Packaging Producer Responsibility Act of 2022, 2 and draft revised regulations. We thank the California Department of Resources Recycling and Recovery (CalRecycle) for being so thoughtful in collecting stakeholder input and look forward to We look forward to continuing to work with the Department on the successful implementation of SB 54.

Background

HCPA represents approximately 240 member companies engaged in the manufacture, formulation, packaging, distribution, and sale of products for household, commercial, institutional, and industrial use. HCPA members are continuously working to improve products and packaging in line with the principles of a circular economy to decrease waste and enable economic growth without greater resource use. Companies utilize several different materials for packing and shipping their products to ensure that products arrive undamaged, uncontaminated, safe for use, meet user expectations, have a lower environmental footprint, and generally enhance the quality of life of the consumers and workers who depend on these products daily. We have many members who sell products into California or otherwise have a presence in the state and are

committed to ensuring that Californians have access to high-quality products with reduced environmental impacts.

1 The HCPA is the premier trade association representing companies that manufacture and sell $180 billion annually of trusted and familiar products used for cleaning, protecting, maintaining, and disinfecting homes and commercial environments. HCPA member companies employ 200,000 people in the U.S. whose work helps consumers and workers to create cleaner, healthier and more productive lives.
2 https://leginfo.legislature.ca.gov/faces/billTextClient.xhtml?bill_id=202120220SB54 1

In addition to representing various categories of household and commercial products (regardless of packaging), HCPA represents products packaged in the aerosol delivery form. The aerosol delivery form is used to dispense a wide range of products, including but not limited to adhesives, air fresheners, antiperspirant, asthma inhalers, body spray, cleaners, degreasers, deodorant, disinfectants, dry shampoo, hair spray, insect repellant, insecticides, lubricants, paints, pan sprays, sealant, shaving creams and gels, sunscreen, and whipped cream. HCPA has represented the U.S. aerosol products industry since 1950 through its Aerosol Products Division, which includes companies that manufacture, formulate, supply, market, and recycle a variety of products packaged in an aerosol form.

Support for Revised Regulations
HCPA appreciates the significant effort CalRecycle put into revising the draft regulations, incentivizing all stakeholders to work towards the ambitious goals of SB 54 while being less prescriptive on how they must do so to minimize undue economic burden. These changes, which will increase efficiency and thus lower the cost burden on consumers, are critical to the success of SB 54 and California's transition to a more circular economy. HCPA supports the changes made, in particular to the following items.

Response to O-65-1

CalRecycle appreciates the commenter's support for the proposed regulations. Nevertheless, the comment must be rejected and no response is required because the comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-65-2

Reuse and Refill– 18980.1(a)(27), 18980.2.1(a)(4)-(5)

HCPA thanks CalRecycle for making numerous updates to recognize the diverse forms of reuse and refill approaches in use today and the importance of supporting consumer participation in these systems. Given the breadth of scope of SB 54, there will not be a one-size-fits-all approach to defining what constitutes meaningful reuse of a given packaging type. Producers, with extensive experience safely managing and clearly labeling their products, should have flexibility in developing and labeling a reusable or

refillable product to incorporate science-based impact assessments and consumer insights.

Response to O-65-2

Comment rejected. No substantive response to this comment is required because it does not recommend any change to the proposed regulations or raise an objection related to the rulemaking process.

Comment O-65-3

Evaluations of Covered Material and Covered Material Categories: Recyclability – 18980.3

HCPA appreciates CalRecycle creating a clearer tie between SB 54, which determines what is collected and recycled within the state, and SB 343, which determines what products sold in the state can be labeled as recyclable. We continue to believe that clarifying the interaction between these two laws is extremely important to support clear communication to all stakeholders about what is and is not recyclable in California.

Response to O-65-3

Comment rejected. The comment offers praise of the proposed regulations but does not suggest changes to them or raise objections related to the rulemaking process.

Comment O-65-4

Recyclability of Certain Covered Material Categories Identified by the Department – 18980.3.1

HCPA would like to reiterate our support for the Department recognizing materials that are trending towards being recyclable to support the increased collection, sortation, processing, and labeling of these materials for recycling. If there is no opportunity for materials that are improving to be recognized for that improvement and communicate about the positive trend, 2 consumers will not know they can recycle the material, making it unlikely the upwards trend will continue. It is key for the Department to support materials in their journey towards meeting the robust recyclability requirements of SB 54.

Response to O-65-4

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-65-5

Producer Responsibility Organization Plan – 18980.8

HCPA thanks CalRecycle for making several updates to allow the Producer Responsibility Organization (PRO) greater flexibility in how to design the program plan and future amendments. It is important that the PRO has the flexibility to structure the program to incentivize municipalities, recycling service providers, and other stakeholders to participate in efforts to achieve SB 54's ambitious goals, not just producers. These updates will help the PRO establish a better understanding by all stakeholders, incentivize collaboration, and ultimately achieve effective implementation.

Response to O-65-5

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-65-6

Minimum Duration of Approved Exemptions – 18980.2.4(g), 18980.5.2(b)

HCPA thanks CalRecycle for making updates throughout section 18980.2.4 to change the minimum duration of an approved exemption from one to two years. This provides greater certainty for producers and decreases the time and cost associated with filing detailed applications with CalRecycle. Packaging changes can take several years to fully implement considering the challenges of sourcing raw materials, conducting appropriate testing, and ensuring consumer acceptance. Allowing for a minimum of two years between exemption applications gives producers the necessary certainty to keep products on the market as they work through what is feasible for packaging changes.

Response to O-65-6

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-65-7

Recycling Technologies and Responsible End Markets – 18980.3.6, 18980.4.1

HCPA thanks CalRecycle for removing section 18980.3.6, which incorrectly characterized certain recycling technologies as hazardous waste management instead of manufacturing and put in place prohibitive barriers for these technologies to be accepted and utilized. HCPA agrees that it is more appropriate to assess all recycling technologies by the same responsible end market standard as described in section 18980.4.1. HCPA appreciates CalRecycle allowing for a technology-neutral approach which will enable the use of any recycling method that can meet strict safety and environmental requirements.

Response to O-65-7

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-65-8

Source Reduction Baseline (18980.3.4, 18980.8.3, 18980.9.1), Detachable Components and Source Reduction Component Reporting (18980.1(a)(4),

HCPA provided comments on the above items as part of a separate producer trades coalition letter submitted by HCPA on October 7 and directs the Department's attention to that letter.

Response to O-65-8

Comment rejected. This comment merely refers to comments that the commenter submitted jointly with other commenters in another submission. No response is necessary here.

Comment O-65-9

Exclusions of Certain Types of Packaging: De Minimis – 18980.2.2(b)

HCPA would like to highlight specific concerns about the lack of clarity on what is considered "de minimis," considering that producer reporting for source reduction will be required this year and producer reporting for EPR implementation will be required less than a year from now. Without an understanding of what does not need to be reported, producers will likely report inaccurately (from being unable to collect supplier information on minor plastic components) and more than is necessary (inflating the source reduction baseline). This also puts a significant burden on businesses to collect detailed information from packaging suppliers, some of which suppliers may consider confidential business information and not agree to share, that could in the end be deemed unnecessary if the components are identified as de minimis.

For example, the source reduction guidance issued by CalRecycle on September 2 appears to consider adhesives as a "plastic component" that needs to be reported– thus bringing even corrugated cardboard into the spectrum of items that are subject to source reduction requirements. Brand owners do not have data on the amount of glue present in each size of box used and there are not other options widely available for the construction of corrugated cardboard (particularly for shipping larger or heavier items), which is one of the most recyclable materials in commerce today. Circular Action Alliance (CAA), the producer responsibility organization (PRO) for California's program, has proposed *polymer adhesive on paper packaging applications and polymer tape and paper tape with polymer adhesive on corrugated cardboard boxes*, among other items, as packaging elements that should be considered de minimis and not categorized as plastic components. Yet, despite not having information and these components likely being considered de minimis, at this time, producers appear to still be expected to report on adhesive weight as part of the source reduction baseline.

The lack of clarity creates the potential for a bottleneck and high levels of confusion inconsistent producer reporting and case-by-case producer submissions unless the agency is prepared to clearly give the PRO authority to independently make de minimis determinations.

Response to O-65-9

CalRecycle rejects this comment for the reasons provided in response to comment I-62-7. The commenter's proposal rests on the false premise that all items that may be identified as having de minimis weight or volume at some point in the future should be considered as such currently. Moreover, to the extent reporting on items likely to be considered "de minimis" is not provided, and such omission constitutes a violation of a producer's obligations, corrective action plans may be available to address such failures without imposition of penalties.

Comment O-65-10

Eco-Modulated Fees and Proposition 65 Malus – 18980.6.7(i)

HCPA remains concerned that, in section 18980.6.7(i), the draft revised regulations require the PRO to assign a malus fee to producers based on the presence of chemicals listed on California Proposition 65 (the list established pursuant to 25249.8 of the Health and Safety Code). Proposition 65 is an exposure-based statute and establishes “safe harbor” levels, which determine acceptable exposure limits for chemicals without significant health risks over a lifetime of exposure (No Significant Risk Levels and Maximum Allowable Dose Levels). Key oversight mechanisms in Proposition 65 – such as warning requirements and enforcement– are activated by exposure risk, not the mere presence of listed chemicals. As written, the draft revised SB 54 regulations are not in alignment with the Proposition 65 statute, regulations, and guidance provided by the California Office of Environmental Health Hazard Assessment 4 (OEHHA). This creates a fundamental inconsistency between the two agencies and disregards the work OEHHA has done to establish meaningful risk-based “safe harbor” limits.

Almost all packaging – including inks, labels, and adhesives – can potentially contain Proposition 65-listed chemicals even if they are not intentionally added. Given the length of the Proposition 65 list and the risk of trace contamination, especially when incorporating postconsumer recycled (PCR) content, it will be nearly impossible for companies to certify that their packaging contains none of these chemicals. Additionally, the proposed approach by CalRecycle of flagging any listed chemical present ignores the framework established by OEHHA, which calculates exposure levels and sets safe harbor levels. The draft revised regulations unfairly penalize producers for the presence of chemicals deemed in California to pose no significant risk at defined exposure levels.

For example, titanium dioxide (TiO_2) is commonly used in plastic packaging, particularly for flexible and rigid packaging materials. It is used to enhance opacity, brightness, and durability, as well as to improve UV resistance and prevent discoloration. TiO_2 is also a Proposition 65 material for inhalation toxicity. However, in plastic packaging, TiO_2 is bound up in the resin matrix and does not present an inhalation exposure risk. So, for this example, it is critical that one considers the exposure Safe Harbor levels when deciding whether a malus fee is appropriate.

HCPA strongly recommends the following change to section 18980.6.7(i) to ensure consistency with the exposure-based requirements of Proposition 65:
"(i) Pursuant to paragraph (4) of subdivision (e) of section 42053(e)(4) of the Public Resources Code, a PRO shall charge a malus fee to producers who use covered material that contains a chemical listed on the list established pursuant to section 25249.8 of the Health and Safety Code at levels that would expose consumers above the respective exposure levels (No Significant Risk Levels/Maximum Allowable Dose Levels) and via the route of exposure of concern established by the Office of Environmental Health Hazard Assessment."

Response to O-65-10

CalRecycle rejects this comment. See the response to comment B-11-9.

Comment O-65-11

Conclusion

HCPA thanks CalRecycle for the opportunity to provide input on CalRecycle's revised regulations for implementation of SB 54. We appreciate the care that CalRecycle is taking to solicit stakeholder input on developing rulemaking concepts. HCPA looks forward to continuing to engage with CalRecycle to support the success of SB 54 implementation. We invite any questions about this submission and look forward to CalRecycle's response.

Response to O-65-11

Comment rejected. No response specific to the commenter's submission is necessary. This closing paragraph summarizes the commenter's recommendations, to which CalRecycle has responded separately.

O-66: Association of California Goodwills (Nicole Suydam)

Comment O-66-1

On behalf of the Association of California Goodwills, a nonprofit organization representing 13 Goodwill organizations across the state, I want to express our appreciation for California's leadership in developing a circular economy and reducing plastic waste through SB 54. We share the state's environmental goals and are deeply committed to prioritizing reuse, reducing waste, and promoting sustainable practices in our operations.

However, as nonprofit organizations with both brick and mortar and e-commerce secondhand retail operations, we face unique financial and operational constraints that make full compliance with the proposed SB 54 regulations particularly challenging. We rely on mailer packaging to meet shipping standards as well as keep goods safe and suitable for reuse when shipping goods purchased through e-commerce platforms. Unlike for-profit producers, nonprofits often rely on donations, grants, and mission-

driven retail or programmatic revenue that are already tightly allocated toward serving our communities.

Implementing the administrative, reporting, and packaging redesign requirements outlined in SB 54 would impose significant costs and staff burdens that could divert critical resources away from our social impact programs. While we support the law's intent, we respectfully request that CalRecycle consider a full exemption for nonprofit organizations—especially those that:
• Operate on limited budgets and reinvest revenues into charitable programs;
Already prioritize sustainability through reuse, recycling, and responsible sourcing;
• Are not primary producers, only utilizing packaging to meet shipping standards on resold donated goods as a means to recirculate materials for reuse;
• Do not introduce packaging into commerce under their own brand; and
• Have minimal influence on large-scale packaging design, labeling or production decisions.

Importantly, other states that have enacted Extended Producer Responsibility (EPR) laws have recognized these same challenges and provided specific carve-outs or broad exemptions for nonprofit entities that serve the public good. We urge CalRecycle to consider a similar approach in its implementation of SB 54 to ensure that California's regulatory framework remains both equitable and effective. Such flexibility would allow nonprofits like ours to continue contributing to California's environmental objectives without compromising our ability to deliver essential community services and focus on promoting the reuse and diversion of millions of pounds of donated materials.

We welcome the opportunity to collaborate with CalRecycle and other stakeholders to identify practical approaches that balance environmental responsibility with nonprofit capacity.

Thank you for considering this request and for your ongoing commitment to inclusive, effective environmental policy.

Sincerely,
Nicole Suydam
Chairperson
Association of California Goodwills
nicoles@ocgoodwill.org

Response to O-66-1

Comment rejected. The commenter requests that CalRecycle establish a specific exemption for non-profit packaging. However, CalRecycle does not have general authority to create exemptions not established by statute. In any event, the proposed regulations accommodate the commenter's concerns because any packaging not within a categorical exemption (e.g., for reusable packaging or for packaging of goods enumerated in Public Resources Code section 42041(e)(2)) might qualify for other exemptions based on public health, safety, and other

special compliance challenges. See, e.g., PRC section 42060(a)(3) and (4), and section 18980.2.4 of the proposed regulations. Accordingly, no changes to the proposed regulations are necessary as CalRecycle does not have authority to create the exemption requested, and the proposed regulations already address the commenters concerns to the extent allowed by statute. See also responses to comment O-52-1 and O-61-3.

O-67: Flexible Film Recycling Alliance (Kurt Kurzawa)

Comment O-67-1

The **Film Recycling Peer Collaborative** is a voluntary coalition of nonprofit organizations and associations representing stakeholders across the plastic film and recycling value chain. Our shared mission is to collaborate, align, and accelerate solutions that expand f ilm and flexible packaging recycling across the United States and within California. We commend CalRecycle for its continued leadership in advancing packaging recyclability and for recognizing the unique opportunities within SB 54 to strengthen the circular economy for flexible films and packaging. The Film Recycling Peer Collaborative and its members stand ready to partner with CalRecycle and other stakeholders to ensure the successful implementation of this landmark legislation.

Finalization and Ongoing Review of Regulations

We encourage CalRecycle to finalize the draft regulations as written, enabling the Producer Responsibility Organization (PRO) to proceed with its mandated responsibilities on schedule. Given the current delay in finalizing the regulations and thereby condensing the timeframe to achieve the stated rates and dates outlined in SB54, we recommend that CalRecycle receive a targeted review within the first year of implementation to address real-world learnings, updated scientific-based data reports, and stakeholder input. If CalRecycle chooses to modify the current draft or reopens the final regulations, we respectfully offer the following considerations to ensure that the state achieves its objectives while maintaining flexibility and alignment with evolving collection infrastructure.

Flexible Films and Packaging: A Growing Opportunity

Flexible films and packaging are a relatively new packaging format, first introduced for commercial use in the 1960s. As a result, collection and processing systems for these materials are still maturing. Over the past two decades, industry-led store drop-off programs have proven the most effective and economic means of collecting flexible packaging, allowing consumers to return polyethylene (PE) films and bags to participating retail locations and community drop-off centers. Today, the United States collects approximately eleven times more flexible material through **Alternative Collection Systems (ACS)** such as store drop-off and business to business (B2B) collection than through traditional curbside or jurisdictional programs. At the same time, industry is investing heavily in research, pilot programs, and equipment installation to

support a scalable transition toward curbside collection—expanding consumer access and participation while ensuring material quality. Until infrastructure, technology, and consumer behavior evolve to support curbside programs at scale, it is critical that California continue to recognize and strengthen all existing forms of collection. Maintaining multiple, complementary pathways will ensure continuity of access for consumers, preserve proven recycling streams, and provide the f lexibility needed for long-term system success.

Support for CalRecycle's Multi-Pathway Approach

We appreciate that the most recent SB 54 draft regulations acknowledge the importance of multiple collection pathways **(ACS).** This balanced, pragmatic approach is essential, particularly in the early years of SB 54 implementation, to increase participation, maintain material quality, and ensure continued investment in flexible film recycling infrastructure. Leveraging all available systems, both alternative and jurisdictional will help California meet its ambitious recycling goals while preserving momentum toward a truly circular economy for flexible packaging.

Recommendations for Alignment and Continuous Improvement

While SB 54 appropriately recognizes both **alternative** and **jurisdictional** collection methods as additive in determining recyclability, certain provisions within **Cal. Code Regs. tit. 14, § 42355.5 et seq.,** including the **material categorization study**, may not yet fully align with this inclusive intent. To ensure clarity and consistency across California's regulatory landscape, we recommend CalRecycle:

1. **Provide regulatory flexibility** allowing the PRO to optimize film and flexible recycling strategies through both alternative and jurisdictional systems.

2. **Conduct a regulatory review within one year** of SB 54 implementation to incorporate early lessons learned, address emerging challenges, and strengthen alignment across related frameworks.

3. **Engage stakeholders in ongoing dialogue** to harmonize California's recyclability regulations, ensuring consistency between SB 54, SB 343, and related policies while accounting for regional infrastructure, geography, and consumer behavior unique to f lexible packaging.

By adopting these recommendations, CalRecycle can ensure that regulatory systems evolve in step with innovation, promoting clarity, collaboration, and measurable progress toward a circular economy for flexible films and packaging.

Conclusion

We appreciate the opportunity to provide input on this important rulemaking process. The Film Recycling Peer Collaborative strongly supports CalRecycle's leadership and

shares its commitment to achieving California’s recycling and circularity goals. By maintaining f lexibility, leveraging proven systems, and ensuring regulatory alignment, California can continue to lead the nation in advancing practical, scalable recycling solutions for all materials, including flexible films and packaging. We look forward to continued engagement and partnership with CalRecycle as implementation of SB 54 progresses.

Response to O-67-1

Comment rejected. Although the comment discusses various issues for consideration in the event that CalRecycle makes any changes to the proposed regulations, the commenter expressly recommends that CalRecycle adopt the proposed regulations "as written." Because it does not propose any change or raise an objection related to the rulemaking process, no response is required. Even interpreting the comment as recommending that CalRecycle make any changes, CalRecycle declines to do so. Regarding the suggestion "regulatory flexibility," the commenter only requests that regulations allow the PRO "to optimize film and flexible recycling strategies through both alternative and jurisdictional systems." The proposed regulations do not disallow such efforts. Regarding "regulatory review within one year," that is not a recommendation of a change to the proposed regulation but rather a recommendation that CalRecycle evaluate whether to adopted revised regulations in the future. Likewise, a recommendation that CalRecycle "[e]ngage stakeholders in ongoing dialogue" is not a request that CalRecycle change the proposed regulations.

O-68: City of Alameda (Sarah Henry)

Comment O-68-1

This letter is to register the City of Alameda's (City) comments on the formal Senate Bill (SB) 54 regulations released on August 22, 2025. While we understand the need to finalize regulations given the regulatory restart, there are still several areas in the draft regulations that we believe do not fully align with the intent of the law. The City offers the following comments to help achieve alignment with the law's intent to accelerate progress toward circularity for packaging and food ware, protect ratepayers, and make local governments whole for costs associated with implementing the law. Thank you for your consideration of the recommendations below.

Response to O-68-1

Comment rejected. No response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations, does not raise an objection concerning the rulemaking process, or refers to suggested changes or objections set forth in greater detail in other portions of the submission. To the extent other portions of the submission suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-68-2

Article 2: Covered Material and Covered Material Categories Categorically Excluded Materials – 18980.2

The May 2025 version of the draft regulations added for the first time in the rulemaking process a new pathway for packaging components to be excluded from the law if it is "necessary to comply with rules, guidance, or other standards issued by the [USDA] or [FDA] … to prevent microbial contamination or to maintain the safety or structural integrity of packaging…."

The City appreciates the revisions made in section 18980.2(a)(2) of the August 2025 (current) version of the draft regulations to clarify these exclusions only apply when "it is not reasonably possible to use other packaging or packaging components…" and requiring that entities must provide rationale to the Department including the conflicting federal regulation and explanation as to why no reasonably possible alternative packaging is available. The City also supports the addition requiring the Department to review exclusion requests and maintain a public list of determinations.

The Department has stated this new categorical exclusion is intended to provide further clarity to statute section 42060(b) which, in summary, states that SB 54's regulations should not conflict with other federal packaging requirements. The City believes that should such a conflict arise, producers can utilize the exemption pathway within subparagraph (4) of section 18980.2.4 Exemptions for Certain Covered Materials for (A) unique challenges, (C) health and safety reasons, or (D) materials determined unsafe to recycle.

Unlike categorically excluded materials, exempted materials remain covered under the law, meaning regulated producers must still report and pay fees into the system with a required phasein plan to ultimately achieve compliance. Exemptions are also limited to 2-5 years, while excluded materials are permanently removed from the law's purview.

Should the Department determine section 18980.2(a)(2) must remain in the regulations, we would like to offer the following revisions to improve the current approach:
• Exclusion vs. exemption rationale – Entities should be required to explain why an exemption under section 2.4 does not apply in their case, providing the statutory basis to exclude their packaging or component from the law entirely rather than request an exemption based on unique challenges or health and safety reasons.

The Department must be able to evaluate the basis for an exclusion vs. exemption and redirect requests to a more appropriate exemption pathway when applicable.
• Time limits – Packaging design and recyclability are shifting rapidly as a result of SB 54. As such, materials excluded under section 18980.2(a)(2) should be limited to 2-5 years, just as exemptions are (18980.2.4(g)) and a phase-in plan or rationale for why a phase-in plan is not feasible should be required, similar to section 18980.2.4(c)(4)(A)viii for exemptions.

Innovation and development of responsible end markets will likely create new compliance pathways for materials that are currently unable to meet the requirements of the law. Excluding currently challenged materials from the law indefinitely goes beyond statutory intent, and should future conditions change, there must be a pathway to integrate excluded material back into the law.

Response to O-68-2

CalRecycle partially accepts and partially rejects this comment as described in response to comment I-59-2, which is substantively the same as this comment.

Comment O-68-3

The City is also opposed to the addition of language that exempts packaging used for over-the counter drugs (18980(a)(6), and we oppose the regulatory change that exempts secondary and tertiary packaging of exempted and excluded primary packaging (18980(b)). We feel these changes go beyond the intent of the authors and many stakeholders that negotiated this bill.

Response to O-68-3

Comment rejected. For the reasons stated in response to comment O-49-1, CalRecycle rejects the implied suggestion that no exemption should encompass over-the-counter drugs. Regarding secondary and tertiary packaging, CalRecycle interprets the commenter's objection to be directed at section 18980.2(b), which states that packaging excluded pursuant to Public Resources Code section 42041(e)(2)(A) through (D) includes secondary and tertiary packaging. The commenter offers no support for their opposition to these provisions other than that they "feel" that they were not the intent of the authors and "stakeholders that negotiated this bill." Those are not legally valid bases for opposing the regulation because they are based neither in the statutory text nor any legislative history (stakeholders that "negotiated this bill" are not legislators, nor are their discussions with legislators "legislative history," which encompasses the record of debates within the Legislature, publications in the Senate or Assembly journal before the bill was voted on, and legislative committee reports). CalRecycle also rejects the objection concerning secondary and tertiary packaging for the reasons provided in response to comment I-59-2 and O-33-6.

Comment O-68-4

Article 3: Evaluations of Covered Material and Covered Material Categories Eligibility for Being Labeled “Compostable” – 18980.3.3

Assembly Bill (AB) 1201 prohibits materials from being labeled “compostable” unless they meet specific criteria, including the requirement to be “designed to be associated with the recovery of desirable organic wastes, such as food scraps and yard trimmings, that are collected for composting, unless the product complies with the department’s regulations pursuant to subparagraph (B), to the extent the department elects to adopt such regulations.” (PRC 42357(g)(E))

Section 18980.3.3(5) of the draft SB 54 regulations clarifies that an item is designed to be associated with the recovery of desirable organic waste "*if it is desirable organic waste itself or is marketed, labeled, or otherwise sold or distributed in a manner that directs or otherwise causes users of the item to use and discard it with desirable organic waste.*"

This regulatory framing essentially provides that any material marketed or labeled to be composted, is considered "associated with the recovery of desirable organic waste" and therefore potentially compostable under SB 54 (if other criteria are met). The intent of section 42357(g)(E) is that a product facilitates the capture of desirable organics, such as food scraps and yard waste. Section 18980.3.3(5) of the current draft regulations effectively says that to be able to be labeled "compostable," a product simply needs to be labeled "compostable," provided it meets the other criteria in section 42357. Allowing all packaging and food ware, regardless of its material composition, bearing a "compostable" label to be considered "desirable" was certainly not the intent of AB 1201, and the draft regulations must be updated to close this unintended loophole.

Further, while the SB 54 regulations will only affect food ware and packaging, including this definition in these regulations could open the door for the same or similar circular logic to be applied to other products seeking to be labeled compostable.

Response to O-68-4

CalRecycle rejects this comment for the reasons provided in responses to comments I-59-3 and O-78-7.

Comment O-68-5

Article 4 – Responsible End Markets Alternative Recycling Technologies – 18980.4(d)

PRC section 42041(aa)(5) states that the SB 54 regulations "shall encourage recycling that minimizes *generation* of hazardous waste, generation of greenhouse gases, environmental impacts, environmental justice impacts, and public health impacts. The regulations shall also include criteria to exclude plastic recycling technologies that *produce* significant amounts of hazardous waste." However, section 18980.4(d)(B) in the current version of the draft regulations goes against this statutory direction and shifts the standard from the *generation or production* of hazardous waste to its *management*.

The draft regulations enable — not exclude — technologies that produce significant amounts of hazardous waste, unlawfully shifting the standard from the production of hazardous waste (as required by the statute) to its management. Therefore, the threshold of avoiding only those technologies where hazardous waste is improperly managed and "presents an imminent and substantial risk of harm to public health or to the contamination of the environment" does not achieve the statutory mandate. Further, the draft regulations state that any hazardous waste handled and disposed of in

“substantial compliance with an applicable permit” does not pose an imminent and substantial risk. This, too, conflicts with statutory guidance and legislative intent to exclude technologies based on the generation, not management, of hazardous waste.

Additionally, the regulations still fail to address the statutory requirement to encourage minimization of the “generation of greenhouse gases, environmental impacts, environmental justice impacts, and public health impacts.” (The draft regulations currently only address hazardous waste generation/management.) The City urges the Department to add provisions to address these critical concerns and meet the statutory directives.

Response to O-68-5

CalRecycle rejects this comment for the reasons provided in response to comment O-62-1.

Comment O-68-6

Compostability of paper and fiber – 18980.4(a)(4)(C) and 18980.3(c)(4)

Alameda supports the regulatory approach to have different compostability standards for paper and fiber than for plastic. However, with the requirement for testing from an independent laboratory in section 18980.3(c)(4) removed, we are concerned the new proposed compostability standards for paper and fiber may provide a perverse incentive for bad actors to maintain vague or otherwise insufficient documentation demonstrating that the fiber truly is “wholly derived from natural resources.” Some form of verification of or attestation that a product is wholly derived from natural resources should be required to be submitted to the Department.

Response to O-68-6

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42041(aa), 42041(ad), and 42060, and the recommended change is not necessary to the implementation of the Act. The testing requirement was removed from section 18980.3.3(c)(4) of the proposed regulations for the reason provided in response to comment O-86-3. Moreover, sections 18980.4(a)(4) and 18980.4(a)(4)(C) do not purport to establish standards for the composition of materials, including those comprised of paper or fiber; rather, those sections establish standards necessary for end markets that accept specified materials to be considered responsible end markets. Therefore, section 18980.4(a)(4)(C) is not well-situated to impose additional verification or attestation requirements concerning the composition of paper and fiber materials. Instead, other proposed regulatory provisions already allow CalRecycle to receive the information necessary to verify that end markets process paper and fiber materials consistent with the standards established in section 18980.4(a)(4)(C). For example, section 18980.4.1(a)(2) of the proposed regulations already requires a PRO or Independent Producer to describe in its plan the process by which it will evaluate

whether each end market meets the standards specified in section 18980.4, including 18980.4(a)(4)(C), and this plan description will be subject to both review and comment by the public and advisory board and review and approval by CalRecycle. Additionally, all responsible end markets will be subject to annual compliance audits by an independent third-party under section 18980.4.2(a) to ensure satisfaction of the requirements of section 18980.4, including 18980.4(a)(4)(C). CalRecycle will then have the opportunity to require the PRO or Independent Producer to provide any records necessary to verify responsible end markets under section 18980.4.2(d), including records necessary to verify that applicable responsible end markets satisfy the requirements of section 18980.4(a)(4)(C). Therefore, the proposed regulations already provide CalRecycle with sufficient opportunity to determine whether appropriate paper and fiber materials are being processed by responsible end markets in accordance with section 18980.4(a)(4)(C), and no change is necessary.

Comment O-68-7

Article 11: Requirements, Exemptions, and Extensions for Local Jurisdictions and Recycling Service Providers

Local jurisdiction requirement – 18980.11(b)

PRC section 42060.5 states "local jurisdictions or recycling service providers shall include in their collection and recycling programs all covered material" contained on the statewide recyclable / compostable list. The current draft of the regulations provides that a "covered material is considered included in a local jurisdiction or recycling service provider's collection and recycling program if the local jurisdiction or recycling service provider collects the covered material and transfers it to responsible end markets directly or to intermediate supply chain entities."

We believe that including the requirement to also transfer recyclable and compostable covered material goes beyond the statutory requirement for local jurisdictions. This framing also makes it difficult to attribute violations to the correct party, muddying the distinction of where the enforceability of a jurisdiction for a violation of this requirement ends and the point at which that responsibility transfers to a recycling service provider or an intermediate supply chain entity. Jurisdictions need clear guidance on what's expected for compliance and how compliance will be determined.

Response to O-68-7

CalRecycle rejects this comment for the reasons provided in response to comment I-59-7.

Comment O-68-8

Article 13: Enforcement Oversight by the Department

The draft regulations must recognize that SB 54's Enforcement Authority is limited to producers and the PRO and respect that local jurisdictions and recycling service

providers are instead subject to existing enforcement regimes under AB 939. Great lengths are taken in statute to outline the potential enforcement actions that can be imposed against producers or the PRO, yet there is not a single instance in statute that refers to enforcement upon local jurisdictions or recycling service providers. Neither Public Resources Code Sections 42080 nor 42081 contemplate penalties against local governments or recycling service providers.

Local jurisdictions are subject to AB 939's diversion requirements and must develop source reduction and recycling elements outlining how they will achieve the state's solid waste and recycling requirements. Under the AB 939 firamework, CalRecycle is required to regularly review jurisdictions and determine whether they have made a good faith effort to implement their source reduction and recycling element, with penalties of up to $10,000/day for noncompliance. Therefore, a local jurisdiction's failure to comply with SB 54 should be considered a violation of their existing requirements to implement diversion programs through AB 939 and subject them to these penalties exclusively.

Reporting and compliance review for 8B 54 should be incorporated into existing Electronic Annual Report (EAR) system run by CalRecycle, as currently utilized for other laws that govern local jurisdiction diversion requirements such as SB 1383, AB 341, and AB 1826 compliance. This existing system can be updated to require local jurisdictions to self-report SB 54 compliance by certifying whether they include the required recyclable or compostable covered materials in their programs.

The City of Alameda appreciates the CalRecycle team's openness to feedback and continued dialogue to ensure the final regulations will provide a foundation for successful implementation of the law. As in our previous letters, Alameda has a longstanding history of policy actions supporting efforts to reduce our carbon footprint and preserve natural resources with a goal to protect our island community and neighbors. We continue to strongly support the intentions of the law to slow the flow of materials entering our communities, keep materials in circulation through reuse and refill, and create packaging that is designed for recycling or composting at end of life. We reinforce our support for the Extended Producer Responsibility (EPR) requirements put forth in the regulations and maintain that shifting responsibility for the costs of collecting and processing covered materials to responsible end markets from jurisdictions and ratepayers to the producers of the materials themselves is of utmost importance.

Response to O-68-8

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment I-59-8, which is substantively the same as this comment.

O-70: Sarah Erlich (Sarah Erlich)

Comment O-70-1

The Center for Environmental Health (CEH) submits the comments below regarding the California Department of Resources Recycling and Recovery's (CalRecycle's) proposed regulations to implement Senate Bill 54, the Plastic Pollution Prevention and Packaging Producer Responsibility Act ("SB 54"). CEH is a national non-profit organization headquartered in Oakland, California, dedicated to protecting the public from environmental and public health hazards, including harmful chemicals in air, food, water, and everyday products. CEH envisions a world where everyone lives, works, learns, and plays in a healthy environment.

Among SB 54's requirements are that producers of plastic covered material that is imported into, distributed, or sold in California must ensure the material is source reduced and meets graduated recycling rates, which will benefit the environment and the health of Californians.1 SB 54 defines "covered material" in part as "single-use packaging that is routinely recycled, disposed of, or discarded" after opened or used, with some notable exceptions; and plastic single-use food service ware, such as "plastic-coated paper or plastic-coated paperboard, paper or paperboard with plastic intentionally added during the manufacturing process, and multilayer flexible material."2 Additionally, beginning on January 1, 2032, covered material sold, distributed, or imported into California must be recyclable in the state or meet criteria for being labeled as compostable.3 Producers of covered material were required to create and join Producer
Responsibility Organizations unless they met specified criteria, such as specific source reductions of its covered materials and recycling rates by January 1, 2024.4

Response to O-70-1

Comment rejected. No response to this portion of the commenter's submission is necessary because it is preface to the commenter's substantive comments and does not suggest a specific change to the proposed regulations or raise an objection to the rulemaking process. To the extent that following portions of the submission suggest specific changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-70-2

These proposed regulations and associated activities to comply with them must follow the legislative mandate to "minimize disproportionate impacts to disadvantaged or low-income communities or rural areas."5 These proposed regulations will need to be modified to effectuate those objectives. CEH's primary concern regards the absence of an explicit prohibition in the draft regulations against incineration methods such as pyrolysis and gasification, and the use of chemical and solvent-based methods to break down plastic, which the plastic industry misleadingly describes as "advanced recycling" or "chemical recycling."6

The regulations should reflect a ban against “advanced recycling.” SB 54 excludes the following processes from the definition of recycling: combustion, incineration, energy generation, fuel production (with the exception of “[a]naerobic digestion of source separate organic materials”), and “[o]ther forms of disposal.”7 Chemical “recycling” does not qualify as recycling. It produces waste that can be heated into fuel.8 Pyrolysis, a form of incineration, comprises 80 percent of
proposed and active “advanced recycling” facilities in the country, and the amount of plastic it recycles is negligible.9

Moreover, for a covered material to have been properly recycled per SB 54, it must have been transported to a “responsible end market,” defined to benefit “the environment and [minimize] environmental health and safety risks to workers and environmental health risks to the public.”10 SB 54 mandates that CalRecycle’s regulations concerning recycling, “encourage recycling that minimizes generation of hazardous waste, generation of greenhouse gases, environmental impacts, environmental justice impacts, and public health impacts.”11 The legislative language continues: “[t]he regulations shall include criteria to exclude plastic recycling technologies that produce significant amounts of hazardous waste.”12 An advanced recycling facility does not meet the definition of a “responsible end market” as defined in SB 54. Rather, such facilities jeopardize the health and safety of surrounding communities and the workers laboring in them. The Attorney General of California notes that pollutants from “plastic waste feedstocks leach into the environment through the facility’s waste streams, and pyrolysis (plastic melting) units are prone to fire accidents.”13 The Natural Resources Defense Council notes that every type of “chemical recycling” produces “hazardous waste, generate[s] hazardous air pollutants, and/or use[s] toxic solvents.”14 From 2021 to 2024, only three pyrolysis facilities produced greater than two million pounds of hazardous waste.15 In the United States, “chemical recycling” facilities are typically situated in “low-income communities and/or communities of color.”16 Chemicals created by some pyrolysis facilities include benzene, dioxins, cadmium, and other heavy metals.17 Toxic air pollutants that are emitted and/or “permitted to be emitted” by a minimum of one pyrolysis facility include chloroform, formaldehyde, hexachlorobutadiene, hexane, methyl bromide, and vinyl chloride.18 Criteria air pollutants that are emitted and/or are “permitted to be emitted by at least one pyrolysis facility,” includes carbon monoxide, lead, nitrogen dioxide, particulate matter, and sulfur dioxide.19 Other types of “chemical recycling” such as solvolysis and solvent-based purification are techniques that are associated with cancer, developmental toxicity, neurotoxicity, and respiratory toxicity.20

For these reasons, CEH urges CalRecycle to explicitly list the “chemical recycling” processes as banned in its proposed regulations. Thank you

Response to O-70-2

CalRecycle rejects this comment for the reasons provided in response to comment O-62-1. As discussed in greater detail in that response, the proposed regulations are consistent with the requirements of the Act, including in PRC

sections 42041(aa), 42041(ad), and 42060, and the recommended change is not necessary to the implementation of the Act. Also, to the extent this comment suggests the proposed regulations must explicitly prohibit "incineration methods" from the definition of recycling, no change is necessary. As recognized by the commenter, PRC section 42041(aa)(2) already clearly excludes incineration from the definition of "recycle" under the Act, and nothing in the proposed regulations suggests otherwise. Furthermore, to the extent the comment implies that "chemical recycling" be banned outright in the regulations, a complete ban on any technology could have been accomplished through straightforward, specific language in the Act that required prohibition based solely on the type of technology at issue. Instead, the Legislature chose to word statute in a way that requires consideration of hazardous waste generation, not merely consideration of the type of technology.

O-71: Mojave Desert and Mountain Recycling Authority (John Davis)

Comment O-71-1

18980.2 Exclusions opens the way to forever removing massive amounts of packaging from covered materials responsibility. Since much of this potentially excluded packaging looks like other non-excluded materials we will continue to confuse consumers and burden rate payers with end-of-life handling while non-excluded packaging producers must bear disproportionate costs. Moreover, exclusions are forever while exemptions are time-bound and subject to reconsideration. Please ensure that all packaging ultimately transitions to recyclable and compostable materials and meet SB 54's recycling standards. Exemptions should be authorized only when there are no other packaging options available.

Response to O-71-1

Comment partially rejected and partially accepted. Regarding the claim that 18980.2 would "forever remove massive amounts of packaging from covered materials responsibility," no change to the proposed regulations can reverse exclusions expressly required by statute, such as those pursuant to Public Resources Code section 42041(e)(2). Those are permanent and cannot be rescinded via regulation. To the extent that comment was directed at 18980.2(a)(2), CalRecycle partially rejects the comment for multiple reasons. First, that provision does what the commenter proposes: It authorizes exemptions "only when there are no other packaging options available" (i.e., those that avoid conflicts with federal laws). Regarding the request that CalRecycle "ensure that all packaging ultimately transitions to recyclable and compostable materials and meets SB 54's recycling standards," doing so would contravene statute, which does not require all packaging to be recyclable or compostable: Only single-use packaging is subject to such a requirement, and only packaging that is "covered material," not all packaging. Regarding disproportionate costs, the statute only requires producers (through a PRO or otherwise) to account for the compliance costs attributable to covered materials;

the challenge in performing such accounting is inherent in the statute, which expressly acknowledges that not all single-use packaging is subject to it. Regarding the burden on rate payers for the management of materials that are not covered material, the statute was not intended to reduce that burden. It concerns only the additional costs incurred with respect to management of covered materials. Lastly, to the extent the commenter intended to suggest that conflicts with federal laws be addressed solely through the exemption provisions pursuant to Public Resources Code section 42060(a)(3) and (4) (implemented in section 18980.2.4 of the proposed regulations), CalRecycle declines to do so for the reasons stated in response to comment I-59-2 and because the commenter's assertion that exclusions under section 18980.2.1(a)(2) are not "subject to reconsideration" is incorrect. Subparagraph (E) (formerly subparagraph (B)) expressly provides for reconsideration.

CalRecycle accepts this comment, however, to the extent it alleges that section 18980.2(a)(2) was unclear in scope or effect, was insufficiently clear with regard to what renders it "not reasonably possible" to resolve conflicts with federal laws, or would have been overbroad in effect due to the potential for the exclusion to be applied despite the conflicts being avoidable. See CalRecycle's response to comment I-19-1, explaining the revisions responsive to this and similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

Comment O-71-2

18980.3.3 Compostable packaging simply should not include synthetic non-organic materials. California's composting infrastructure is designed to handle organic materials as covered by SB 1383. That infrastructure is not designed to process plastic. A circular economy doesn't force incompatible materials into circular systems. Please ensure that non-organic materials are handled in the recycling system, replaced by reusable products, or prohibited in California as intended by SB 54.

Response to O-71-2

Comment rejected. The comment does not set forth any particular recommendation for revisions to the proposed regulations. If the commenter intended to recommend that the proposed regulations prohibit "synthetic non-organic materials" from being used in "compostable packaging," CalRecycle rejects the proposal because the statute, not regulations, establishes the criteria for eligibility to be labeled "compostable" and requires that CalRecycle rely on those criteria for purposes of Public Resources Code section 42050(b).

Comment O-71-3

18980.8(g) Covered costs in SB 54 are not limited to increased costs or costs of a different nature as proposed in the draft regulations. Although local jurisdictions are to be made financially whole for any new costs, we are collecting and processing covered

materials now and that infrastructure will be integral going forward. It is not possible to achieve the required recycling rates without including already recycled materials and that recycling includes the full range of covered costs. Is the intent to pay only for those programs not now recycling certain materials and not to pay for those already recycling the same materials? Will some communities be paid for new outreach while others must continue ongoing payments for those same activities? How will market value fluctuations be reflected as cost increases for materials already recycled? What is to ensure that capital costs incurred prior to 2023 will be covered to handle additional materials?
"Local jurisdictions are the backbone of the solid waste management and recycling efforts in California. The new statewide comprehensive circular economy framework established by this chapter is intended to shift the burden of costs to collect, process, and recycle materials from the local jurisdictions to the producers of plastic products." ((PRC 42040(b)(2))
The PRO plan and budget should fully fund the costs described in PRC 42051.1 (j) (1) (B) as required by PRC 42060.
These costs include:
• Costs associated with this chapter incurred by local jurisdictions, recycling service providers, and other collection programs, and
• costs related to consumer outreach and education;
• the transportation of covered materials to a materials recovery facility, broker, or viable responsible end market;
• cleaning, sorting, aggregating, and baling covered materials as necessary to bring those materials to a viable responsible end market;
• waste stream sampling and reporting required by this chapter for local governments;
• costs incurred to educate ratepayers to improve the preparation and sorting of covered material;
• and improvements to collection, sorting, decontamination, remanufacturing, and other infrastructure necessary to achieve recycling rates.
• These costs include costs related to both curbside and noncurbside collection programs and may be varied based on population density, distance to a viable responsible end market, and other relevant factors.
PRC 42060 provides that "The regulations shall include, but not be limited to, all of the following: "1) Any regulations necessary to ensure the PRO fully funds plan implementation, including fully funding the budget. This shall include the costs incurred by a local jurisdiction or a local jurisdiction's recycling service providers to implement this chapter, including, but not limited to, the cost of consumer education and of collection, including the cost of containers where relevant, as well as the processing, storage, and transportation of covered materials. Costs may vary based on population density or other relevant factors and shall allow local jurisdictions to protect ratepayers from increased costs associated with the processing and marketing of covered material."

Response to O-71-3

Comment rejected. The commenter poses a series of questions and quotes and paraphrases various statutory provisions. It does not propose any particular

changes to the regulations. To the extent the commenter intended to recommend that the proposed regulations be modified so that every cost related to management of covered material waste, not just the increased or new costs incurred due to the statute implemented by these proposed regulations, CalRecycle rejects this comment for the reasons provided in response to comments O-56-3.

Comment O-71-4

18980.11(b) Local agencies or haulers should not be responsible for assuring that covered materials reach responsible end markets. Identification and verification of those markets is the PRO's responsibility and should be removed from local collection obligations.

Response to O-71-4

Comment rejected. Section 18980.11(b) does not state that any entity is responsible for "assuring that covered materials reach responsible end markets." Rather, the first sentence states that it is sufficient for covered material to be transferred to intermediate supply chain entities, and the second expressly states that there is no obligation to establish the availability of responsible end markets. The commenter does not explain how they read that text to have the opposite meaning.

Comment O-71-5

Article 4 Responsible end markets are to be "viable" per SB 54, yet that term does not appear in the draft regulations. Markets should be financially sound and sufficient to cover materials processing costs. Despite California PET post-consumer minimum content requirements we lost two key in-state end markets in the last year.

Response to O-71-5

Comment rejected. The proposed regulations do not use the term "viable" because it is axiomatic that the purpose of "financial support" and the development of responsible end markets is to establish them as ongoing concerns that process cover materials. Such progress is inherent in the PRO's obligations under the statute (e.g., the requirements of Public Resources Code section 42050); those obligations cannot be met without enduring enhancements to recycling infrastructure. Using the term "viable" would therefore serve no purpose.

Comment O-71-6

Article 13 Enforcement against local jurisdictions is contrary to SB 54's specific focus only on producers and the PRO. The statute does not include local agencies in its enforcement provisions and CalRecycle should honor that exclusion.

Response to O-71-6

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements set forth in the Act, including in sections 42060, 42060.5, and 42081 of the Public Resources Code, and the recommended change is not necessary to the implementation or enforcement of the Act. Section 42081(a)(1) provides that CalRecycle may issue a notice of violation to, and impose an administrative civil penalty not to exceed fifty thousand dollars ($50,000) per day per violation to, any entity not in compliance with the Act or any of the regulations adopted to implement the Act. Section 18980.13.2(a) of the proposed regulations implements this statutory provision by specifying that any entity, including a local jurisdiction, not in compliance with the Act is subject to penalties pursuant to section 42081(a).

O-72: Renee Pinel

Comment O-72-1

On behalf of the Western Plant Health Association (WPH), I am submitting these comments regarding CalRecycle's recently released draft regulatory language for the Plastic Pollution Prevention and Packaging Producer Responsibility Act (SB 54). WPH appreciates the opportunity to comment on this proposed regulation and looks forward to working with CalRecycle moving forward. WPH represents pesticide and fertilizer manufacturers, agricultural biotechnology providers, and agricultural retailers in California, Arizona, and Hawaii.

WPH fertilizer and pesticide manufacturing and distributor member companies have supported agricultural container recycling programs for decades to ensure sound stewardship of these containers. Program parameters for the stewardship and recycling of these unique containers is demonstrated by the Ag Container Recycling Council (ACRC) program. WPH requests that as agricultural container recycling is a unique program, CalRecycle provide an exemption for manufacturers who participate in ACRC from the Circular Action Alliance.

Current Agricultural Collection Program

The ACRC is a nonprofit association that promotes and funds programs in the United States for the collection and recycling of rigid HDPE plastic agricultural chemical containers, including pesticide, specialty pest control, micronutrient, biological, fertilizer, adjuvant and surfactant products. ACRC currently operates in 47 states as the agricultural chemicals industry's not-forprofit stewardship program, strictly following ANSI/ASABE S596 Standards.

The ACRC has operated a specialized agricultural container stewardship program in California for over three decades. ACRC also serves as a compliance mechanism for the California Department of Pesticide Regulation's (CDPR) pesticide container recycling requirements under Food and Agriculture Code §12994 et seq. WPH refers

CalRecycle to the included comprehensive comments submitted by the ACRC for detailed history and performance of the ACRC program and structure.

The ACRC program operates under rigorous EPA standards established in the 2006 Container and Containment Rule (40 CFR Part 165), which requires 99.99% removal of each active ingredient. All containers collected under the ACRC program, including non-Federal Insecticide, Fungicide, Rodenticide Act (FIFRA) containers undergo the strict collection protocols of this program, so all agricultural containers received this higher level of stewardship than other mainstream collection programs.

Response to O-72-1

Comment rejected. The commenter requests that CalRecycle establish a specific exemption for manufacturers who participate in the Ag Container Recycling Council program. However, CalRecycle does not have general authority to create exemptions not established by statute. In any event, the proposed regulations accommodate the commenter's concerns because any packaging not within a categorical exemption (e.g., for reusable packaging or for packaging of goods enumerated in Public Resources Code section 42041(e)(2)) might qualify for other exemptions based on public health, safety, and other special compliance challenges. See, e.g., PRC section 42060(a)(3) and (4), and section 18980.2.4 of the proposed regulations. Accordingly, the proposed regulations accommodate that commenter's concerns, and no change is necessary.

Comment O-72-2

Incompatibility of Proposed Producer Responsibility Organization Program

WPH is concerned that the proposed SB-54 regulations do not contain real protection and pathway recognition for existing high-performing stewardship programs. This will require WPH member organizations to pay both ACRC membership fees and Producer Responsibility Organization (PRO) fees. This will result in a duplicative fee structure that will threaten ACRC program viability and the intended positive environmental outcomes that the ACRC has provided for the last 30 years.

In our initial discussion with CalRecycle regarding implementation of SB 54, it was suggested that ACRC could become a subcontractor for the CAA. After reviewing this suggestion, we do not believe this is a viable approach.

A subcontracting arrangement would create a financially and administratively inefficient structure as ACRC member fees would flow to CAA who would retain funds to administer its overhead and management fees. Remaining funds could then be directed to ACRC in subcontractor payments. However, both organizations would have to bear duplicative administrative and management costs. The result will be the diversion of resources from actual collection operations, reducing the pounds of agricultural containers collected per dollar spent— the opposite of efficient program design.

The resulting administrative bureaucracy and reduced funding efficiency would ultimately harm California growers and agricultural chemical users who rely on ACRC's collection network. Rural collection sites, agricultural retailers, and on-farm collection services operate on very thin margins. Any reduction in program funding, which we believe a subcontractor relationship would result in, would force service reductions in precisely the areas where municipal collection infrastructure is absent or inadequate.

As has been described previously, the stewardship protocols of the ACRC program are not compatible with proposed producer compatibility programs. Agricultural chemical containers possess characteristics that distinguish them from general packaging waste streams. As outlined in comments submitted by ACRC, this unique program differs from standard collection programs because:

- “ACRC handles both FIFRA-regulated pesticide containers (already exempt under the Act) and non-FIFRA agricultural products (fertilizers, adjuvants, and other agricultural amendments) as a unified stream. Requiring segregation would impose impractical operational burdens on farmers and collection sites while creating safety concerns around increased handling of potentially contaminated containers.
- ACRC requires all containers to be triple-rinsed, and decontamination protocols meet EPA's 99.99% active ingredient removal standard, making them unsuitable for standard materials recovery facilities due to pesticide residue contamination risks. This specialized processing meets the criteria for "unique compliance challenges" under PRC §42060(a)(3) and presents "health and safety concerns" under PRC §42060(a)(4).
- The ACRC operates entirely through alternative collection as defined in §18980.1(a)(2)—collection at agricultural and non-residential sites not conducted by local jurisdictions or their contracted service providers. Materials are never commingled with municipal curbside recyclables, meeting a key criterion of §18980.2.3(a)(3)(B).
- The ACRC program unambiguously qualifies as an "alternative collection" program under §18980.1(a)(2), collecting covered materials at agricultural and non-residential sites entirely independent of local jurisdiction curbside programs. The program collects covered materials "regardless of whether the covered material is discarded or considered solid waste and regardless of the manner and location of collection," using systematic collection means including drop-off locations at agricultural retailers, on-farm collection, and dedicated collection events—all conducted without involvement of local jurisdictions or their contracted recycling service providers.
- ACRC maintains complete chain of custody documentation from collection through verified end markets (such as agricultural drainpipe, nursery pots, landscaping products, and underground conduit), as required under §18980.4(a)(2) (A), conducts annual third-party audits per §18980.4.2, and achieves recycling yields exceeding industry standards for agricultural container plastics.

- ACRC has provided annual collection and recycling data to CDPR since 2012, demonstrating long-term accountability and transparency. The program operates under ANSI/ASABE S596 standards for agricultural plastics recycling."

Response to O-72-2

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process. To the extent other portions of the submission do suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-72-3

Effective Pathways Forward

WPH supports the legislature's intent through SB 54 to increase plastic recycling. However, we do not believe the current direction of the program, a consolidation of all collection activities under a single organizational structure is in California's best interest. Where specialized, high-performing collection infrastructure already exists and operates independently of municipal systems, CalRecycle should recognize and preserve that infrastructure rather than force artificial integration that adds costs without adding environmental value.

Through the ACRC's heightened environmental and human health protection standards, it eliminates agricultural plastics entering landfills or abandonment in the environment and ensures that agricultural plastics cannot be recycled into products streams that could come in contact with food products, like plastic wraps and containers or grocery bags.

WPH requests that CalRecycle recognize ACRC as an alternative compliance program, and not as a subcontractor. This will allow continuation of the most efficient use of member resources to achieve positive environmental outcomes while eliminating unintended human health exposures.

WPH asks that CalRecycle adopt language approved by the State of Oregon for the collection of agricultural plastics. Oregon's recently adopted regulations (OAR 340-090-0840(2)(d)(D)) specifically exempt rigid HDPE packaging of commercial-use pesticides, fertilizers, adjuvants, surfactants, and agricultural amendments produced by ACRC members, conditioned upon maintenance of consistent collection rates, recycling at responsible end markets, annual datasubmission, and periodic third-party audits. This approach preserves proven infrastructure while maintaining accountability through performance monitoring. WPH has included in our submission this amendment to Oregon's Extended Producer Responsibility Program for CalRecycle's convenience.

WPH recommends that CalRecycle adopt a class-wide "Agricultural Container Recognition" under § 18980.2.7 (or equivalent new § 18980.2.8), modeled on a

program-level exemption and justified by the distinct regulatory, logistical, and operational characteristics of agricultural pesticide and chemical containers. The alternative would be the Creation of a "Qualified Stewardship Program" pathway under new § 18980.2.8, tied to the authority in § 18980.2.7 and PRC § 42051(b)(2), allowing CalRecycle to recognize long-standing, high-performing stewardship systems that already achieve SB 54 outcomes independently of the PRO.

Conclusion

WPH is very concerned that if ACRC's program becomes unsustainable, agricultural containers will enter landfills or be burned on farms—which directly contradict SB-54's environmental objectives under PRC §41780.01 and §42040. We believe that exempting the ACRC program and designating ACRC as an alternative collection program will promote a sound Extended Producer Responsibility program that maintains a strong stewardship infrastructure while achieving statutory goals.

WPH urges CalRecycle to expedite providing an exemption for agricultural organizations who are members of ACRC from participating in CAA. This will allow for a seamless continuation of the ACRC program and prevent the risk of duplicate fees and significant funding erosion leading to reduced or discontinued collection. We thank you for your consideration of our comments. If you have any questions, please feel free to contact me.

Response to O-72-3

Comment rejected. The commenter's first proposal is, in effect, for CalRecycle to recognize an alternative to the statutorily mandated PRO program—in other words, the commenter proposes that CalRecycle disregard the statute. CalRecycle rejects that proposal for the reasons set forth in response to comment O-98-3. The commenter also specifically requests that CalRecycle adopt regulatory language adopted by the state of Oregon to exempt agricultural pesticide and chemical containers that participate in a particular collection program. CalRecycle declines to do so because it is beyond CalRecycle's authority under the statute to single out a particular collection program in regulations and declare the materials it collects not to be "covered material." Instead, the statute authorizes exclusions and exemptions based on certain criteria, such as those stated in Public Resources Code section 42041(e)(2)(H). The exclusion authorized under section 42041(e)(2)(H) also renders the proposed change unnecessary because any organization, such as the one commenter identifies, operating an alternative collection program may establish eligibility. In effect, that provision provides the "program-level exemption" that the commenter seeks.

Regarding the attachment to the commenter's submission (the October 7, 2025, letter to CalRecycle under ACRC letterhead), that attachment is included in the rulemaking record but not addressed here because it was also submitted by

another party as its own set of comments. Those comments are O-98-1 through O-98-14. CalRecycle has responded to them separately.

O-73: West Contra Costa Integrated Waste Management Authority (Cliff Feldman)

Comment O-73-1

The West Contra Costa Integrated Waste Management Authority (Recyclemore) supports the intent of SB 54 and we appreciate CalRecycle's efforts to provide regulations to commence shifting to a more circular economy for California as prescribed in SB 54 is achieved. We strongly support the intentions of the law to slow the flow of materials entering our communities, keeping materials in circulation through reuse and refill, and by creating packaging that is designed for recycling or composting at end of life. We also strongly support the EPR intent of the law – to shift the responsibility for the costs of collecting and processing covered materials from jurisdictions and ratepayers to the producers of the materials themselves.

Response to O-73-1

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process. To the extent other portions of the submission do suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-73-2

Topic #1: Funding Sources for Implementation

Chapter 3, Article 1 of SB 54 states that:

Local jurisdictions are the backbone of the solid waste management and recycling efforts in California. The new statewide comprehensive circular economy framework established by this chapter is intended to shift the burden of costs to collect, process, and recycle materials from the local jurisdictions to the producers of plastic products. It is the intent of the Legislature in enacting this chapter to ensure that local jurisdictions will be made financially whole for any new costs incurred associated with the implementation of this chapter and its implementing regulations.

However, the proposed regulations lack language that specifically: 1) requires service providers to request funding from the PRO for any new costs incurred associated with the implementation of SB 54; 2) prohibits service providers from obtaining funding from local jurisdictions for any new costs incurred associated with the implementation of SB 54; 3) prohibits service providers from receiving cost reimbursements from the PRO and then also recovering those same costs from local jurisdictions ("double-dipping"); and 4) requires service providers to share with affected local jurisdictions any reduction in operational costs resulting from PRO payments. Without those protections in the regulations, the requirements of Section 42060.5 of the Public Resources Code and Article 11 of the draft regulations could become an unfunded mandate on local jurisdictions, with the costs of SB 54 ultimately being incurred by ratepayers and taxpayers instead of by the producers.

Service providers must be prohibited from obtaining or seeking to obtain reimbursements from ratepayers for costs eligible for reimbursement from the PRO, regardless of whether or not the service provider opts to seek reimbursement from the PRO. The express legislative intent is that rate payers do not bear these costs. That intent cannot be assured unless service providers are prohibited from obtaining and seeking to obtain reimbursement of eligible costs from ratepayers.

We appreciate the addition to section 18980.8 of the proposed regulations regarding reimbursable costs which requires that the PRO or Independent Producer "first" notify the local jurisdiction when costs are deemed covered for a recycling service provider. However, while this will be a helpful tool to enhance transparency, it is not a mandate or prohibition under law from including reimbursed costs in ratepayers' rates. We believe that such a prohibition is necessary. The proposed regulations place the burden of enforcement against "double-dipping" on local jurisdictions. We believe this enforcement should be the responsibility of CalRecycle. Below we have provided suggested draft language. We request that this language or similar be incorporated into the adopted regulations in order to ensure the intent of SB 54.

- *Recycling service providers shall request reimbursement from a PRO for any new costs incurred in order to comply with Section 42060.5 of the Public Resources Code.*
- *Recycling service providers shall not request, accept, or obtain funds from Ratepayers, taxpayers, or local jurisdictions for new costs incurred by the recycling service providers in order to comply with Section 42060.5 of the Public Resources Code.*
- *If a service provider receives reimbursement from a PRO for costs incurred in order to implement Section 42060.5 of the Public Resources Code, that service provider shall not request, accept, or obtain funds from Ratepayers, taxpayers or local jurisdictions for reimbursement of the same costs for which they were reimbursed by a PRO.*
- *If a service provider receives funds from a PRO and also receives funds for reimbursement of those same costs from Ratepayers, taxpayers, or local jurisdictions, either before or after being reimbursed by the PRO, that service provider shall refund all such funds to the Ratepayers, taxpayers, or local jurisdictions. The Department shall enforce this requirement, shall investigate related complaints from Ratepayers, taxpayers and local jurisdictions, and may assess penalties on recycling service providers sufficient to achieve compliance.*
- *• If a service provider receives funds from a PRO and the use of these funds results in the service provide achieving process improvements resulting in reductions in cost of operations or monetary savings, that service provide shall refund these reductions in cost of operations or monetary savings directly to the Ratepayers, taxpayers or local jurisdictions.*

Response to O-73-2

CalRecycle rejects this comment for the reasons provided in response to comment O-33-2.

Comment O-73-3

Topic #2: Enforcement Oversight by the Department - Section 18980.13

It is clear that SB 54's enforcement authority is directed toward producers and the PRO, not specifically local jurisdictions. In addition, local jurisdictions are subject to related, yet different statutory enforcement mechanisms. There is no statutory basis to inflict substantive penalties on local jurisdictions, and the direction to impose penalties of up to $50,000 per item per day for violations by local jurisdictions for failure to include covered materials in their collection programs is unconcsionable. **SB 54 does not authorize these penalties, nor expressly target local jurisdictions for monetary fines.** The law authorizes monetary penalties for only PROs, producers, retailers, and wholesalers. (Public Resources Code sections 42080-42084.) This is an error in the draft regulations that needs to be corrected.

References to "PRO" and "producer" appear repeatedly in sections 42080-42084 of the Public Resources Code, the SB 54 enforcement statutory provisions. **There is no reference to local jurisdictions.** In section 42080, "entity" is used to refer to PRO, producer, wholesaler, and retailer. When in section 42081 there is a reference to "any entity," the statute goes on to provide a single exception for small producers, retailers, and wholesalers that are listed in section 42060(a)(5) – with no mention of an exception or extension for certain local jurisdictions or recycling service providers (as in 42060.5(b)), or rural counties/jurisdictions (as in 42060.5(c)), which one would expect to see if they were among the types of "entities" that could be penalized under that section. Producers and PROs are the only specific types of entities mentioned in section 42081. Therefore, "any entity" in section 42081, and all the enforcement provisions of that Article 5, are intended to refer only to producers, PROs, retailers, and wholesalers. There are no other enforcement provisions in the SB 54 statutes. Again, this error should be corrected.

Response to O-73-3

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements set forth in the Act, including in sections 42060, 42060.5, and 42081 of the Public Resources Code, and the recommended change is not necessary to the implementation or enforcement of the Act. Section 42081(a)(1) provides that CalRecycle may issue a notice of violation to, and impose an administrative civil penalty not to exceed fifty thousand dollars ($50,000) per day per violation to, any entity not in compliance with the Act or any of the regulations adopted to implement the Act. Section 18980.13.2(a) of the proposed regulations implements this statutory provision by specifying that any entity, including a local jurisdiction, not in compliance with the Act is subject to penalties pursuant to section 42081(a).

Comment O-73-4

Topic #3: Categorically Excluded Materials – Section 18980.2

The May 2025 version of the draft regulations added for the first time in the rulemaking process a new pathway for packaging components to be excluded from the law if it is "necessary to comply with rules, guidance, or other standards issued by the [USDA] or [FDA] … to prevent microbial contamination or to maintain the safety or structural integrity of packaging…."

We appreciate the revisions made in section 18980.2(a)(2) of the current version of the draft regulations to clarify these exclusions apply only "if it is not reasonably possible to use other packaging or packaging components…" and requiring that entities must provide rationale to the Department including the conflicting federal regulation and explanation as to why no reasonably possible alternative packaging is available. We also support the addition requiring the Department to review exclusion requests and maintain a public list of determinations.

We understand that this new categorical exclusion is intended to provide further clarity to statute section 42060(b), which, in summary, states that SB 54's regulations should not conflict with other federal packaging requirements. We believe that should such a conflict arise, producers can utilize the exemption pathway within section 18980.2.4(c)(4), under, for example, (A) unique challenges, (C) health and safety reasons, or (D) materials determined unsafe to recycle.

Unlike categorically excluded materials, exempted materials remain covered under the law, meaning regulated producers must still report and pay fees into the system with a required phase-in plan to ultimately achieve compliance. Exemptions are also limited to two to five years, while excluded materials are permanently removed from the law's purview. Care must be taken when excluding materials so as not to unintentionally weaken SB 54.

Recommendation:

We urge CalRecycle to remove section 18980.2(a)(2) from the draft regulations and instead rely on the existing exemption process (18980.2.4) for packaging or packaging components used by food or agricultural commodities that are unable to comply with SB 54 due to conflicting federal regulations.

Should the Department determine that section 18980.2(a)(2) must remain in the regulations, we would like to offer the following revisions to improve the current approach:

- Entities should be required to explain why an exemption under section 18980.2.4 does not apply in their case, providing the statutory basis to exclude their packaging or component from the law entirely rather than request an exemption based on unique challenges or health and safety reasons.

The Department must be able to evaluate the basis for applying an exclusion versus an exemption, and redirect requests to a more appropriate pathway when applicable.

Suggested revisions to section 18980.2(a)(2)(A):
"The basis shall identify the specific provision of this Chapter that causes a conflict, cite the conflicting federal regulations or rules, ~~or guidelines,~~ and explain why no reasonably possible alternative packaging or packaging component is available and why the exemption pathways outlined in section 189890.2.4 do not apply."

Note: We also recommend removing "guidelines" because federal guidelines are not always compulsory.

- Time limits – Packaging design and recyclability are shifting rapidly as a result of SB 54. As such, materials excluded under section 18980.2(a)(2) should be limited to 2-5 years, just as exemptions are (18980.2.4(g)) and a phase-in plan or rationale for why a phase-in plan is not feasible should be required, similar to section 18980.2.4(c)(4)(A)viii for exemptions.

Innovation and development of responsible end markets will likely create new compliance pathways for materials that are currently unable to meet the requirements of the law. Excluding currently challenged materials from the law indefinitely goes beyond statutory intent, and should future conditions change, there must be a pathway to integrate excluded material back into the law.

Response to O-73-4

CalRecycle partially rejects and partially accepts this comment as described in response to comment I-59-2, which is substantively the same as this comment.

Comment O-73-5

We are also opposed to the addition of language that exempts packaging used for over-the-counter drugs (18980(a)(6). As we understand it, the inclusion of over-the-counter drugs into the list of categorically excluded materials conflicts with the legislature's intent when it enacted SB 54. Over-the-counter drugs already use packaging that is well-suited for source reduction, packaging material changes, and reuse and refill.

Furthermore, we strongly oppose the regulatory change that exempts the secondary and tertiary packaging of excluded materials (18980.2(b)). We believe that these changes are unnecessary and go beyond the intent of the authors and many stakeholders that negotiated this bill.

Response to O-73-5

CalRecycle rejects this comment for the reasons provided in responses to comments O-49-1 and O-33-6.

Comment O-73-6

Topic #4: Methodology for Recycling Rate Determination – Section 18980.3.2

For new covered material categories with a pending recycling rate, it is more rational to presume that they do NOT achieve the required recycling rate under Public Resources Code section 42050(c), rather than that they do meet the rate. Without this presumption, producers could avoid the recyclability requirements by changing to a new form of packaging every year, circumventing the law and unintentionally disadvantaging other producers. It is challenging to determine, and to meet, the recyclability requirements of SB 54, and new items should not be exempt from going through the process that all the other covered items that have met the required recycling rate have had to go through.

Response to O-73-6

CalRecycle rejects this comment for the reasons stated in response to comment O-78-6.

Comment O-73-7

Topic #5 – Eligibility for Being Labeled "Compostable" – 18980.3.3(c)(5)

AB 1201 prohibits materials from being labeled "compostable" unless they meet specific criteria, including the requirement to be "designed to be associated with the recovery of desirable organic wastes, such as food scraps and yard trimmings, that are collected for composting, unless the product complies with the department's regulations pursuant to subparagraph (B), to the extent the department elects to adopt such regulations." (PRC § 42357(g)(1)(E).)

Section 18980.3.3(c)(5) of the draft SB 54 regulations clarifies that an item is designed to be associated with the recovery of desirable organic waste "if it is desirable organic waste itself or is marketed, labeled, or otherwise sold or distributed in a manner that directs or otherwise causes users of the item to use and discard it with desirable organic waste." This language is too broad. Marketing and labeling can be misleading, and are not even mentioned in PRC section 42357(g)(1)(E).

Recommendation:

A potential fix for this issue would be to simply delete the second sentence of section 18980.3.3(c)(5), as follows:

They must satisfy the requirement set forth in subparagraph (E) of paragraph (1) of subdivision (g) of section 42357 of the Public Resources Code concerning association with the recovery of desirable organic wastes. ~~For purposes of this requirement an item is designed to be associated with the recovery of desirable organic waste if it is desirable organic waste itself or is marketed, labeled, or otherwise sold or distributed in~~

~~a manner that directs or otherwise causes users of the item to use and discard it with desirable organic waste.~~

Response to O-73-7

CalRecycle rejects this comment for the reasons set forth in responses to comments I-59-3 and O-78-7.

Comment O-73-8

Topic #6: Responsible End Market for Plastic Materials

Under PRC Code section 42040 (aa) (3) "**..in order for a covered material to be considered recycled, it must be sent to a responsible end market.**" For plastic materials, under proposed regulations section 18980.4 (b) (4), "***...the end market is the entity that first produces plastic feedstock that meets the quality standards necessary to be used in lieu of virgin materials for the creation of new or reconstituted products. Such end markets include, but are not limited to, entities that create pellet.***"

The proposed language above would enable the receipt of a bale of plastics at a facility capable of producing pellet from that bale to be counted as recycling – regardless of whether that pellet was ever produced and regardless of whether that plastic was actually ever recycled into a new product. As demonstrated in the SB 54 Advisory Group's report on Plastic Leakage, plastic production in 2025 continues to grow beyond the capacity for collection and recycling programs to capture and recover those materials.

Until the demand for manufacture-ready plastics exceeds the supply, accumulating bales or piles of plastics should not be counted as recycling, as there are no assurances that such stockpiled materials will actually be made into products and there is no tracking mechanism within SB 54 to assure such actual production of a recycled product at any time in the future.

This proposed regulation also creates challenges in assessment of recycling rates at responsible end markets, in that proposed regulations section 18980.4 (a) (4) (A)(i): "***For any period, average recycling yield shall be calculated by taking the total weight of material that has been recycled and dividing it by the total weight of material that has been accepted by the end market and not sent to a responsible end market for further processing.***"

For these reasons we recommend that proposed regulations section 18980.4 (b) (4) be revised as follows: "**...the end market is the entity that first produces plastic feedstock ~~that meets the quality standards necessary to be~~ used in lieu of virgin materials for the creation of new or reconstituted products ready for sale using such plastic feedstock. Such end markets <u>do not</u> include~~, but are not limited to~~, entities that create pellet until those pellets are used to make a product.**"

Response to O-73-8

CalRecycle rejects this comment. See the response to comment O-56-10. In particular, the current language of section 18980.4(b)(4) concerning end markets for material made of plastic is consistent with the statutory definition of "recycling" in PRC section 41041(aa). Therefore, no change is necessary to the implementation of the Act.

Comment O-73-9

Topic #7: Definition of Hazardous Waste

The regulations reference the *federal* definition of hazardous waste, and not the California state definition, which is far more protective of public health and the environment. This problematically opens the door to the generation of hazardous wastes that are not considered federally hazardous but should otherwise be considered 'California Hazardous.' This includes more protective toxicity tests, lower thresholds for heavy metals (e.g., lead, copper, zinc), lower thresholds for ignitability, lower thresholds for reactivity and corrosion, and prohibitions on certain chemical products and pharmaceuticals.

A more appropriate definition is the one already existing in Public Resources Code Section 40141, which defines "hazardous waste" for all of Division 30 of the Public Resources Code except where "the context requires otherwise." That section defines "hazardous waste" to include, but does not limit the definition to, RCRA hazardous waste. It also cross-references Health and Safety Code 25117, which includes any wastes that meet criteria adopted by the Department of Toxic Substances Control (DTSC).

The legislature has repeatedly stated, and the courts have upheld, that "it is in the interest of the health and safety of all Californians...to establish a regulatory program that is more stringent than federal law" (Health & Safety Code 25100) when it comes to hazardous waste. In the absence of other statutory direction, the Department must default to California statutory and regulatory definitions when implementing state laws, like SB 54.

I thank you in advance for your consideration of these comments.

Response to O-73-9

CalRecycle rejects this comment for the reasons provided in response to comment O-62-1.

O-74: California Compost Coalition (Neil Edgar)

Comment O-74-1

Our comments are provided below and in the attached .pdf version of the draft proposed regulations:

My comments reflect those of my composter members and are not on behalf of the SB 54 Advisory Board
Despite assertions from producers, CCC has no desire to eliminate or ban compostable packaging. In fact, CA compost manufacturers are receiving and processing hundreds of tons of food-soiled fiber and paper every day.
Bioplastic materials, however, are not functional in collection and composting systems at the scale of services being delivered by commercial operators in CA.
CA Composters have decades of experience in working with the jurisdictions they serve trying to make compostable plastics work and have learned many costly lessons about how they don't.
We fully understand the difference between the investment manufacturers have sunk into making functional packaging for safely delivering food to consumers and what is functional at the end of life in composting facilities that are relied upon to manage that waste.
My members operate composting facilities that have invested millions of dollars in environmental compliance measures and must meet the demands of their primary agricultural markets to manufacture the highest value compost products they can in order to meet very ambitious revenue targets.
Food service ware and packaging marketed as compostable, presents significant challenges to compost manufacturers that impair its ability to function as a circular solution:

Contamination Impacts
Removing contamination from compost during the manufacturing process is job #1 for composters. Quite simply, we need to keep plastics out of compost. Plastics contamination - including from bioplastics which meet lab biodegradation standards in ASTM D6400 - represent the largest threat and processing cost to compost production. As SB 1383 collection programs have increased in number and volume, the costs of removing increasing plastics contamination has risen significantly.
ASTM marketing standards require materials to 90% disintegrate in 84 days and 90% biodegrade within 180 days. Those standards do not reflect the production cycles for commercial composters who must move finished product to market within 90 days. Any partially degraded, visible plastic is very difficult to remove and will devalue the compost.

Lack of Proper Labeling and Enforcement
California has adopted labeling standards for compostable products under AB 1201 (Ting, 2021). Existing statutory requirements, found mainly in Public Resources Code 42357(g), are not being enforced. A large proportion of these products sold in California are not clearly labeled, causing confusion for consumers and adding cost unnecessarily, as they are typically disposed of following costly removal.

Consumer Confusion Leading to Higher Costs and Contamination
Compostable plastics are often confused with conventional disposables (which they are often designed to mimic), leading to contamination in both the compost and recycling streams, increasing processing costs for ratepayers and customers, and reducing the

marketability of material, due to the physical contamination resulting from the acceptance of packaging, at large, with food materials. While fiber and paper compostable products come with their own potential contamination challenges, composters have not found nearly the level of impact on product quality that comes with plastics.

Creates a Permission Structure for Increasing Contamination
Despite signage and other education attempts, many users, lost in the confusion of multiple products, resin types, and conflicting messages carelessly throw all food-associated packaging in the green bin, leading to the need for mechanical separation which wastes additional food and increases costs for processing.

Not Allowed in Certified Organic Agriculture and not Desired by Farmers
California farmers buy over 60% of our compost and want product that is allowable for use in certified organic agriculture as a means of assuring quality. Under the National Organic Program (NOP) rules, plastic is considered a synthetic product which is not allowed, even if it is "compostable".

Toxicity and Microplastics Concerns
Some compostable products still contain harmful chemicals like PFAS, which do not break down during composting and can contaminate soil and water. Other polymers and chemical constituents are also concerning. While the science and understanding of microplastics is emerging there is evidence that in the absence of specific composting conditions (moisture content, adequate temperature) some of these compostable plastics generate microplastics like the conventional plastics they mimic, causing all of the same environmental damage to soil and impairment of plant function.

Thank you for the opportunity to comment.

Section 18980.2. Categorically Excluded Materials

- We fully support a very narrow interpretation for what may be categorically excluded. The goal to migrate covered materials to only circular solutions will be unachievable without a dominant portion of the disposable products being included as contributors to the PRO effort. Any covered materials not explicitly identified in statute and corresponding federal regulations, where the packaging is clearly specified to meet standards for the primary packaging, should not be excluded; they should be required to request an exemption and provide detailed reasoning for justification.

Section 18980.3.3. Eligibility for Being Labeled “Compostable”

- Unclear why CalRecycle removed the definition of "desirable organic waste" which was in the October 2024 15-day draft regs.

- This language appears to give too much room for misinterpretation. It seems to say that any item which is marketed, labeled, or otherwise sold or distributed and tells users to place it in a green bin is eligible to be labeled compostable, regardless of whether it is actually used for the recovery of desirable organic waste.
- We recommend revising this section as per the previous language: (5) They must satisfy the requirement set forth in subparagraph (E) of paragraph (1) of subdivision (g) of section 42357 of the Public Resources Code concerning association with the recovery of desirable organic wastes. For purposes of this requirement:
- (A) “Desirable organic waste” means food material (as defined in paragraph (20) of subdivision (a) of section 17852 of this division), yard trimmings (as defined in paragraph (43) of subdivision (a) of section 17852 of this division), or an allowable agricultural organic input under the requirements of the United States Department of Agriculture National Organic Program.
- (B) An item is designed to be associated with the recovery of desirable organic waste if it is desirable organic waste itself or is marketed, labeled, or otherwise sold or distributed in a manner that directs or otherwise causes users of the item to use and discard it with desirable organic waste.

Section 18980.4. Responsible End Market Criteria

- We fully support the requirements of this section B. Biological decomposition considers both the disintegration and biodegradation requirements found in the ASTM D6400 marketing standards. For composters to operate as responsible end markets, they cannot have partially decomposed materials as residue in their finished products, within about 90 days from the time they enter active composting.
- typo: inadvertently
- Fiber and paper substrates cannot be held to the same standards as plastics. while plastics will fully biologically decompose, paper and fiber products contain lignins and cellulosic materials that will not fully biodegrade within the compost production cycle (or within 180 days). Composters cannot be required to manage compostable materials in a manner that extends the processing window beyond a reasonable timeframe. Additionally, they must be able to screen out some of the larger pieces of residual paper and fiber to move materials to market in a condition which is saleable. No composters will want to be responsible end markets if they cannot have the ability to manage covered materials in the same manner as other compost feedstocks.
- We disagree that composting facilities are truly an "end market"; they are nearly always an intermediate processor who moves materials to agricultural, landscaping, fire remediation and erosion control "end markets".

Response to O-74-1

Comment partially and partially rejected. Regarding section 18980.2, the commenter states, "[w]e fully support a very narrow interpretation for what may be categorically excluded." It is unclear whether the commenter is expressing support for the proposed regulation as written or recommends that the proposed regulations are not narrow enough. No response is required to comments merely expressing support.

If the commenter intended to suggest that the regulations be narrowed, the only specific recommendation is that exclusions should only apply to covered materials "explicitly identified in statute and corresponding federal regulations, where the packaging is clearly specified to meet standards for the primary packaging" and that "they should be required to request an exemption and provide detailed reasoning for justification." The proposed regulations already require detailed justification for exclusions described in section 18980.2(a)(2). Limiting regulations to concern only packaging "explicitly identified in statute and corresponding federal regulations" is untenable because it is not clear what it means for a statute or regulation to "explicitly identify" packaging; the scope of statutes and regulations typically rely on defined categories of things, not identification of every discrete thing to which they might apply. Also, no application or submission can be required for packaging for products listed in Public Resources Code section 42041(e)(2) because those products are by definition not "covered material." Regarding the implied suggestion that exclusions should only apply to primary packaging, CalRecycle rejects that suggestion for the reasons provided in response to I-59-2 and O-33-6. To the extent the commenter intended to suggest that the exemptions described in section 18980.2.4 are sufficient to address issues related to food and agricultural packaging and conflicts with federal law, CalRecycle rejects that suggestion for the reasons provided in response to comment I-59-2.

CalRecycle accepts this comment with regard to food and agricultural packaging, however, to the extent it alleges that section 18980.2(a)(2) was unclear in scope or effect, was insufficiently clear with regard to what renders it "not reasonably possible" to resolve conflicts with federal laws, or would have been overbroad in effect due to the potential for the exclusion to be applied despite the conflicts being avoidable. See CalRecycle's response to comment I-19-1, explaining the revisions responsive to this and similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

To the extent this comment generally objects to the breadth of exclusions described in section 18980.2, CalRecycle rejects that objection for the reasons provided in responses to comments O-13-3, O-13-6, I-19-1, I-59-2, O-93-9, O-90-2, O-90-3, and B-47-3.

Regarding section 18980.3.3, "desirable organic waste" is an express term in statute and is mentioned in that section (18980.3.3(c)(5)), which clarifies application of the term with respect to the concept of items "designed to be associated with the recovery of desirable organic waste." CalRecycle rejects the commenters suggestion for the reasons provided in response to comment O-63-8.

Regarding the objection to considering composting facilities end markets, CalRecycle rejects that objection because the statute (Public Resources Code section 42041(aa)(1) expressly states that compost is an output of "recycling," not an intermediate product in a broader recycling process. The settings that the commenter contends are "end markets" are end uses of that output, not materials recovery settings (see Public Resources Code section 42041(ad), defining "responsible end market").

O-75: Californians Against Waste, Coalition of Stakeholders Signed on (Tony Hackett)

Comment O-75-1

On behalf of a diverse coalition of advocates who have been engaged in the SB 54 rulemaking process in its entirety, we write to share our persisting concerns about the language as written. Given the unprecedented scale and complexity of this task, SB 54 presents a generational opportunity to transform how packaging is designed, collected, and recovered, and we are optimistic that CalRecycle will continue to work with diligence in moving this process forward. That said, we are deeply concerned that the current draft regulations fail to incorporate or meaningfully respond to the substantive feedback we and many others provided throughout earlier workshops and comment periods. By disregarding critical recommendations from local governments, recyclers, and environmental advocates, CalRecycle risks weakening the enforceability and effectiveness of SB 54, as well as failing to fulfill its statutory obligations. These omissions threaten to undermine the core intent of the law—holding producers accountable, ensuring program transparency, and driving the systemic changes needed to reduce plastic waste and pollution.

CalRecycle cannot afford to squander this crucial moment. Our comments detail unresolved issues that have not been adequately addressed despite multiple iterations of draft regulatory text and public comment periods. Specifically, our major areas of concern revolve around allowable recycling technologies, the creation of unnecessary exemptions and loopholes, and the need for public transparency in data for deliberative decision-making. Each of these areas is foundational to the success of the overall program.

Also included here are suggestions (‘Attachment 1’) for the Department to issue a ‘Frequently Asked Questions’ plain-language resource that provides clarity on the

recurring questions surrounding implementation. We look forward to working with you to resolve these concerns.

Response to O-75-1

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process. To the extent other portions of the submission do suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-75-2

Article II: Covered Material and Covered Material Categories

Categorically Excluded Materials (§18980.2.) Must Include Mandatory Sunset, Narrowing of Pathway to Exclusion's Scope

FDA/USDA Exclusions Risk Swallowing Covered Materials

The revised draft regulations improve upon prior versions by requiring that packaging excluded under § 18980.2(a)(2) must be those for which it is not reasonably possible to use packaging that also complies with USDA or FDA rules or regulations. The regulations also establish a process where producers must submit the basis of their claim to CalRecycle, which will maintain a public database of exclusions. However, while this clarification narrows the earlier overbroad exemption, the provision still risks sweeping in far more materials than intended by statute.

The reliance on "guidelines"1 as a basis for categorical exclusions is fundamentally flawed, because guidelines do not constitute law. This vagueness creates a boundless loophole where any informal memorandum, nonbinding policy, informal rule, or voluntary guidance document could be weaponized to exempt entire classes of packaging from SB 54's requirements.

As drafted, this section could allow entire categories of food and agricultural packaging to be excluded simply because producers claim it is not "reasonably possible" to use compliant alternatives. Many of these packaging types already have recyclable or compostable options in practice and at scale.

We therefore urge CalRecycle to revise this section to:

- Require producers seeking such exclusions to provide detailed, verifiable justification subject to public notice and comment. Public deliberation on these exemptions/exclusions is a crucial tool in enabling adequate oversight of often opaque regulatory processes.
- Ensure that packaging with available recyclable or compostable alternatives cannot be categorically excluded simply because industry claims such alternatives are inconvenient or less profitable.

- Without these changes, the FDA/USDA exclusion risks creating a loophole large enough to exempt the majority of food packaging—undercutting the recyclability and source reduction objectives at the heart of SB 54.

Exclusions Must Have A Prescribed Sunset
When exclusions are granted, they should also be time-bound in the same way that exemptions are treated. The way that the current regulations are written would give producers *carte blanche* to find a permanent way out of the program, locking in current polluting packaging technologies and stifling future innovation. By having a process where they are forced to reapply for said exclusion, producers would be forced to reconsider alternatives on a continuous basis, rather than having an open invitation for indefinite use of their current packaging formats.

Response to O-75-2

Comment partially rejected and partially accepted. CalRecycle rejects the suggestion to subject exclusions under section 18980.2(a)(2) to a public notice and comment process for the reasons provided in response to comment O-111-2. Regarding the suggestion for a "prescribed sunset," CalRecycle rejects that suggestion for the reasons provided in response to comment I-59-2, which also suggests a time limitation for exclusions. CalRecycle otherwise accepts this comment and has revised section 18980.2(a)(2) to address the concerns raised. See CalRecycle's response to comment I-19-1, explaining the revisions responsive to this and similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

Comment O-75-3

Exclusion of Reusable and Refillable Packaging and Food Service Ware (§18980.2.1): Reuse and Refill Standards Regressed and Became Far Too Lax

Lack of Product Standard Floor Might Enable a New ‘Thicker Plastic Bags’ Problem

Throughout this section, language that was once perhaps too lofty in its requirements has now been gutted to no longer include any quantifiable thresholds for measuring performance and defining “reusable and refillable.2” While we don’t have our own perfect solution to offer, it is worth mentioning that recent historical precedent of the ‘Thicker Plastic Bag Problem’ underscores the need for some degree of clearly identifiable enforcement criteria lest packaging manufacturers just race to the bottom.

Following the passage of SB 270 and Proposition 67, California retailers were permitted to offer only reusable plastic bags that met minimum durability standards. These standards were soon found to be far too weak, unintentionally allowing producers to use

plastic bags as long as they were of slightly thicker plastic rather than switch to more sustainable alternatives as was intended.

The thicker bag problem should be a warning: if SB 54 permits minimal or nominal reuse claims, without rigorous criteria for refill infrastructure, number-of-use thresholds, collection systems, and post-consumer accountability, it risks replicating this failure at scale across packaging types; with the opposite legislative intent adding to, and not reducing, California's single-use disposable waste problem

This regulation is far broader in scope, so there are many more opportunities for disingenuous "reuse" designed to skirt the fees and recyclability requirements of the law. To avoid the repeat of this unintended consequence, CalRecycle must:

- Adopt stricter, performance-based definitions for reusable packaging, informed by lifecycle data and enforcement capacity.
- For consumer good packaging, producers should be required to submit verified reuse/refill take-back data as a condition of maintaining reuse/refill status. The PRO plan should also identify a clear strategy for quantifying the amount of reusable and refillable packaging that is actually reused, as well as outlining steps that the PRO is implementing to maximize these numbers (including through deposits or other incentives).
- Packaging cannot be considered reusable if it doesn't realistically get collected and reused, and the label should reflect that.
- CalRecycle should also establish a process for adopting third-party certification requirements when they become available.

Response to O-75-3

CalRecycle rejects this comment. First, section 18980.2.1(the proposed regulations contain performance-based requirements for producer-refill systems, which must use systematic means to ensure items cycle through the supply chain multiple times. The statute does not authorize stricter performance requirements; instead, the statute relies on infrastructure, design and marketing, and durability requirements to ensure that items will be reused. Second, regarding the proposed requirement that "producers be required to submit . . . data as a condition of maintaining reuse/refill status," that proposal is legally untenable because reusable items are not "covered material," so there is no "producer" of them required to participate in a PRO plan. Instead, section 18980.2.1(a)(1)(A) and (b) establish that CalRecycle may pursue enforcement against any person that is a "producer" notwithstanding that person's claim that they are not a producer, and such a person will have the burden of rebutting CalRecycle's evidence that their items are not reusable or refillable. Regarding the suggestion of a "realistically get collected and reused" requirement, the criteria imposed under Public Resources Code section 42041(af) reflect the Legislature's intent that items meeting those criteria clear that threshold.

Regarding adoption of third-party certification requirement, imposing such a requirement would exceed CalRecycle's authority, which does not include adding independent criteria to those enumerated in 42041(af). CalRecycle's responses to comments B-6-2, O-104-8, and B-38-3 further support rejection of the commenter's proposals.

Comment O-75-4

Exclusion of Certain Types of Packaging (§18980.2.2): Definitional Criteria and Public Process.

Expand Scope of Considerations Beyond Singularly on Process of Composting when Evaluating *de minimis* Exemptions

Today's regulatory language evaluates *de minimis* considerations in part on the basis of if a component or group of components makes "*recycling or composting more difficult* pursuant to subdivision (h) of section 18980.6.7.3." This language specifically focuses on the ease of composting rather than on whether there is a contamination-free, quality end product. This language is unnecessarily problematic in previously unanticipated ways. For instance, a plastic liner or coating on a foodservice ware item wouldn't *necessarily* affect the composting process directly, but it would contribute to microplastic pollution in soils and be an undesirable contaminant in the end product. This example and others like it represent an opportunity to open the floodgates to allowing unlimited product contaminants as long as they don't pose a risk to the general ease of composting. As such, we suggest that language be revised to widen the scope of scrutiny across multiple categories of potential impact, from process to product, ultimately to ensure uncontaminated soil that can be used with confidence on California commercial crops and in residents' community and home gardens

Response to O-75-4

CalRecycle rejects this comment because the proposed regulation, contrary to the commenter's assertion, already "widen[s] the scope of scrutiny across multiple categories of potential impact." The commenter even concedes that the "de minimis considerations" are only "in part" based on whether components make "recycling or composting more difficult." Despite that acknowledgment, the commenter goes on to claim that the proposed regulations render it sufficient that components "don't pose a risk to the general ease of composting." To the contrary, subparagraph (E) of section 18980.2.2(b)(2) addresses the concerns the commenter raises.

Comment O-75-5

Vague and Insufficient Definitional Criteria for Eligibility Need Further Detail

We remain deeply concerned that the proposed de minimis exemption is drafted in a way that continues to lack enforceable thresholds and opens the door to abuse. While the new text introduces a definition of "independent plastic component" and lays out a

multi-factor test for whether a component is of *de minimis* weight or volume, the operative standards remain vague and subjective.

One major loophole is in the definition of an Independent Plastic Component. The new definition excludes coatings, films, stickers, and labels from being considered “independent plastic components.” This could allow producers to continue using problematic films, foils, shrink labels, and barrier coatings while arguing they are *de minimis* because they are not separately detachable and thus ‘independent components4.’ These are precisely the materials that routinely contaminate MRF streams and frustrate recyclability and compostability, directly undermining the statutory requirement in PRC § 42050(b) that packaging be recyclable or compostable in practice and at scale.

The impact is the creation of a perverse incentive to deliberately fragment packaging into ‘non-countable’ subcomponents to strategically fall below the *de minimis* threshold. This risks creating a perverse incentive for packaging design to evolve toward more hidden plastics—small films, detachable liners, and coatings—that erode source reduction and recyclability goals, and frustrate the intent of the law.

While we recognize the need to exempt incidental elements not associated with harm to the environment or human health, the current proposal does not contain the necessary specificity to prevent abuse by ensuring these crucial parameters are respected. By removing objective criteria (such as the prohibition on chemical or thermal separation) and relying on vague, discretionary standards, the draft risks opening a backdoor for widespread noncompliance. Unless clarified, the *de minimis* provision may encourage a “race to the bottom” in packaging design, contrary to both the intent and the express requirements of SB 54.

Response to O-75-5

Comment rejected. The commenter impliedly recommends "objective criteria" and requests that 18980.2.2(b) be "clarified," but, except as discussed below, offers no particular proposals, so no further response is possible.
The commenter's objection to the definition of "independent plastic component" ignores the plain meaning of "independent." For example, a coating is not a discrete thing that can be removed from its substrate, so it cannot reasonably be called "independent" from that substrate. The commenter's concern is also overstated: Just because the materials of concern may not be "independent plastic components" does not mean that they are of de minimis weight or volume. To the contrary, materials presenting the problems that the commenter identifies would not satisfy the other criteria in 18980.2.2(b)(2). Similarly, components that experience chemical or thermal separation would present problems that would likely disqualify them from being considered de minimis. In other words, the criteria have the effect the commenter desires.

Comment O-75-6

Procedural Transparency Should Be Obligatory

The current version permits producers or PROs to submit exemption requests for de minimis designation with no clear public notice, stakeholder input, or third-party review process. Even with the Department's intent to publish approved components online and have other documents available under Public Records Act requirements5, the regulations lack data transparency that is communicated to the public outside of the Department as an intermediary filter. To promote transparency and fairness, all exemptions must be handled through an open process with input from both the advisory committee and members of the public.

Response to O-75-6

Comment rejected. Handling all exemptions through an "open process with input from both the advisory committee and members of the public" would results in a process that could not be administered with the timeliness reasonably necessary for program implementation and for regulated entities' compliance obligations to reflect the practical realities that the de minimis and other exclusions were intended to accommodate.

Comment O-75-7

Exemptions for Certain Covered Materials (§18980.2.4): The Exemption Application process must include public deliberation.

Exemption Process Should Immediately Be Public Record

The proposed exemption process for packaging based on "unique challenges for compliance6" doesn't have any requirement that decisions be made in an open forum with input from the public. Despite subsection (d) of 18980.2.4 proclaiming that applications are "public documents subject to mandatory disclosure under the California Public Records Act7," there is no mandated transparency in the regulations, and is instead reliant on the public requesting data. Given the wide range of possible applications, it is imperative that any proposed exemption only be granted with public input. Our recommendations for public deliberation include the following:

- The Department should only adopt exemptions at a duly-noticed public meeting, including, but not limited to, the monthly public meeting, after providing an opportunity for public comment.
- Additionally, adoption of any exemptions should become part of the public record, such that individuals can confirm which material exemptions are relevant and up to date.
- A component of information required for potential exemptions should be the type of recycling/processing used, such that communities disproportionately affected by certain technologies (contrary to the express intent of the legislation) have access to meaningfully engaging in the public deliberation process.

Response to O-75-7

Comment rejected. The public process described by the commenter would be impractical and would result in CalRecycle being unable to consider all exemption requests within a reasonable time. The proposed regulations appropriately mitigate the risk of CalRecycle granting undesirable or unjustified exemptions by requiring extensive justification and limiting the duration of exemptions. See, also, response to comment O-45-5.

Comment O-75-8

Article III: Evaluation of Covered Material and Covered Material Categories

Recyclability (§18980.3.): Audit requirements should be strengthened to avoid oversimplification.

Audits must be randomized and representative of the entire supply chain; must be strong enough to ensure compliance.

The regulations currently require annual audits of two intermediate supply chain entities and two end markets8 when evaluating participant producer compliance. It is unclear if two of each type of facility will be sufficient for a given material type, and a better approach might be to use percentages, along with a framework similar to that established in the SB 1383 Route Review requirements (Cal. Code Regs. tit. 14 § 18995.1), which requires jurisdictions to "have an inspection and enforcement program that is designed to ensure overall compliance with this chapter." Additionally, a percentage-based approach would make more sense than a static number to ensure that audits sufficiently evaluate compliance with the regulations and represent different strata of the market chain itself. For instance, the regulations could require "visits to intermediate supply chain entities and markets that, respectively, collect, process, or recycle 75% of the material under investigation." Having a flexible, percentage-based approach would ensure greater compliance and more certainty with regard to intermediate supply chain entities and end-markets that are fully responsible and receiving just scrutiny.

Response to O-75-8

Comment rejected. The suggestion to add a provision expressly requiring an "overall compliance with this chapter" requirement is unnecessary because the proposed regulations already have the effect that such a change would have: 18980.3(f)(1)(C) states minimum conditions that must be met (including the numbers of visits required to certain entities), but the overarching express requirement is that audits and investigations must "ensure that the covered materials . . . continue to meet the requirements [pursuant to section 42355.51(d)(4) or (5)]." Regarding a percentage-based approach, that change would not necessarily add flexibility, but rather would change the nature of the minimum conditions that the PRO must meet. CalRecycle declines to take that approach because it would not necessarily improve the calibration between the

scope of conducting audits and investigations and the proof required to reasonably verify compliance.

Comment O-75-9

Independent Third-Party Validation of Postconsumer Recycled Content (§18980.3.4): PCR content calculations must explicitly prohibit the use of mass balance credit methods.

The incorporation of real postconsumer recycled content into products can be a powerful tool to stimulate the demand and usage of recycled materials, creating a financial incentive to increase the recovery of these materials and reducing the dependence on virgin natural resources. It is for this reason that SB 54 encourages producers to use postconsumer recycled content in covered material.

Producers, in California and elsewhere, have argued for the use of mass balance credit methods to be allowed as part of recycled content accounting. If such methods are allowed, this would undermine the effectiveness of SB 54 since mass balance credit methods enable producers to use virgin materials, which are labeled/certified as "recycled" and then claim that they are incorporating recycled content. In some cases, these credit methods can skirt the intent of SB 54 and allow plastic to be turned into fuel to create fake recycled content credits, which are then assigned to virgin plastic. Mass balance credit methods are deceptive and should explicitly not be allowed in the SB 54 regulations since they will incentivize greenwashing rather than real recycling and recycled content.

Response to O-75-9

Comment rejected. It is unnecessary to single out and prohibit any particular method of accounting for recycled content because the evaluation required under 19880.3.4(b)(4) already enables CalRecycle to consider flaws like the ones the commenter identifies with so-called "mass balance credit methods." In particular, (b)(4)(A) requires a showing that any alternative to the Association of Plastic Recyclers (APR) certification program will adhere to standards at least as stringent as does that program and provide more consistent and accurate assessments of recycled content.

Comment O-75-10

Article IV: Responsible End Markets

End Market Identification (§18980.4.1): Provisions around recycling technologies are dangerous, inconsistent with statutory requirements, and antithetical to legislative intent

Approval of Non-Mechanical Recycling Technologies

Minimum Performance: 'Management…in compliance with a Permit'9

Section 18980.4.1(d)(B), when considered in conjunction with the rest of Section 18980.4.1(d), indicates that chemical recycling facilities generating hazardous waste that is produced and disposed of in "compliance with an applicable permit10" are allowable under the regulations, disqualifying them as generating "significant amounts of hazardous waste." This means that these technologies are effectively automatically allowed under the regulations, no matter how much hazardous waste is produced, since the litmus test for approval is solely 'substantial compliance' with a permit they would have needed to obtain in order to operate anyway. In effect, this creates a legally tautological requirement under which no amount of hazardous waste would be considered "significant."

By construing the hazardous waste provision in a manner that largely nullifies its operative force, the Department renders the Legislature's deliberate choice of language null and void, contrary to the presumption that each word in a statute serves a purpose. The proposed interpretation contravenes the surplusage canon11, a settled principle of statutory construction which requires that effect be given to every word and clause enacted by the Legislature, such that no portion of the statute is rendered redundant, inoperative, or devoid of meaning.

Additionally, compliance with applicable permits may vary by jurisdiction, making enforcement difficult or impossible. Per Section 18980.4.1(d)(B), compliance with permitting may be different in different jurisdictions, and this provision applies to end markets, which may be outside California. This would impose unequal requirements for the same technology in different jurisdictions for meeting a California requirement focused on the amount of hazardous waste generated. Accordingly, this would exacerbate historic waste colonialism by encouraging the siting of polluting technologies in the parts of the U.S. and the world with the fewest environmental protections.

Insufficient Evaluatory Metrics/Criteria

Conflation of Risk and Amount

The definition of "significant amounts of hazardous waste" in Section 18980.4.1(d)(1)12 and Section 18980.4.1 (d) (B)13 is problematic. SB54 language refers to the amount of hazardous waste, not the "risk" associated with it, and these are clearly different standards. The proposed regulatory framework in this regard is also clearly and critically at odds with the SB 54 statute.

As mentioned in the letter submitted to the Governor on behalf of a myriad of legislators14, this unlawfully shifts the standard from the production of hazardous waste (as required by the statute) to its management, which directly conflicts with the legislative intent to exclude technologies based on the generation, not governance, of hazardous waste.

Weakness in Defining 'Hazardous Waste' - Federal vs. State15

The regulations reference the federal definition of hazardous waste, and not the California state definition, which is far more protective of public health and the environment. Use of the weaker federal definition problematically opens the door to the generation of hazardous wastes that are not considered federally hazardous but should otherwise be considered 'California Hazardous.' This includes more protective toxicity tests, lower thresholds for heavy metals (e.g., lead, copper, zinc), lower thresholds for ignitability, lower thresholds for reactivity and corrosion, and prohibitions on certain chemical products and pharmaceuticals.

Section 25117 of the California Health and Safety Code clearly states that "hazardous waste" means "a waste that meets any of the criteria for the identification of a hazardous waste adopted by the department pursuant to Section 25141."

The legislature has repeatedly stated, and the courts have upheld, that "it is in the interest of the health and safety of all Californians...to establish a regulatory program that is more stringent than federal law" (Health & Safety Code 25100) when it comes to hazardous waste. In the absence of other statutory direction, the Department must default to California statutory and regulatory definitions when implementing state laws, like SB 54.

Divergence from Department Precedent on Definition of 'Hazardous Waste'

CalRecycle's proposal to rely on the federal RCRA definition16 of "regulated hazardous waste" (40 CFR part 261) for SB 54 implementation is inconsistent with how CalRecycle and its partner boards define and use "hazardous waste" elsewhere in Title 14 and Title 27 of the California Code of Regulations, where the agency repeatedly anchors to DTSC's California definition in Health & Safety Code § 25117 and Title 22, Division 4.5. For example, Title 27's joint CalRecycle/SWRCB technical definitions make "hazardous waste" expressly coextensive with Title 22 ("any waste which, under … Title 22 … is required to be managed according to Division 4.5 of Title 22"), and ties "hazardous constituent" to Title 22 Chapter 11/Appendix VIII, not federal RCRA alone.

In Title 14, CalRecycle's Household Hazardous Waste definitions incorporate HSC § 25117 by reference for "Hazardous Waste," and multiple construction & demolition/inert debris provisions exclude materials that are "hazardous waste as defined in Title 22, § 66261.3 et seq.," again deferring to California's state definition rather than importing federal RCRA scope.

Using the federal definition in SB 54—where the rest of CalRecycle's solid-waste framework consistently points to California's existing definitions—creates an unnecessary and incongruent departure from agency precedent and risks narrowing California's protective coverage for hazardous characteristics that are broader under state law.

For instance, some illustrative examples where CalRecycle regulations rely on existing California definitions for Hazardous Waste rather than RCRA definitions:

- 27 CCR § 20164 (Technical Definitions): “Hazardous waste” means any waste required to be managed under Title 22, Div. 4.5; “hazardous constituent” cross-references Title 22, Ch. 11/App. VIII; “regulated hazardous waste” points to § 66260.10 (Title 22).
- 14 CCR § 18502 (HHW Definitions): “Hazardous Waste (HW)” incorporates HSC § 25117 (DTSC’s statutory definition) within CalRecycle’s HHW program definitions.
- 14 CCR § 17225.32 (Minimum Standards—Definitions): “Hazardous Wastes” expressly tethered to HSC § 25117 and related California definitions.
- 14 CCR §§ 17381, 17388 (C&D/Inert Debris): “Inert debris” may **not contain hazardous waste as defined in Title 22, § 66261.3 et seq.—an explicit reliance on DTSC’s regulatory definition.

Because CalRecycle’s own rules overwhelmingly anchor “hazardous waste” to the state’s existing Title 22/HSC § 25117 framework, importing the federal definition for SB 54 is incongruent with CalRecycle’s established regulatory practice.

Reference to Inappropriate ISO Standards17

ISO 59014:202418 does not define 'recycling,' nor does it establish criteria relevant to environmental safety, GHG emissions, or human health. Its focus on material tracking and internal process management is wholly insufficient to serve as a proxy for SB 54’s environmental justice and pollution minimization mandates. Referencing ISO 59014 misleads stakeholders into believing it aligns with California's goals when it demonstrably does not.

Staff comments during the workshop indicate that this ISO standard is intended to be a proxy for the requirement that “the department’s regulations shall encourage recycling that minimizes generation of hazardous waste, generation of greenhouse gases, environmental impacts, environmental justice impacts, and public health impacts.” ISO 59014:2024 does not address (or even reference) the majority of these criteria.

Furthermore, the aforementioned ISO standard does not even define recycling at all, let alone in line with the statutory definition of recycling, nor does it include a single environmental or efficiency benchmark to distinguish legitimate recycling operations from fraudulent, toxic, and climate-harming operations. Instead, the ISO proposes soft, optional, qualitative guidelines for material recovery operators to standardize their operations from a labor and circular economy aspect (e.g., recommendations on types of data to collect, and on types of policies to include) and is a purely non-binding standard.

In fact, unlike California law, this ISO standard does not consider energy recovery a form of disposal and promotes the use of a very narrow Life Cycle Analysis, which ignores issues around toxics and human health concerns and environmental pollution.

Infrequently Reported Facility Level Information

The proposed regulations still allow PROs and Independent Producers to approve non-mechanical recycling technologies, including so-called “chemical recycling,” with CalRecycle review. Facilities must now submit information on throughput and hazardous waste generation (§ 18980.4.1(d)(4)19), but this requirement is tied only to initial reporting. A facility could easily demonstrate minimal hazardous waste at pilot scale, secure approval, and then expand operations or shift feedstocks to produce significant hazardous waste without triggering a new review. The definition of “significant amounts of hazardous waste” is narrowed to weaker federal standards, and the prior requirement to evaluate risks against mechanical recycling baselines has been removed.

This structure undermines both transparency and accountability, while violating the legislative intent of SB 54. Although records submitted to CalRecycle are nominally subject to the Public Records Act, large portions can be withheld as trade secrets, leaving the public in the dark on hazardous waste, costs, and climate impacts. To prevent abuse, the regulations must explicitly require facilities to re-enter the approval process when scaling up, changing or adding technologies, or processing new covered materials. They must also restore comparative evaluation against mechanical recycling and ensure that hazardous waste and whole-lifecycle climate impact data, including the significant climate footprint from the production and management of solvents used in recycling operations,20 are publicly accessible. Without these safeguards, the rules risk enabling unproven or polluting “chemical recycling” projects under the guise of compliance, in direct conflict with the intent of SB 54.

Language Should Reflect Unequivocal Prohibition on Chemical Recycling

Leaving the approval of recycling technologies solely to the discretion of the Producer Responsibility Organization (PRO)—as currently permitted under the draft regulations—undermines the objectivity, transparency, and environmental rigor required by SB 54. The PRO, by design, is a producer-led entity with a fiduciary and operational interest in minimizing compliance costs for its members. Granting the PRO unilateral authority to determine which technologies qualify as "recycling" creates an inherent conflict of interest that threatens to weaken the law’s core requirements.

Under Public Resources Code § 42051.1, CalRecycle is directed to ensure that packaging is recyclable in practice and at scale. That determination must be grounded in science, operational evidence, and public accountability—not left to an industry-governed body with incentives to greenlight technologies that may have questionable environmental outcomes, such as pyrolysis, gasification, solvolysis, solvent-based technologies, and similar technologies , so long as they are good for their members’ bottom line

To safeguard SB 54's credibility and intent, all recycling technology approvals must be subject to final CalRecycle review, with decisions made during publicly noticed monthly meetings, after:

- Meaningful public comment;
- Technical vetting by independent experts; and
- Clear findings regarding environmental safety, yield efficiency, and alignment with California's waste hierarchy.

This public, science-based process built into the statute ensures that "recycling" maintains its integrity, avoids regulatory capture, and reflects the law's intent to advance genuine circularity, not just a green-washed chemical conversion or incineration masquerading as recycling. The baseline for a process like this should be overseen by the regulatory agency, not by the companies and industry via the PRO.

Furthermore, CalRecycle must defer to the legislative history reflected in both Senate and Assembly analyses and Senator Allen's21 unambiguous statement when answering future queries on whether waste-to-energy and related technologies constitute recycling under SB 54.

Response to O-75-10

CalRecycle rejects this comment for the reasons provided in responses to comments O-62-1 and O-90-15. Also, regarding the commenter's reference to statements by a legislator after the Legislature voted on SB 54, it is legally proper for CalRecycle to look to legislative history when interpreting a statute, but any statements made after the Legislature's vote on a bill cannot be "legislative history."

Comment O-75-11
End Market 'Viability' is Ignored

While the regulations refer to a "viable responsible end market" as a responsible end market that is feasible and capable of being economically successful, there are no clear criteria for "viability" – especially given the viability requirement is only mentioned one time in the entire draft regulatory text. The regulations must be amended to require a company proposing a new recycling end market to demonstrate a track record of viability at scale.

Manufacturers have pledged recyclability for the packaging for decades, often without anything to show for it. Recovering a material that has never been effectively recycled is not "viable," and this needs to be explicitly addressed in the regulations to avoid intentional delay by packaging manufacturers that want to see material as long as possible, even when they know they will never hit the ultimate targets in the law.

The statute sets a clear baseline that should eliminate problematic material types *prima facie* if the market for recycling those materials is not sustainable or solvent. To this end, CalRecycle must provide further clarity on what a viable, responsible endmarket looks like relative to a non-viable one, as well as publish guidance about how the PRO should enhance or expand access to new viable endmarkets.

Absent a functional definition of 'viable responsible endmarket' in statute or the regulations, it will be impossible for the Department or the PRO to ensure that covered material recycling is occurring in a way that prioritizes sustained investment into industries with a proven track record of success. We would urge the Department to also include a requirement for the end market technology to have successfully demonstrated a meaningful recovery rate in a comparable producer responsibility program. As such, viability and financial solvency are of utmost importance in ensuring that Responsible End Markets remain a core fixture of the PRO's planning efforts. Additionally, it should be noted that a system where each material producer is responsible for the cost of recycling that material is crucial to prevent "punishing" highly recyclable material producers by using their money paid to the PRO to cover the cost of recycling less recyclable covered materials. Building this stipulation into the PRO funding structure is essential to ensure the equitable treatment of producers. Similarly, eco-modulation should be differentially calculated based on material type and impact, and fees collected should similarly be directed to mitigate the impacts of each.

Response to O-75-11

CalRecycle rejects this comment. To the extent this comment recommends revising the proposed regulations to define and clarify the criteria for viability, see the response to comment O-71-5. Additionally, the proposed regulations are consistent with the requirements of the Act, including PRC sections 42051.1 and 42060, and no change is necessary to the implementation of the Act. Relevant statutory provisions, including, for instance, PRC section 42051.1(c)(1), already require a PRO to describe in its plan how it will meet the requirements of the Act, including how it will, in an economically efficient and practical manner, provide for the necessary infrastructure and viable responsible end markets to ensure the covered material will achieve the requirements of PRC section 42050. That plan will then be subject to review and approval by CalRecycle. Section 18980.4.3 of the proposed regulations implements these requirements by further clarifying the scope and extent of a PRO's responsibility to describe its financial investments in recycling infrastructure in its plan. Therefore, the proposed regulations strike an appropriate balance between extending the necessary discretion to the PRO in developing its financial investment strategy and offering clear guidance as to the requirements it must satisfy while reserving an opportunity for CalRecycle to review and approve a PRO's plan and budget.

To the extent this comment recommends requiring producers of covered material to be responsible for the cost of recycling that material, no change is necessary. PRC section 42053(d)(1) already requires a PRO to base producer fees on the costs to ensure each covered material category meets the requirements of the

Act. Indeed, that section explicitly provides that covered material that is easier and less expensive to recycle or compost or that is designed to be recycled into a similar covered material or a material that is easier to be composted shall be subject to lower fees. PRC section 42053(d)(2) similarly requires that the increased costs or difficulty of recycling specific covered materials be reflected in the fees for those materials. Section 18980.6.7, including section 18980.6.7(e), of the proposed regulations implements these requirements by specifying that the PRO must consider relevant factors, including data pertaining to recycling rates, in establishing base fee rates. Finally, both the Act and the proposed regulations, including PRC sections 42053(e) and (f) and sections 18980.6.7(d) and (f) of the proposed regulations, already ensure that eco-modulated fees will be structured based on material type and impact and will be collected to mitigate the impacts of each. Therefore, the proposed regulations are sufficient and no change is necessary.

Comment O-75-12

Responsible End Market Criteria (§18980.4.): Threshold for non-degraded fraction of compost is an impossible standard, must be reduced or eliminated

Full biological decomposition is an impossibility

The regulations require that “must fully biologically decompose22.” While the intent here is laudable, it is unlikely that even naturally occurring organic materials would meet a requirement for 100% degradation, especially within the same timeframe as other biologically degrading materials of diverse organic chemistry. With current technologies, setting the threshold at 100% makes this a nearly impossible standard to meet, and will result in the effective prohibition of ‘compostability’ as a compliance pathway under SB 54. We suggest using compliance with the applicable evolving and most up-to-date ASTM Standards as a proxy for ensuring the inherent degradability of covered materials. Specifically, making use of ASTM D6400 and D6868 would allow for congruency with other state and federal definitions of compostability.

Response to O-75-12

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42041(aa), 42041(ad), and 42060, and no change is necessary to the implementation of the Act. For the reasons identified in response to comment B-6-5, the distinct standard established by section 18980.4(a)(4)(B) is appropriate because it accounts for the particular environmental and public health risks presented by covered material partially or wholly comprising plastic. Moreover, CalRecycle rejects this comment to the extent it asserts that the standard of section 18980.4(a)(4)(B) is impossible. Section 18980.4(a)(4)(B) clearly provides that the requirement for full biological decomposition refers to the complete biodegradation and disintegration of the material under controlled composting conditions, resulting in its conversion to carbon dioxide, water, biomass, and inorganic compounds, with no visible, distinguishable, or toxic residues remaining after the composting

cycle. This requirement for full biological decomposition refers to the processes and scientific principles commonly understood to underlie the conversion of materials into compost. This is a reasonable and attainable standard that is tailored to the particular environmental and public health risks presented by the affected material type, consistent with PRC section 42041(ad). Therefore, no change to section 18980.4(a)(4)(B) is necessary.

Comment O-75-13

End Market Identification (§18980.4.1): Producer Data should be required to be submitted to CalRecycle in addition to the PRO

Submission of Producer Data to the Department should be Compulsory

The regulations propose that producers be required to produce compliance records to the Department "upon written request23". This is insufficient for proper regulatory oversight by the Department, the Advisory Committee, and members of the Public. It must be a requirement that these records are annually submitted to CalRecycle, without exception. Any data that is exempt from disclosure requirements should be provided to the public and the advisory committee in aggregated form, if applicable, with trade secrets redacted. However, it is not enough for the Department to only reactively request this data – instead, it should adopt a proactive approach of requiring this data annually and reviewing these submissions as frequently as needed.

Response to O-75-13

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42041(ad), 42051.1, 42060, and 42080, and the recommended change is not necessary to the implementation or enforcement of the Act. PRC sections 42051.1(c)(1) and (2) require a PRO to describe in its plan how it will meet the requirements of the Act, including how it will provide for the necessary infrastructure and viable responsible end markets to ensure the covered materials achieve the requirements of PRC section 42050, and how it will support and achieve the collection, processing, recycling, or composting of, and the development of viable responsible end markets for, covered materials to meet the requirements of the Act. Moreover, PRC section 42051.1(m)(4) requires a PRO to include in its plan record maintenance protocols sufficient to demonstrate whether each producer participating in the plan has complied with the requirements of the plan and the Act, including the requirement to ensure covered materials are recycled at responsible end markets satisfying the criteria of PRC section 42041(ad), for at least the previous three years. Additionally, PRC section 42080(a) authorizes CalRecycle to conduct investigations, including by inspecting operations, facilities, and records of producers and PROs, to determine whether entities are complying with the requirements of the Act. Section 18980.4.1(c) of the proposed regulations implements these requirements by requiring a PRO or Independent Producer to maintain records necessary to demonstrate that end markets satisfy the requirements to be considered a responsible end market for a minimum of

three years and to further provide such records to CalRecycle upon written request. The requirement of section 18980.4.1(c) ensures that CalRecycle can receive and review any record concerning a responsible end market that it considers necessary or relevant to carry out its enforcement obligations under the Act, while also avoiding any burdensome or costly requirements mandating the production of all records that are not relevant and do not otherwise facilitate CalRecycle's enforcement activities under the Act. By only requiring relevant records to be provided upon written request, section 18980.4.1(c) minimizes costs and administrative burdens for both the PRO and CalRecycle. The recommendation of this comment—i.e., to require the annual production and review of all records—would go beyond the requirements of the Act and would impose unnecessary expenses on the PRO and CalRecycle. The proposed regulations therefore strike an appropriate balance between providing CalRecycle with all necessary information to enforce the Act, protecting facilities' information to an appropriate extent, and minimizing costs in compliance with the requirements of the Act.

Comment O-75-14

Article VI: Requirements for the Producer Responsibility Organization

Eco-modulated Fee and Fee Schedule (§18980.6.7) Regulations Must Provide Greater Detail on How Malus Fees Should be Assigned to Covered Products Containing Toxic Chemicals

SB 54 requires fees for PRO participants and directs that the fees be adjusted with malus fees or credits, based on various delineated factors. CalRecycle's proposed regulations provide detail on several of these factors, with CalRecycle explaining that "[b]y presenting a list of items, further detailed below, this subsection clearly lays out requirements related to the fee, so that a PRO and participating producers can readily understand how the PRO must assess it." Similar detail is required for the factors specifying malus fees and credits related to the presence of toxic heavy metals or additives in plastic that can make recycling harder or embed toxics in the recycled plastics—these factors are not addressed in the regulations. CalRecycle should include provisions in the regulations that give greater specificity to what pathogens, heavy metals, or additives should result in credit or malus fee adjustments.

Response to O-75-14

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42053 and 42060, and the suggested change is not necessary to the implementation or enforcement of the Act. PRC section 42053(d) authorizes a PRO to structure the producer fee schedule as it deems necessary to ensure the requirements of the Act are met, and PRC section 42053(e) authorizes it to adjust those fees based on the factors set forth in that section. Consistent with PRC sections 42053(e)(8) and (9), the proposed regulations reserve the adjustment of fees based on the presence of toxic heavy metals, pathogens, or additives to the discretion of a PRO. This is

consistent with the overarching framework of the Act, which tasks a PRO with the responsibility to develop a plan and budget that is sufficient to meet the requirements of the Act. Section 18980.6.7(f) of the proposed regulations implements the statutory requirements by further providing that a PRO must include a justification along with any fee adjustment under PRC sections 42053(e)(8) and (9). CalRecycle will then have the opportunity to review and determine whether the proposed budget and producer fee schedule meet the requirements of sections 42053(d) and (e) under section 18980.6.2 of the proposed regulations. Therefore, the proposed regulations strike a balance between reserving the appropriate and necessary amount of discretion for the PRO to structure the producer fee schedule while maintaining sufficient opportunity for effective review and oversight by CalRecycle. No further change is necessary.

Comment O-75-15

The Department has one chance to implement SB 54 faithfully and in full alignment with the Legislature's intent. If the regulations fall short—by permitting "chemical recycling," allowing broad exemptions, or creating definitional loopholes —the credibility of the entire law will be jeopardized along with its effective implementation. Californians cannot afford a hollow framework that replicates past policy failures and shifts burdens back onto the public. We therefore urge CalRecycle to correct the serious deficiencies outlined in this letter and adopt a regulatory package that is clear, enforceable, and uncompromising in holding producers accountable. Getting this right is not optional; it is essential to the integrity of SB 54, the health of California's residents and iconic environment, and the state's leadership in solving the plastic pollution crisis. We also encourage the department to build our plain-language resources/guides (such as the Annotated FAQ Guide in Attachment #1) to create clarity and certainty before ambiguity invites unavoidable, necessary future litigation. Thank you for your consideration.

Response to O-75-15

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it reiterates the other portions of the submission without additional objections or suggestions. To the extent those other portions of the submission suggest changes or raise objections, CalRecycle has responded to them separately. Regarding the attachment referred to as "Annotated FAQ Guide," the attachment itself is included in the rulemaking record but does not require further response because it an example of a publication the commenter presents as an example of "plain-language" guidance, not as an objection or suggested change to the regulations. Furthermore, no change to the regulations is necessary for CalRecycle to publish a similar "frequently asked questions" document to assist the public in understanding the regulations and how to apply them.

O-76: Elizabeth Esquivel (Elizabeth Esquivel)

Comment O-76-1

Csilla Richmond
SB 54 Plastic Pollution Prevention & Packaging Producer Responsibility Act Permanent Regulations
Department of Resources Recycling and Recovery (CalRecycle)
1001 I Street, MS-24B
Sacramento, CA 95812-4025

RE: CMTA Comments – SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act Permanent Regulations

Dear Csilla Richmond:

On behalf of the California Manufacturers & Technology Association (CMTA), I appreciate the opportunity to submit the following comments regarding the proposed permanent regulations for the SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act ("Proposed Regulations"). While CMTA and its members appreciate efforts to address significant implementation issues and cost drivers associated with the Proposed Regulation, we remain concerned about the ability to implement them in a manner that will avoid significant compliance hurdles for producers and cost increases for consumers. The following comments seek to highlight the ongoing concerns and provide suggestions for addressing them in a more workable, cost-effective manner.

Response to O-76-1

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process. To the extent other portions of the submission do suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-76-2

Section 18980.1(a)(8) – Food Service Ware Definition

CMTA continues to be concerned that the current regulatory definition of "Food service ware" is unclear and will prompt retail producers not to report sales if there is a lack of clarity on which items are covered materials. By referring to the food service ware items as a "good" rather than a type of packaging associated with direct food contact, the definition removes the party filling/using the *"food service ware"* as the producer in (A). However, the definition under (B) refers to where the covered materials listed are used, which may obligate the party filling/using the food service ware. This approach creates ambiguity and inconsistency across covered materials and their obligated producer.

CMTA urges CalRecycle to provide greater clarity for compliance purposes and ensure consistency in implementation and enforcement.

Response to O-76-2

CalRecycle rejects this comment because it misinterprets the clear text of both the statute and the proposed regulations. The commenter suggests that food service ware is merely a subtype of packaging. That is an impossible statutory interpretation: Public Resources Code section 42041(e)(1) identifies two independently sufficient criteria for items to be "covered material," but the commenter's interpretation would collapse that into one (single-use packaging). Even worse, it is nonsensical to say that utensils, stirrers, and straws (each expressly identified as covered material in 42041(e)(1)(B)) are "packaging," and the commenter offers no explanation for that obvious mismatch in terms. The commenter suggests that the party "filling/using" food service ware should be the producer, which obviously was not the Legislature's intent: Every person that eats food would be a producer, as would every food truck, school cafeteria, and concession stand. The commenter is also mistaken that 42041(e)(1)(B) would draw in such parties as "producers." That subparagraph unambiguously identifies items as food service ware based on the characteristics of items themselves, so identification of the producer is not delayed until a person fills or uses them; the items are food service ware the moment they enter the supply chain in California, and there is a producer at that moment.

Comment O-76-3

Section 18980.1(a)(15) – Plastic Definition

CMTA also remains concerned that the regulatory definition of “plastic” under Section 18980.1.1 is overly broad and does not reflect how materials are recovered or how they move through the recycling system. The broad definition of “plastic,” which includes traditional plastics as well as coatings and adhesives, creates significant challenges for compliance and certification, especially for fiber-based materials. This broad scope complicates producers’ ability to accurately identify, separate, and report plastic content. The Proposed Regulations extend this definition to any component partially or fully made of plastic, unless contamination can be proven, further increasing producer responsibility. As a result, many fiber and paper products (e.g., paper packaging and food service ware) are likely to be erroneously classified as containing plastic.

To this end, CMTA recommends incorporating a weight-based or de minimis threshold within the definition of “nonplastic” or creating a separate definition for “partially made of plastic.” Establishing clear pathways for the PRO to develop and recommend de minimis standards or guidelines rather than fixing a rigid threshold in regulation.

Response to O-76-3

Comment rejected. CalRecycle rejects this comment for the reasons provided in response to comments B-30-2 and O-82-7

Comment O-76-4

Section 189.80.2.2(b) defines the criteria to meet the *de minimis* standard as “material that is part of or directly connected to packaging but is of de minimis weight or volume is not itself packaging for purposes of the act.” However, this section requires added clarity on how it applies to adhesives and coatings on packaging that are primarily composed of recycled materials.

Failure to include a specific *de minimis* threshold based on the percentage of the weight of the product or packaging could create barriers to sorting and aggregating products that are readily recyclable, if they are incorrectly included in the definition of “plastic.” Where there are industry standards on recyclability, the *de minimis* threshold in the definitions should align with those standards.

Response to O-76-4

Comment rejected. CalRecycle rejects this comment for the reasons provided in response to B-30-2 and O-82-7. Moreover, the criteria provided in section 18980.2.2(b) apply to all materials, including all adhesives and coatings, and the commenter does not explain how their application is unclear with respect to any adhesives and coatings or why being "primarily composed of recycled materials" would have special relevance.

Comment O-76-5

Section 18980.1(a)(17) & Section 18980.1.1 – Producer & Producer Identification

The current regulatory definition of “producer” and the Producer Identification framework lack sufficient specificity to ensure predictable and consistent assignment of responsibility in complex supply chains. The definition of “producer” and the identification of the obligated producer as provided in Section 18980.1.1 are also overly broad and do not adequately define which party is the producer in the first instance. As currently drafted, they do not provide clear, operational rules for assigning producer responsibility in real-world scenarios where multiple parties may be involved in manufacturing, branding, importing, or distributing a covered material. This ambiguity creates significant uncertainty for compliance planning and risks duplicative or inconsistent obligations across supply chain actors.

We recommend making the brand owner the producer in the first instance to provide clarity and certainty to the process. Under both (1)(c) and (d): *“The designated brand or trademark shall be one used with the goods when they are first sold or distributed or used with such initial sale or distribution, regardless of where such use occurs (…).* We agree with the Foodservice Packaging Institute that there needs to be certainty as to

where the obligation occurs: when covered materials are first sold or distributed or used.

Additionally, references to “most prominently used” trademarks in subdivision (e)(3) could lead to inconsistent interpretations. CMTA recommends empowering the PRO to establish standardized guidelines for determining brand or trademark prominence. Similarly, subdivision (e)(1), which applies to plastic food service ware, should include PROdeveloped guidance to clarify brand ownership and producer identification. Language in subdivision (c) referencing where covered materials are “first sold or distributed or used” should be clarified to ensure certainty regarding the point of obligation.

Response to O-76-5

CalRecycle rejects this comment. First, the comment incorrectly suggests that CalRecycle can change the definition of "producer" via regulation. Second, the commenter appears to misread 18980.1.1(c)(1) and (d)(1), which refer to the first sale or distribution of items for the purpose of identifying the relevant brand or trademark and only concerns identification of producers for purposes of Public Resources Code section 42041(w)(1) and (2). Third, to the greatest extent permitted under statute, the proposed regulation already achieves what the commenter recommends. The commenter requests that there be "certainty as to where the obligation occurs: when covered materials are first sold or distributed or used." When the owner or exclusive licensee of the brand used with the first sale or distribution (which necessarily must happen before a product is "used"), that is exactly the effect of 18980.1.1(c)(1) and (d)(1). However, when Public Resources Code section 42041(w)(3) applies because no producer can be assigned based on the brand, the statute cannot accommodate the commenter's suggestion. That provision unambiguously requires the producer to be identified based on sale or distribution within the state, which might not be the same as when covered materials are first sold or distributed anywhere.

With regard to the phrase "most prominently used," CalRecycle disagrees with the commenter's assertion. The nature of branding ensures that the use of one brand or group of brands will be readily apparent when that "use" is considered as described in 18980.1(a)(17)(E). Moreover, designating a single brand will not necessarily require comparison of multiple brands, even when there are multiple brands associated with a product at the end the supply chain; if there is only one brand used on the product initially or with the first sale or distribution of the product, then that brand would be the designated one, regardless of its prominence relative to the other brands. Lastly, section 18980.1.1(e)(5) provides ample flexibility for the PRO to coordinate with its members to establish voluntary guidelines (based on prominence or otherwise) for how the relevant brand owners should decide which brand to designate as the one relevant under PRC section 42041(w)(1) and (2). However, no statutory provision supports assigning the PRO ultimate authority over identification of a producer.

Comment O-76-6

We also agree that, as currently drafted, the producer identification framework for food service ware ((1)(d)) appears to have been adapted directly from the framework developed for other covered materials under (1)(c). However, in the context of those other covered materials, the term “manufacturer” typically refers to the entity placing the product inside the covered material. When this same language is applied to food service ware, it seems to shift the designation of “producer” to the manufacturer of the packaging itself, rather than to the brand owner associated with the food service ware. This shift introduces an inconsistency in how producer responsibility is defined and may not align with the legislative intent of SB 54.

Response to O-76-6

Comment rejected. The commenter appears to conflate "packaging" with "food service ware" ("it seems to shift the designation of 'producer' to the manufacturer of the packaging itself"). Even if the commenter meant to refer to the "manufacturer of the food service ware itself," its objection is meritless because the statute requires manufacturers to be producers when they are the brand owner or exclusive licensee and are in the state. It is unclear how the commenter draws a distinction between the manufacturer that owns the brand and whoever else the commenter describes as "the brand owner associated with the food service ware"; they are one and the same. Even so, if the commenter intended to assert that the designated brand (and thus the brand owner identified as producer) should always be the food- or food service-related brand used on the food service ware when it is manufactured or first sold or distributed, that is the outcome guaranteed under 18980.1.1(d)(1) and (e)(1). The food- or food-service-related brand would be designated regardless of any role the manufacturer's brand or trademark has in the supply chain.

Comment O-76-7

In addition, in 18980.1.1(c), the statement “the person who manufactured the goods is the producer, provided that the person is in the state and either owns the designated brand or trademark or is licensed to manufacture the goods” creates confusion for many supply chains as to which party “manufactured” the goods. The regulations need to provide clarity to assign producer responsibility in the first instance based on real application in complex supply chains.

Response to O-76-7

Comment rejected. Without explanation, the commenter asserts that the reference to "the person who manufactured the goods" creates confusion. In any event, the "person who manufactures" is the phrase used in statute—the proposed regulation does not introduce confusion—and the verb "manufacture" has a plain, readily understood meaning.

Comment O-76-8

Additionally, the “most prominently used” standard in subdivision (e)(3) for identifying obligated brands or trademarks could lead to inconsistent interpretations. The brand owner is the party unless there is an exclusive licensee in California for the brand. To address this, it may be preferrable to grant the PRO the authority to develop standardized guidelines for determining brand or trademark prominence. Similarly, in subdivision (e)(1), which addresses food service ware (plastic food service ware), the PRO should be empowered to provide clear guidance on identifying the appropriate brand owner.

Response to O-76-8

CalRecycle rejects this comment for the reasons provided in responses to comments O-76-5 and O-55-1.

Comment O-76-9

Section 18980.1. and Section 18980.3. – Detachable Components

CMTA is concerned with additional language that was added to subparagraph (ii) of subparagraph (C) of paragraph (4) of subdivision (a) of Section 18980.1 to specify that a “detachable component” is defined by certain characteristics “regardless of whether the component is discarded attached to the other components.” Notably, this language conflicts with the Association of Plastic Recyclers’ (APR) Design Guide, which recommends leaving plastic caps on bottles and containers when recycling. As you may know, APR’s Design Guide recommends caps be attached to packaging prior to disposal because it dramatically improves recovery of these materials in the recycling stream; if caps were separated prior to disposal, they are much more likely to be lost in the sortation process. When caps are attached, material recovery facilities process and recover the caps along with the bottles, eventually sorting out and recovering differing material types where necessary through additional processing steps. The cap material is typically recyclable high-density polyethylene (HDPE) or polypropylene (PP) plastic, for which recycling collection and processing technology has improved, so reattaching caps to bottles prior to disposal optimizes recovery.

Further, consumers are urged to keep the cap on beverage containers subject to California’s Beverage Container Recycling Program for exactly these reasons. In this regard, it is unclear why it would be acceptable for beverage containers that are not in scope for this Proposed Regulation but not other types of packaging. Notably, 82.4% of California consumers indicate they recycle packaging with caps reattached to bottles.

Recycling packaging with caps helps prevent remaining product flow/odors, reduce the number of items in their bin, and match years of recycling instruction communication from organizations such as APR and How2Recycle.

Taking a position contrary to the APR Design Guide, as the Formal Proposed Regulations do, negatively impacts both the calculation of actual recycling rates for

components and the recyclability determination for components in a way that does not match current recycling practices.

Response to O-76-9

CalRecycle rejects this comment for the reasons stated in response to comment O-39-5.

Comment O-76-10

For the calculation of actual recycling rates for components, under the Formal Proposed Regulations a recycling rate is calculated using the covered material category applicable to each component standing on its own, regardless of whether the component is designed to be reattached to the primary packaging. The APR Design Guides instruct components to be reattached, and current material recovery facilities process the packaging as a whole and sort it into a single recycling stream. Understanding this guidance, a single recycling rate should be calculated for the covered material category applicable to component and the packaging to which it is reattached. To this end, CMTA aligns with our colleagues in supporting the addition of language to Section 18980.1. and Section 18980.3.2. to ensure that such components are properly considered together with the packaging to which they are designed to be reattached prior to disposal.

Response to O-76-10

CalRecycle rejects this comment for the reasons provided in responses to comments O-39-5 and O-41-3

Comment O-76-11

Additionally, for recyclability determinations for components, under the Formal Proposed Regulations components that are less than 2 inches by 2 inches in size may not be considered recyclable due to their small size and current processing limitations with material recovery facilities. However, these same components are recyclable when designed to be reattached to the larger recyclable packaging, pursuant to APR Design Guides. As such, CMTA urges CalRecycle to include language in Section 18980.1 to ensure that such components are properly considered together with the packaging to which they are designed to be reattached prior to disposal. Such language should align with the APR Design Guides and actual material recovery facility practices, which requires evaluation of components in conjunction with primary packaging.

Response to O-76-11

Comment rejected. The commenter asserts that the proposed regulations impose a requirement that components must be larger than 2" by 2" to be considered recyclable. The proposed regulations contain no such standard. The commenter might have intended to refer to the covered material categories list published by CalRecycle, but that publication is not part of this formal rulemaking. CalRecycle's responses to comments O-39-5 and O-41-3 also apply

to the commenter's request that components "designed to be reattached prior to disposal" be considered together.

Comment O-76-12
Section 18980.2(a)(6) – OTC Exclusion

CMTA strongly supports paragraph (6) of subdivision (a) that provides an exclusion for over the counter (OTC) drugs and urges CalRecycle to maintain this important exclusion in the final approved regulation. As we've previously discussed, these "Medical Products," which were exempted in the statutory language of SB 54, must meet stringent Food & Drug Administration (FDA) requirements that limit the ability to use certain packaging materials, to source reduce packaging or to consider reusable packaging. OTC drugs face the same regulatory scrutiny and unique compliance challenges that prescription drugs do, and it is appropriate to exclude them.

However, CMTA is concerned that the OTC drug exclusion is unnecessarily narrowed by subparagraphs (A) and (B) that limit the exclusion to only medicines by removing OTC drugs that also make cosmetic claims, are soap, or contain sunscreen active ingredients. Notably, all FDA-regulated OTC drugs that display a "Drug Facts" panel on packaging are medical products under 21 U.S.C. 321(g) and should be exempt from SB 54 requirements. While some OTC drugs also provide secondary benefits (e.g., cosmetic, cleaning, or sunscreen) it does not alter the fact that they are OTC drugs and are considered medical products under 21 U.S.C. 321(g). These products provide consumers with important health benefits to which, without an exclusion, consumers may lose access or must buy multiple products, using more packaging, to receive the same benefits.

Without including all products that are regulated as OTC drugs by the FDA in the OTC drug exclusion, manufacturers will be forced to eliminate or upsize many affordable product options or separate consumer benefits into multiple product offerings in order to address compliance obligations including source reduction and more. To address this concern, CMTA urges CalRecycle to revise Section 18980.2(a)(6) related to Categorically Excluded Materials, as follows:

(6) Packaging for medical products. "Medical products" means products that are "drugs," as defined pursuant to paragraph (5), that do not require a prescription~~. and satisfy at least one of the following criteria:~~

~~(A) They are neither "cosmetics," as defined in subsection (i) of section 321 of Title 21 of the United States Code, nor "soap," as defined in section 701.20 of Title 21 of the Code of Federal Regulations.~~

~~(B) They are not a drug solely by virtue of containing a "sunscreen active ingredient," as defined in section 352.3 of Title 21 of the Code of Federal Regulations.~~

Response to O-76-12

CalRecycle rejects this comment for the reasons provided in response to comment B-11-3.

Comment O-76-13

Section 18980.2(c) – Exclusion for Tertiary Packaging for CRV Containers

Notably, SB 54 contemplated a number of exemptions and categorical exclusions that included packaging material for food and agriculture, medical goods, as well as beverage containers. In providing such exemptions and exclusions, exemptions for all of the exempted packaging associated with that category was referenced in Section 42041(e)(2)(A)-(G) so as to also exempt or exclude secondary and tertiary packaging associated with the primary regulated good.

CMTA urges CalRecycle to include exemptions for all secondary and tertiary packaging associated with CRV beverages as "not covered material." The final regulation should revert to the original interpretation and exclude secondary and tertiary packaging associated with containers subject to the Beverage Container Recycling Program. Given the exemptions and exclusions included throughout this section of code, the language in (E) indicates that the Legislature intended the same breadth of exclusion for beverage containers subject to California Redemption Value (CRV) as well. A narrow approach to the beverage container exclusion in SB 54 as contemplated in the Proposed Regulation would create direct conflict by forcing producers to comply with overlapping and inconsistent mandates under both the Bottle Bill and SB 54. Although "beverage container" is characterized differently as compared with the surrounding exclusions, its placement in a list where each item excluded entire packaging systems indicates that it should be construed in a similar fashion.

Ultimately, providing a broader interpretation of the exemption helps to ensure the Legislature's priorities are addressed without upending its highly successful recycling program.

Response to O-76-13

CalRecycle rejects this comment for the reasons stated in response to comment O-91-5.

Comment O-76-14

Section 18980.2.1. – Refillable & Reusable

CMTA strongly supports the deletion of paragraphs (4) and (5) of subdivision (a) that removed from the Formal Proposed Regulations arbitrary and overly burdensome requirements. To this end, we urge CalRecycle to maintain this change and avoid applying uniform requirements to the design and labeling of reusable/refillable packaging regardless of the significant differences in packaging types and purposes across consumer product categories.

Response to O-76-14

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-76-15

Section 18980.2.2 – Exclusion of Certain Types of Packaging

Section 18980.2.2(b) provides an exclusion for treating a component as a plastic if it is of *de minimis* weight and volume, and the revised provision is helpful in referring to "small size or weight and other relevant characteristics." However, the language does not distinguish between functional polymers and trace plastics used as adhesives or coatings, which may result in the misclassification of non-plastic materials that are still recyclable or compostable resulting in excessive regulatory scope. Because it is unclear what process CalRecycle and/or the producer responsibility organization (PRO) would follow to declare a component or group of components as *de minimis*, we recommend introducing a *defined de minimis* threshold of a minimum of 5% plastic content by weight or volume for composite materials and exclude materials below this threshold from "covered material" classification.

Response to O-76-15

Comment rejected. The commenter misdescribes section 18980.2.2(b) as "provid[ing] an exclusion for treating a component as plastic." Section 18980.2.2(b) does not purport to have that effect, nor does Public Resources Code section 42041(s)(4), the statutory provision authorizing the de minimis exclusion. The effect of the de minimis exclusion is that elements of packaging that are of de minimis amounts or volumes are not considered "packaging" for purposes of the statute. The commenter appears also to claim that whether packaging components are "plastic" and whether they are "still recyclable and compostable" affect whether the components are subject to the statute. Those claims have no basis in statute.. Lastly, CalRecycle also rejects the proposal to use a percentage threshold for determining whether components are of de minimis weight or volume for the reasons provided in response to comments B-30-2.

Comment O-76-16

We appreciate the addition of (b)(3) which allows a PRO or an Independent Producer to request that CalRecycle deem certain covered material components or groups of components as *de minimis* in weight or volume.

This section does not currently list plastic food service ware alongside packaging as eligible for the outlined exclusions. We recommend using "covered materials" throughout the proposed regulations rather than listing "packaging," including in the title of this section.

Response to O-76-16

CalRecycle rejects this comment for the reasons provided in response to comment O-55-2. To the extent that the commenter suggests that the phrase "covered materials" should replace the word "packaging" throughout the regulations, CalRecycle rejects that sweeping suggestion because packaging and food service ware are inherently different items, serve different purposes, and are not equally relevant to all statutory provisions, some of which concern only one of the two types of covered material.

Comment O-76-17

Importantly, CMTA recommends delaying producer reporting requirements for these materials until the PRO establishes an approved clear classification methodology.

Response to O-76-17

Comment rejected. The commenter proposes that CalRecycle delay basic compliance obligations established in statute. CalRecycle does not have authority to delay the effectiveness of statutory obligations.

Comment O-76-18

Section 18980.2.3(a)(3(B) – Exemptions for Specific Materials with Demonstrated Recycling Rates

CMTA agrees with the American Forest & Paper Association (AF&PA) that the criteria to qualify for an exemption in Section 18980.2.3(a)(3)(B) that “after being collected, none of the items are commingled with unsorted material collected by curbside programs” is unnecessary because clean sorted material would not be combined with unsorted material during curbside collection. Rather, the regulations should align with the language from SB 54 stating, “the covered material does not undergo separation from other materials at a comingled recycling processing facility.”

Response to O-76-18

CalRecycle rejects this comment for the reasons stated in response to comment O-54-6.

Comment O-76-19

Section 18980.2.7 – Exemption Duration

CMTA appreciates the prior revisions to subdivision (g) of Section 18980.2.7 that changed the minimum duration for an approved exemption from one year to two years, providing a longer period of certainty for producers who may be granted exemptions. CMTA urges CalRecycle to preserve this change as it helps assure producers about the continued availability of an exemption for critical packaging materials. Making packaging changes and finding replacement materials can take considerable time and planning to ensure viability, safety, and consumer acceptance for new materials, often across a broad range of product categories. Producers’ certainty about whether material will be

available for use in California is necessary to make the extended producer responsibility (EPR) program in California workable. Without this, producers may be forced to remove products from the California marketplace while they find and qualify replacement packaging.

Response to O-76-19

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process.

Comment O-76-20

Section 18980.3.1 – Recyclability of Certain Covered Material Categories Identified by the Department

CMTA is concerned that the restriction of covered material categories considered "recyclable" being required to meet the categorical requirements in SB 343 in Section 18980.3(a) will place significant requirements on recyclability and result in recyclable materials ending up in landfills and could even subject them to a de facto ban if they do not meet the recyclable criteria by 2032.

More specifically, CMTA is concerned that the criteria outlined in Section 18980.3.1(b) may be practically unattainable as currently drafted. Further, the inclusion of the proposed timeframe in subsection (b)(3) is not required by statute, imposing unnecessary constraints. In order to be a true and effective "on-ramp," it should be available at any time following the first Material Characterization Study.

Response to O-76-20

Comment rejected. The categorical requirements stated in 18980.3(a) are expressly mandated by statute (e.g., Pub. Resources Code section 42061(c)) and cannot be modified by regulation, and the commenter's assertion that applying statute as written will result in "recyclable materials ending up in landfills" is illogical and unexplained. The commenter might mistakenly believe that CalRecycle's authority encompasses ruling upon whether products are lawfully labeled "recyclable" or with the chasing arrows; however, the manner in which products are labeled is not relevant to whether a producer violates Public Resources Code section 42050(c). In other words, the commenter has it backwards: CalRecycle's determinations concerning recyclability are limited to assessing whether covered material can lawfully be labeled "recyclable," not whether covered material labeled "recyclable" are labeled lawfully. In other words, in assessing recyclability, CalRecycle does not issue authoritative decisions under labeling laws, which CalRecycle does not have enforcement authority over.

CalRecycle does, however, have limited authority to affect when covered materials should be considered "recyclable" for purposes of labeling laws. The

commenter does not explain why the criteria in section 18980.3.1(b) may be "practically unattainable as currently drafted" other than by pointing to the "timeframe in subsection (b)(3)." All of the criteria stated in subdivision (b) are directly linked to the express provisions in Public Resources Code section 42061(a)(3)(B), and the commenter does not allege otherwise. Regarding the timeframe in (b)(3) specifically, the commenter asserts that a "trending" designation pursuant to 42061(a)(3)(B) should be available "at any time following the first Material Characterization Study." However, the statute expressly restricts CalRecycle's identification of materials as "trending toward meeting the requirements of [42355.51(d)(2)(A) and (B)]" to "[w]hen updating information pursuant to [42355.51(d)(10(B)(ii)]." CalRecycle regulations cannot disregard that express statutory restriction.

Comment O-76-21

Finally, it is critical that the “recyclable” recycling rate be based on the weight of the covered materials sent to be recycled and not on the incoming material weight at a responsible end market. The regulatory language in Section 18980.3.2 should be clarified to reflect that the point of measurement is the weight of materials to be recycled, which is more consistent with the language of SB 54.

Response to O-76-21

Comment rejected. The statute (Public Resources Code section 42041(ab) expressly authorizes CalRecycle to adopt a "new methodology for calculating the recycling rate by regulation," and section 18980.3.2(b) presents a methodology that reasonably measures "recycling rate" as defined in statute: "the percentage, overall and by category, of covered material sold, offered for sale, distributed, or imported in the state that is ultimately recycled." Contrary to the commenter's assertion, the proposed regulation does not base recycling rate on the "incoming material weight at a responsible end market." The weight recycled is assessed based on the recycled content produced by the end market (i.e., the "ultimately recycled" material). CalRecycle declines to adopt the commenter's suggestion of a methodology based on "the weight of covered materials sent to be recycled" because the amount of the material sent to be recycled exceeds what is ultimately accepted, and even the material that is accepted, based on the specification of the material aggregation, includes some amount of contamination and incompatible materials.

Comment O-76-22

Section 18980.3.3 – Compostable Packaging

CMTA is growing increasingly concerned about the fate of compostable packaging amid the compostable packaging framework that falls short of supporting innovation in composting and addressing infrastructure limitations. Limiting compostable materials to allowable agricultural organic inputs under the requirements of the United States Department of Agriculture National Organic Program excludes compostable polymers that meet ASTM D6400 or ASTM D6868 standards and are accepted at industrial

composting facilities throughout the country and in parts of California. This unnecessarily narrows the definition and undermines market innovation in the composting space. The reference to the National Organic Program, combined with the overly broad definition of “plastic” in Section 18980.1(a) as noted above, makes for an unworkable constraint. Eliminating composting as an end-of-life option for food service ware, in particular, will result in less collection of food waste overall, contrary to the language and the intent of SB 54.

Response to O-76-22

Comment rejected. The commenter expresses concern over the requirement established in Public Resources Code section 42357(g)(1)(B) for eligibility to be labeled "compostable." That concern is directed at a statutory requirement that the proposed regulations cannot change or ignore. The statute (e.g., Public Resources Code sections 42050(b) and 42061(d)) expressly requires CalRecycle to apply that requirement.

Comment O-76-23

Section 18980.3.4. – Post Consumer Content (PCR) Credit

SB 54 specifies that the PRO may apply for a source reduction credit up to 8% through an alternative compliance formula that offers source reduction credit “on a sliding scale based on the ratio of virgin plastic to postconsumer recycled content plastic to producers who incorporate postconsumer recycled content into plastic covered material.” Paragraph (1) of subdivision (b) of Section 18980.3.4 of the Formal Proposed Regulations requires that the PRO measure the increase in absolute amount of postconsumer recycled content (PCR) used versus a 2023 baseline.

Although SB 54 requires CalRecycle to determine a 2023 baseline for purposes of measuring overall source reduction, nothing in SB 54 requires CalRecycle to adopt a 2023 baseline for purposes of determining this credit. Many producers began incorporating PCR into packaging decades ago and had already achieved significant amounts of PCR usage by 2023. Measuring producers’ absolute volume increase of PCR based on a 2023 baseline does not recognize, and in fact penalizes, the proactive sustainability efforts of producers who voluntarily took early action to incorporate PCR into plastic packaging prior to 2023. Necessarily, due to PCR already incorporated prior to 2023, the ability to incorporate more is limited.

Response to O-76-23

CalRecycle rejects this comment for the reasons provided in response to comment B-11-7.

Comment O-76-24

Section 18980.4(a)(3) – Responsible End Market Criteria

As CalRecycle can appreciate, markets for recycled materials are complex and everchanging, offering various incentives for end markets to manage incompatible materials. However, requiring entities to send incompatible materials for further processing assumes cost-effective methods of collection, sorting, and transportation, which may not always be possible or environmentally preferable.

To that end, this provision should be amended to include flexibility, allowing end markets to assess environmental impacts and opt for alternatives if sending materials for further processing would be detrimental. Alternatively, it would be helpful to receive further detail on the specific materials that meet the definition of "incompatible materials," and how and by whom the decision will be made.

Response to O-76-24

CalRecycle rejects this comment. See the response to comment O-55-4.

Comment O-76-25

With respect to the "items partially or wholly constituting plastic", the proposed regulations continue to use the undefined term "biologically decomposed" and seemingly still requires full conversion which is not possible. An alternative approach would be to include demonstration and evidence that composted covered materials are processed into final marketable compost as evidence of a responsible end market for recycled organic product, as is now drafted for *"items comprised of fiber or paper substrates."* Another approach may be to consider substituting "biological decomposition" with "disintegration," as the latter is evaluated according to ASTM standards.

Response to O-76-25

CalRecycle rejects this comment. See the responses to comments B-6-5 and O-75-12.

Comment O-76-26

Section 18980.4.1. – Physical Recycling

CMTA urges CalRecycle to restore recognition of physical recycling technology as an acceptable responsible end market technology, in addition to mechanical recycling as it was recognized in earlier versions of the Proposed Regulation. Physical recycling enables a method to clean plastic and remove contaminants from the recycling stream in a manner that also results in significantly reduced greenhouse gas emissions compared to virgin resin. Physical processes are not chemical recycling because they maintain "plastic to plastic" recycling, as they do not chemically alter the plastic polymers or break chemical bonds but rather remove both intentionally and unintentionally added materials to vastly improve the quality of recycled plastics and produce a high-quality post-consumer recyclate (PCR). Physical processes can also be operated in tandem with mechanical processes to vastly improve the quality of output. This broadens the potential applications for recycled plastic and promotes

continued circularity in similar types of applications, helping to reduce the amount of plastic that is downcycled. Physical recycling processes do not result in significant hazardous waste production.

Response to O-76-26

CalRecycle rejects this comment for the reasons provided in response to comment B-11-8.

Comment O-76-27

Section 18980.6.7. – Malus Fees

CMTA also urges CalRecycle to add language in paragraph (i) to restrict any Proposition 65-listed chemicals in packaging that are present at levels that would expose consumers above the respective exposure levels (No Significant Risk Levels-NSRLs/Maximum Allowable Dose Levels-MADLs) established by the Office of Environmental Health Hazard Assessment (OEHHA). Importantly, Proposition 65 is an exposure-based statute that does not restrict chemicals solely based on presence at any level. Instead, Prop 65 establishes "safe harbor" levels that determine acceptable exposure limits for chemicals without significant health risks over a lifetime of exposure (NSRLs and MADLs).

As written, the Proposed Regulations are not in alignment with the Proposition 65 statute, regulations, and guidance provided by OEHHA. This creates a fundamental inconsistency between the two agencies and disregards the work OEHHA has done to establish meaningful risk-based "safe harbor" limits. Current testing and compliance systems are not set up to measure and report Proposition 65-listed chemicals at trace levels well below those established by OEHHA. Requiring the establishment of a new level of trace contaminant monitoring imposes significant costs, while such trace levels do not present any significant risk to consumer health. It also negatively impacts circularity by unduly restricting the amount of recycled content that could be incorporated into packaging, again for no benefit.

To this end, CMTA recommends including additional language in Section 18980.6.7 for eco-modulated fees and the overall fee schedule to address this concern.

(i) Pursuant to paragraph (4) of subdivision (e) of section 42053 of the Public Resources Code, a PRO shall charge a malus fee to producers who use covered material that contains a chemical listed on the list established pursuant to section 25249.8 of the Health and Safety Code *at levels that would expose consumers above the respective exposure levels (No Significant Risk Levels/Maximum Allowable Dose Levels) and via the route of exposure of concern established by the Office of Environmental Health Hazard Assessment.*

Response to O-76-27

CalRecycle rejects this comment. See the response to comment B-11-9.

Comment O-76-28

Section 18980.8.3. – Source Reduction Adjustment

CMTA urges CalRecycle to restore the wholesale deletion of Section 18980.8.3 that removes the PRO's express ability to utilize important, common sense adjustment factors in the development of its source reduction plan. The deleted section included adjustment factors for fluctuations in economic conditions and the change in number of producers participating in the PRO plan. The restoration of this language is critical to provide for adjustments for product sales growth over time. During the negotiations on SB 54, the issue of sales growth as it related to source reduction as discussed at length with agreement that there needed to be consideration for economic growth and adjustment to protect California's vibrant economy.

To address this significant issue, CMTA recommends the addition of language as follows:

Section 18980.8.3. Source Reduction Adjustments

(a) Subject to the limitations of this section, a source reduction plan developed pursuant to subdivision (f) of section 42057 of the Public Resources Code may utilize adjustment factors and methods to account for fluctuations in economic conditions and the increase or decrease in the number of producers participating in the PRO plan and must utilize adjustment factors and methods to allow producer reporting of material usage to be adjusted by units of sale to normalize for business growth over time, in each case for determining whether the PRO has met its source reduction obligation relative to the baseline established by the Department under subdivision (b) of section 42057 of the Public Resources Code.

Response to O-76-28

CalRecycle rejects this comment for the reasons set forth in response to comment B-11-6.

Comment O-76-29

Section 18980.9.1. – Source Reduction Compliance Timeline

CMTA members remain concerned about the lack of clarity regarding the reporting period for measuring compliance against the source reduction requirements. Absent such clarity, producers may not fully understand their compliance obligations much less be able to comply. The overarching issue is producers will not have the information necessary to implement source reduction compliance any earlier than calendar year 2027 as they have less than three months until January 2026 and they need far longer lead time to develop, test and implement packaging changes.

To address this issue, CMTA proposes adding language to paragraph (2) of subdivision (d) of Section 18980.9.1 to specify that source reduction requirements that are required as of January 1, 2027, 2030, and 2032, are based on producer source reduction

reporting using the measurement period of the respective calendar years of 2027, 2030, and 2032.

Response to O-76-29

CalRecycle rejects this comment, see responses to B-27-2, I-63-15, O-41-4, and 0-48-5.

Comment O-76-30

Section 18980.13.1(a) – Corrective Action Plans

This section clarifies that CalRecycle has the authority to enter into a Corrective Action Plan (CAP) agreement with a producer to resolve violations on any terms the parties mutually deem appropriate and that CalRecycle is not required to issue financial penalties. To be clear, CalRecycle is not limited in their authority to pursue a CAP as a standalone compliance mechanism. This provides the Department more flexibility to prioritize compliance as part of its enforcement policy and work with producers who are doing everything within their power to achieve this shared goal.

Response to O-76-30

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-76-31

Cost Recovery

CMTA appreciates the Department's approach to cost recovery, aligning with the intent – as reiterated to the Department by Senator Ben Allen, author of SB 54 in a letter dated October 11, 2024 – of the enacting statute. More specifically, SB 54 intended for resources from producers and cost recovery associated with implementation of SB 54's mandates to be prospective. We urge the Department to maintain this prospective approach which is consistent with the statutory intent.

CMTA and its members appreciate your consideration of these comments. If you have any questions or if you would like to discuss further, please contact Dawn Koepke with McHugh Koepke Padron at dkoepke@mchughgr.com or (916) 606-5309. Thank you.

Response to O-76-31

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process.

O-77: AMERIPEN Consumer Brands Association EPR Leadership Forum Sustainable Food Policy Alliance (Mark Bescher)

Comment O-77-1

Thank you for the opportunity to submit comments regarding the latest regulatory proposal from California's Department of Resources Recycling and Recovery's ("CalRecycle") implementation of the Plastic Pollution Prevention and Packaging Producer Responsibility Act (SB 54). The comments below reflect positions from the American Institute for Packaging and the Environment (AMERIPEN), Consumer Brands Association, the EPR Leadership Forum, and the Sustainable Food Policy Alliance. Our membership represents some of the most crucial stakeholders in the packaging value chain engaged in the work that CalRecycle is undertaking. We are grateful for the opportunity to comment on the formal proposed regulations for SB 54 implementation, which represent significant improvement over prior drafts. Our organizations recommend the following opportunities to support the implementation of SB 54:

Response to O-77-1

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process. To the extent other portions of the submission do suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-77-2

Source Reduction Baseline Should Account for Continued Growth in Consumer Demand and Economic Expansion

Issue: In EPR programs across the United States and around the world, the PRO is primarily responsible for planning and financing infrastructure improvements based on the outcomes of a needs assessment. Source reduction as a concept should be incentivized by EPR as one lever companies can deploy in improving the circularity of their plastic packaging, reflected in eco-modulated fees based on positive or negative environmental attributes of a package. Companies should be given flexibility to determine the most appropriate lever considering their product portfolios. As in recently passed EPR bills, such specificity on packaging design should be left out of statute.

The source reduction baseline continues to pose likely unachievable targets, given that the amount of packaging utilized in California is projected to increase annually. The growth in packaging is the direct result of economic growth supporting the state of California, influenced by factors such as an increasing population, an increase in ecommerce, and increasing consumer demand for convenience. These macroeconomic and societal behavior shifts are outside both the control and authority of producers obligated under SB 54.

Establishing a source reduction baseline that does not take into account the projected growth of packaging caused by external factors is punitive and saddles the regulated community with an unattainable compliance burden. Source-reduction opportunities are constrained by contamination risk, product-performance requirements, conflicting PCR-content mandates, and limited recyclability pathways. Using a static, flat baseline calculation of packaging in California as the basis for a decade-long target fails to account for significant growth in packaging driven by market demand and population growth. This will hold producers unfairly accountable for factors out of their control and sets the regulated community up to fail.

We appreciate that the regulations already recognize the Department's discretion to recalibrate the source-reduction baseline after the initial January 1, 2025, establishment. In particular, Section 18980.9(c) authorizes the Department to update the baseline using verified producer-reported supply data. We respectfully request that the Department exercise this same discretion in subsequent years to reflect actual market conditions and material flows. Absent periodic, data-driven adjustments, producers may face untenable compliance expectations potentially requiring product withdrawals, or else they will incur significant financial and reputational risk.

Solution: Restore Section 18980.8.3 (Source Reduction Adjustments) from prior drafts and explicitly provide that source reduction targets can adjust for projected growth of consumer demand for packaging materials, particularly the population increase and increase of ecommerce, in 2032. The PRO should be designated to establish the recommendation based on growth as market demand increases.

Response to O-77-2

Comment rejected. The commenter references restoring "Section 18980.8.3," but the currently proposed regulations are the only regulations relevant to this rulemaking. Without including that section for CalRecycle to consider, there is no alternative text for CalRecycle to consider. Nevertheless, CalRecycle understands the commenter to propose some method for the PRO's plan to allow adjustment of its source reduction requirements in 2032. CalRecycle declines to make such a change because it would be unnecessary and contrary to statute, which contemplates no adjustment to the requirement stated in Public Resources Code section 42057(a). Moreover, the statute does not preclude the PRO plan from having provisions accommodating growth of market demand, and the Act already has multiple provisions accounting for the problem the commenter describes. Section 42057(f)(1) requires the PRO to give credit to producers that achieved reductions from 2013 to 2022. Section 42057(g) requires the PRO to penalize producers that add new covered material and to optimize their packaging; in other words, when a producer expands its usage of covered material, statute clearly intended that the producer would face an enhanced burden. Lastly, 42057(h) is expressly directed at "ensur[ing] source reductions achieved by January 1, 2032, are not lost after [that date] while still allowing for businesses to grow." These provisions reflect a clear intent for the PRO not to have flexibility to alter how the PRO's overall source reduction will be

evaluated (i.e., neither the goal nor the calculation of source reduction can be adjusted). To the extent growth of market demand puts satisfaction of the source reduction requirement at risk, statute clearly puts the burden on the PRO to account for that risk.

Comment O-77-3

Regulations Do Not Align to Existing California Regulations & Laws

Issue: Section 18980.6.7(h) of the draft of regulations would direct the PRO to assign malus fees to producers based on the presence of chemicals listed in section 25249.8 of the Health and Safety Code, also known as Proposition 65 (Prop 65) List of Chemicals Known to Cause Cancer or Reproductive Toxicity. However, Prop 65 is an exposure-based statute and establishes "safe harbor" levels, which determine acceptable exposure limits for chemicals without significant health risks over a lifetime of exposure. As such, key oversight mechanisms in Prop 65, such as warning requirements and enforcement, are activated by exposure risk, not the mere presence of listed chemicals. As written, the SB 54 regulations do not align with the intent of the Prop 65 statute and regulations and would unfairly penalize producers for simply the presence of chemicals even if California already has deemed there is no significant risk of exposure.

Solution: We encourage CalRecycle to make the following change to the language in Section 18980.6.7(h) regarding malus fees on Prop 65 chemicals to ensure consistency with the exposure-based requirements of the relevant Health and Safety Code section: (h) Pursuant to paragraph (4) of subdivision (e) of section 42053 of the Public Resources Code, a PRO shall charge a malus fee to producers who use covered material that contains a chemical listed on the list established pursuant to section 25249.8 of the Health and Safety Code **at levels that would expose consumers above any established exposure levels (NSRLs/MDLs) established by OEHHA.**

Response to O-77-3

CalRecycle rejects this comment. See the response to comment B-11-9.

Comment O-77-4

Definition of Producer & Producer Hierarchy for Food Service Ware Products

Issue 1: We appreciate the significant improvements to the definition of producer. Various approaches to define "producer" create confusion, ambiguity and unnecessary complexity for both manufacturers/brands/licensees and the PRO in their efforts to develop the Plan required by both the legislation and the regulations. The statute clearly assigns responsibility to the manufacturer and brand owner licensee of the physical good that is packaged, rather than the producer of the packaging material. While the current draft of regulations are improved regarding their alignment with this interpretation, the language still obligates the packaging manufacturer for plastic single-use food service ware, rather than the manufacturer and brand owner/licensee that uses the plastic single-use food service ware for a food product.

Solution: Amend Section 18980.1.(a)(17)(B) as follows:
(a)(17)(B) The terms "product that uses covered material" and "product using the covered material" refer to a good that uses covered material. A good uses covered material if its packaging is covered material or if the good itself is **unfilled** plastic single-use food service ware **supplied to a final consumer pursuant to the items listed in Public Resources Code 42041(e)(1)(B)(i)** and thus constitutes covered material. Empty packaging materials not yet used by a good are not "single-use packaging" or otherwise "covered material" under the Act, such that a person is not a producer merely because they manufacture, sell, offer for sale, or distribute such materials. **Single-use food service ware, other than unfilled plastic single-use food service ware sold to a final consumer, is not "covered material" under the Act until it is used to facilitate service of prepared food or beverages for human consumption. For the purposes of this subparagraph, "consumer" means a natural person who purchases goods and services for personal use.**

Issue 2: The current definitions of food service ware can be confusing and needs clarification to distinguish it from food packaging. There are some food service ware interpretation challenges and therefore the determination of the obligated producer remains present within Section 18980.1.1. It would be preferable for the regulations to include a distinct determination for each covered material type so that it is clear what is being referred to with respect to a "good." For example, a container might be seen as both service ware and packaging depending on how it is used, which creates potential ambiguity. Without clear definitions, the provisions in the law for exemptions, compliance, and penalties could become unclear, leading to misunderstandings between different categories. It is important to explicitly define these terms to avoid confusion and ensure proper compliance with SB 54.

Solution: The regulations should instead include language that specifies how producer obligation is assigned across each of the following distinct covered material types:
1. Unfilled plastic single-use food service ware as a covered material when it is a good sold to a final consumer
2. **Plastic single-use food service ware** as a covered material when it is used to contain or facilitate service of food or beverages served to a consumer by a food service establishment
3. **Single-use packaging** as covered material when it is used to facilitate service of a consumer

Response to O-77-4

CalRecycle rejects this comment. The commenter erroneously asserts that the proposed regulation would obligate a person as a producer merely because they are the "packaging manufacturer for plastic single-use food service ware." That assertion appears to conflate "packaging" with "plastic single-use food service ware"; for the former, the manufacturer is only relevant if they manufacture the good being packaged, whereas for the latter, the good is the food service ware items themselves, so the manufacturer is only relevant it manufactured those

items. The commenter does not identify what provision of the proposed regulations would lead to a different outcome. Moreover, there is no statutory support for plastic-single-use food service ware only being covered material when it is supplied to a final consumer, nor is there statutory support for the word "consumer" only being a natural person. The commenter identifies no statutory provision on which they base these assertions.
Regarding the suggestion that the regulations create three categories of covered material (unfiled plastic single-use food service ware, plastic single-used food service ware, and single-use packaging) as a framework for how producers are to be identified, CalRecycle rejects that suggestion for the reasons stated above (the commenter is incorrect as to when food service ware is "covered material") and because it would only add complexity to the regulation. Regardless of how covered material might be assigned a certain type, the statutory definition of "producer" requires the tiered approach looking first at the manufacturer and brand, second at the brand only, and third at sale and distribution. Lastly, to the commenter asserts that CalRecycle should publish demonstrations of how regulations apply in the different settings in which plastic single-use food service ware may exist, no change is necessary because CalRecycle can do so outside of the regulatory process.

Comment O-77-5
Aggregated Reporting for Material Categories

Issue: Requiring disaggregated compliance by material type risks penalizing producers for packaging formats that currently lack scalable recycling pathways, regardless of broader efforts to reduce or redesign. Aggregating covered material categories to achieve compliance targets encourages holistic progress across an entire packaging material portfolio. This approach aligns with the statute's overarching goals of increasing the sustainability of all packaging materials, while allowing producers flexibility in innovation, managing reporting costs, and achieving compliance. For example, it will help foster advancements in recyclability and recycling of flexible materials both in California and globally.
Solution: Allow producers to have their compliance rates aggregated for all types of single-use covered material.

Response to O-77-5
Comment rejected. The statute prohibits compliance from being evaluated with respect to the aggregate of all covered material. The most obvious indication of that basic statutory feature is that section 42061(b)(1) requires publication of "recycling rates being achieved in the state for each covered material category," not a single recycling rate. Elsewhere, the statutory text repeatedly makes clear that compliance is with respect to covered material categories.
• Section 42040(b)(4) states: "[T]he Legislature acknowledges that . . . producers will be required to eliminate, redesign, or shift packaging or food service ware to a covered material category that can more efficiently meet the requirements of this chapter."

• 42051(b)(2)(A)(iii): "a covered material category that meets a 30-percent recycling rate as of January 1, 2023."
• 42051(e): "The PRO may organize itself into subcommittees . . . to ensure sufficient focus on each covered material category to better enable each category to meet the recycling rates required in subdivision (c) of Section 42050."
• 42053(d)(1): "The costs to ensure each covered material category meets the requirements of this chapter."
• 42060(a)(5)(B): "If the department determines that exempting a particular small producer . . . would hinder the ability of a type of covered material or covered material category from complying with the requirements of this chapter . . . ."
• 42060(c): "[T] he department shall publish on its internet website a list of covered material categories that are, based on available collection and processing infrastructure and recycling markets, deemed recyclable as of January 1, 2024."

Comment O-77-6

Covered Material and Covered Materials Categories

Issue: To comply with federal requirements established by USDA and FDA, the proposed regulation creates an exclusion for "packaging or packaging components used by a food or agricultural commodity (without regard to its origin) if it is not reasonably possible to use other packaging or packaging components."

It is likely that exempted food and agricultural packaging will still flow into the same recycling waste stream as covered materials, especially for examples where the same packaging type is used for both exempt and non-exempt material categories and when primary sortation is done by the consumer. As a result, recycling facilities and haulers will still need to collect, sort, and process these exempt materials. Without additional guidance, the PRO will be viewed as responsible for covering these costs, even though the PRO is not responsible for covering costs of exempted materials.

Solution: To support accurate reimbursement formulations, we recommend that the Department develop a formula that accounts for categorically excluded materials entering the recycling stream. This would ensure the PRO only pays for the processing and recycling of covered material categories.kris

Response to O-77-6

Comment rejected. Producer responsibility plans have the burden of proposing specific reimbursement formulations that comply with the criteria in section 18980.8(g). Plans must present the manner in which costs "incurred . . . due to requirements of the Act" will be covered; those costs necessarily exclude those attributable to packaging that is not "covered material."

Comment O-77-7

Regulations of Reuse and Refill Limit Incorporation of Reuse Models

Issue: The Department has made significant improvements in the current draft, however, reuse requirements within the regulations still are not fully conducive to multiple reuse models and, as a result, limit opportunities for reuse. The Ellen MacArthur Foundation (EMF), an evidence-based research foundation for developing a circular economy, has identified four types of reuse models: refill at home, refill on the go, return from home, and return on the go.1 Extensive research on the environmental impact, efficiency, and consumer demands of each model has been conducted by EMF, industry, and other non-government organizations. This research has been translated into innovation and investment to create and implement reuse models for products and packaging materials.2 It is imperative that reuse and refill guidelines maximize the ability for these fledgling formats to develop and propagate, which will in turn facilitate source reduction.

Solution: Enable performance-based flexibility so the PRO can advance any reuse pathway that measurably reduces single-use plastic covered material by creating a limited, performance-based waiver process administered by the PRO and approved by CalRecycle.

Response to O-77-7

Comment rejected. The commenter requests that CalRecycle create a new performance-based waiver process for types of reusable material not included in the categorical exemption for reusable packaging. However, CalRecycle does not have general authority to create exemptions not established by statute, nor does it have authority to modify the criteria established for reusability in Public Resources Code section 42041(af). In any event, the proposed regulations accommodate the commenter's concerns because any packaging not within the categorical exemption for reusable packaging might qualify for other exemptions based on public health, safety, and other special compliance challenges. See, e.g., PRC section 42060(a)(3) and (4), and section 18980.2.4 of the proposed regulations. Accordingly, the proposed regulations accommodate the commenter's concerns, and no change is necessary.

Comment O-77-8

Streamlining De Minimis Determinations

We appreciate the inclusion of flexibility in the definition of "de minimis" within the proposed framework. However, we respectfully recommend that the Producer Responsibility Organization (PRO) be granted the authority to independently establish de minimis thresholds, rather than requiring prior approval from the Department. Allowing the PRO to set these thresholds will expedite the transition to more sustainable packaging solutions, such as paper-based materials, by enabling earlier implementation and reducing administrative delays.

Solution: Amend Section 18980.2.2. Exclusion of Certain Types of Packaging (b)(3) "The PRO or an Independent Producer ~~may request that the Department deem~~ **shall**

establish certain components or groups of components to be of de minimis weight or volume. **De minimis designations** ~~Requests~~ must be in writing and describe each component or group of components at issue with sufficient detail, such as its purpose, range of physical characteristics, and the types of packaging or goods with which it is conventionally used, to clearly distinguish it from other materials. **The designations** ~~request~~ must include supporting evidence and explanation establishing that the component or group of components meets the requirements of paragraph (2)."

Response to O-77-8

Comment rejected. The commenter's proposal would vest ultimate authority in the PRO and Independent Producer to unilaterally declare components to be of de minimis weight or volume. No support is given for how nullifying CalRecycle's basic authority to enforce the law is consistent with statute, especially considering the relevant statutory provision (Public Resources Code section 42041(s)(4)(A) expressly states that the exclusion is to be applied "as determined by the department."

Comment O-77-9

Finally, consistent with SB 54's objective to increase recycling, we urge CalRecycle to address misalignment with SB 343 (Truth in Labeling). SB 343 restricts use of the chasing-arrows symbol unless specific recyclability criteria are met. As a result, the materials eligible for "recyclable" labeling under SB 343 do not fully align with SB 54's covered-material framework, creating conflicting signals for producers and consumers within California and complicating multi-state commerce. To reduce confusion and improve outcomes, we respectfully request that CalRecycle:

(1) develop clear crosswalks between SB 54 covered-material categories and SB 343 recyclability determinations; (2) provide harmonized guidance and examples for on-pack claims that support SB 54 compliance without undermining SB 343; and (3) consider targeted regulatory updates or phased compliance options that better align labeling requirements with SB 54's materials-management goals.

We thank CalRecycle for its commitment to an open and transparent regulatory process. We respectfully request that the Department consider these changes to ensure the successful implementation of SB 54 and advancement of a truly circular economy in California.

Response to O-77-9

Comment rejected. Regarding SB 343, the commenter asserts that "materials eligible for 'recyclable' labeling under SB 343 do not fully align with SB 54's covered-material [sic] framework." The commenter does not explain that assertion or how the proposed regulations cause the misalignment, so CalRecycle cannot discern what "crosswalks" the commenter requests to address it. Moreover, how a product is labeled is irrelevant to CalRecycle determinations of whether covered material complies with Public Resources

Code section 42050(b) (requiring recyclability or compostability). Moreover, to the extent addressing supposed "misalignment" would simplify producers' evaluation of how to comply with both SB 54 and SB 343, the manner of doing so would be through the covered material list published by CalRecycle under Public Resources Code section 42061 and the information and studies that CalRecycle publishes pursuant to section 42355.51(d)(1). Those publications are not part of this rulemaking; CalRecycle can address the commenter's concern without revising the proposed regulations. Regarding "guidance and examples for on-pack claims," CalRecycle cannot provide guidance as to liability for label claims because CalRecycle has no enforcement authority under labeling laws. To the extent the commenter's request is that CalRecycle provide whatever "guidance and examples" it can provide, however, no change to the proposed regulations is necessary. No regulation is needed for CalRecycle to publish resources, such as frequently asked questions or demonstrative examples based on adopted regulations, that it determines will be helpful to stakeholders. Regarding "targeted regulatory updates or phased compliance options that better align labeling requirements with SB 54's materials-management goals," if that request was intended to concern future regulations, it is not a requested change to the proposed regulations. To the extent the request was intended to ask CalRecycle to adopt regulations changing labeling requirements, no change is appropriate because CalRecycle has no authority to affect labeling requirements or deem labels in compliance with the prohibition of deceptive labeling. If the commenter's request for "phased compliance options" was directed at compliance with Public Resources Code section 42050(b) instead of with deceptive labeling laws, no change is necessary because exemptions under Public Resources Code section 42060(a)(3) can include phase-in plans to address compliance challenges.

O-78: Concerned Solid Waste JPA's (David Krueger)

Comment O-78-1

The attached coalition of stakeholders, the executive directors of Solid Waste JPA’s (local governments), submits the following comments in response to the formal draft of the SB 54 regulations published on August 22, 2025.

Despite the unanticipated delays in adopting the regulations, we appreciate CalRecycle’s work to provide a robust set of regulations so that SB 54 can achieve its potential to accelerate a shift to a more circular economy for California. We also appreciate the changes CalRecycle has made that are responsive to comments that we and other local agencies have raised. We strongly support the intentions of the law to slow the flow of materials entering our communities, keeping materials in circulation through reuse and refill, and by creating packaging that is designed for recycling or composting at end of life. We also strongly support the EPR intent of the law – to shift the responsibility for the costs of collecting and processing covered materials from jurisdictions and ratepayers to the producers of the materials themselves.

Response to O-78-1

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process. To the extent other portions of the submission do suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-78-2

Topic #1: Funding Sources for Implementation

Chapter 3, Article 1 of SB 54 states that:

Local jurisdictions are the backbone of the solid waste management and recycling efforts in California. The new statewide comprehensive circular economy framework established by this chapter is intended to shift the burden of costs to collect, process, and recycle materials from the local jurisdictions to the producers of plastic products.

It is the intent of the Legislature in enacting this chapter to ensure that local jurisdictions will be made financially whole for any new costs incurred associated with the implementation of this chapter and its implementing regulations.

However, the proposed regulations lack language that specifically: 1) requires service providers to request funding from the PRO for any new costs incurred associated with the implementation of SB 54; 2) prohibits service providers from obtaining funding from local jurisdictions for any new costs incurred associated with the implementation of SB 54; 3) prohibits service providers from receiving cost reimbursements from the PRO and then also recovering those same costs from local jurisdictions ("double-dipping"); and 4) requires service providers to share with affected local jurisdictions any reduction in operational costs resulting from PRO payments. Without those protections in the regulations, the requirements of Section 42060.5 of the Public Resources Code and Article 11 of the draft regulations could become an unfunded mandate on local jurisdictions, with the costs of SB 54 ultimately being incurred by ratepayers and taxpayers instead of by the producers.

Service providers must be prohibited from obtaining or seeking to obtain reimbursements from ratepayers for costs eligible for reimbursement from the PRO, regardless of whether or not the service provider opts to seek reimbursement from the PRO. The express legislative intent is that rate payers do not bear these costs. That intent cannot be assured unless service providers are prohibited from obtaining and seeking to obtain reimbursement of eligible costs from ratepayers.

We appreciate the addition to section 18980.8 of the proposed regulations regarding reimbursable costs which requires that the PRO or Independent Producer "first" notify the local jurisdiction when costs are deemed covered for a recycling service provider. However, while this will be a helpful tool to enhance transparency, it is not a mandate or prohibition under law from including reimbursed costs in ratepayers'

rates. We believe that such a prohibition is necessary. The proposed regulations place the burden of enforcement against “double-dipping” on local jurisdictions. We believe this enforcement should be the responsibility of CalRecycle. Below we have provided suggested draft language. We request that this language or similar be incorporated into the adopted regulations in order to ensure the intent of SB 54.

• Recycling service providers shall request reimbursement from a PRO for any new costs incurred in order to comply with Section 42060.5 of the Public Resources Code.

• Recycling service providers shall not request, accept, or obtain funds from Ratepayers, taxpayers, or local jurisdictions for new costs incurred by the recycling service providers in order to comply with Section 42060.5 of the Public Resources Code.

• Recycling service providers shall share any reduction in operational costs resulting from PRO payments with the ratepayers, taxpayers, or local jurisdictions that they serve.

• If a service provider receives reimbursement from a PRO for costs incurred in order to implement Section 42060.5 of the Public Resources Code, that service provider shall not request, accept, or obtain funds from Ratepayers, taxpayers or local jurisdictions for reimbursement of the same costs for which they were reimbursed by a PRO.

• If a service provider receives funds from a PRO and also receives funds for reimbursement of those same costs from Ratepayers, taxpayers, or local jurisdictions, either before or after being reimbursed by the PRO, that service provider shall refund all such funds to the Ratepayers, taxpayers, or local jurisdictions. The Department shall enforce this requirement, shall investigate related complaints from Ratepayers, taxpayers and local jurisdictions, and may assess penalties on recycling service providers sufficient to achieve compliance.

Response to O-78-2

CalRecycle rejects this comment for the reasons provided in response to comment O-33-2.

Comment O-78-3

Topic #2: Enforcement Oversight by the Department - Section 18980.13

As discussed in our comments dated November 4, 2024, we continue to believe that penalties of up to $50,000 per item per day for violations by local jurisdictions for failure to include covered materials in their collection programs is illogical and unreasonable. **SB 54 does not authorize these penalties.** The law authorizes monetary penalties for only PROs, producers, retailers, and wholesalers. (Public Resources Code sections 42080-42084.) This is an error in the draft regulations that needs to be corrected.

References to “PRO” and “producer” appear repeatedly in sections 42080-42084 of the Public Resources Code, the SB 54 enforcement statutory provisions. There is no reference to local jurisdictions. In section 42080, “entity” is used to refer to PRO, producer, wholesaler, and retailer. When in section 42081 there is a reference to “any entity,” the statute goes on to provide a single exception for small producers, retailers, and wholesalers that are listed in section 42060(a)(5) – with no mention of an exception or extension for certain local jurisdictions or recycling service providers (as in 42060.5(b)), or rural counties/jurisdictions (as in 42060.5(c)), which one would expect to see if they were among the types of “entities” that could be penalized under that section. Producers and PROs are the only specific types of entities mentioned in section 42081. Therefore, “any entity” in section 42081, and all the enforcement provisions of that Article 5, are intended to refer only to producers, PROs, retailers, and wholesalers. There are no other enforcement provisions in the SB 54 statutes. Again, this error should be corrected.

Response to O-78-3

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment O-73-3, which is substantively the same as this comment.

Comment O-78-4

Topic #3: Categorically Excluded Materials – Section 18980.2

The May 2025 version of the draft regulations added for the first time in the rulemaking process a new pathway for packaging components to be excluded from the law if it is “necessary to comply with rules, guidance, or other standards issued by the [USDA] or [FDA] … to prevent microbial contamination or to maintain the safety or structural integrity of packaging….”

We appreciate the revisions made in section 18980.2(a)(2) of the current version of the draft regulations to clarify these exclusions apply only “if it is not reasonably possible to use other packaging or packaging components…” and requiring that entities must provide rationale to the Department including the conflicting federal regulation and explanation as to why no reasonably possible alternative packaging is available. We also support the addition requiring the Department to review exclusion requests and maintain a public list of determinations.

We understand that this new categorical exclusion is intended to provide further clarity to statute section 42060(b), which, in summary, states that SB 54’s regulations should not conflict with other federal packaging requirements. We believe that should such a conflict arise, producers can utilize the exemption pathway within section 18980.2.4(c)(4), under, for example, (A) unique challenges, (C) health and safety reasons, or (D) materials determined unsafe to recycle.

Unlike categorically excluded materials, exempted materials remain covered under the law, meaning regulated producers must still report and pay fees into the system with a required phase-in plan to ultimately achieve compliance. Exemptions are also limited to

two to five years, while excluded materials are permanently removed from the law's purview. Care must be taken when excluding materials so as not to unintentionally weaken SB 54.

Recommendation:
We urge CalRecycle to remove section 18980.2(a)(2) from the draft regulations and instead rely on the existing exemption process (18980.2.4) for packaging or packaging components used by food or agricultural commodities that are unable to comply with SB 54 due to conflicting federal regulations.

Should the Department determine that section 18980.2(a)(2) must remain in the regulations, we would like to offer the following revisions to improve the current approach:

• Entities should be required to explain why an exemption under section 18980.2.4 does not apply in their case, providing the statutory basis to exclude their packaging or component from the law entirely rather than request an exemption based on unique challenges or health and safety reasons.

The Department must be able to evaluate the basis for applying an exclusion versus an exemption, and redirect requests to a more appropriate pathway when applicable.

Suggested revisions to section 18980.2(a)(2)(A):
"The basis shall identify the specific provision of this Chapter that causes a conflict, cite the conflicting federal regulations or rules, ~~or guidelines,~~ and explain why no reasonably possible alternative packaging or packaging component is available and why the exemption pathways outlined in section 189890.2.4 do not apply."

Note: We also recommend removing "guidelines" because federal guidelines are not always compulsory.

• Time limits – Packaging design and recyclability are shifting rapidly as a result of SB 54. As such, materials excluded under section 18980.2(a)(2) should be limited to 2-5 years, just as exemptions are (18980.2.4(g)) and a phase-in plan or rationale for why a phase-in plan is not feasible should be required, similar to section 18980.2.4(c)(4)(A)viii for exemptions.

Innovation and development of responsible end markets will likely create new compliance pathways for materials that are currently unable to meet the requirements of the law. Excluding currently challenged materials from the law indefinitely goes beyond statutory intent, and should future conditions change, there must be a pathway to integrate excluded material back into the law.

Response to O-78-4

CalRecycle partially accepts and partially rejects this comment as described in response to comment I-59-2, which is substantively the same as this comment.

Comment O-78-5

We are also opposed to the addition of language that exempts packaging used for over-thecounter drugs (18980(a)(6). As we understand it, the inclusion of over-the-counter drugs into the list of categorically excluded materials conflicts with the legislature's intent when it enacted SB 54. Over-the-counter drugs already use packaging that is well-suited for source reduction, packaging material changes, and reuse and refill.

Furthermore, we strongly oppose the regulatory change that exempts the secondary and tertiary packaging of excluded materials (18980.2(b)). We believe that these changes are unnecessary and go beyond the intent of the authors and many stakeholders that negotiated this bill.

Response to O-78-5

CalRecycle rejects this comment for the reasons provided in responses to comments O-49-1 and O-33-6.

Comment O-78-6

Topic #4: Methodology for Recycling Rate Determination – Section 18980.3.2

For new covered material categories with a pending recycling rate, it is more rational to presume that they do NOT achieve the required recycling rate under Public Resources Code section 42050(c), rather than that they do meet the rate. Without this presumption, producers could avoid the recyclability requirements by changing to a new form of packaging every year, circumventing the law and unintentionally disadvantaging other producers. It is challenging to determine, and to meet, the recyclability requirements of SB 54, and new items should not be exempt from going through the process that all the other covered items that have met the required recycling rate have had to go through.

Response to O-78-6

Comment rejected. The commenter conflates two independent requirements of Public Resources Code section 42050. Subdivision (c) concerns recycling rates, whereas subdivision (b) concerns recyclability. Moreover, the commenter's concern is that producers might "chang[e] to a new form of packaging every year," but that concern assumes that there can be a new covered material category every year to switch to; that is not a realistic possibility. But, even if it were to happen, the commenter is nonetheless incorrect that switching to each new covered material category annually would have any effect on compliance with the recyclability requirement of Public Resources Code section 42050(b). Finally, a negative presumption while data on a new covered material category remains pending would make it impossible to establish any new covered material category without creating a serious compliance obstacle that would need to be addressed through exemptions and corrective action plans. The presumption described in 18980.3.2(f) is a far more efficient, practical approach.

Comment O-78-7

Topic #5 – Eligibility for Being Labeled "Compostable" – 18980.3.3(c)(5)

AB 1201 prohibits materials from being labeled "compostable" unless they meet specific criteria, including the requirement to be "designed to be associated with the recovery of desirable organic wastes, such as food scraps and yard trimmings, that are collected for composting, unless the product complies with the department's regulations pursuant to subparagraph (B), to the extent the department elects to adopt such regulations." (PRC § 42357(g)(1)(E).)

Section 18980.3.3(c)(5) of the draft SB 54 regulations clarifies that an item is designed to be associated with the recovery of desirable organic waste "if it is desirable organic waste itself or is marketed, labeled, or otherwise sold or distributed in a manner that directs or otherwise causes users of the item to use and discard it with desirable organic waste." This language is too broad. Marketing and labeling can be misleading, and are not even mentioned in PRC section 42357(g)(1)(E).

Recommendation:

A potential fix for this issue would be to simply delete the second sentence of section 18980.3.3(c)(5), as follows:

They must satisfy the requirement set forth in subparagraph (E) of paragraph (1) of subdivision (g) of section 42357 of the Public Resources Code concerning association with the recovery of desirable organic wastes. ~~For purposes of this requirement an item is designed to be associated with the recovery of desirable organic waste if it is desirable organic waste itself or is marketed, labeled, or otherwise sold or distributed in a manner that directs or otherwise causes users of the item to use and discard it with desirable organic waste.~~

Response to O-78-7

Comment rejected. The commenter requests deletion of the second sentence of 18980.3.3(c)(5) because it is "too broad," but deleting it could only render the regulations less clear. Moreover, simply deleting it would leave nothing in 18980.3.3(c)(5) other than a recitation of Public Resources Code section 42357(g)(1)(E), with no clarification of how that statutory provision should be applied. Lastly, CalRecycle disagrees with the commenter's suggestion that marketing and labeling should not be considered. They are highly relevant to whether, as required by statute, that material be "designed to be associated with the recovery of desirable organic wastes."

Comment O-78-8

Topic #6: Responsible End Market for Plastic Materials

Under PRC Code section 42040 (aa) (3) **"..in order for a covered material to be considered recycled, it must be sent to a responsible end market."** For plastic

materials, under proposed regulations section 18980.4 (b) (4), ***"...the end market is the entity that first produces plastic feedstock that meets the quality standards necessary to be used in lieu of virgin materials for the creation of new or reconstituted products. Such end markets include, but are not limited to, entities that create pellet."***

The proposed language above would enable the receipt of a bale of plastics at a facility capable of producing pellet from that bale to be counted as recycling – regardless of whether that pellet was ever produced and regardless of whether that plastic was actually ever recycled into a new product. As demonstrated in the SB 54 Advisory Group's report on Plastic Leakage, plastic production in 2025 continues to grow beyond the capacity for collection and recycling programs to capture and recover those materials.
Until the demand for manufacture-ready plastics exceeds the supply, accumulating bales or piles of plastics should not be counted as recycling, as there are no assurances that such stockpiled materials will actually be made into products and there is no tracking mechanism within SB 54 to assure such actual production of a recycled product at any time in the future.

This proposed regulation also creates challenges in assessment of recycling rates at responsible end markets, in that proposed regulations section 18980.4 (a) (4) (A)(i): ***"For any period, average recycling yield shall be calculated by taking the total weight of material that has been recycled and dividing it by the total weight of material that has been accepted by the end market and not sent to a responsible end market for further processing."***

For these reasons we recommend that proposed regulations section 18980.4 (b) (4) be revised as follows: ***"...the end market is the entity that first produces plastic feedstock ~~that meets the quality standards necessary to be~~ used in lieu of virgin materials for the creation of new or reconstituted products ready for sale using such plastic feedstock. Such end markets do not include, ~~but are not limited to,~~ entities that create pellet."***

Response to O-78-8

CalRecycle rejects this comment. See the response to comment O-73-8.

Comment O-78-9

Topic #7: Definition of Hazardous Waste

The regulations reference the *federal* definition of hazardous waste, and not the California state definition, which is far more protective of public health and the environment. This problematically opens the door to the generation of hazardous wastes that are not considered federally hazardous but should otherwise be considered 'California Hazardous.' This includes more protective toxicity tests, lower thresholds for heavy metals (e.g., lead, copper, zinc), lower thresholds for ignitability, lower thresholds

for reactivity and corrosion, and prohibitions on certain chemical products and pharmaceuticals.

A more appropriate definition is the one already existing in Public Resources Code Section 40141, which defines “hazardous waste” for all of Division 30 of the Public Resources Code except where “the context requires otherwise.” That section defines “hazardous waste” to include, but does not limit the definition to, RCRA hazardous waste. It also cross-references Health and Safety Code 25117, which includes any wastes that meet criteria adopted by the Department of Toxic Substances Control (DTSC).

The legislature has repeatedly stated, and the courts have upheld, that “it is in the interest of the health and safety of all Californians...to establish a regulatory program that is more stringent than federal law” (Health & Safety Code 25100) when it comes to hazardous waste. In the absence of other statutory direction, the Department must default to California statutory and regulatory definitions when implementing state laws, like SB 54.

Response to O-78-9

CalRecycle rejects this comment for the reasons provided in response to comment O-62-1.

Comment O-78-10

Topic #8: Chemical Recycling

Despite clear statutory direction to the contrary, the regulations allow a PRO to use nonmechanical recycling technologies that produce significant amounts of hazardous waste.

Public Resources Code Section 42041(aa)(5) require CalRecycle to exclude plastic recycling technologies that produce significant amounts of hazardous waste. On the contrary, Proposed Regulation Section 18980.4.1(d) seeks to allow recycling facilities to generate ANY amount of hazardous wase as long as it is handled and disposed of in compliance with an applicable permit. This clearly exceeds CalRecycle’s regulatory authority and jeopardizes implementation of the law. SB 54 clearly prohibits the ***production*** of significant amounts of hazardous waste – it does not prohibit the ***unauthorized management of significant amounts of hazardous waste*****,** as outlined in the proposed regulations. Simply stated, SB 54 is concerned with generation, not management or disposal, of hazardous waste.

The regulations also presuppose that materials will be managed domestically, where permits and laws regulate the management and disposal of hazardous waste. Foreign markets may not have hazardous waste disposal requirements commensurate with the Resource Conservation and Recovery Act. In the absence of an equivalent regulatory environment, the regulations would allow foreign chemical recycling facilities to manage hazardous wastes as ordinary trash.

To align the regulations with existing statutory law, CalRecycle must strike proposed Section 18980.4.1(d)(1)(B):

~~(B) The production and management of hazardous waste that is handled and disposed of in compliance with an applicable permit does not present a substantial risk of harm to public health or of contamination of the environment, for purposes of the Act and this chapter. Minor technical violations or minor deviations from permit conditions that do not result in, or are not reasonably likely to lead to, actual environmental harm or harm to public health shall not, by themselves, be considered noncompliance for purposes of this section.~~

Thank you for your consideration of these comments.

> **Response to O-78-10**
> CalRecycle rejects this comment for the reasons provided in response to comment O-62-1.

O-79: City of Oakland (Rebecca Parnes)

Comment O-79-1

Dear CalRecycle,

This letter is in response to the formal draft of the SB 54 regulations released on August 22, 2025. We appreciate CalRecycle's responsiveness to several concerns and recommendations that were raised by local government and other stakeholders since the May 2025 draft. While we understand the need to finalize regulations given the regulatory restart, there are still several areas in the draft regulations that we believe do not fully align with the intent of the law. We offer the following comments and suggested regulatory revisions to help achieve alignment with the law's intent to accelerate progress toward circularity for packaging and foodware, protect ratepayers, and make local governments whole for costs associated with the law's implementation. Thank you for your consideration of the recommendations below.

> **Response to O-79-1**
> Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process. To the extent other portions of the submission do suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-79-2

Article 2: Covered Material and Covered Material Categories

Categorically Excluded Materials – 18980.2

The May 2025 version of the draft regulations added for the first time in the rulemaking process a new pathway for packaging components to be excluded from the law if it is "necessary to comply with rules, guidance, or other standards issued by the [USDA] or [FDA] ... to prevent microbial contamination or to maintain the safety or structural integrity of packaging...."

We appreciate the revisions made in section 18980.2(a)(2) of the August 2025 (current) version of the draft regulations to clarify these exclusions only apply when "it is not reasonably possible to use other packaging or packaging components..." and requiring that entities must provide rationale to the Department including the conflicting federal regulation and explanation as to why no reasonably possible alternative packaging is available. We also support the addition requiring the Department to review exclusion requests and maintain a public list of determinations.

The Department has stated this new categorical exclusion is intended to provide further clarity to statute section 42060(b) which, in summary, states that SB 54's regulations should not conflict with other federal packaging requirements. We believe that should such a conflict arise, producers can utilize the exemption pathway within subparagraph (4) of section 18980.2.4 Exemptions for Certain Covered Materials for (A) unique challenges, (C) health and safety reasons, or (D) materials determined unsafe to recycle.

Unlike categorically excluded materials, exempted materials remain covered under the law, meaning regulated producers must still report and pay fees into the system with a required phase-in plan to ultimately achieve compliance. Exemptions are also limited to 2-5 years, while excluded materials are permanently removed from the law's purview.

Recommendation: **We urge CalRecycle to remove section 18980.2(a)(2) from the draft regulations and** instead rely on the existing exemption process (18980.2.4) for packaging or packaging components used by food or agricultural commodities that are unable to comply with SB 54 due to conflicting federal regulations.

Response to O-79-2

CalRecycle partially accepts and partially rejects this comment and comments O-79-3 and O-79-4 as a group, as described in response to comment I-59-2, which is substantively the same as the group of comments.

Comment O-79-3

Should the Department determine section 18980.2(a)(2) must remain in the regulations, we would like to offer the following revisions to improve the current approach:

- Exclusion vs. exemption rationale – Entities should be required to explain why an exemption under section 2.4 does not apply in their case, providing the statutory

basis to exclude their packaging or component from the law entirely rather than request an exemption based on unique challenges or health and safety reasons.

The Department must be able to evaluate the basis for an exclusion vs. exemption and redirect requests to a more appropriate exemption pathway when applicable.

Suggested revisions to section 18980.2(a)(2)(A): *"The basis shall identify the specific provision of this Chapter that causes a conflict, cite the conflicting federal regulations or rules, ~~or guidelines,~~ and explain why no reasonably possible alternative packaging or packaging component is available and why the exemption pathways outlined in section 189890.2.4 do not apply."*

Note: We also recommend removing "guidelines" (as shown above), as federal guidelines are not always statutorily compelling.

Response to O-79-3

CalRecycle partially accepts and partially rejects this comment and comments O-79-2 and O-79-4 as a group, as described in response to comment I-59-2, which is substantively the same as the group of comments.

Comment O-79-4

- Time limits – Packaging design and recyclability are shifting rapidly as a result of SB 54. As such, materials excluded under section 18980.2(a)(2) should be limited to 2-5 years, just as exemptions are (18980.2.4(g)) and a phase-in plan or rationale for why a phase-in plan is not feasible should be required, similar to section 18980.2.4(c)(4)(A)viii for exemptions

Innovation and development of responsible end markets will likely create new compliance pathways for materials that are currently unable to meet the requirements of the law. Excluding currently challenged materials from the law indefinitely goes beyond statutory intent, and should future conditions change, there must be a pathway to integrate excluded material back into the law.

Response to O-79-4

CalRecycle partially accepts and partially rejects this comment and comments O-79-2 and O-79-3 as a group, as described in response to comment I-59-2, which is substantively the same as the group of comments.

Comment O-79-5

We are also opposed to the addition of language that exempts packaging used for over-the-counter drugs (18980(a)(6), and we oppose the regulatory change that exempts secondary and tertiary packaging of exempted and excluded primary packaging

(18980(b)). We feel these changes go beyond the intent of the authors and many stakeholders that negotiated this bill.

Response to O-79-5

CalRecycle rejects this comment for the reasons provided in response to comments O-49-1 and O-33-6.

Comment O-79-6

Article 3: Evaluations of Covered Material and Covered Material Categories

Eligibility for Being Labeled "Compostable" – 18980.3.3

AB 1201 prohibits materials from being labeled "compostable" unless they meet specific criteria, including the requirement to be "designed to be associated with the recovery of desirable organic wastes, such as food scraps and yard trimmings, that are collected for composting, unless the product complies with the department's regulations pursuant to subparagraph (B), to the extent the department elects to adopt such regulations." (PRC 42357(g)(E))

Section 18980.3.3(5) of the draft SB 54 regulations clarifies that an item is designed to be associated with the recovery of desirable organic waste *"if it is desirable organic waste itself or is marketed, labeled, or otherwise sold or distributed in a manner that directs or otherwise causes users of the item to use and discard it with desirable organic waste."*

This regulatory framing essentially provides that any material marketed or labeled to be composted,is considered "associated with the recovery of desirable organic waste" and therefore potentially compostable under SB 54 (if other criteria are met). The intent of section 42357(g)(E) is that a product facilitates the capture of desirable organics, such as food scraps and yard waste. Section 18980.3.3(5) of the current draft regulations effectively says that to be able to be labeled "compostable," a product simply needs to be labeled "compostable," provided it meets the other criteria in section 42357. Allowing all packaging and food ware, regardless of its material composition, bearing a "compostable" label to be considered "desirable" was certainly not the intent of AB 1201, and the draft regulations must be updated to close this unintended loophole. Further, while the SB 54 regulations will only affect food ware and packaging, including this definition in these regulations could open the door for the same or similar circular logic to be applied to other products seeking to be labeled compostable.

Recommendation: We recommend deleting the following sentence from section 18980.3.3(5) of the draft regulations: "They must satisfy the requirement set forth in subparagraph (E) of paragraph (1) of subdivision (g) of section 42357 of the Public Resources Code concerning association with the recovery of desirable organic wastes. ~~For purposes of this requirement an item is designed to be associated with the recovery of desirable organic waste if it is desirable organic waste itself or is marketed, labeled,~~

~~or otherwise sold or distributed in a manner that directs or otherwise causes users of the item to use and discard it with desirable organic waste."~~

Response to O-79-6

CalRecycle rejects this comment for the reasons provided in responses to comments I-59-3 and O-78-7.

Comment O-79-7

Article 4 – Responsible End Markets

Alternative Recycling Technologies – 18980.4(d)

PRC section 42041(aa)(5) states that the SB 54 regulations "shall encourage recycling that minimizes generation of hazardous waste, generation of greenhouse gases, environmental impacts, environmental justice impacts, and public health impacts. The regulations shall also include criteria to exclude plastic recycling technologies that produce significant amounts of hazardous waste." However, section 18980.4(d)(B) in the current version of the draft regulations goes against this statutory direction and shifts the standard from the generation or production of hazardous waste to its management.

The draft regulations enable — not exclude — technologies that produce significant amounts of hazardous waste, unlawfully shifting the standard from the production of hazardous waste (as required by the statute) to its management. Therefore, the threshold of avoiding only those technologies where hazardous waste is improperly managed and "presents an imminent and substantial risk of harm to public health or to the contamination of the environment" does not achieve the statutory mandate. Further, the draft regulations state that any hazardous waste handled and disposed of in "substantial compliance with an applicable permit" does not pose an imminent and substantial risk. This, too, conflicts with statutory guidance and legislative intent to exclude technologies based on the generation, not management, of hazardous waste.

Response to O-79-7

CalRecycle rejects this comment for the reasons provided in response to comment O-62-1.

Comment O-79-8

Additionally, the regulations still fail to address the statutory requirement to encourage minimization of the "generation of greenhouse gases, environmental impacts, environmental justice impacts, and public health impacts." (The draft regulations currently only address hazardous waste generation/management.) We urge the Department to add provisions to address these critical concerns and meet the statutory directives.

Response to O-79-8

Comment rejected. The comment only makes a vague suggestion to address specified environmental and public health impacts but does not suggest specific changes to the proposed regulations or raise objections related to the rulemaking process. Moreover, for the reasons specified in response to comment O-62-1, the proposed regulations already adequately encourage recycling that minimizes such impacts, as set forth in PRC section 42041(aa)(5).

Comment O-79-9

Compostability of plastic – 18980.4(a)(4)(B)

We appreciate clarification of the use of the term "fully biologically decompose," and reference tothe ASTM D-6400 standard. We strongly support the Department's requirements for items "partially or wholly comprising plastic." Visible particles of compostable plastic in compost products hamper the marketability of those products. There is also a growing body of research showing the compostable microplastic residue has detrimental effects on plant and soil health, and potentially human health. Because of this, the City of Oakland has banned the distribution of compostable plastics in Oakland and urges CalRecycle to do the same.

Response to O-79-9

CalRecycle rejects this comment. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-79-10

Compostability of paper and fiber – 18980.4(a)(4)(C) and 18980.3(c)(4)

We support the regulatory approach to have different compostability standards for paper and fiber than for plastic. However, with the requirement for testing from an independent laboratory in section 18980.3(c)(4) removed, we are concerned the new proposed compostability standards for paper and fiber may provide a perverse incentive for bad actors to maintain vague or otherwise insufficient documentation demonstrating that the fiber truly is "wholly derived from natural resources." Some form of verification of or attestation that a product is wholly derived from natural resources should be required to be submitted to the Department.

Response to O-79-10

CalRecycle rejects this comment for the reasons provided in response to comment O-68-6.

Comment O-79-11

Article 8 – Producer Responsibility Plan Requirements

Reimbursable costs – 18980.8(g)

While we appreciate the addition to this section requiring that the PRO or Independent Producer "first" notify the local jurisdiction when costs are deemed covered for a recycling service provider this does not go far enough to protect rate payers. This will be a helpful tool to enhance transparency, however it is not a statutory prohibition from recycling service providers from including a request that rate payers cover the exact same costs reimbursed by the PRO. This section of the regulations should specifically be updated to make it against the law for recycling service providers to charge rate payers for costs reimbursed by the PRO. Relying solely on that informational tool to deter fraud and abuse will disproportionately burden local jurisdictions with policing and enforcing the exclusion of reimbursed costs from rates.

Recommendation: We strongly recommend the Department make the following addition to draft regulations section **18980.8(g)** to protect rate payers:18980.8(g) (8)(A)The PRO's notification to both the recycling service provider and jurisdiction shall make clear the value of the covered costs shall benefit the rate payers in the local jurisdiction and shall make clear that recycling service providers cannot charge rate payers for the same service for which it receives a payment from the PRO for covered costs. If the PRO payment is to reimburse past costs already included in rates paid by rate payers, the recycling service provider shall pass on the reimbursement payment as a savings or benefit to rate payers in the next future rate increase calculation.

Response to O-79-11

CalRecycle rejects this comment for the reasons stated in response to comment I-51-1.

Comment O-79-12

Article 11: Requirements, Exemptions, and Extensions for Local Jurisdictions and Recycling Service Providers

Local jurisdiction requirement – 18980.11(b)

PRC section 42060.5 states "local jurisdictions or recycling service providers shall include in their collection and recycling programs all covered material" contained on the statewide recyclable / compostable list. The current draft of the regulations provides that a "covered material is considered included in a local jurisdiction or recycling service provider's collection and recycling program ifthe local jurisdiction or recycling service provider collects the covered material and transfers it to responsible end markets directly or to intermediate supply chain entities."

We believe that including the requirement to also transfer recyclable and compostable covered material goes beyond the statutory requirement for local jurisdictions. This framing also makes it difficult to attribute violations to the correct party, muddying the distinction of where the enforceability of a jurisdiction for a violation of this requirement ends and the point at which that responsibility transfers to a recycling service provider or an intermediate supply chain entity. Jurisdictions need clear guidance on what's expected for compliance and how compliance will be determined.

Recommendation: Delete ~~"and transfers it to responsible end markets directly or to intermediate supply chain entities."~~

Response to O-79-12

CalRecycle rejects this comment for the reasons provided in response to comment I-59-7.

Comment O-79-13

Article 13: Enforcement Oversight by the Department

The draft regulations must recognize that SB 54's Enforcement Authority is limited to producers and the PRO and respect that local jurisdictions and recycling service providers are instead subject to existing enforcement regimes under AB 939. Great lengths are taken in statute to outline the potential enforcement actions that can be imposed against producers or the PRO, yet there is not a single instance in statute that refers to enforcement upon local jurisdictions or recycling service providers. Neither Public Resources Code Sections 42080 nor 42081 contemplate penalties against local governments or recycling service providers.

Local jurisdictions are subject to AB 939's diversion requirements and must develop source reduction and recycling elements outlining how they will achieve the state's solid waste and recycling requirements. Under the AB 939 framework, CalRecycle is required to regularly review jurisdictions and determine whether they have made a good faith effort to implement their source reduction and recycling element, with penalties of up to $10,000/day for noncompliance. Therefore, a local jurisdiction's failure to comply with SB 54 should be considered a violation of their existing requirements to implement diversion programs through AB 939 and subject them to these penalties exclusively.

Reporting and compliance review for SB 54 should be incorporated into existing Electronic Annual Report (EAR) system run by CalRecycle, as currently utilized for other laws that govern local jurisdiction diversion requirements such as SB 1383, AB 341, and AB 1826 compliance. This existing system can be updated to require local jurisdictions to self-report SB 54 compliance by certifying whether they include the required recyclable or compostable covered materials in their programs.

We appreciate the CalRecycle team's openness to feedback and continued dialogue to ensure the final regulations will provide a foundation for successful implementation of the law.

Response to O-79-13

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment I-59-8, which is substantively the same as this comment.

O-80: California Strawberry Commission (Rick Tomlinson)

Comment O-80-1

The California Strawberry Commission (CSC) is writing in support of the **SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act Permanent Regulations**, as proposed on August 22, 2025 (Proposed Regulations). The CSC appreciates all the efforts made by CalRecycle to address our past comments1 and align the Proposed Regulations with the Plastic Pollution Prevention and Packaging Producer Responsibility Act (the Act).

California berry farmers remain committed to environmental sustainability and meeting the diverse needs of consumers for nutritious, affordable, and safe fruit. In fact, strawberries have become a staple food in the American diet and are the number one source of vitamin C from fresh fruit. California strawberry farms also play a vital role in supporting the global agricultural economy, positioning California as the world's fourth-largest economy, and contributing directly to local, national, and international food security. Currently, California strawberry farmers are responsible for nearly 90 percent of the strawberries produced in the U.S. and provide over 50,000 jobs, contributing directly to food and economic security.

In the 1990s, berry farmers invented the clear plastic clamshell to reduce food waste, improve transport, and enhance food safety. By the early 2000s, berry clamshells contained more than 50% recycled content. For many years, CalRecycle highlighted the berry clamshell as a success story. In fact, for nearly a decade, California berry clamshells contained the most recycled content of any food package in the nation.

Today, California berry clamshells are officially declared "recyclable" and exceed nearly all SB54 requirements. Berry farmers are sourcing new berry clamshells with recycled plastic from post-consumer clamshells to create a circular economy. We are leading by example to show how farmers are moving faster and more cost-effectively than regulations to invent and optimize the most sustainable berry package in the world.

We greatly appreciate that the Act recognized the work of berry farms as well as the unique challenges of farming when it excluded agricultural operations from being a "producer"2. Field pack is a standard practice for strawberries and other berries.

The Proposed Regulation Section 18980.1(17)(B) adds important definitions consistent with the Act. Section 18980.1(17)(C) also provides a useful definition that combined with Public Resources Code Section 42041, reaffirms and further clarifies that products in single use packaging that are exported out of California are not covered material. Section 18980.1 (17)(F) clarifies that mere transportation does not make the transporter a "producer". Likewise, Section 18980.1(17)(H) provides additional clarity to Public Resources Code Section 42041 (w)(4) for agricultural commodities that are not a "producer"2.

We acknowledge the Department for implementing the above referenced sections of the Proposed Regulations in a manner consistent with the Act's definition that berry brand owners and farming operations are not considered a "Producer" for purposes of the Act and Proposed Regulations. The economic impact of changing these definitions would be significant. Many agricultural commodities grown in California are exported from the state and must meet the legal requirements of those end markets. If the definitions were changed and did not align with the Act, the combined economic impact to California agricultural commodities would increase from millions of dollars annually, to billions of dollars and require a new Standardized Regulatory Impact Assessment (SIRA).

We also appreciate the Governor's concerns about the impact on food prices and consumers. Earlier this year, Oregon implemented an extended producer responsibility program, and the annual fees are more than what some farmers earn. In such cases, the brand owner and farmer have no choice but to pass the cost increases forward or stop selling to that state. In fact, we can confirm that some berry operations have stopped selling California strawberries to Oregon as a result of their EPR program.

The addition of Section 18980.2 now makes the regulation consistent with Chapter 3 Section 42060(b)(1) of the Act which states, *"the department shall ensure that any regulations adopted pursuant to this chapter consider guidelines and do not conflict with regulations issued by the United States Food and Drug Administration and the United States Department of Agriculture and consider requirements imposed by other California state agencies."*

It is critical that the above Section is implemented into the permanent regulation, so as to avoid the real-world conflicts between state and federal requirements as well as to avoid cost increases to food. As initially stated, California berry clamshells are officially declared "recyclable" and exceed nearly all SB54 requirements. Berry farmers are sourcing new berry clamshells with recycled plastic from post-consumer clamshells to create a circular economy. We are leading by example to show how farmers are moving faster and more cost-effectively than regulations to invent and optimize the most sustainable berry package in the world.

Implementation of Section 18980.2 does NOT undermine the goals of SB54. Instead, Section 18980.2 addresses legal precedent already acknowledged in the Act that will simultaneously ensure food safety and avoid unnecessary cost increases to consumers.

The following is a summary of some of the real-world conflicts that demonstrate the importance of maintaining Section 18980.2.

1. California's SB 54 is in direct conflict with the US Food and Drug Administration's (FDA) Food Safety Modernization Act (FSMA) and other federal standards for strawberry packaging

2. Single-use fiber/paper-based packaging has higher environmental impact and higher food safety risk

3. Economic impact and impacts on disadvantaged communities (DACs)

4. Additional Considerations

1. California's SB 54 is in direct conflict with the US Food and Drug Administration's (FDA) Food Safety Modernization Act (FSMA) and other federal standards for strawberry packaging

Beginning in 2015, as a result of several food illness outbreaks, the U.S. Food and Drug Administration (FDA) developed science-based minimum standards for the safe growing, harvesting, packing, and holding of produce, meaning fruits and vegetables grown for human consumption3. The objective of the standards was to minimize the risk of serious adverse health consequences or death from consumption of contaminated produce.

In Section 112:116 of 21 CFR under "Growing, Harvesting, Packing, and Holding Activities" of the FDA rule titled Standards for the Growing, Harvesting, Packing, and Holding of Produce for Human Consumption, measures taken for food packaging and material must;

"(a) Use food-packing material that is adequate for its intended use, which includes being:

(1) Cleanable (for reuse) or designed for single use; and
(2) Unlikely to support growth or transfer of bacteria."

The current plastic clamshell complies fully with the federal standards noted above. There is currently no viable alternative to ensure "cleanable or single use" and "unlikely to support growth or transfer of bacteria". Further there is no alternative packaging that is reusable after ensuring the food contact surfaces are clean. In the next several sections, we substantiate how the current plastic PET clamshell complies with all federal standards and must be therefore excluded as a covered material under SB 54 regulations.

"Use food-packing material that is adequate for its intended use" - 21 CFR Parts 112:116 (a)

The "intended use" in this case is fresh strawberry packing, shipping and delivery for consumer food consumption. The FDA requires that packing into primary, secondary, and tertiary packaging and the transportation of that packaging be compliant with FDA code sections to ensure that the packaging, storage, and transportation prevent "adulteration" (which includes spoilage), and insanitary conditions (food contamination). FDA food safety guidelines further emphasize USDA requirements as related to microbial contamination, reduce contamination during strawberry harvesting, processing and packaging, and ensure temperature controls are maintained to reduce and slow microbial growth.

It is important to note that FDA and other federal guidance documents provide a clear, acceptable path to compliance with legally binding statutes and regulations, such as the Food Safety Modernization Act (FSMA) and other critical food safety protective

measures. These documents have been previously reviewed and deemed acceptable by the FDA to meet these underlying legal requirements. Following FDA guidance documents, in addition to adhering to the mandated rules and regulations, represents the gold standard for operational excellence and food safety requirements.

The existing thermoform plastic PET single-use clamshells for strawberries meet stringent federal guidelines by providing robust structural protection against physical damage to the fruit, facilitating rapid cooling through strategically designed venting systems to enhance shelf life of the product, and ensuring cleanliness to minimize exposure to potential contaminants including fungal growth. For example, the United States Department of Agriculture (USDA) has established specific requirements for US Grade No. 1 and Grade No. 2 strawberries4, which are the grades predominantly found in grocery stores for fresh strawberry consumption by consumers. Other grades of strawberries, which don't typically use clamshell packaging, are reserved for processing into products such as juices and fruit cups. For a strawberry to qualify as Grade No. 1, it must be “firm, not overripe or undeveloped, and which are free from mold or decay and free from damage caused by dirt, moisture, foreign matter, disease, insects, mechanical, or other means. Each strawberry has not less than three-fourths of its surface showing a pink or red color.” Minimum fruit size must be at least ¾ inch in diameter. Grade No. 2 strawberries must be “free from decay and free from serious damage caused by dirt, disease, insects, mechanical or other means. Each strawberry has not less than one-half of its surface showing a pink or red color.” Strawberry size must have a minimum diameter of ⅝ inch. The USDA's tolerances permit that no more than 10% of strawberries in a shipment may fail to meet these grade standards, and further, no more than 2% may exhibit decay. The USDA also specifies requirements for a “US Combination” which consist of packaging with Grade No. 1 and 2. These grades are established to standardize quality and facilitate efficient trade while at the same time providing a high quality and consistent product to consumers.

To meet USDA requirements, the California strawberry farmers utilizes the thermoform plastic PET clamshell packaging to provide several critical benefits that enhance fruit quality and contribute to keeping consumer prices low:

• Consumer Transparency: The clear plastic used in clamshells allows consumers to visibly inspect the quality of the strawberries before making a purchase, thereby fostering transparency and trust in food purchases.
• Rigid Structural Protection: Constructed from durable and lightweight polyethylene terephthalate (PET) and recycled polyethylene terephthalate (rPET), clamshells are designed to prevent bruising, crushing, and mechanical damage that can occur during harvesting, handling and transportation.
• Ventilation Design: The inclusion of strategically positioned sidewall, top, and bottom vents facilitates rapid cooling to between -1 and 32°C and relative humidity levels of 5095% (moisture levels) while ensuring proper air circulation thereafter. This design effectively reduces moisture buildup, which can lead to mold growth, thus preserving the quality of the strawberries and increasing shelf-life.

• Secure Closure: Clamshells feature hinged lids equipped with patented locking mechanisms (pin locks or tri-lock buttons). These closures prevent accidental opening and contamination of the fruit, ensuring that the strawberries remain in uncontaminated condition from farm to consumer.
• Stackability for Efficient Transport: The clamshells are specifically designed to fit standard cardboard trays, allowing for efficient stacking during harvesting, transportation and storage. This design not only optimizes space but also contributes to reduced greenhouse gas emissions by decreasing the fuel consumption required for transport, ultimately leading to lower costs for consumers.

The SB 54 regulations highlight the importance of lightweighting packaging over time. Thermoform plastic PET clamshells are already lightweighted to ensure the highest possible rigidity for structural integrity in the transportation of strawberries and to ensure food safety (e.g., ventilation points to avoid moisture accumulation which can lead to the development of molds). Lightweighting directly connects with transportation weight and subsequently fuel costs across the harvest and distribution supply chain. Further lightweighting of the thermoform plastic PET packaging is not possible as it will compromise USDA structural integrity standards of the package and damage the strawberries during transportation.

Consumers will not pay for damaged products which in turn will lead to increased food waste. Food waste in turn has been shown to emit methane greenhouse gases which have a global warming potential of 80 times more than carbon dioxide. The lightweighting requirements therefore in the regulations conflict directly with USDA guidelines for product quality and FDA food safety standards. The federal regulations highlight the importance of using single use packaging to ensure consumer food safety.3 The information presented relates directly to the plastic PET clamshell that is a *“food-packing material that is adequate for its intended use”* and consistent with FDA rules.

“Cleanable (for reuse) or designed for single use” - 21 CFR Parts 112:116 (a)(1)
The current plastic PET clamshell complies with federal standards because it is a packing material that is the best option for “single use”.

In the 1990s, after the development of thermoform plastic PET bottles for carbonated drinks, given their high strength and lightweighting compared to glass bottles, packaging suppliers created clear, rigid thermoformed plastic PET packaging containers for fruits and vegetables, including the current strawberry clamshell. The thermoformed PET plastic single-use clamshell, which was molded from plastic using heat and air pressure, allowed for clear transparency to see the fruit and increased consumer confidence that the product is safe. PET packaging is easily identifiable by the #1 resin code, it is a clear, durable and versatile plastic material. To ensure a reusable container for a ready to eat food item requires sanitation. Sanitization is the process of using high temperatures or high temperature water to clean and sanitize the product. Cleaning the plastic PET clamshell at high temperatures or with high temperature water would undermine the structural integrity, shape, and ability to reuse the plastic PET clamshell.

For example, glass milk bottles can go through several reuse steps since high temperature water or steam can be used to clean and sanitize the glass bottles without undermining the structural integrity of the glass bottle. For the plastic PET clamshell, the high temperature water will begin to melt the plastic and therefore undermine the structural integrity of the product to the point where its shape would change and can no longer be used for its “intended use” as defined in the FDA rule above. Therefore, any packaging must be “single use” given that no packaging material used for strawberries can be cleaned and sanitized.

Additionally, no dedicated collection and reuse program for the plastic PET clamshell currently exists to advance cleanability for reuse for several reasons. The most logical reason such a program does not exist is because consumers will not place a plastic PET clamshell in a separate collection bin amongst all the other plastic containers recycled. It is important to recognize that strawberry plastic PET clamshells are currently sorted and baled with PET carbonated bottles by several material recycling facilities. This baled material is used in the recycled content of the current plastic rPET clamshell used by farmers creating a closed-loop system for plastic PET clamshells.

“Unlikely to support growth or transfer of bacteria” - 21 CFR Parts 112:116 (a)(2)
The FDA standards state that food packaging material must not support the growth or transfer of bacteria. This rule is designed to ensure food safety and to reduce food borne illnesses. We highlight that the current plastic PET clamshell is the only packaging material that can offer the highest degree of certainty in limiting the growth and transfer of bacteria regarding this rule compared to other packaging materials.

It is well known that increased shelf life from packaging can reduce the ability of microbial bacterial growth. Plastic packaging also increases shelf life considerably. For example, plastic packaging increases shelf life for strawberries by 10 days, cucumbers by six days, and bell peppers by 16 days and can reduce food waste by 75 percent.5,6

Recent research7 has highlighted findings regarding microbial bacterial growth on various packaging materials, specifically comparing plastic PET clamshells to cardboard (paper-based) options. This study, conducted in 2023 in collaboration with strawberry farmers, academia (Clemson University), and a federal research lab (USDA Agricultural Research Services), aimed to investigate the potential for bacterial pathogens to proliferate on different packaging materials. The overarching goal was to gain insights into how these pathogens could transition through the strawberry supply chain, affecting both fields and containers based on the chosen packaging. Previous food science studies have indicated that diverse microorganisms can settle within the porous structure of corrugated cardboard, where bacterial growth may occur under suitable conditions, such as the presence of moisture. The findings from this 2023 study suggest that bacterial pathogens preferred cardboard over other materials tested. Cardboard paper-based material also resulted in the pathogen lasting up to 270 days after inoculation at significant levels. In contrast, plastic materials demonstrated the lowest and insignificant levels of bacterial growth which was only detected through 14 days.

These findings underscore the potential advantages of using plastic PET clamshells in enhancing food safety within the strawberry sector and that no other packaging material can provide the level of sanitary and food safety conditions as described in the FDA rules as the current plastic PET clamshell.

2. Single-use fiber/paper-based packaging has higher environmental impact and higher food safety risk.

For many decades, the strawberry farmers in California have been investing in sustainable packaging to address consumer concerns over plastics. In the early 2000s, packaging manufacturers incorporated recycled PET (rPET), initially sourced from recycled plastic beverage containers. One of the primary initiatives was to ensure the thermoform plastic PET packaging included rPET at certain percentages and that the plastic packaging was 100% recyclable. Currently, thermoformed PET plastic clamshells used in California are fully “recyclable” and exceed the requirements outlined in the regulations for recycling; “the packaging or food service ware must be shown to have had a recycling rate of at least 65 percent for 2024, 2025, and 2026, and at least 70 percent for 2027 and each year thereafter.”8 A survey conducted by the CSC in 2023 indicates that the average post-consumer recycled content in strawberry clamshells is more than 50% and often as high as 61%.9

The investments included requiring manufacturers of the plastic clamshell to purchase rPET from sorted bales for the use in strawberry packaging. One strawberry producer and distributor for example, worked closely with their clamshell provider to boost their average percentage of rPET derived from thermoforms from 0% to 10% by the end of 2021. Some clamshell providers even reached 25%.10 These investments included potentially higher prices (based on rPET demand) for the clamshells without drastically increasing the price of strawberries to the consumer. With adequate recycling infrastructure for sorting at Material Recovery Facilities (MRFs) and new and expanded reclaimer markets, the plastic PET clamshell can be considered 100% sustainable packaging. The farmers have also invested in making the entire strawberry package recyclable with the addition of biaxially-oriented polypropylene (BOPP) labels which are 100% recyclable. The strawberry sector continues to engage in research and development efforts to identify non-plastic packaging options for strawberries that will ensure the USDA structural integrity and FDA food safety guidelines can be met equivalent to the plastic thermoform PET clamshells.

In 2024, the USDA Foreign Agricultural Services (FAS) funded the Sustainable Packaging Innovation lab (SPIL) with a $5 million investment. The intent of the lab, a joint venture between USDA and the International Fresh Produce Association (IFPA), is designed to fund sustainable packaging that complies with international markets. Several other nations, especially in the European Union, have initiatives to reduce plastic packaging and increase recycling. The USDA FAS is committed to ensuring that packaging is not a hinderance to international trade agreements and therefore the investments are key to advancing alternative packaging options. The investments from USDA FAS are expected to yield new findings into sustainable packaging but not at the

same time frames specified in the regulations. For example, the regulations require that packaging by 2032 should be 100% compostable. The CSC believes that this is an ambitious timeframe to innovate the current packaging to a 100% compostable product by 2032. To this specific last point, we appreciate the ability of the CSC to petition for an industry-wide exclusion based on USDA and FDA guidelines for structural integrity and food safety of strawberries produced in and distributed from California.

No environmental analysis has been completed on the environmental tradeoffs of using paper/fiber-based packaging for strawberries or fruits and vegetables, in the Programmatic Environmental Impact Report (PEIR). The CSC has determined that paper/fiber-based products are 1.5 to 2 times heavier than the currently used lightweighted thermoform PET plastic clamshell. If the entire strawberry farmers were to use paper/fiber-based packaging for the 2024 strawberry harvest alone, the CSC estimates 10,000 acres of trees will be needed and would result in almost a million tons (900,000 tons CO2e) of carbon dioxide greenhouse gas emissions that will be added to earth's atmosphere each year. According to a 2023 report by Stravens (2023), a staggering 90% of paper pulp is derived from wood, with paper production being accountable for approximately 35% of all clear-felled trees globally. In fact, paper-based packaging has emerged as the predominant source of packaging waste within the European Union, contributing to an alarming 41.1% of total waste. This shift away from plastic packaging has not come without consequences, as only half of the produced paper and board is sourced from recovered fiber, with the remainder ending up in landfills, consequently producing significant amounts of methane - a more potent greenhouse gas than carbon dioxide.11 These estimates and findings directly conflict with state mandates to reduce greenhouse gas emissions to offset climate change from every sector including agriculture. No greenhouse gas emission data has been provided in the PEIR from alternative non-plastic packaging.

The greenhouse gas emission values above do not include additional vehicle miles travelled (VMT) because of the heavier paper/fiber-based packaging. Farmers feedback to CSC noted that with the increased paper/fiber weight compared to the already lightweighted thermoform PET clamshell, trucks taking packaging to strawberry fields will result in three-times more trips. Heavier weights of paper/fiber-based packaging means increased VMT which in turn results in increased fuel costs exponentially across the supply chain. Increased fuel costs lead to potentially higher consumer prices and increased carbon dioxide greenhouse gases. No VMT analysis has been completed in the PEIR for alternative packaging in the regulations that could be successful for industries to transition towards.

These findings show that the current thermoform PET plastic clamshell is best-available technology (BAT). BAT is defined by the Organization for Economic Co-operation and Development as the "the most effective and advanced stage in the development of industrial activities and their methods of operation, designed to prevent and, where that is not practicable, to reduce emissions and the impact on the environment as a whole".12 These findings underscore the strawberry farmers strong commitment to environmental sustainability and responsible packaging initiatives.

3. Economic impact and impacts on disadvantaged communities (DACs)

The CSC is evaluating the extent of EPR programs on strawberry prices through farmers surveys and estimated calculations based on recent EPR programs that have established fees for specific packaging (e.g., Oregon).

Oregon's EPR annual fees for plastic verses paper/fiber are 18 to 25 times greater (e.g., plastic clamshell fees range $1.4 per pound (lbs) while cardboard (paper/fiber) fees are $0.08 per pound. These fees can eliminate up to 80% of a grower's profit margin when selling to Oregon. Recent analyses conducted by the CSC indicate that the anticipated packaging fees stipulated by the Producer Responsibility Organization (PRO) in Oregon could impose costs equating to approximately 3% to 4% of the total sale price for a typical pallet of strawberries. A standard pallet contains 120 trays, each holding eight one-pound packages of strawberries. Although California's specific packaging fees have yet to be disclosed, industry experts project that these fees will likely exceed those currently in place in Oregon, thereby increasing the financial strain on California producers.

The ripple effects of EPR legislation are not confined to California alone; similar initiatives are underway in states such as Maine, Minnesota, and Colorado. If several states implement comparable fee structures of 3% to 4% per pallet, the financial implications for strawberry producers could escalate dramatically, possibly resulting in a staggering cumulative increase of 30% to 40% in total packaging costs for each pallet of strawberries sold across ten states that may implement EPR laws and regulations. These costs are not absorbable by the farmers.

The surge in EPR-related costs presents a significant challenge for strawberry farmers, which is already characterized by extremely narrow profit margins. Currently, growers profit approximately 5 cents on every dollar generated from sales, while the overwhelming majority - 95 cents - is allocated back into the community and distributed among various sectors, including labor, agricultural supplies, and the ever-increasing costs of plastic rPET packaging13. The cumulative EPR costs from several states, in the absence of federal harmonization laws, will therefore either result in strawberry growers going out of business and affecting the many communities that depend on the farmers, including several DACs in the state, or lead to higher consumer prices.

Many strawberry growers operate within or close to DACs that depend heavily on these agricultural opportunities for employment and essential services, such as packing and shipping operations. As such, the mounting financial pressures stemming from increased EPR costs, along with the potential for declines in revenue from on-farm activities, could have detrimental effects not only on the farmers but also on the broader communities that rely on strawberry farmers for economic stability and job creation. For DACs that spend most of their income on food compared to non-DACs, higher food prices will impact these communities the most. The ramifications of EPR fees may

reach far beyond the field, posing risks to livelihoods and the socio-economic fabric of many communities throughout California.

Any price increases to strawberries pose a particular risk to DACs, which are disproportionately affected by food price inflation. Of the approximately 9,000 census tracts in the state, almost 2,000 are classified as disadvantaged. Research demonstrates that individuals and families within these communities allocate a significantly larger portion of their income to grocery expenditures compared to their more affluent counterparts.14 Therefore, increases in the cost of staple food items, such as strawberries, may severely limit access to nutritious food options for these populations. Strawberries, known for their nutritional value and popularity among children, underscore the importance of maintaining affordable pricing to ensure accessibility across all demographics. It is crucial to address the challenges posed by rising production and packaging costs while concurrently supporting the most vulnerable segments of the population.

Response to O-80-1

Comment rejected. No response is required because the comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-80-2

4. Additional Considerations

Pursuant to the Act, the department "shall consider relevant information on reduction programs and approaches in other states, localities, and nations, including, but not limited to, the European Union, India, Costa Rica, China, Chile, Canada, and international standards".15

The CSC has been closely following the developments of plastic packaging regulations elsewhere for several years now with France and Canada proposing a complete phase-out of single-use plastic packaging.

After learning more about the benefits of berry clamshells and its contributions to food safety and national food security, Canada paused the ban, and France permanently exempted 29 fruits and vegetables. Canada noted the critical role packaging plays in protecting perishable produce throughout the entire supply chain, stating, "*A much different picture emerged in relation to product protection functions. A direct correlation exists between the importance of packaging functions related to product protection and products' perishability. The increased importance of these packaging functions extends across the value chain."* France recognized that without exemptions, fruits and vegetables are at more risk of deterioration, leading to spoilage – causing food waste, environmental impacts, and food safety risks*."This French decree is an implementation of the Anti-waste and Circular Economy (Agec) law which… provides exemptions for "fruits and vegetables presenting a risk of deterioration when sold in bulk."*

Consumers, in general, have strong confidence and trust in the existing PET plastic packaging, indicating that any modifications should be approached with careful consideration. A recent consumer survey conducted by the California Strawberry Commission, which included 800 participants, revealed that the primary concerns regarding strawberry packaging are its ability to protect the fruit from damage and to preserve freshness16. Notably, these factors held more weight for consumers compared to food safety and ease of use, as indicated by the rankings of their preferences. Furthermore, the survey findings suggest that consumers show a marked preference for packaging recyclability, with response rates reflecting two to four times more emphasis on this attribute compared to other qualities, such as compostability and the use of non-plastic materials.

In summary, the CSC confirms in this letter that, other than the current thermoform plastic PET clamshell used for strawberries, there is no reasonable packaging alternative available to replace and scale-up the annual plastic PET clamshells used by the industry (88% of which leaves the state17) and at the same time comply with federal USDA and FDA regulations, rules, and guidelines. The current clamshell also meets the requirements of the Act and CalRecycle's EPR goals; cut single-use plastic packaging by 25%, recycle 65% and ensure 100% recyclable by 2032.18 These manufacturing approaches adhere to international resin codes and meet the sustainability expectations set forth by major retailers, demonstrating responsibility toward environmental conservation. Strawberry thermoformed PET plastic clamshells, therefore, are made of the most sustainable material currently available and through stewardship and participation in the California Beverage Container Recycling and Litter Reduction Act, already exceed the requirements of the Act.

In conclusion, the CSC greatly expresses its support for the recently introduced language in the formal regulations and consistency with the statutory references to federal mandates, particularly Sections 18980.2(a)(1) and (2). We want to acknowledge all the efforts of CalRecycle and the many hours of public engagement that has been spent by you and your team. Thank you for your consideration of these comments and if you have any questions or concerns, please do not hesitate to reach out to me directly at Rick@calstrawberry.org.

Response to O-80-2

Comment rejected. No response is required because the comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

O-81: Glass Packaging Institute (Scott DeFife)

Comment O-81-1

The Glass Packaging Institute appreciates the opportunity to provide comments on the proposed SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act permanent regulations.

GPI is the North American trade association for the glass food and beverage manufacturing companies, glass recycling processors, raw material providers and other supply chain partners within the industry. GPI and its members endeavor to work closely with local and state governments throughout the country on issues surrounding sustainability, recycling, packaging manufacturing and energy use, and our members have operations, products, and services that would be subject to the SB 54 permanent regulations.
We urge CalReycle to consider changes to the proposed regulations as follows:

Response to O-81-1

Comment rejected. No response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations, does not raise an objection concerning the rulemaking process, or refers to suggested changes or objections set forth in greater detail in other portions of the submission. To the extent other portions of the submission suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-81-2

Section 18980.2.(A)(2) Categorically Excluded Materials

This section should be deleted from the regulations. The exclusions described in this section are extremely broad and may be interpreted to exclude a large proportion of all packaging sold into California. The result would be detrimental to the program given the volume of material they may exclude, undermining the intent of SB54. The large volume of potential exclusions may create an uneven playing field in which a small proportion of producers are required to pay for the operation of the statewide recycling system. We believe that the proposed rules for exemptions (such as sections 18980.2.3 and 18980.2.4) will provide sufficient pathways for materials that must also comply with US Food and Drug Administration or Department of Agriculture requirements.

Response to O-81-2

Comment partially rejected and partially accepted. CalRecycle rejects the suggestion to remove section 18980.2(a)(2) because removing it would leave the proposed regulations without a mechanism for sufficiently addressing the conflicts that must be addressed pursuant to Public Resources Code section 42060(b). For the reasons stated in response to comment I-59-2, CalRecycle also rejects the assertion that exemptions pursuant to section 18980.2.4 are appropriate for implementing Public Resources Code section 42060(b). Likewise, the commenter's suggestion that section 18980.2.3 is also a potential compliance pathway for food and agricultural packaging subject to federal requirements is misguided because that exemption only applies to packaging that has already established a sufficient recycling rate through a non-residential collection service (it concerns recycling rates beginning in 2024).

CalRecycle accepts this comment, however, to the extent it alleges that section 18980.2(a)(2) was unclear in scope or effect, was insufficiently clear with regard

to what renders it "not reasonably possible" to resolve conflicts with federal laws, or would have been overbroad in effect due to the potential for the exclusion to be applied despite the conflicts being avoidable. See CalRecycle's response to comment I-19-1, explaining the revisions responsive to this and similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

Comment O-81-3

Section 18980.2.4. Exemptions for Certain Covered Materials to include "producers".

In support of the previous comment, and to provide additional flexibility for exemptions, we suggest this section include "Producers" along with a PRO or an Independent Producer as entities that may submit a request for an exemption.

Response to O-81-3

Comment rejected. Statute authorizes, but does not require, CalRecycle to grant exemptions under PRC section 42060(a)(3) and (4). Rather than requiring a process for exempting producers, those provisions require CalRecycle to create a "process to identify covered material" for CalRecycle to consider exempting. Nowhere does statute state that the exemptions are to be specific to any producer. The "unique challenges" or health and safety reasons are those presented by materials themselves, not those that any certain person faces. Accordingly, for participant producers, creating a process that necessarily goes through their PRO is appropriate because the PRO is responsible for acting on producers' behalf to ensure fulfillment of statutory requirements. Notably, those requirements include achieving recycling rates for all plastic covered material, and plastic covered materials affect those rates regardless of whether they are exempt under PRC section 42060(a)(3) or (4), highlighting the importance of the PRO retaining discretion over which exemptions are consistent with, and will not prevent satisfaction of, statutory requirements.

Lastly, producers have the option to comply with their obligations and to request exemptions as Independent Producers. Accordingly, no change is necessary.

Comment O-81-4

Section 18980.2 Categorically Excluded Materials (a)(3)

We support the categorical exclusion of packaging that is "refillable" or "reusable". Reusable and refillable packaging are not "single-use" and thus should not be obligated to pay fees under the program. We encourage additional reporting requirements to ensure that reusable and refillable packaging programs are appropriately tracked and that requirements of the regulations are met. Reporting should be required of all reusable and refillable packaging, not only the reusable and refillable packaging used as a source reduction strategy.

Response to O-81-4

Comment rejected. The statute does not authorize general reporting requirements for items that are not covered material, and reusable and refillable items are, by definition, not covered material.

Comment O-81-5

Section 18980.1 Definitions (a)(10)

The definition of "Independent Producer" should be amended to say, "Independent Producer means a producer that is approved by the Department to comply with the requirements of this chapter without being a participant producer, pursuant to section 42051(b)(2)(A) of the Public Resources Code. This clarification would allow for a group of producers with the same or similar products/packaging to work collaboratively to support collection programs that enhance packaging collection and recycling in CA.

Enabling a group of producers to develop an 'Independent Producer Plan' in California would support EPR harmonization efforts in the U.S., while enhancing the amount of packaging material collected and managed by producers in California.

Response to O-81-5

Comment rejected. The text that the commenter proposes adding to would be superfluous because there is no basis other than Public Resources Code section 42051(b)(2)(A) on which CalRecycle could approve a producer to comply with the statute despite not being a participant producer. The producer offers no explanation for the contention that the change would be relevant to compliance by a "group of producers." In any event, the cited statutory provision expressly addresses compliance "individually," not collectively.

Comment O-81-6

Section 18980.5.1. Application for Independent Producer Compliance

Greater clarity is needed on whether the definition and use of the term 'Independent Producer' throughout the proposed rule is a new term and separate from the statute provision that enables a producer to comply 'Individually', thus creating a compliance pathway for a producer or group of producers to create an independent collection program. The following amendment would clarify such a compliance pathway:

(a) A producer seeking to comply with the Act without participating in a PRO shall first, if not already registered with the Department pursuant to subdivision (a) of section 18980.5, register with the Department pursuant to subdivision (a) of section 18980.10 and submit an ~~application for individual compliance~~ *application for independent producer compliance* to the Department.

Response to O-81-6

CalRecycle rejects this comment as the commenter's suggestion is unnecessary and without merit. There is no indication in the regulations that "Independent Producer" is a "new term" and separate from any statutory provisions, making

any regulatory definition of "Independ Producer" unnecessary and potentially creating confusion. Further, not only is section 42051 on the PRC referenced throughout 18980.5.1, the title section 18980.5.1 is "Application for Independent Producer Compliance". Thus, the commenter's suggested change is unnecessary and would have no substantive effect on the regulations.

O-82: AMERIPEN (Gregory Melkonian)

Comment O-82-1

Please see the attached comments on behalf of AMERIPEN. You may disregard the prior submission from AMERIPEN. Thank you.

Response to O-82-1

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process. To the extent other portions of the submission do suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-82-2

Dear California Department of Resources Recycling and Recovery,

AMERIPEN – the American Institute for Packaging and the Environment – appreciates the opportunity provided by the California Department of Resources Recycling and Recovery (“Department” or “CalRecycle”) to submit written comments during the formal rulemaking comment period for the proposed permanent regulations for the Plastic Pollution Prevention and Packaging Producer Responsibility Act (“SB 54”) released by CalRecycle on August 22, 2025. AMERIPEN respectfully submits these written comments for CalRecycle’s consideration when finalizing the proposed regulations.

AMERIPEN represents the entire packaging value chain, advocating for responsible packaging policies that drive meaningful progress in packaging sustainability while supporting industry growth and consumer needs. As the leading voice for packaging policy in the United States, AMERIPEN collaborates with legislators, regulators, and stakeholders to develop science-based, data-driven solutions that enhance the role of packaging in product protection and circularity. We have several member companies with a significant presence in California, as well as many more that import packaging materials and products into the state. The packaging industry supports nearly 156,000 jobs and generates $49 billion in total economic output in California.

AMERIPEN supports policy solutions, including packaging producer responsibility, that are:

- **Results Based:** Designed to achieve the recycling and recovery results needed to create a circular economy.
- **Effective and Efficient:** Focused on best practices and solutions that spur positive behaviors, increase packaging recovery, recapture material values, and limit administrative costs.
- **Equitable and Fair:** Focused on all material types and funded by shared cost allocations that are scaled to make the system work and perceived as fair among all contributors and stakeholders.

AMERIPEN greatly appreciates CalRecycle's time and effort in sharing various drafts of the SB 54 regulations with the public after the initial rulemaking period. AMERIPEN also acknowledges that the Department has made significant progress in controlling the administrative costs of the program while preserving the intent of the law to foster a circular economy for packaging, but there are still concerns about some of the remaining contents.

The below written comments and clarifying questions from AMERIPEN speak to the contents of the proposed regulations shared by the Department on August 22, 2025. They are ordered by rule section.

Response to O-82-2

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process. To the extent other portions of the submission do suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-82-3

CHAPTER 11.1 PLASTIC POLLUTION PREVENTION AND PACKAGING PRODUCER RESPONSIBILITY

Article 1: Definitions

§ 18980.1. Definitions

Subparagraph (a)(4) provides a definition for "component." Subdivision (A) states that a covered material component is, among other things, "a covered material item that has no physically distinct subparts." "Physically distinct" and "subparts" are undefined terms that will require producers to subjectively interpret their meaning and potential compliance. AMERIPEN would appreciate greater clarity in this terminology and suggests at a minimum modifying the language as follows to further delineate components: "item that **cannot be separated into** ~~has no~~ physically distinct subparts[…]." Relatedly, during a regulatory workshop in 2023, CalRecycle proposed defining "separable," as used in the definition of "plastic component" in SB 54, but that definition was not included in these proposed regulations. AMERIPEN recommends

defining “separable” in the regulations as “designed by the producer to be detachable by the consumer upon use.” Finally, AMERIPEN appreciated the previous modifications made to subdivision (C), which help clarify the nature of a “detachable component,” but asks the Department what the purpose of the word “materials” serves.

Response to O-82-3

CalRecycle rejects the commenter's proposals. Changing "has no physically distinct subparts" is not substantively different than the proposed phrasing, "cannot be separated into physically distinct subparts." In either case, the core term is "physically distinct subparts" and has a plainly understood meaning. The proposed change would also mean that groups of non-detachable components would necessarily be considered single components; the result would be that there would be "components" within other components, rendering it conceptually impossible to identify or quantify components. Regarding the proposed definition of "separable," that definition would serve no purpose because that word is not used in the proposed regulations other than within 18980.1(a)(4)(E), which defines the phrase "separable and distinct material component" for the purpose of clarifying statute (Public Resources Code section 42041(s)). In that context, that phrase is used to explain that "packaging" is "separable and distinct" from the good being packaged; the phrase is not related to the separability of packaging subparts. Lastly, the commenter impliedly suggests that the word "material" should be removed from 18980.1(a)(4)(C). Mentioning "material" is necessary, as a technical matter, because referencing "component" would, by definition, only refer to "packaging," and that term is subject to nuanced exclusions. Referring more generally to "material" avoids the problem that certain materials are not "packaging" and therefore technically not "components."

Comment O-82-4

Subparagraph (a)(4) also provides two different tests for determining whether a component is a “detachable component.” One test is based on design and one is based on detachment by a consumer. The SB 54 25% source reduction mandate requires reduction by weight and by plastic component for covered materials. AMERIPEN would appreciate the Department clarifying whether one or both tests for “detachable component” will be applied to measure source reduction, or whether the Producer Responsibility Organization (PRO) will be given flexibility to determine any application of the tests.

Response to O-82-4

Comment rejected. No revision is necessary because nothing in the proposed regulations suggests that either of the clauses within 18980.1(a)(4)(C) may be ignored in any context for determining what constitutes a "detachable component." Clauses (i) and (ii) are unambiguously presented as independent conditions, either of which is sufficient (along with subparagraph (C) itself) to render a component "detachable."

Comment O-82-5

Language was added to subdivision (C) of paragraph (4) of subdivision (a) to specify that a "detachable component" is defined by certain characteristics "regardless of whether the component is discarded attached to the other components." This new language negatively impacts the recyclability determination for components that are made of recyclable material but that are less than two inches by two inches in size. These materials would not currently be considered recyclable on their own due to their size but would be considered recyclable when reattached to the larger recyclable packaging (e.g., a cap replaced on a bottle). The regulations should adhere to the Association of Plastic Recyclers (APR) Design Guides, which require evaluation of attachments in conjunction with primary packaging. They should also ensure a package that would be fully capable of being recycled is considered recyclable. To help ensure that components made of recyclable materials that are reattached to a recyclable packaging do not impact the recyclability of the packaging, AMERIPEN recommends modifying subdivision (a)(4)(C) as follows: "A 'detachable component' is one that may be completely detached from all other components or material**, is not designed to be reattached before disposal,** and is either of the following:".

Response to O-82-5

CalRecycle rejects the suggested change for the reasons stated in response to comment O-39-5 and O-41-3.

Comment O-82-6

By treating "food service ware" as a "good" rather than a type of packaging used in food service environments, per the proposed definition in paragraph (8), the draft rules do not consider that food service ware is intended to be used in conjunction with an underlying product (i.e., food). As a result, the definition appears to exclude the party filling or using the "food service ware" from responsibility, whereas the definition for "packaging" still assigns responsibility to the party using (or filling) the package for its products.

Also, the definition of "food service ware" must be considered in conjunction with the proposed definition of "producer" to recognize additional implications. The proposed definition of "producer" includes the following language: "A good uses covered material if its packaging is covered material or if the good itself is plastic single-use food service ware and thus constitutes covered material." This further removes the connection between the food service operator and the operator's use of "food service ware." Additionally, in so doing, the "producer" definition appears to expand the scope of covered materials to include "packaging-like products" that are supplied or sold to consumers empty; this would create a disparity in the treatment between packaging and plastic food service ware.

Thus, the proposed approach to defining "food service ware" does not allow for a level playing field across all producers and introduces ambiguity as to the obligated party for these covered materials. The intent of SB 54 is to first obligate the brand owner "who manufactures a product that uses covered material"1 (e.g., food service ware), as that

person ultimately specifies its design and service, rather than to obligate the manufacturer of the food service ware (if a different person).

Subdivision (a)(8)(A) identifies types of "food service ware" and states that those types include "other goods typically used with food, provided that such goods are intended or marketed to be used, or are customarily used, in the act of consuming food or providing to consumers food or beverages that require no further preparation or packaging prior to consumption." "Other goods typically used with food," "intended," and "customarily used" are very subjective, again forcing producers to make judgement calls on terms whose meaning can vary from person to person. AMERIPEN recommends striking "intended or marketed to be used, or are customarily," as this is not a readily discernible standard and "customarily used" is not something in the control of the producer. Furthermore, striking it would align with the last sentence of the subdivision, which AMERIPEN supports. AMERIPEN does support the addition of clarifying language to this subdivision in this draft, specifically as contained in "[…] act of consuming […] put to such use."

Several of the issues raised above for this definition may be addressed by instead defining "food service ware" as follows:

(8) "Food service ware" means ~~the goods~~ **covered material** identified in subparagraphs (A) and (B) **that are added at the point of sale by food service, or other service entities, to serve, store, handle, protect, or market food and facilitate the consumption of prepared food.** Plastic singleuse food service ware […]

(A) Trays, plates, bowls, clamshells, lids, cups, utensils, stirrers, hinged or lidded containers, straws, and other ~~goods~~**items** typically used with food, provided that such ~~goods~~ **covered materials** are ~~intended or marketed to be~~ used~~, or are customarily used,~~ in the act of consuming food or providing to consumers food or beverages that require no further preparation or packaging prior to consumption."

Response to O-82-6

Comment rejected. CalRecycle declines to make the proposed changes for the reasons provided in response to comment O-55-1, which proposes substantively similar changes.

Comment O-82-7

Subparagraph (a)(15) defines "plastic," in reference to a component, to mean "the component or object contains or is made partially or entirely of plastic[…]." The continued use of the phrase "made partially" in the existing statutory definition and the proposed regulation is very subjective and open to divergent interpretations. The proposed definition would encompass all multi-material packaging components made of any amount of plastic (no matter how little). This is inconsistent with how the recycling industry classifies, treats, and manages such materials. For some of these materials, like polycoated paperboard, processing facilities recognize that a small amount of plastic will come along with the primary material and is not a barrier to recycling. In

addition, the statutory intent is unlikely to be met if a material like this were treated as a plastic and subject to the source reduction requirements, as reductions to the non-plastic portion would appear as a plastic reduction. Moreover, the sentence at the end of this subparagraph reinforces that it is possible to distinguish the non-plastic content of a component from the plastic content. Absent restricting the definition to only a single piece of covered material made entirely of plastic, AMERIPEN strongly encourages CalRecycle to specify in a revised definition that “made partially” means the component is comprised of a specific amount of plastic (e.g., at least 20% by weight).

Response to O-82-7

Comment rejected. CalRecycle's regulations cannot establish a definition of "plastic" that diverges from the statute's definition of that term. CalRecycle also rejects the comment's assertion that "made partially or entirely of plastic" is subjective. That phrase unambiguously refers to material that contains any amount of plastic and is a direct application of Public Resources Code section 42041(u), which defines "plastic component" as any component "made partially or entirely of plastic." Moreover, to the extent that considering such material to be "plastic" is unreasonable because of contamination, the proposed regulations have been updated to exclude such contamination (section 18980.1(a)(15)).

Comment O-82-8

AMERIPEN requests the addition of clarifying language to the “producer” definition in subparagraph (a)(17) providing that, **“A manufacturer of a component is not considered a producer for that component solely for reason of manufacturing that component.”** This will avoid misconstruing the definition of “producer” under SB 54 and these proposed rules as applying to a manufacturer of packaging components whose products are subsequently used in packaging by another entity that is the appropriate “producer” of covered material. Additionally, neither SB 54 nor the proposed regulations provide explicit guidance regarding producer responsibility for transactions involving covered material over the internet (i.e., “e-commerce”). This language would help producers, e-commerce platforms, and shippers clearly understand their respective obligations under SB 54. Other states with packaging extended producer responsibility (EPR) requirements provide such guidance, whether through statutory language or via rulemaking. AMERIPEN suggests that the Department consult the framework in paragraph (b) of the “producer” definition implemented in Colorado’s adopted EPR regulations2 as a potential source for clarifying e-commerce “producer” duties.

Response to O-82-8

Comment rejected. The proposed addition to the definition of "producer" regarding component manufacturers is unnecessary because it would not change the effect of the regulations. Materials are only "packaging" when they are used with a good, and any material that is not "packaging" (or food service ware) is not covered material and has no producer. Moreover, which person manufactured packaging is irrelevant to identifying the packaging's producer:

PRC section 42041(w)(1) concerns the manufacturer of the good that is packaged, not the manufacturer of packaging itself.

Comment O-82-9

AMERIPEN appreciates the addition of the sentence in subparagraph (a)(17)(B) specifying that empty packaging materials are not covered material, as it is a logical clarification. However, SB 54's definition of "covered material" encompasses plastic food service ware, as opposed to all food service ware. Furthermore, for reasons stated above regarding the definition of "food service ware," the sentence treating packaging and food service ware differently should be removed. As such, AMERIPEN recommends amending subdivision (a)(17)(B) to add corresponding clarification for food service ware as follows: "[…] ~~A good uses covered material if its packaging is covered material or if the good itself is plastic single-use food service ware and thus constitutes covered material.~~ Empty packaging materials not yet used by a good are not 'single-use packaging' or otherwise 'covered material' under the Act, **and non-plastic food service ware that is not packaging is not 'covered material' under the Act,** such that a person is not a producer merely because they manufacture, sell, offer for sale, or distribute such materials."

Response to O-82-9

Comment rejected. Adding a reference to "non-plastic" food service ware is unnecessary because there is no ambiguity as to whether such items are covered material: food service ware is only covered material if it is plastic and single-use. Additionally, the proposed sentence deletion is untenable for the reasons stated in response to comment O-76-2 and because it would leave ambiguity in the statute unresolved. Not considering plastic single-use food service ware, by itself, to be the product referred to in Public Resources Code section 42041(w) would mean that the statute would either not encompass large swaths of single-use plastic food service ware or would render every person who acquires items like utensils, plates, and straws and uses them in private a "producer." That is obviously absurd and could not have been intended.

Comment O-82-10

AMERIPEN appreciated the addition of subdivision (a)(17)(D), which clarifies that the scope of packaging that is considered "covered material" applies only to packaging associated with a product before the point of sale or distribution and before initial physical display.

AMERIPEN greatly appreciated the addition of language in subdivision (a)(17)(F)(i) excluding products and the covered materials they use that merely pass through California without reaching a user or disposal in California.

Response to O-82-10

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-82-11

Subdivision (a)(17)(F)(ii) provides that the “mere transportation of products (e.g., parcel or freight shipping) on behalf of another person shall be deemed conducted by that person, not the transporter.” While this provides clarity in some respects, it prompts further confusion in various scenarios. For example, who would be the producer in a situation where a brand owner manufactures a product but ships it into California at the direction of a retailer? At the very least, AMERIPEN recommends replacing “person” with “producer” in this subdivision to provide more clarity that a producer’s obligation does not transfer based on transportation.

Response to O-82-11

Comment rejected. The regulatory provision cited (section 18980.1(a)(17)(F)(ii) clarifies that the physical act of transporting a good, if conducted for hire (e.g., shipping via commercial carrier) must be ascribed to the person hiring the entity that conducted it. That provision avoids interpretations of statute under which a commercial carrier might be deemed the one distributing products. It does not, however, concern only producers, nor does it state that the act of transporting a good is necessarily "distribution" of that good. Whether shipping a product is "distribution" depends on whether it is "transferring products to another person within the supply chain." If transporting a good does not constitute transferring ownership of the product, it could not be "distribution." Moreover, if an out-of-state manufacturer sends a product to a business in the state and the brand owner is in the state, Public Resources Code section 42041(w)(2) would govern producer identification, and manufacturer could not be the producer. Even if the brand owner is not in the state, if the product is distributed or sold pursuant to an exclusive license in the state, then the licensee would be the producer. Finally, to the extent any out-of-state manufacturer or distributor or seller wishes to ensure that a brand owner or licensee is the producer, they can do so by confirming that the brand owner or licensee is "in the state," as described in section 18980.1.1(a). Regardless of where they are incorporated or reside, a company can voluntarily render itself "in the state."

Comment O-82-12

AMERIPEN greatly appreciates the deletion of the definitions of “sufficiently durable,” “washable,” and “sufficiently washable” in subdivisions (a)(27)(C) and (a)(27)(D), as they were cumbersome and would stifle development of reusable and refillable materials.

Response to O-82-12

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-82-13

§ 18980.1.1. Producer Identification

Paragraph (a) outlines when a person may be considered “in the state” for purposes of SB 54. While this language is helpful in elucidating how to understand this term as it is used in statute, some uncertainty remains. AMERIPEN seeks the Department’s determination as to whether a producer would be considered as consenting to being regarded as “in the state” merely for registering with a PRO.

Response to O-82-13

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process. Furthermore, the provision that provides the basis for the commenter's request for a determination is sufficiently clear and requires no further explanation.

Comment O-82-14

AMERIPEN reiterates its appreciation for the Department’s efforts to consolidate and clarify criteria for identifying obligated producers under this section. That includes some of the changes made in recent drafts of the rules, such as providing dedicated hierarchies for packaging and for plastic food service ware without substantively changing the order of obligation. However, complications still remain in some areas and further refinement is merited. One specific example is subdivision (e): it establishes standards for designating which brands or trademarks are obligated when multiple ones are present, including by pointing to the brand or trademark “most prominently used.” “Most prominently used” is an inherently subjective standard that may create differing interpretations and disputes among parties. As such, AMERIPEN recommends allowing a PRO to develop uniform guidance for determining brand and trademark prominence for products under its program.

AMERIPEN supports the flexibility afforded in subdivision (e)(5), which allows producers to voluntarily agree on designating a brand or trademark on a good for which they both have responsibility.

Response to O-82-14

CalRecycle rejects this comment for the reasons provided in responses to comments O-76-5 and O-55-1.

Comment O-82-15

Regarding subdivision (f)(1), AMERIPEN assumes and is seeking clarifying language under this subdivision to confirm that if a franchisee adds transport or tertiary packaging to covered material items within the supply chain, that franchisee would be the responsible producer for those added covered material items.

Response to O-82-15

Comment rejected. No clarification is necessary because whether a business in the supply chain is a franchisee is relevant is addressed in section 18980.1.1(c)(3) and (d)(3). The commenter does not explain how a business's status as a "franchisee" might be relevant to whether adding transport or tertiary

packaging would render the business a "producer," especially considering subdivision (f) only applies when no producer can be identified based on the packaged good's brand or trademark (addressed in subdivisions (b) through (e)). Nor does the commenter explain why secondary or tertiary packaging used by a franchisee to sell, offer for sale, or distribute goods under a brand or trademark would be considered not part of the "commercial enterprise" described in Public Resources Code section 42041(w)(1) and (w)(2). The commenter might misread the meaning of subdivision (f), which only concerns identifying a producer pursuant to Public Resources Code section 42041(w)(3). Paragraphs (1) through (3) of subdivision (f) present examples of how (w)(3) applies in certain circumstances, but it does not purport to affect the identity of the producer of covered material sold or distributed under circumstances that render a person the producer under 42041(w)(1) and (w)(2).

Comment O-82-16

Subdivision (f)(2) provides that, “If there is no brand owner or licensee in the state, the person who first sells or distributes the good in the state is the producer of all covered material items, including any covered material items added by such person, used by the good at the time of such sale or distribution.” This corresponds at least partially to the third tier of the statutory “producer” definition in subdivision (w)(3) of Public Resources Code (PRC) section 42041. It is unclear how these provisions will be implemented in certain scenarios. AMERIPEN believes that the default obligated producer would be the brand owner under subdivisions (c) and (d) of this section, and AMERIPEN seeks additional clarifying language that private label manufacturers that reside in the state would not be the producer if the product’s brand owner resides outside the state. For example, a product manufacturer in California may create a private label product at the direction of and under the brand of a retailer not based in California; the manufacturer then sells/distributes that product to the retailer to be sold to consumers at one of its retail locations in California. In this example, AMERIPEN believes the responsible producer would be the brand owner that resides outside the state but directs the production and use of covered material items.

Response to O-82-16

Comment rejected. No revision is necessary because the statute and the proposed regulations clearly address the scenario when a brand owner is not in the state. That brand owner cannot be the producer under Public Resources Code section 42041(w)(1) or (w)(2); in other words, it could not be the producer by virtue of its ownership of the brand. However, in the commenter's example, where the brand owner operates retail locations in California (despite being described as "not based in California"), PRC section 42041(w)(2) would likely apply, anyway, because that business activity would likely require the businesses to have a registered agent for service of process in the state, which would place them "in the state" pursuant to section 18980.1.1(a)(1). Moreover, even if the brand owner had no physical presence in the state, the two parties could, via contract, establish that the brand owner is in the state, thus preventing the private label manufacturer from being considered the producer. See section

18980.1.1(a)(2). Lastly, the manufacturer could only be a producer due to its license to manufacture the product if that license were geographically exclusive.

Comment O-82-17

Article 2: Covered Material and Covered Material Categories

§ Section 18980.2. Categorically Excluded Materials

Subparagraph (a)(2) establishes a process for producers to determine "if it is not reasonably possible to use other packaging or packaging components to comply with regulations, rules, or guidelines issued by the United States Department of Agriculture or the United States Food and Drug Administration" for food or agricultural commodity packaging. While this process may prove time- and resource-intensive, AMERIPEN is grateful that this subparagraph makes non-exhaustive reference to federal laws included in SB 54, provides an appropriate window for compliance for materials determined not eligible, and includes trade secret protections.

Subparagraph (a)(6) specifies that excluded medical products include certain drugs that do not require a prescription. In order to clarify that either of the conditions from subparagraphs (A) or (B) must be met to qualify, AMERIPEN recommends amending the subparagraph as follows: "[…] that do not require a prescription and **that do** satisfy at least one of the following criteria:".

Response to O-82-17

Comment rejected. The proposed change is non-substantive, grammatically unnecessary, and would not add clarity to the regulation, which is clear that not requiring a prescription is one necessary condition, and satisfying the condition stated in (A), the condition stated in (B), or both is a second necessary condition. No other reading of 18980.2(a)(6), as written, is reasonable.

Comment O-82-18

§ 18980.2.1. Exclusion of Reusable and Refillable Packaging and Food Service Ware

As a general note, AMERIPEN greatly appreciates the progress the Department previously made in simplifying the complexity and length of these rules governing reuse and refill. This is crucial for producers to be able to collectively increase their use of reusable and refillable materials as expected, particularly given the nascent state of this sector. AMERIPEN cautions against reinstating much of the struck provisions or imposing significant new requirements, at least for the early years of the SB 54 program, as that will inhibit growth of these formats.

Response to O-82-18

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-82-19

Subparagraph (a)(3)(B) requires packaging or food service ware items to be reused "for the same good without being recovered from the consumers or returned into the supply chain" to be considered "reused or refilled by a consumer." Restricting consumer reuse to the exact "same" good is unnecessarily restrictive: reusable covered material can be used for similar goods that may differ in minor ways, such as colors, flavors, or scents. AMERIPEN therefore recommends amending this provision as follows: "[…] for the same **or a similar** good […]."

Response to O-82-19

CalRecycle rejects this comment because it reflects a misreading of Public Resources Code section 42041(af)(2)(A). In contrast with 42041(af)(1)(A), which concerns producer-refilled items and expressly allows uses to be "for the same product, or for another purposeful packaging use in a supply chain," (af)(2)(A) expressly requires the uses to be "for the same product." The commenter's suggest would contravene the clear intent reflected in the difference between those two provisions.

Comment O-82-20

AMERIPEN supports the deletion of what was subdivision (a)(4), which would have established requirements for packaging or food service ware to be considered "explicitly designed and marketed to be utilized multiple times," including prescriptive labeling standards and advertising restrictions. The requirements were one-size-fits-all and did not accommodate the wide diversity of products. For example, requiring English labeling for reuse and refill instructions may limit the ability to import products. The requirements also may have disqualified reuse and refill pilot projects like the one conducted recently in Petaluma, California, which provide helpful real-world testing of consumer instructions.

Response to O-82-20

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-82-21

Subdivisions (a)(4)(A) and (a)(5)(A) require a convenience standard for return locations that is either the same as the location of obtainment or delivery or that is within one mile of that location. The onemile standard is impractical, particularly for communities that are rural or geographically restricted. AMERIPEN recommends allowing the PRO or Department to waive this requirement for communities where the standard is impractical.

Response to O-82-21

Comment rejected. The one-mile standard is not a requirement, but rather an alternative sufficient criterion. Where the one-mile criterion is not met, satisfying

the criterion in clause (i) (return to the same location of acquisition or delivery) is sufficient. The commenter provides no explanation for how any geographical restriction could affect satisfaction of the latter criterion. Nor does the commenter provide any alternative sufficient criterion to ensure that there is a suitable return location. When satisfying either criterion is "impractical," the inescapable conclusion is that reuse or refill itself is impractical, and packaging distributed in those circumstances must be considered covered material.

Comment O-82-22

AMERIPEN also supports the deletion of the prior version of subdivision (a)(5), which would have required packaging to be “sufficiently durable to remain usable when used multiple times over at least three years following initial use” to qualify as “designed for durability to function properly in its original conditions for multiple uses.” It could have been too restrictive and ended up prohibiting reusable materials that may be used very frequently but over a duration of less than three years, which would be counterintuitive.

AMERIPEN supports the deletion of what was subdivisions (a)(7)(A) and (a)(9)(A) in the prior draft, which would have required returning an item to the producer to “not require more time[…]than obtaining a new item.” This was far too restrictive, as a consumer can obtain a new item online easier than going back to the return/refill site.

AMERIPEN supports the changes made to what used to be subdivisions (a)(7)(B) and (a)(9)(C) to limit the provisions to remote means and to allow for alternative return options. This avoids encumbering future technologies and methods of reuse and refill (such as a third-party collection system that can collect packaging provided by individual companies). For similar reasons, AMERIPEN supports the deletion of what was subdivision (a)(7)(D) in the prior draft.

AMERIPEN is grateful for the deletion of portions of what was subdivision (a)(8)(A) in the prior draft, which would have established requirements for how often items must, on average, be used or filled by the producer before disposal. AMERIPEN was concerned that the approach in the subdivision would have unfairly penalized producers that switched from a non-plastic single use product to a reusable product with a slight amount of plastic; even though such a reusable product will facilitate greater circularity and environmental benefits, it might have been disqualified due to the presence of a slight amount of plastic. AMERIPEN also questioned what will happen if there is no “single-use version” of an item, compared to its reusable or refillable counterpart, as referenced in the former subdivision. Furthermore, the provisions in what was subdivision (a)(8)(B) would have unfairly deflated the magnitude of source reduction by arbitrarily preferring for comparison single-use products with a comparable plastic composition; such products may not be the most direct substitute for the reusable/refillable option and so may not be appropriate for comparison. Finally, this provision would have become more complicated when trying to understand how the source reduction requirements and integration of postconsumer recycled content would have interacted with it.

Response to O-82-22

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-82-23

§ 18980.2.2. Exclusion of Certain Types of Packaging

Subparagraph (a) provides that the Department may request producers to substantiate their claims of being exempt for materials used for long-term protection or storage. This is a supportable approach compared to a prior version, which would have used an application process, as it will save resources for the Department, producers, and consumers. However, AMERIPEN objects to the language in subdivision (a)(1) requiring an exempted good to be "one that is not ingested, irreversibly used, destroyed, or expended through its ordinary used." This approach is unnecessary, as the relevant test for eligibility under the long-term storage materials exemption is whether the packaging and associated product have a lifespan of at least five years; the product's status as diminishable is immaterial. The Department exceeded what is provided for in the plain language of SB 54 (the five-year lifespan requirement) by imposing this additional requirement that is neither specified in law nor necessary to implement the law. Therefore, AMERIPEN requests the Department to strike subdivision (a)(1).

Response to O-82-23

CalRecycle rejects this comment for the reasons provided in response to comment O-48-3. If a product is diminishable, the exclusion for long-term storage materials would drastically undermine the purpose of the statute by excluding packaging that is discarded practically immediately after acquisition.

Comment O-82-24

AMERIPEN appreciates the recent revisions made in subparagraph (b)(1), especially to add clarity in subdivision (b)(1)(B)(ii), which will help producers more readily identify when material is an "independent plastic component."

Response to O-82-24

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-82-25

Subdivision (b)(1)(B) introduces a definition of "independent plastic component," to make specific that term as it is used in subdivision (s)(4)(A) of PRC section 42041. SB 54 provides that an "independent plastic component" is ineligible to be treated as "[a]n element of the packaging or food service ware with a de minimis weight or volume" that would be excluded from the definition of "packaging." The statute provides little direction as to what "independent plastic component" means, but AMERIPEN believes the approach taken in the regulations is flawed. As the purpose of the exclusion is to accommodate plastic materials that do not complicate a good's recyclability, the

definition should be drafted accordingly (rather than assessing detachability and continuity). AMERIPEN recommends rewriting the definition to read as follows: "'Independent plastic component' is a packaging component, or a group of components, that wholly or partially comprises plastic and that is not recyclable."

Response to O-82-25

Comment rejected. The proposed change would not define the phrase "independent plastic component" with respect to any of its constituent words. Rather, it would effectively define the term to refer to packaging that is plastic and recyclable. That definition is wrong on its face: It would merely recapitulate the statutory meaning of the qualifier "plastic," add the qualifier "recyclable" (which has no relevance to whether a component is plastic or independent," and ignore the qualifier "independent."

Comment O-82-26

Subparagraph (b)(3) establishes a new process for a PRO or Independent Producer to request CalRecycle "deem certain components or groups of components to be of de minimis weight or volume." AMERIPEN appreciates this new provision that will increase certainty in this area of the law that is difficult to assess. However, AMERIPEN requests two amendments to improve it. First, individual producers also should be authorized to make requests under this mechanism to avoid tying up PRO time and resources processing requests. Second, AMERIPEN requests explicit clarification that use of this mechanism is not a mandatory prerequisite for claiming a material is of de minimis weight or volume; AMERIPEN's understanding from the informal regulatory workshop on May 27, 2025, was that it is an advisable but optional approach, and therefore AMERIPEN seeks clarification accordingly.

Response to O-82-26

Comment rejected. The proposed change would be inappropriate because the PRO is best positioned to evaluate whether and how (e.g., how broad the request should be) designating components as de minimis comports with the needs of its program. Regarding the PRO's time and resources, the PRO can effectively eliminate that burden because nothing in the proposed regulations precludes it from deciding that its scrutiny of requests is unnecessary, in which case its burden would be little more than to pass along requests to CalRecycle. Regarding the request for "explicit clarification" as to whether the mechanism is a mandatory prerequisite, no change is necessary because the proposed regulation does not purport to state any mandatory prerequisite for claims that a material is of de minimis weight or volume, and 18980.2.2(b)(4) even acknowledges that such a claim may be made in response to notices of violation.

Comment O-82-27

§ 18980.2.3. Exemptions for Specific Material with Demonstrated Recycling Rates

Subdivision (b)(2)(B) prohibits packaging or food service ware items from being "commingled with unsorted material collected by curbside programs." However, this does not adhere to the language in PRC section 42041(e)(2)(H)(i)(II) and may preclude them from being sent for additional processing and secondary sorting before transport to a responsible end market. AMERIPEN recommends amending this section to allow such activities by instead requiring that the information demonstrate conformance with PRC section 42041(e)(2)(H)(i)(II).

Response to O-82-27

Comment rejected. The change concerning commingled material is rejected because that provision applies the express requirement of PRC section 42041(e)(2)(H)(II) that material must not have undergone separation from other materials at a commingled recycling processing facility.

Comment O-82-28

Paragraph (c) specifies that applications under this section are public documents unless exemptions apply or the Department allows for treatment as a trade secret. AMERIPEN is deeply concerned about the risk of proprietary and sensitive market information pertaining to end markets being publicly released after being shared with the Department, as it may negatively affect the competitiveness of the market. AMERIPEN requests the addition of an option for a producer to submit their data to a third party approved by a PRO that will anonymize the data or certify that the producer is compliant with the responsible end market obligations.

Response to O-82-28

CalRecycle rejects the comment. First of all, the change is unnecessary because PRC section 40062 and the proposed regulations provide rigorous protection for allegedly confidential records. Second, the suggestion would obliterate transparency concerning compliance with the law and render CalRecycle unable to enforce the law's requirements. CalRecycle relying on representations by a third party, with no demonstration directly to CalRecycle, is plainly unreasonable because CalRecycle would have no way to evaluate the legitimacy of such a representation. This even directly contradictions express terms in statute, which requires parties' representations to be "demonstrated to the department." See PRC section 42041(e)(2)(H)(IV).

Comment O-82-29

§ 18980.2.4. Exemptions for Certain Covered Materials

Paragraphs (a) and (b) do not allow a participating producer to submit an application to exempt its covered material under this section, requiring the request to instead come from the PRO. AMERIPEN requests restoration of the authority for a participant producer to make exemption requests, as there is no guarantee that a PRO will be able to apply on the producer's behalf.

Response to O-82-29

Comment rejected. Statute authorizes, but does not require, CalRecycle to grant exemptions under PRC section 42060(a)(3) and (4). Rather than requiring a process for exempting producers, those provisions require CalRecycle to create a "process to identify covered material" for CalRecycle to consider exempting. Nowhere does statute state that the exemptions are to be specific to any producer. The "unique challenges" or health and safety reasons are those presented by materials themselves, not those that any certain person faces. Accordingly, for participant producers, creating a process that necessarily goes through their PRO is appropriate because the PRO is responsible for acting on producers' behalf to ensure fulfillment of statutory requirements. Notably, those requirements include achieving recycling rates for all plastic covered material, and plastic covered materials affect those rates regardless of whether they are exempt under PRC section 42060(a)(3) or (4), highlighting the importance of the PRO retaining discretion over which exemptions are consistent with, and will not prevent satisfaction of, statutory requirements.

Lastly, producers have the option to comply with their obligations and to request exemptions as Independent Producers. Accordingly, no change is necessary.

Comment O-82-30

Under paragraph (a), the regulations provide only a limited explicit exemption from SB 54, specifically pertaining to PRC section 42050. However, subdivisions (a)(3) and (a)(4) of PRC section 42060 allow CalRecycle to grant exemptions from the entirety of SB 54. Therefore, AMERIPEN requests replacement of language from a prior version of the regulations stating exemptions apply to “the requirements of the Act and this chapter.”

Response to O-82-30

CalRecycle rejects this comment. Under the Act, the exemptions are for covered materials, not producers, and the required exemption process is only for identifying covered materials that CalRecycle may decide to exempt. The consequences of exemptions from the entirety of SB 54 would render exemptions unjustifiable except in extreme cases, if any -- an outcome the Legislature could not reasonably have intended. In any event, revising the language to merely stating "the requirements of the Act and this chapter" would not have the effect sought; that language would have the effect now more clearly stated in the current version of the regulations. As this comment demonstrates, that phrase was ambiguous and required the clarification provided by the current language.

Comment O-82-31

The “practical necessity” of a covered material has no bearing on whether it has “unique challenges” complying with SB 54 or health or safety reasons that justify an exemption. The Department also should not be the arbiter of the “practical necessity” of any

covered material introduced into interstate commerce. Therefore, AMERIPEN recommends deletion of subparagraph (c)(4)(A)(iii).

Response to O-82-31

CalRecycle rejects this comment. For multiple reasons, the commenter is incorrect that the practical necessity of a covered material has no bearing on whether "unique challenges" for complying with the law or health or safety concerns justify an exemption.

First, exempting any material from the requirements of PRC section 42050 is a drastic action because it risks undercutting the law's effectiveness, thereby implicating CalRecycle's core mandate under the law: to adopt regulations that ensure that the law's requirements, "in particular the requirements established in Section 42050 and the policy goal established in Section 41780.01 . . . are met" (PRC section 42060(a)). Fulfilling that mandate requires CalRecycle to minimize the risk of counteracting the law's effectiveness whenever possible, including by not granting exemptions from the requirements of PRC section 42050 absent significant extenuating circumstances. In other words, the practical necessity of a covered material is an extenuating circumstance highly relevant to whether an exemption is consistent with CalRecycle's obligations under PRC section 42060(a).

Regarding the claim that CalRecycle should not be deciding whether such circumstances exist, that assertion directly contradicts statute, which expressly authorizes CalRecycle to exempt covered material and establish the process for doing so, without any limitation other than the overall mandate set forth in PRC section 42060(a).

Lastly, to the extent that the commenter implies that the mere existence of "unique challenges" in complying with the law, absent practical necessity, requires CalRecycle to grant an exemption, CalRecycle rejects that implication. Statute provides that CalRecycle "may exempt" covered material identified as presenting those challenges but does not universally require it to do so. Instead, it leaves determination of whether exemptions are appropriate to CalRecycle's discretion.

Comment O-82-32

Subparagraph (c)(4)(A)(iv) requires a party seeking an exemption based on the unique challenges of a material to identify “[p]otential alternatives to the covered material and a description of why they are infeasible or unreasonable,” as specified. This analysis is not required or even contemplated under SB 54 and is irrelevant to determining whether a certain material “presents unique challenges in complying with” SB 54. The question is whether the given material itself is associated with “unique challenges,” not whether there are alternatives. At a minimum, AMERIPEN recommends striking subparagraph (c)(4)(A)(iv).

Response to O-82-32

Comment rejected. If there are alternatives that are feasible and reasonable to adopt, that fact contradicts the assertion that a material presents a challenge to compliance. The commenter's analysis, in effect, asserts that producers have a right to continue using materials that render compliance impracticable. But nothing in statute guarantees such a right. To the contrary, at its core the commenter's assertion would have the absurd result that compliance would essentially be voluntary: A producer could avoid having to comply with the law by continuing to choose to use materials that violate it.

Comment O-82-33

Subparagraph (f)(3) requires that for an exemption for health and safety reasons or because a material is unsafe to recycle, the Department must establish both that:

“(A) Compliance with the Act is not possible without increasing overall risks to health or safety or risks of significant effects on the environment compared to the risks posed by exempting the packaging or food service ware.

“(B) The exemption will not make it more difficult for any other producer to satisfy the requirements of section 42050 of the Public Resources Code."

However, “risks of significant effects on the environment” and whether an exemption will “make it more difficult for any other producer to satisfy the requirements of section 42050 of the Public Resources Code” do not directly factor into the statutory grounds for this exemption. As such, subparagraph (f)(3) should be revised to read as follows: “An exemption request based on section 42060(a)(4) of the Public Resources Code shall be approved if the application clearly and convincingly establishes compliance with the Act is not possible without increasing overall risks to health or safety compared to the risks posed by exempting the packaging or food service ware or because it is unsafe to recycle the packaging or food service ware.”

Response to O-82-33

Comment rejected. CalRecycle rejects the commenter's express premise that CalRecycle can only consider issues that "directly factor into the statutory grounds for this exemption." Statute places no restriction on CalRecycle's consideration of relevant factors, whether direct or indirect.

Regarding effects on the environment, the commenter may misunderstand the relevance of CalRecycle considering environmental effects: If recycling material causes risks of environmental harm, that risk would make it more likely, not less likely, that an exemption is appropriate. Regardless of that potential misunderstanding, the commenter's suggestion is rejected because effects on the environment and health and safety concerns are inextricably linked. Moreover, even if there were no link between the environment and health and safety, considering the environment would still be appropriate because, regardless of the statutory provision being implemented, statute unambiguously

requires CalRecycle to ensure that regulations "avoid or minimize disproportionate impacts to disadvantaged or low-income communities or rural areas." See PRC section 42060(d). Moreover, this exemption directly concerns recycling, and statute also expressly requires the regulations to encourage recycling that minimizes . . . environmental impacts. Without information about environmental effects, which often fall on such communities and areas, CalRecycle cannot fulfill that statutory mandate.

Regarding subparagraph (B), whether an exemption will affect other producers' ability to comply with the law, is a crucial requirement that the proposed regulations must include to fulfill their express purpose: to ensure that the requirements of section 42050 are met. Implementing and enforcing the law without regard to the effects on every producer other than the one applying for an exemption would violate that mandate.

Comment O-82-34

Subparagraph (g)(1) now provides that exemptions under this section last for two years by default instead of one year, except in certain circumstances. AMERIPEN supports this change because a oneyear exemption period would necessitate a significant amount of producer and Department resources, respectively, to reapply for and to review reapplications for the exemption. However, the subparagraph was also modified to cap the Department's authority to extend exemptions to five years; AMERIPEN requests removal of this clause because it is unnecessarily limiting given that the Department has oversight authority. AMERIPEN instead requests that this paragraph be modified to allow applicants to request an exemption duration longer than two years with a description of justification for doing so, and provide that CalRecycle should consider such a request and, if the longer exemption duration is not granted, provide a detailed explanation as to why. Finally, to afford the Department and PRO ample time to review and process requests, AMERIPEN encourages the Department to provide guidance regarding the forthcoming exemption application process as soon as possible so the public with enough time to understand and prepare for its implementation.

Response to O-82-34

Comment rejected. Section 18980.2.4(g)(1) strikes a reasonable balance between establishing a clear, consistent period for exemptions and the need for flexibility to account for when that limitation is unnecessary or unreasonably burdensome. The commenter objects to the upper limit of five years because CalRecycle "has oversight authority." CalRecycle having oversight authority does not eliminate the usefulness of the upper limit of five years. That limit reflects CalRecycle's assessment that it is not practicable to estimate with confidence any longer period for which an exemption's justification will persist. CalRecycle also declines to give applicant's unfettered flexibility to request a duration of longer than two years and place the burden of justifying any shorter duration on CalRecycle. That requested approach defies logic because it would allow applicants to leverage their superior access to information relevant to justifying an exemption. Regarding the encouragement for CalRecycle to "provide

guidance," no response is necessary because that is not a proposed revision to the regulatory text.

Comment O-82-35

§ 18980.2.5. Covered Material Category List Updates

A prior draft of the regulations deleted language in paragraph (a) specifying what portions of the Covered Material Category (CMC) List should be reviewed and, "if necessary," updated. Furthermore, a prior draft added language to the beginning of paragraph (b) and deleted the sentence stating, "For example, the Department shall update the list if the list, as updated, would more accurately or completely reflect how distinct material types and forms are collected or processed separately or would accurately account for novel material types and forms." AMERIPEN is concerned that removal of this language will restrict the Department's authority to make updates to the CMC List when there is significant new information about recycling that would substantively modify characterizations in the List. The Department should make timely updates to the recycling and composting designations in the CMC List to reflect changing and, under SB 54, improving recycling conditions. Furthermore, PRC section 42355.51(d)(1)(B)(iii) authorizes CalRecycle to "publish additional information that was not available at the time of the most recent periodic material characterization study regarding the appropriate characterization of material types and forms." AMERIPEN therefore requests the Department undo the changes previously made in paragraphs (a) and (b) of this section in the December 2024 draft. Alternatively for paragraph (b), AMERIPEN recommends the Department add a final sentence stating, "At a minimum, the Department shall update the list twice annually if new information and changed circumstances warrant it."

Response to O-82-35

Comment rejected. Regarding 18980.2.5(a), CalRecycle cannot discern the proposed change because that provision does include the qualifier "if necessary." Regarding the proposed addition to subdivision (b) (the sentence beginning "For example"), CalRecycle declines to make that change because it is unnecessary and could even have an effect opposite of the one the commenter seeks. Not including an example does not imply any limitation on the scope of the regulation as written, and that scope is sufficiently clear in subdivision (b) as written. In contrast, including an example might, by providing context that was not strictly necessary, suggest an unintended narrower reading of the range of potential reasons for updating the list. Regarding suggestion that updates shall be made "twice annually if new information and changed circumstances warrant it," that addition would exceed the minimum requirements imposed under Public Resources Code section 42061(e) and (f), to which the proposed regulation refers (18980.2.5(a)), but no explanation is provided for why those minimum requirements are inadequate to be considered "timely," especially considering they are only minimum requirements: CalRecycle can update the list whenever it deems necessary, such as when CalRecycle publishes information pursuant to Public Resources Code section

42355.51(d)(1)(B)(iii). CalRecycle declines to adopt a greater frequency than provided in statute, which reflects the Legislature's understanding of what is adequate.

Comment O-82-36

§ 18980.2.6. Covered Material Category List Recommendations

AMERIPEN supports the language in paragraph (a) clarifying that entities may recommend changes to the CMC List in alignment with the timing for submissions in paragraph (f) of section 18980.2.5. To further ensure that CMC List updates are considered in a cohesive manner, AMERIPEN recommends requiring the Department to consider any recyclability determination information timely submitted pursuant to paragraph (f) of section 18980.2.5 when considering any suggested updates for a CMC List update for the same material pursuant to paragraph (a) of section 18980.2.6. AMERIPEN also recommends allowing industry associations, trade associations, and groups of producers to recommend changes to the CMC List.

Response to O-82-36

CalRecycle rejects the commenter's suggestion because sections 18980.2.5 and 18980.2.6 already have substantially the same effect as the one the commenter requests. Section 18980.2.5(f) establishes time constraints on when CalRecycle will consider information submitted concerning CMC list updates. In turn, section 18980.2.6 concerns CMC list recommendations that a PRO, participant producer, or Independent Producer submit, and it expressly states that those recommendations are "subject to the same time constraints applicable to information submitted under [section 18980.2.5(f)]." The only manner in which the proposed regulations do not achieve the commenter's desired effect is that, under 18980.2.5(f), information may not be considered on the same timeframe as recommendations submitted under 18980.2.6 if the information is not "sufficiently limited." But that limitation is logically necessary in every event—CalRecycle cannot review information if doing so is beyond its capacity—and applies to both 18980.2.5 and 18980.2.6 equally.

With regard to the commenter's request that entities other than producers (individually or collectively) make recommendations pursuant to this section, the comment is rejected. The purpose of this section is to provide a process for the statutory requirements of PRC section 42061(f)(3), which only concerns producers. Moreover, nothing in statute or the proposed regulations restricts interested parties from collaborating with a PRO or individual producers concerning CMC list recommendations. Importantly, the proposed regulations do not generally prohibit any person from submitting information to CalRecycle. While CalRecycle will not necessarily consider specific recommendations submitted to it other than as described in section 18980.2.6, subdivision (f) of section 18980.2.5 explains that, subject to minimal restrictions, it will consider information submitted by any person when updating the CMC list. This level of participation (the ability to submit information for CalRecycle to consider)

reasonably accommodates interested persons who are not directly subject to the Act but wish to provide information to CalRecycle relevant to its maintenance of the CMC list.

Comment O-82-37

Article 3: Evaluations of Covered Material and Covered Material Categories

§ 18980.3. Recyclability

Paragraph (d) requires a producer to supply the Department, upon request, with specified lab testing to verify compliance with chemical ingredient requirements. AMERIPEN requests that producers be given the alternative option to comply with this via provision of material safety data sheets or certificates of compliance from their suppliers, as this will demand fewer resources while utilizing readily available information. This would be like requirements in the rules for Maine's packaging stewardship law.3

Response to O-82-37

Comment rejected. Statute expressly requires application of 14 CCR 17989.2, as that section existed as of enactment of SB 54. For the presence of PFAS, that section expressly requires the testing described in section 18980.3(d). More generally, to the extent any material safety data sheets or certificates of compliance are not backed by test results from a qualified laboratory, they are not trustworthy indicators of compliance; and, if any data sheets or certificates of compliance that are backed by such results, that would mean that compliance with 18980.3(d) would be straightforward.

Comment O-82-38

For subparagraph (e)(3), AMERIPEN notes recovery rates will vary for items based on consumer habits and it is unclear if the timing contemplated in this subparagraph will sufficiently capture reuse and refill. Producers are unlikely to have data on "the average time between the items' sale or distribution and collection," and it will be difficult to determine a reliable figure for each given item. Furthermore, food service ware may be retained for longer than single-use packaging. AMERIPEN suggests reconsideration of whether it is necessary to impose the one-year timeframes proposed in this subparagraph, and suggests instead deferring to a PRO or Independent Producer to propose within their program plan a calculation methodology for paragraph (5) of subdivision (d) of PRC section 42355.51.

Response to O-82-38

Comment rejected. Regarding the recommendation that the PRO or Independent Producers be permitted to propose a calculation methodology, no change is necessary because section 18980.3(f) already provides that the PRO and Independent Producer plans must address how compliance will be demonstrated but does not prescribe specific methodologies for the systems producers develop

to do so. Subdivision (e) imposes no restrictions except for the one-year period and the offset between sale or distribution and collection. Modifying that one-year period is unnecessary because, over time, using any period for which accurate data is available will accurately gauge a program's effectiveness. To the extent using a one-year period presents difficulty or accuracy concerns caused by the newness of a program, exemptions and phase-in plans based on Public Resources Code section 42060(a)(3) are available. Section 18980.2.4(c)(4)(B) specifically addresses that scenario.

Comment O-82-39

Paragraph (f) contains a discrepancy in the level of scrutiny between producers participating in a PRO and Independent Producers required to verify continuing eligibility for recyclability pursuant to PRC sections 42355.51(d)(4) and section 42355.51(d)(5). The setting of a specific auditing frequency of annually and specifying verification duties for only the PRO exacerbates this issue. For consistency and equitability, AMERIPEN requests that both producers participating in a PRO and Independent Producers be subject to the same standard, whether it is the one provided subparagraph (f)(1)(C) or the one provided in subparagraph (f)(2)(B).

Response to O-82-39

Comment rejected. No change is necessary because the different nature of PROs and Independent Producers require different approaches. A PRO necessarily acts on behalf of its participant producers, and that function is central to achieving efficient implementation and enforcement of SB 54. To reasonably fulfill that function, a PRO must establish uniform processes through which it verifies information from producers demonstrating that covered material satisfies applicable requirements for being considered recyclable. Statute expressly requires that a PRO's plan include "measures to ensure that producers participating in the plan comply with the requirements of the plan and this chapter," including "protocols to ensure that the PRO becomes aware" of violations. In contrast, Independent Producers act on their own behalf, so a more streamlined, case-by-case evaluation of the support sufficiency of their recyclability claims is appropriate.

Comment O-82-40

§ 18980.3.1. Recyclability of Certain Covered Material Categories Identified by the Department

While there previously has been advisement that subdivision (a)(3)(B) of PRC section 42061 places a restriction on timing for the use of the “trending on-ramp,” AMERIPEN notes that this interpretation is an unnecessarily restrictive reading of SB 54. Subdivision (a)(3)(B) of PRC section 42061 allows the Department to utilize the on-ramp “when updating” the MCS, as opposed to when the MCS “is updated.” The Department simply needs to be in the act of making edits to the MCS to utilize the on-ramp, and statute does not restrict when that work may be undertaken (rather, it specifies when the update is “issued”). AMERIPEN therefore recommends beginning

update work as soon as possible to ensure the t imely usage of the “trending on-ramp” to reflect up-to-date recyclability progress.

Response to O-82-40

CalRecycle rejects this comment for the reasons set for in response to comment O-82-41. Regarding the commenter's interpretation of "when updating," that interpretation is clearly wrong because it reads an absurd meaning into the Legislature's stylistic choice to use the adverbial phrase "when updating," which is an obvious reference to the discrete, official act that Public Resources Code section 42355.51(d)(1)(B)(ii) requires CalRecycle to perform every five years: issue a material characterization study. The commenter's interpretation--that CalRecycle is "updating" the study any time it is undertaking the "work" leading up to the update--would interpret the entire phrase "when updating information pursuant to [section 42355.51(d)(1)(B)ii)" out of the statute. CalRecycle's mere act of performing its day-to-day work (as opposed to performing any official act, such as publishing a study) would be "updating" the study and could occur at CalRecycle's whim. That is an extraordinary interpretation of an ordinary statutory reference to a discrete, official act by a governmental entity.

Comment O-82-41

Paragraph (b) establishes criteria for a material to qualify for the “trending on-ramp,” as provided in PRC section 42061(a)(3)(B). For a material to be eligible, there must be a demonstrated “increase in the collection and sorting” of the material that “is more likely than not to continue” and “is more likely than not to result in the covered material category satisfying the requirements of paragraph (2) of subdivision (d) of section 42355.51 of the Public Resources Code before the next mandatory update to the material characterization study.” In essence, this paragraph requires a CMC to demonstrate likelihood to fully satisfy the recyclability provisions of SB 343 before the next material characterization study (MCS) update (i.e., within five years).

This time limit imposed in subparagraph (b)(3) is not required anywhere under SB 54 and is arbitrarily short. The law refers to “materials that are trending toward meeting” certain requirements of SB 343, without any conditions placed on what “trending” entails. AMERIPEN understands it may be desirable to provide specificity to implement this provision and acknowledges the Department’s rationale provided in the Initial Statement of Reasons regarding “the express, non-permanent function of the exemption (to apply to materials expected to fully comply with the Act in the future).” However, the statute can be satisfied without imposing this unjustified expectation for full compliance within five years. It is critical that the “trending on-ramp” be applied to maximize the potential for materials to achieve full “recyclability” under SB 343, but an arbitrary timeline undermines this.

The intent of subparagraph (b)(3) can be achieved by simply requiring the Department to determine the increase will eventually result in satisfaction of PRC section 42355.51(d)(2). As such, AMERIPEN recommends deleting “ before the next mandatory

update to the material characterization study" from this subparagraph. AMERIPEN also recommends making a corresponding change in subparagraph (c)(1).

Response to O-82-41

CalRecycle rejects this comment. Rather than a justification for not imposing reasonable restrictions, the commenter's explanation that the statute refers to SB 343 "without any conditions place on what trending entails" is proof that a regulation establishing the bounds of statute is necessary. The "trending" provision cannot reasonably be interpreted as having no conditions attached; if that were the case, attempts by CalRecycle to apply it would either be arbitrary or constitute a new interpretation of the law, which requires formal regulations.

Moreover, the commenter's proposal (merely requiring a finding that increases will "eventually" result in compliance with PRC section 42355.51(d)(2) requirements) is clearly untenable. Requiring such a minimal determination is so lax that, in application, it would result in permanent exemptions and undermine PRC section 42355.51(d)(2) rather than promote compliance with it. It would be sufficient for the exemption to applies if, for example, CalRecycle determined that a covered material category is more likely than not to satisfy the requirements of section 42355.51(d)(2) within 100 years. Given the inexorable nature of scientific advancement and the likelihood that sufficient economies of scale could render currently cost-prohibitive technologies economically viable in the future, practically any scientific progress and infrastructure expansion could permit such a determination. If the commenter did not intend to suggest that a trajectory of 100 years or more could be sufficient, but instead intended that CalRecycle should in every event apply some reasonable limit, that suggestion demonstrates why the commenter's solution is a non-starter. Without some more concrete indication in the proposed regulations as to what trajectory is reasonably short, CalRecycle's application of the "trending" exemption would be arbitrary or would require CalRecycle to establish some uniform approach, which would constitute an unlawful regulation. A more reasonable application of statute is to require, at a minimum, a finding that compliance will occur before the next mandatory material characterization study update under section 42355.51(d)(1)(B)(ii). Especially given the lack of any other express indication of how imminent compliance must be to be considered "trending" toward it, that interpretation gives reasonable effect to the five-year periodicity of those updates.

Comment O-82-42

§ 18980.3.2. Methodology for Recycling Rate Determination

AMERIPEN requests clarification in paragraph (b) that data for recycling of a given covered material can be combined from curbside and non-curbside or alternative collection programs, as some materials may utilize both systems.

Response to O-82-42

Comment rejected. Nothing in the proposed regulations suggests that whether material is considered "recycled" depends on how it was collected. More specifically, subdivision (b) of section 18980.3.2 does not suggests that the the distinction between curbside and non-curbside collection is relevant; section 18980.3.2 contains no reference to collection. Accordingly, the proposed change is necessary.

Comment O-82-43

Subdivision (b)(2)(A) should be amended as follows to reflect the definition of “recycle” in SB 54: “[…]for the creation of new**, reused,** or reconstituted products.”

Response to O-82-43

Comment rejected. The proposed revision would introduce ambiguous, confusing text because "reuse" has a particular meaning elsewhere in the statute and the proposed regulations, and that meaning would be nonsensical in context of describing end markets and recycling processes. Also, while the statute uses the word "reused" in the definition of "recycle" (Public Resources Code section 42041(aa)(1)), in that context, it is one of a group of adjectives ("new, reused, or reconstituted") that serves as a unitary descriptor for one abstract concept: the output of recycling. Especially considering the overlap between those three adjectives—a "new" product made from used materials is necessarily "reconstituted," and a product "reconstituted" from previous ones comprises material that was "used" and thus could be said to be "reused" in the reconstituted one—the context makes clear that the Legislature did not intend each of those words to stand on their own as describing a different thing. Omitting the word "reused' therefore avoids confusion without losing any meaning.

Comment O-82-44

Local jurisdictions can be exempted from managing covered material categories on a case-by-case basis. To account for this, AMERIPEN requests addition of a subparagraph (4) to paragraph (d) that would require the recycling rate denominator to be adjusted down accordingly based on any jurisdictions that receive exemptions from managing covered material categories.

Response to O-82-44

Comment rejected. First, the commenter provides no rationale for the change, such as why certain materials could not be accounted for. Second, PRC section 42041(ab) defines recycling rate with respect to all covered material, without regard to whether certain covered material complies with all applicable requirements, is exempt from needing to do so, or is not collected by certain local jurisdictions. Third, PRC section 42060.5(b) (authorizing exemptions from the requirement of including certain covered materials in recycling programs) does not exempt any packaging or food service ware from being considered

"covered material" or otherwise suggest that covered material not included in a recycling program should not affect recycling rates. Fourth, exemptions from the obligation to include covered materials in recycling programs are not necessarily category-wide. Lastly, depending on the recycling rate that the covered material at issue otherwise achieves, the commenter's suggestion could have the perverse effect of disincentivizing the PRO from addressing the circumstances justifying the exemption.

Comment O-82-45

AMERIPEN supports the phase-in approach for new CMCs under subparagraph (f) but suggests extending the period to 18 months for the first several years of the program as producers ramp up their reporting capabilities.

Response to O-82-45

Comment rejected. Permitting 18 months would result in an unreasonably long period of uncertainty with respect to recycling rates and related compliance assessments. Also, to the extent extenuating circumstances contribute to the failure to comply with reporting obligations, corrective action plans pursuant to PRC section 24081)(b) or exemptions with phase-in plans pursuant to section 42060(a)(3) may be requested. See, also, responses to comments C-120-34 and C-61-14.

Comment O-82-46

§ 18980.3.3. Eligibility for Being Labeled "Compostable"

Paragraph (e) states "Satisfying the legal requirements for being labeled 'home compostable' pursuant to sections 42355 through 42357.5 of the Public Resources Code or any other law shall not be construed to mean that any covered material is eligible for being labeled 'compostable' for purposes of section 42050(b)." AMERIPEN is disappointed by the addition of this paragraph, as it will hinder the rollout and support for an emerging segment of the organics market. AMERIPEN encourages the Department to strike this paragraph and promote a pathway for these materials to qualify as eligible to be labeled "compostable" under SB 54.

Response to O-82-46

CalRecycle rejects this comment for the reasons provided in response to comment B-48-10.

Comment O-82-47

§ 18980.3.4. Independent Third-Party Validation for Postconsumer Recycled Content

AMERIPEN is grateful for the inclusion of the last sentence in subdivision (b)(4)(B)(ii), which will help avoid an interpretation that the alternative third-party validation entity

would be prohibited from approval simply for purchasing a product from a producer subject to the validation requirement.

Response to O-82-47

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-82-48

Article 4: Responsible End Markets

§ 18980.4. Responsible End Market Determination Criteria

Subdivision (a)(3)(A) requires a responsible end market to send "incompatible materials that can be further processed and recycled[…] to entities that are authorized to further process and recycle the material." Sending such materials for further processing and recycling is not necessarily a cost-efficient or environmentally preferable option, and thus may raise costs or deter end markets from taking part in California's EPR system. AMERIPEN recommends avoiding application of this mandate in cases that would be counterproductive. This may be achieved by amending the clause as follows: "For incompatible materials that can be further processed and recycled, the entity sends materials to entities that are authorized to further process and recycle the material**, unless the end market determines that doing so would not be cost-effective or would create more impacts to the environment than an alternative**."

Response to O-82-48

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements set forth in the Act, including in sections 42051.1 and 42060 of the Public Resources Code, and the recommended change is not necessary to the implementation or enforcement of the Act. Additionally, the recommended change is inconsistent with the intent and purpose of the Act because it would permit and encourage the disposal of covered materials that are otherwise recyclable. Consistent with the waste hierarchy established in section 40051 of the Public Resources Code, section 18980.4(a)(3) of the proposed regulations is designed to prioritize recycling whenever possible and to prevent the disposal of covered materials. Finally, consistent with section 18980.4.3(a)(2) of the proposed regulations, it is the responsibility of a PRO or Independent Producer, through its plan, to establish how it will facilitate material recycling and assist end markets in satisfying the standards specified in section 18980.4.

Comment O-82-49

Subdivision (a)(4)(A)(i) excludes material "not sent to a responsible end market for further processing" from the denominator in an average recycling yield calculation. AMERIPEN supports this new language, as it will more accurately reflect the final actual yield proportion.

Response to O-82-49

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process.

Comment O-82-50

Subparagraph (a)(4)(B) requires an entity to ensure covered material "intentionally included in the process used to generate a recycled organic product must fully biologically decompose" for the entity to qualify as a responsible end market. The rules now limit this condition only to covered material "partially or wholly comprising plastic." It should still be noted that it is not guaranteed that any product, whether it is food waste, vegetation, or a piece of compostable packaging, will fully convert in every compost cycle. Additionally, non-plastic covered material does not necessarily need to fully decompose, and composters can often have remaining pieces of food and yard waste, even after long composting cycles. Moreover, the addition of subparagraph (a)(4)(C) is helpful for non-plastic compostable materials but creates a discrepancy in treatment compared to plastic compostable materials. Finally, end markets are unlikely to be able to distinguish between plastic and non-plastic material that has already disintegrated. AMERIPEN recommends subjecting all covered material intended to generate a recycled organic product be subject to the same standard as provided in subdivision (a)(4)(C). AMERIPEN also suggests that using a term like "disintegrate" rather than "biologically decompose" may be more appropriate, as disintegration is measure by ASTM standards.

Response to O-82-50

CalRecycle rejects this comment. To the extent this comment recommends subjecting all covered material intended to generate a recycled organic product to the standard of section 18980.4(a)(4)(C), see the response to comment B-6-5. To the extent this comment recommends revising that standard to use the term "disintegrate," instead of "biologically decompose," see the responses to comments O-83-5 and O-75-12. No change is necessary.

Comment O-82-51

AMERIPEN greatly appreciates the sentence in paragraph (b) added in a recent draft that allows an entity to qualify as an end market if it "produces and uses" recycled organic product or recycled content feedstock rather than selling or transferring it. AMERIPEN still also seeks guidance as to what qualifies as "quality standards necessary," as used in this section.

Response to O-82-51

CalRecycle rejects this comment, which recommends revising section 18980.4(b) to clarify the meaning of the term "quality standards necessary." The meaning of that term, as it is used in section 42041(aa) of the Public Resources Code and section 18980.4(b) of the proposed regulations, has a plain and straightforward meaning, and no further clarification is necessary to the

implementation or enforcement of the Act. Recycled content feedstock meets the quality standards necessary to be used for the creation of new or reconstituted products if, after being processed, it is in such a state and quality that it may be sold or transferred in the marketplace to be used in lieu of virgin material for the creation of new or reconstituted products. Additionally, because such quality standards will necessarily depend on various factors, including the specific type of covered material at issue and the available technologies, no further clarification in the proposed regulations is necessary or appropriate at this time.

Comment O-82-52

§ 18980.4.1. End Market Identification

Subdivision (a)(3) requires a PRO or Independent Producer to describe how it will obtain cooperation with an end market or intermediate supply chain entity (ISCE) that is not responsible. While this planning is somewhat helpful, AMERIPEN remains concerned that it will be difficult to obtain documentation from end markets and ISCEs to confirm they are responsible. AMERIPEN continues to request that end markets and ISCEs be obligated to provide relevant records to the PRO or Independent Producer to satisfy this need, consistent with what section 18980.4(a)(2)(G) provides for responsible end market entities. This will help ensure PROs and Independent Producers can comply with this requirement for information that they do not have in their possession.

Response to O-82-52

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements set forth in the Act, including in sections 42051.1 and 42060 of the Public Resources Code, and the recommended change is not necessary to the implementation or enforcement of the Act. Section 42041(ad) of the Public Resources Code permits CalRecycle to establish criteria to identify responsible end markets under the Act. Moreover, pursuant to section 42051.1(c), a PRO or Independent Producer is responsible for identifying such responsible end markets it plans to use in its producer responsibility plan. Section 18980.4.1 of the proposed regulations implements these statutory requirements, and section 18980.4.1(a)(3) provides that, to the extent an end market cannot be identified or confirmed as a responsible end market without cooperation from intermediate supply chain entities, the PRO or Independent Producer that has identified the end market must describe how it will obtain such cooperation. As an example, that provision provides that the plan must explain how the PRO or Independent Producer will ensure that intermediate supply chain entities continue to operate with all required permits, licenses, and other clearances. Therefore, the proposed regulations already achieve the intended result of this recommendation in a manner that is consistent with the relevant statutory provisions. No further change is necessary to the implementation or enforcement of the Act.

Comment O-82-53

Section (c) refers to “paragraphs (4) and (6) of subdivision (d) of section 18980.4,” but there is no subdivision (d) in that section. AMERIPEN notes this cross-reference should be corrected, presumably to refer to section 18980.4.1 instead.

Response to O-82-53

Comment accepted. CalRecycle has made a nonsubstantial change to section 18980.4.1(c) of the proposed regulations.

Comment O-82-54

Subparagraph (d)(1)(A) no longer contains a requirement to compare novel recycling technologies against mechanical recycling technologies. AMERIPEN greatly appreciates this change, as the merits of new recycling technologies should not be based on statutory criteria rather than weighed in relation to others.

Response to O-82-54

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-82-55

§ 18980.4.2. End Market Compliance Audits and Verification

Paragraph (c) requires a PRO or Independent Producer to “annually verify that each end market it uses satisfies the requirements to be a responsible end market[…].” This verification frequency will create substantial recurring costs and compliance burdens for producers. There is little realistic need for repeating verification so often, especially given that end markets will be audited and investigated annually pursuant to this section. AMERIPEN continues to recommend the Department instead make this requirement biennial at minimum and reconsider the frequency in subsequent rulemakings.

Response to O-82-55

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements set forth in the Act, including in sections 42051.1 and 42060 of the Public Resources Code, and the recommended change is not necessary to the implementation or enforcement of the Act. Section 18980.4.2 requires a PRO or Independent Producer to have annual compliance audits of responsible end markets conducted and completed by an independent third party (section 18980.4.2(a)) and to verify to CalRecycle, in its annual report, that each end market it uses satisfies the requirements to be a responsible end market (section 18980.4.2(c)). CalRecycle, in consultation with its Audits Office, has determined that compliance audits should be conducted annually to ensure entities are compliant with applicable requirements. The annual verification requirement is necessary to ensure CalRecycle is apprised of the results of each audit and to

ensure it regularly receives relevant information that may be necessary to ensure that a PRO or Independent Producer is recycling covered materials in compliance with the Act and its approved plan. The verification requirement will not result in any unnecessary or substantial costs for a PRO or Independent Producer.

Comment O-82-56

A PRO or Independent Producer may not have complete access to or knowledge of certain information regarding an end market, including complaints made against the end market if made to a different entity. Subparagraph (a)(1) of a prior version of section 18980.4.2 acknowledged this limit, but only as it pertains to compliance failures. AMERIPEN continues to recommend making this exception more general by now by amending paragraph (c) as follows: "[…]shall include, but not necessarily be limited to the following**, if in the possession of the PRO or independent producer**:."

Response to O-82-56

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements set forth in the Act, including in sections 42051.1 and 42060 of the Public Resources Code, and the recommended change is not necessary to the implementation or enforcement of the Act. Section 18980.4.2(c) describes the information that is required for a PRO or Independent Producer to verify that an end market it uses continues to satisfy the criteria for a responsible end market, as set forth under section 18980.4(a). Section 18980.4.1(a)(3) requires a PRO or Independent Producer to describe in its plan how it will obtain the cooperation of any intermediate supply chain entity or end market, where such cooperation is necessary to identify or confirm that an end market satisfies the criteria of section 18980.4(a). See the response to comment O-82-52. Therefore, a PRO or Independent Producer is required to have access to all of the information described in section 18980.4.2(c) to fulfill its verification obligations, and it will be able to access such information pursuant to the description contained in its plan pursuant to section 18980.4.1(a)(3). No further changes to the proposed regulations are necessary to the implementation or enforcement of the Act.

Comment O-82-57

§ 18980.4.3. End Market Development

Paragraph (b) requires a PRO or Independent Producer to conduct a study for covered material that does not have an end market, unless the PRO or Independent Producer opts to phase out the material. Subparagraph (b)(3) requires the PRO or Independent Producer to invest in alternatives for the material proposed to be phased out. To avoid unneeded expenditures when developing and implementing alternatives would duplicate existing efforts, AMERIPEN recommends adding the following caveat immediately before the final sentence of subparagraph (b)(3): "This investment requirement does not apply if additional investment in alternatives is not necessary."

Response to O-82-57

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements set forth in the Act, including in sections 42051.1 and 42060 of the Public Resources Code, and the recommended changes are not necessary to the implementation or enforcement of the Act. Section 18980.4.3(b)(3) of the proposed regulations simply provides that, if a PRO or Independent Producer opts to phase out a covered material instead of conducting a study pursuant to section 18980.4.3(b)(1), then it must invest in alternatives to that covered material to facilitate phasing it out. If the PRO or Independent Producer is already investing in alternatives to a sufficient degree where it is facilitating the phasing out of the covered material, then no additional investment is required by section 18980.4.3(b)(3). Therefore, the language of section 18980.4.3(b)(3) is already sufficiently clear and no change to that section is necessary to achieve the result recommended by this comment.

Comment O-82-58

Article 5: Requirements for Producers

§ 18980.5. Producer Compliance

AMERIPEN appreciates the final sentence in paragraph (b) clarifying that a producer is not required to participate in a PRO plan or develop an Independent Producer plan for covered material not sold, offered for sale, imported, or distributed in California.

Response to O-82-58

While CalRecycle appreciates the commenter's support, not further response is required for this comment as it does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-82-59

Paragraph (c) previously required participant producers that leave a PRO to apply to become an Independent Producer within six months. With this language deleted in a prior draft, AMERIPEN seeks clarification about the expected deadline for producers in this situation.

Response to O-82-59

CalRecycle rejects this comment as no substantive response is required because the comment raises general concerns that are already sufficiently addressed in the regulations, including 18980.5 and 18980.5.1 in conjunction, with no additional specific recommendation or explanations required.

Comment O-82-60

§ 18980.5.2. Exemptions for Small Producers

AMERIPEN appreciates the extension of the exemption duration for small producers from one year to two years. This will lower administrative costs for producers and the Department while also providing more market stability for producers with limited resources.

Response to O-82-60

While CalRecycle appreciates the commenter's support, his comment is rejected as it does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-82-61

Article 6: Requirements for the Producer Responsibility Organization

§ 18980.6.5. Annual Reports

AMERIPEN supports the change made in this section and elsewhere in the regulations to split the annual report into two phases. This will allow more time for the PRO to process data reporting and prepare annual fee rates, in better synchronization with other states' EPR programs.

Response to O-82-61

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-82-62

§ 18980.6.7. Eco-modulated Fee and Fee Schedule

Paragraph (g) requires a PRO to "develop a formula to calculate each participant's market share and corresponding surcharge assessment," and requires the formula to "be based on the number of plastic components and weight of plastic covered material a producer offers for sale, sells, distributes, or imports in or into the state." However, PRC section 42064(f)(1) requires the environmental mitigation surcharge to be based on each producer's "market share of plastic covered material, accounting for both number of plastic components and weight." AMERIPEN recommends addition of the "market share" factor into this paragraph to ensure alignment with SB 54. AMERIPEN also appreciates the language accounting for Independent Producers' share of the annual environmental mitigation surcharge.

Response to O-82-62

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including PRC sections 42053, 42060, and 42064, and no change is necessary to the implementation of the Act. As noted by this commenter, section 18980.6.7(g) of the proposed regulations already incorporates the "market share" factor established in PRC 42064(f)—in their entirety, the first two sentences of section 18980.6.7(g) read: "In assessing fees

pursuant to paragraph (5) of subdivision (c) of section 42053 of the Public Resources Code, a PRO shall develop a formula to calculate each participant's market share and corresponding environmental mitigation surcharge assessment. Pursuant to section 42064(f) of the Public Resources Code, the formula shall be based on the number of plastic components and weight of plastic covered material a producer offers for sale, sells, distributes, or imports in or into the state." Therefore, section 18980.6.7(g) of the proposed regulations already faithfully and accurately implements the market share requirement of PRC section 42064(f). To the extent this comment expresses support for section 18980.7.6, no response is necessary because this comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process. No further change is necessary.

Comment O-82-63

Paragraph (h) lists descriptions in a certain publication ("design guide") that would result in a specific element being considered "to make recycling more difficult" under the proposed rules. One such description is "requires test results." However, the fact that the publication states that an element "requires test results" is different from a determination that it is detrimental; rather, as its title indicates, it is an indication that further investigation is needed to determine whether the element is detrimental. An element may be found to be "preferred" after testing and therefore should not be considered detrimental. Thus, AMERIPEN continues to request the Department amend paragraph (g) as follows: "…or 'requires test results.' **unless the element passes the required test.**" Additionally, this "more difficult" standard should not apply to products that are managed through composting, as that process is subject to different requirements than standard recycling.

Response to O-82-63

CalRecycle rejects this comment. To the extent this comment recommends revising the proposed regulatory language concerning test results, see the response to comment B-47-4. To the extent this comment recommends revising the language to provide that the "more difficult" standard does not apply to products that are managed through composting, no change is necessary. Section 18980.6.7(h) of the proposed regulations is sufficiently clear and no further clarification is necessary. The requirement of PRC section 42053(d)(2) specifically applies to covered materials managed through both the recycling and composting process. Thus, both are subject to malus fees for the incorporation of specific elements that make recycling or composting more difficult. While the reference in PRC section 42053(d)(2) to the APR design guide only applies to covered materials managed through the recycling process, that section further allows for determinations based on "other relevant industry association" publications. For covered materials managed through the composting process, therefore, a PRO or Independent Producer must incorporate into its plan any applicable publications that are appropriate for evaluating whether composting is made more difficult by the incorporation of specific elements under PRC section 42053(d)(2). This incorporation authority is established in section 18980.8(j)(2) of

the proposed regulations. Therefore, the current proposed regulations are sufficiently clear and no further changes are necessary.

Comment O-82-64

Paragraph (i) requires a PRO to "charge a malus fee to producers who use covered material that contains a chemical listed on" the Proposition 65 List. Under this proposal, a malus fee would be triggered for the mere presence of any chemical on the list irrespective of its hazardous status. However, Proposition 65 is more nuanced. Equating presence with hazard is unscientific and will result in a sprawling list of chemicals that unnecessarily trigger a malus, thereby creating unwarranted costs. Moreover, listed chemicals often have "safer harbor levels," including No Significant Risk Levels (NSRLs) and Maximum Allowable Dose Levels (MADLs). According to the California Office of Environmental Health Hazard Assessment (OEHHA), "Exposure levels and discharges to drinking water sources that are below the safe harbor levels are exempt from the requirements of Proposition 65." Therefore, paragraph (i) should be amended to focus on the presence of hazardous materials identified by the state rather than using Proposition 65. Should CalRecycle instead maintain an approach relying on Proposition 65, a malus fee should apply only in instances where the presence of a Proposition 65 List chemical exceeds an established safe harbor level. Such an approach would be more consistent with PRC section 42053(e)(4), which references "hazardous material as identified by" OEHHA, since chemicals with safe harbor levels should not be considered hazardous if they do not exceed the level identified by OEHHA.

Response to O-82-64

CalRecycle rejects this comment. See the response to comment B-11-9.

Comment O-82-65

§ 18980.6.8. Recordkeeping and Reporting Requirements

Subdivision (a)(1)(D) was added in a previous draft to require a PRO to maintain annual records of the total weight of material disposed for each CMC, disaggregated by participant producer. This is a very granular level of information that will be nearly impossible to track down for each material and for each producer. AMERIPEN recommends deletion of this subdivision, just as subdivision (a)(5) was deleted in a prior draft, and AMERIPEN recommends deletion of subdivision (a)(2)(C) for similar reasons. AMERIPEN also recommends corresponding deletion of subdivision (a)(1)(D) and subdivision (a)(2)(C) in section 18980.7.7 to make the same changes for Independent Producers, and deletion of related language in section 18980.10.2..

Response to O-82-65

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements set forth in the Act, including in sections 42051.1, 42052, and 42060 of the Public Resources Code, and the recommended changes are not necessary to the implementation or enforcement of the Act. Section 42052(a)(4)

requires a PRO or Independent Producer to annually submit any information deemed necessary to collect and report data pursuant to section 42060(a), and section 42064(d) requires a producer or PRO to maintain records of covered materials offered for sale, sold, distributed, or imported in or into the state in a form and manner established by CalRecycle that CalRecycle determines is necessary to determine if a producer is in compliance with the Act during an audit. Consistent with those statutory requirements, CalRecycle has determined that the information concerning the total weight of material disposed is necessary to enforce the Act and to ensure that its requirements, including the requirements established in section 42050 and the policy goal established in section 41780.01, are met. Additionally, this requirement is not overly burdensome and will not result in unnecessary administrative costs, because the data reported pursuant to section 18980.6.8(a)(1)(D) will closely relate to the data already being reported pursuant to section 18980.6.8(a)(1)(C).

Comment O-82-66

Article 8: Producer Responsibility Plan Requirements

§ 18980.8. Producer Responsibility Plan

Paragraph (d) previously authorized but now requires a program plan to include various education and promotion efforts. While the listed elements are generally reasonable, there may be cases where such elements are unnecessary or are already provided and therefore these actions would be duplicative. AMERIPEN recommends reverting this paragraph to be discretionary, to afford the PRO or Independent Producer more discretion in designing its education and outreach work.

Response to O-82-66

CalRecycle rejects this comment. The proposed changes are unnecessary because they merely reiterate the requirements set forth in PRC section 42051.1(e); that provision requires plans to "use education and promotion to encourage proper participation in recycling and composting collection and reuse and refill systems" and requires the PRO to "ensure coordination between these efforts and existing educational and promotional efforts." Further, section 18980.8(d) is necessary to list the minimum applicable requirements and enable PROs and Independent Producers to go through the list to ensure they include all required information in their producer responsibility plans.

Comment O-82-67

AMERIPEN supports several of the changes made in paragraph (g), including the following: clarifying that producer funding of costs can take forms other than reimbursement; explicitly providing that pre-2023 costs are not covered; allowing for performance-based compensation approaches; and preventing duplicative compensation for the same activity. AMERIPEN supports these changes that together allow for a clearer and more workable system for producers, local jurisdictions, and recycling service providers.

Response to O-82-67

While CalRecycle appreciate your support and comments, this comment is rejected as it does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-82-68

Paragraph (h) requires a program plan to include a cost dispute resolution process, and subparagraph (h)(3) requires the process to "avoid unnecessary burden on local jurisdictions and recycling service providers." It is unclear what would qualify as an "unnecessary burden," so AMERIPEN recommends clarification that the phrase refers to "necessitating a significant amount of new financial or technical resources."

Response to O-82-68

Comment rejected. Both the current text and the proposed changes would rely on the objective test of necessity, the latter would introduce the ambiguous concept of "significant amount," which will decrease clarity. Also, the change would replace "burden" with the narrower "new financial or technical resources." That is both less clear and unjustifiably limiting: It is unclear what would constitute a "new" resource, and there is no legitimate reason why avoidable burdens of any type should be considered acceptable. The commenter provides no justification for why avoiding the imposition of unnecessary burden (regardless of whether it relates to "new" resources) would be overly restrictive on the process that the PRO may adopt.

Comment O-82-69

Former § 18980.8.3. Source Reduction Adjustments

The 2025 informal draft rules removed Section 18980.8.3, which previously would have specified procedures for allowing a source reduction plan to utilize adjustment factors and methods for f luctuations in the economic conditions and the number of producers participating in a PRO plan. It is unclear whether adjustments can be made without this language, even though SB 54 does not prohibit them. The previous language required implementation of these factors and methods in an unbiased manner and with Department oversight. Allowing such adjustments is critical to the function of packaged consumer goods and food service ware. Without adjustments, producers will have to work against an absolute baseline. It is not sufficient to argue that some producers can be assigned a larger obligation to source reduce to address this issue, since there is a practical limit to how much source reduction can be achieved even in aggregate. Additionally, population and market conditions can outstrip that limit in a way that cannot be mitigated. Because the baseline would be static and cannot reflect population changes or changes in the number of producers, producers would have to pull off the shelves products that have reached their maximum feasible source reduction and that do not have feasible alternatives; this in turn limits available consumer options, creates sunk costs, results in product losses, and generates unnecessary environmental impact.

Additionally, in the event of a decline in population or producers, it will result in more plastic available to use in plastic than intended under the law.

Finally, the source reduction baseline also explicitly should be able to be adjusted and normalized for business growth. Sales numbers can fluctuate with population and producer changes but also can fluctuate for any number of other reasons (e.g., shifts in consumer preferences, e-commerce trends, and advances in technology). Without this adjustment, growing businesses could be forced to bear a disproportionate share of source reduction burden solely by virtue of their growth. As a result, it is important to consider sales growth when setting adjustment factors.

Therefore, AMERIPEN urges the Department to restore Section 18980.8.3 as contained in the December 2024 draft of the rules and to explicitly include changes in sales volume as grounds for adjustment as part of paragraph (c).

Response to O-82-69

CalRecycle rejects this comment for the reasons set forth in response to comment B-11-6.

Comment O-82-70

Article 9: Source Reduction Baseline Report and Annual Reports

§ 18980.9.1. Annual Reports

PRC section 42057(a) establishes phased-in source reduction requirements that take effect on January 1 of 2027, 2030, and 2032. However, there is no clarity in the statute or regulations as to how to measure compliance with these requirements. To afford appropriate time to implement these requirements and not begin counting compliance before they take effect, AMERIPEN recommends adding language specifying that compliance is measured in the one-year period covering the calendar year for each of the three phase-in dates. This will comply with the letter of the law and help prevent unnecessary removal of covered material from the market in the near future. Specifically, subdivision (d)(2)(A) can be amended as follows: "Percentage of reduction across all participant producers **achieved during the applicable calendar year 2027, 2030, or 2032, respectively, based on producer source reduction reporting pertaining to calendar year 2027, 2030, and 2032, to determine the PRO's compliance with its source reduction plan and the requirements of subdivision (a) of section 42057 of the Public Resources Code."**

Response to O-82-70

CalRecycle rejects this comment, see responses to B-27-2, I-63-15, O-48-5, and O-41-4. Please also see response to I-63-16.

Comment O-82-71

Article 10: Registration and Data Reporting Requirements

§ 18980.10.2. Data Report Contents

Subparagraph (a) requires producers or their PRO to submit, by CMC and for the previous calendar year, the total weight of material and the total number of plastic components that were sold, distributed, or imported in or into the state, the total weight of material disposed, and the total weight of material recycled.

Producers may not have a way to accurately measure or determine the actual number and weight of covered materials in this state-specific manner, given the complexity of that proposition. Therefore, AMERIPEN requests that producers explicitly be allowed to use national sales data and prorate it to estimate their share produced for California. This is critical to ensure many producers have a viable pathway to satisfy the reporting obligations, particularly those with fewer resources as a matter of equity. The Maine Department of Environmental Protection has adopted rules for Maine's packaging EPR program that can serve as a model for estimating units produced.4

Response to O-82-71

CalRecycle rejects this comment. The relevant reporting requirements in section 18980.10.2 of the proposed regulations are consistent with the requirements of section 42052(a) of the Public Resources Code. That provision requires the aggregate quantities in total weight and number of plastic components—not merely an estimation of such quantities—to be reported, and CalRecycle does not have statutory authority to depart from that requirement. These proposed regulations require no more information than what is necessary to determine a producer's or PRO's compliance with this Act, and the comment has identified no less burdensome reporting metric that would adequately capture the information that is required to be reported under section 42052(a) of the Public Resources Code. See responses to comments B-30-12, I-63-15, B-27-2, I-63-15, O-48-5, and O-41-4 for additional information.

Comment O-82-72

Related, manufacturers occasionally produce customized packaging for products for which the producers cannot extrapolate their reporting or data from standard packaging options. In these cases, packaging may be tailored and determined after the product to be packaged is manufactured. AMERIPEN recommends affording a PRO some authority to determine a mechanism for estimating reportable volume in such exceptional circumstances involving customized packaging.

Response to O-82-72

CalRecycle rejects this comment. The relevant reporting requirements in section 18980.10.2 of the proposed regulations are consistent with the requirements of section 42052(a) of the Public Resources Code. That provision requires the aggregate quantities in total weight and number of plastic components—not merely an estimation of such quantities—to be reported, and CalRecycle does

not have statutory authority to depart from that requirement, nor can CalRecycle adequately entertain or sufficiently address what amounts to a hypothetical scenario. These proposed regulations require no more information than what is necessary to determine a producer's or PRO's compliance with this Act, and the comment has identified no less burdensome reporting metric that would adequately capture the information that is required to be reported under section 42052(a) of the Public Resources Code. Response to comment B-30-12 may provide additional information.

Comment O-82-73

Various requirements in this section entail reporting on the postconsumer disposition of covered material, including the weight of material disposed or recycled. Individual producers cannot obtain this information in any generally feasible manner, so recyclers and disposers must provide it to the reporting entities. This data sharing necessity is not readily apparent in the proposed regulations but is a fundamental requirement of any functional EPR program. Therefore, AMERIPEN requests the addition of language that obligates recyclers, disposers, and other postconsumer managers of covered material to share relevant data with reporting entities. Such language may include confidentiality requirements, as necessary.

AMERIPEN is grateful for the change to the reporting increments in paragraph (b) from monthly to annual. This will greatly lower the burden on producers to gather and manage supply data, especially firms with less capacity to track such data.

Response to O-82-73

CalRecycle rejects this comment because the recommended changes are not necessary and do not raise issues related to the rulemaking process. The proposed regulations are consistent with the requirements set forth in the Act. The commenter does not identify any statutory language authorizing CalRecycle to require intermediate supply chain entities or end markets to share the relevant information with a PRO or producers, nor does the comment identify statutory language authorizing CalRecycle to promulgate specific regulations as requested. Rather, pursuant to section 42051.1 of the Public Resources Code, a PRO's producer responsibility plan must describe, among other requirements, how the PRO will meet the requirements of the Act and how the PRO will support and achieve the collection, processing, recycling, or composting of covered materials. Additionally, there is nothing in the Act or the proposed regulations preventing these entities from voluntarily entering into agreements to share such information, and such agreements may involve the exchange of relevant data and the protection of confidential information.

Comment O-82-74

Article 11: Requirements, Exemptions, and Extensions for Local Jurisdictions and Recycling Service Providers

§ 18980.11. Requirements for Local Jurisdictions and Recycling Service

Paragraph (b) includes language stating that “the absence of responsible end markets shall be deemed a local condition, circumstance, or challenge rendering inclusion of the covered material in the program impracticable,” thereby allowing a local jurisdiction to seek an exemption from collection of that covered material. While that may be a reasonable outcome in some cases, AMERIPEN cautions that the mandatory nature of this sentence removes flexibility for implementing the program and could jeopardize collaborative efforts to ensure collection of covered materials. Therefore, AMERIPEN argues the “shall” should be replaced with “may” to maintain full discretion for CalRecycle when considering collection exemptions.

Response to O-82-74

CalRecycle rejects this comment for the reasons stated in response to comment B-48-9. As further explained in that response, the suggested change would result in a regulation with an unclear requirement—the effect of the absence of responsible end markets would be indefinite, if not illusory—that could not be applied in a reliable, non-arbitrary manner.

Comment O-82-75

§ 18980.11.1. Extensions or Exemptions for Local Jurisdictions and Recycling Service Providers

AMERIPEN requests addition of a requirement for a PRO to make exemption requests available to all participant producers so that they have awareness of local jurisdictions’ and recycling service providers’ plans for material management.

AMERIPEN suggests clarifying throughout this section that these provisions apply to recycling “and composting” programs, as is provided in subparagraph (d)(3).

Response to O-82-75

Comment rejected. The proposed addition of a requirement for a PRO to make exemption requests available to all participant producers is unnecessary because nothing in the proposed regulations restricts a PRO from ensuring that participant producers are made aware of governments' and recycling service providers' plans for material management. The regulation as drafted provides a reasonably efficient process to address the commenter's concerns by empowering the PRO to exercise its discretion to act on behalf of its participant producers. Statute contemplates this arrangement: PRC section 42060.5(b) mentions objections by the PRO, not objections by participant producers. Permitting every participant producer to directly participate in the exemption process would impose a potentially enormous burden on the application process that could render the statutory exemption effectively unavailable.

Additionally, the proposed clarification regarding composting is unnecessary because section 18980.11(a) of the proposed regulations makes it clear that "For

all purposes under the Act, the term "recycling programs" encompasses composting-related collection and processing." Accordingly, the proposed regulations accommodate the commenter's concerns.

Comment O-82-76

§ 18980.11.2. Exemption for Rural Counties and Rural Jurisdictions

As with the request in the previous section, AMERIPEN requests that a PRO be required to inform participant producers of any adopted rural jurisdiction exemptions.

Response to O-82-76

Comment rejected. The proposed addition of a requirement for a PRO to inform participant producers of any adopted rural jurisdiction exemptions is unnecessary because nothing in the proposed regulations restricts a PRO from ensuring that participant producers are made aware of those exemptions. Additionally, a participant producer can obtain this information by submitting a California Public Records Act request to CalRecycle, since CalRecycle is the entity notified of those exemptions under section 18980.11.2.

Comment O-82-77

Article 13: Enforcement Oversight by the Department and Administrative Civil Penalties

§ 18980.13. Compliance Evaluation and Determination

Paragraph (c) provides that, “Except as specifically set forth in this section, for each discrete requirement of the Act, this chapter, or a Producer Responsibility Plan, each distinct condition, action, or course of action constituting or resulting in a violation of the requirement shall constitute a single violation of the Act.” It is unclear what constitutes a “distinct condition, action, or course of action.” For example, it is unclear if the production of a line of products that does not meet the recyclability requirements of SB 54 constitutes a single action, or if the production of each product is a separate action. AMERIPEN continues to seek clarification of this provision but cautions the Department to implement it in a manner that balances compliance with avoiding being prohibitively punitive. Such balance would be achieved, for example, by treating a noncompliant product line as a single violation.

Response to O-82-77

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements set forth in the Act, including in PRC sections 42050, 42060, 42080, and 42081, and no changes to the proposed regulations are necessary to the implementation or enforcement of the Act. The meaning of "each distinct condition, action, or course of action," as it is used in section 18980.13(c) of the proposed regulations, is sufficiently clear and does not require additional clarification. Moreover, section 18980.13(h) of the proposed regulations

adequately and clearly addresses the situation identified in this comment. No further changes to the proposed regulations are necessary.

Comment O-82-78

As used in paragraph (d) and throughout Article 13, AMERIPEN seeks clarification as to the meaning of the word “accrue.” PRC section 42081(a)(3) states that, “Penalties against a PRO or producer shall not begin accruing with respect to a violation until 30 calendar days following the notification of the violation.” AMERIPEN is under the understanding and supports that “accruing” in this context means accumulating, such that entities would not be liable for penalties for any violations that occur before the thirty-first day after the notice of violation. Does CalRecycle interpret “accrue,” in SB 54 and in the proposed rules, to mean “to accumulate” or does CalRecycle interpret it “to become due?” If the Department interprets it as “to become due,” AMERIPEN requests it provide parties receiving a notice of violation with ten business days to respond to and cure any violation to provide reasonable time to address simple issues without incurring penalties. AMERIPEN appreciated the replacement of “further accrue” with “begin accruing” in subparagraph (e)(1) for penalties relating to failure to maintain records in the prior draft. This is more consistent with SB 54 and the other provisions in this section, such that an initial violation would not be subject to a penalty before the thirty-day period.

Response to O-82-78

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements set forth in the Act, including in PRC sections 42060 and 42081, and the recommended change is not necessary to the implementation or enforcement of the Act. As acknowledged by this comment, section 42081(a)(3) provides that any penalties against a PRO or producer shall not begin accruing with respect to a violation until 30 calendar days following the notification of the violation. Section 18980.13(d) of the proposed regulations implements this requirement by providing that, for different types of violations, penalties will begin to accrue after the thirtieth day after CalRecycle issues a notice of violation. "Accrue" in this context has a straightforward, understandable, and plain meaning that is consistent with the statutory requirement established in PRC section 42081(a)(3). Finally, to the extent this comment poses questions to CalRecycle, as opposed to making any recommendation or objection that is specifically directed at CalRecycle's proposed regulations, no response is required.

Comment O-82-79

AMERIPEN continues to seek more direction in the enforcement section about how CalRecycle will deal with obligated producer entities that fail to register with a PRO or act as an Independent Producer, thereby avoiding financial and compliance obligations (“free riders”). At a minimum, AMERIPEN recommends that CalRecycle: (1) develop a methodology to identify producers that fail to register or act by the deadline; and (2) state in the regulations that any entity found to have avoided registration as a covered entity will be required to publicly report to the Department on the nature and duration of

its violation and be obligated to compensate a PRO and the Department for the fees and penalties it would have paid if it had complied with its obligation in a timely manner.

Response to O-82-79

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements set forth in the Act, including in PRC sections 42060, 42080, and 42081, and the recommended changes are not necessary to the implementation or enforcement of the Act. Pursuant to PRC section 42051(b), a producer is required to participate in an approved PRO plan, or otherwise comply with the Act as an Independent Producer, by January 1, 2027. Section 18980.5(b) of the proposed regulations implements this statutory provision by offering additional clarification as to this requirement. Pursuant to PRC section 42080(a), CalRecycle will conduct any investigations and audits as necessary to determine whether a producer is in compliance with the requirements of sections 42051(b) and 18980.5(b). Consistent with sections 18980.13(c) and 18980.13.2(a) of the proposed regulations, any failure by a producer to comply with the requirements of section 42051(b) and 18980.5(b) will constitute a violation of the Act and will subject that producer to penalties. Finally, pursuant to PRC section 42081(c), CalRecycle will determine the appropriate penalties amount for such a violation after considering the various factors identified in that section. Therefore, the proposed regulations already give effect to CalRecycle's enforcement obligations and authority in a manner that is consistent with the requirements set forth in the Act and no further revisions are necessary.

Comment O-82-80

§ 18980.13.4. Procedure for a Hearing

Paragraph (b) provides only 15 days for a respondent to request a hearing to contest a proposed enforcement action, which was reduced from the 30 days provided in the draft version of the rules released in December 2023. Respondents need ample time to consider the allegations of a violation, examine the circumstances, and decide whether contesting the matter is merited. To afford sufficient time accordingly, AMERIPEN continues to request restoration of the full 30 days to make a hearing request.

Response to O-82-80

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42060, 42080, and 42081, and the recommended change is not necessary to the implementation or enforcement of the Act. Section 18980.13.4(b) of the proposed regulations provides that a respondent may submit a request for a hearing to CalRecycle within fifteen days of being served an accusation pursuant to section 18980.13.3(c). However, the accusation will necessarily follow the issuance of at least one notice of violation, consistent with section 18980.13.3(a), and any other communications, requests, investigations, or audits conducted by CalRecycle pursuant to PRC section 42080(a). Therefore, by the time the respondent

receives the accusation, it will have already had the opportunity to consider the merits of the purported violations and to determine whether contesting the matter is appropriate. Thus, a timeline of fifteen days following receipt of the accusation to submit a request for a hearing provides the respondent with sufficient time and opportunity to make an informed decision, and no changes to the proposed regulations are necessary.

Comment O-82-81

Paragraph (d) allows the Department to "take any disciplinary or remedial action authorized under" SB 54 after conducting a hearing on the merits or if no hearing is requested. The mere conducting of a hearing should not authorize the imposition of penalties; instead, the Department should only proceed with penalties if the hearing proves the respondent is at fault. AMERIPEN requests this paragraph amended accordingly as follows: "After conducting a hearing on the merits **and finding the respondent at fault**, or if no hearing is requested, the Department may take any disciplinary or remedial action authorized under the Act, including those described in section 18980.13.5."

Response to O-82-81

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42060 and 42081, and the recommended change is not necessary to the implementation or enforcement of the Act. Section 18980.13.4(d) of the proposed regulations only concerns the timing with which CalRecycle can take disciplinary or remedial actions (i.e., only after a hearing has been conducted on the merits or after no hearing has been requested pursuant to section 18980.13.4(b)). Section 18980.13.4(d) does not relate to the standard of conduct or burden of proof that must be established to warrant disciplinary action. The Act and proposed regulations are clear that penalties will only be imposed where violations of the Act have been established, and no further changes to section 18980.13.4(d) are necessary to achieve this result.

Comment O-82-82

CHAPTER 11.5 ENVIRONMENTAL MARKETING AND LABELING

Article 1: Approval of Certification Entities

§ 18981. Third-Party Certification Entity Criteria and Approval Process

AMERIPEN appreciates the amendment made to subparagraph (b)(2)(B) consistent with the prior amendment made to subdivision (a)(4)(B) of section 18980.3.4 to exempt transactions for routine or administrative expenses unrelated to approval.

Response to O-82-82

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-82-83

AMERIPEN strives to offer a good-faith and proactive approach. We continue to focus on strategies that develop and/or strengthen policies to advance the “reduce, reuse, recycle” strategies, while also enhancing the value of packaging. Our members are driving innovation, designing better environmental performance to evolve the recycling infrastructure and to create a more circular economy for all packaging. In our efforts to reduce environmental impact by increasing the circularity of packaging, our members continue to recognize the value of collaboration and the importance of working across the packaging value chain.

AMERIPEN looks forward to the continued open dialogue with the Department while collectively balancing the myriad needs of the packaging industry, developing sound solutions to foster a more sustainable future, an effective circular economy, and systems that achieve positive environmental outcomes for everyone, ultimately supporting the success of this program. We remain committed to supporting progressive, proactive, and evidence-based strategies for sustainable packaging policies and programs.

AMERIPEN thanks the Department for this opportunity to provide written comments regarding the proposed regulations for SB 54 and appreciates the Department staff during the SB 54 regulatory process. Please feel free to contact me by email (GMelkonian@serlinhaley.com) with any questions on AMERIPEN’s positions.

Response to O-82-83

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process. To the extent other portions of the submission do suggest changes or raise objections, CalRecycle has responded to those portions separately.

O-83: Biodegradable Products Institute (Alexander Truelove)

Comment O-83-1

To CalRecycle,

The Biodegradable Products Institute (BPI) is North America’s leading organization representing certified compostable materials, products, and packaging, with over 600 member companies worldwide and tens of thousands of certified products. BPI is the foremost association for the circular bioeconomy who convenes the compostable product value chain, and facilitates inclusive discourse to create consensus on

actionable, science-backed standards, claims, and policy. Our certification program has verified tens of thousands of items using ASTM standards as a baseline, with additional requirements to prohibit PFAS, promote clear labeling, and sensible eligibility criteria, all to help to keep organic waste out of landfills.

As an active stakeholder in the development of Senate Bill 54 and champion of its goal to make all covered products and packaging in California reusable, recyclable, or compostable by 2032, we'd like to further clarify and contextualize our comments in response to this version of the regulatory text.

While many of our comments below support the regulations proposed by CalRecycle, we also highlight specific issues that render the proposed regulations inconsistent with other California laws, including Senate Bill 54 and Assembly Bill 1201. We also highlight specific issues that render the proposed regulations inconsistent with the available scientific evidence, BPI's experience, and CalRecycle's duty to protect human health and the environment. Considering BPI's expertise and authority as set forth above, CalRecycle must meaningfully grapple with BPI's comments on the proposed regulations. See, e.g., Gov't Code § 11346.9(a)(3); Sims v. Dep't of Corr. & Rehab., 216 Cal. App. 4th 1059, 1071– 74 (2013) (regulations invalidated for "substantial failure" to comply with APA procedural duties, including failure to address alternatives)

Response to O-83-1

Comment rejected. No response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations, does not raise an objection concerning the rulemaking process, or refers to suggested changes or objections set forth in greater detail in other portions of the submission. To the extent other portions of the submission suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-83-2

Section 18980.1 (Definitions)

We support and appreciate the changes that CalRecycle has made to two different definitions, namely the definitions of: (1) "alternative collection"; and (2) "food service ware". The changes to "alternative collection" now more expressly include mail back collection programs and other extended logistics collection programs. The changes to "food service ware" now appropriately include food-associated items that facilitate disposal of food-contact items, such as cup sleeves which facilitate the disposal of cups. We continue to request revisions to the definition of "plastics or polymers" and the addition of a separate definition of "polymers." **We ask that the definition of "polymer" in ASTM D883 is included in this regulation to reflect both the intent and the language in existing statute.** It should be noted that the ASTM D883 definition is referenced for the meaning of "polymer" in both ASTM D6400 and ASTM D6868.

It is imperative that CalRecycle define “polymers” separately from “plastics” for the purposes of this regulation. This is a concern because plastics are articles made from a small subset of polymers—polymers are simply long-chain molecules and can be found in nearly every item in our daily lives. By not defining “polymers”, the very narrow exemption to meet safety and performance criteria in current statute enshrined as PRC 42356.1(d) is now a very wide one. Polymers are likely included in most certified compostable products, especially fiber-based products, to some extent; this is why we have a certification to ASTM standard specifications to ensure that they are biodegradable, do not negatively impact disintegration, and do not add any toxic effects.

Should this definition not be properly addressed, the inevitable result is that companies that do all the careful product design and testing to ensure integrity of the resulting compost will have to compete with companies that do not do this under SB54. It will result in consumer confusion, as the statute says one thing, but non-compostable products could be considered eligible to be labeled compostable under SB54, and receive any economic benefit associated with that claim. Should those products end up in a composting facility, filled with untested and unknown components, the integrity of soil in California is at risk. As such, the proposed regulations need to include a specific definition of “polymers” and the definition of “plastics or polymers” should refer to this definition of polymers.

Rationale provided by the department in the ISOR document misunderstands the statute in multiple ways. First, the need to test and certify products with polymers is not limited to the “rate of composting.” The relevant ASTM standard specifications include requirements for ecotoxicity and constituents, in addition to biodegradation and disintegration, all of which are necessary to protect the quality of the resulting compost. Furthermore, the claim that fiber is itself a polymer does not change the need for other “incorporated” polymers to be tested. It has always been intended and understood that the exemption for paper and fiber-based products without polymers applies only to an extremely narrow subset of products such as wooden stir sticks. This is also why certification entities like BPI require testing for countless uncoated paper and fiber products, to prevent persistent and/or toxic elements from being introduced into compost. CalRecycle cannot ignore the clear purpose of the law for the purpose of drawing an arbitrary distinction between product types.

Response to O-83-2

CalRecycle rejects this comment for the reasons provided in response to comment B-14-2.

Comment O-83-3

Section 18980.2. (Categorically Excluded Materials)

We appreciate and support the changes to require an entity to “explain why no reasonably
possible alternative packaging or packaging component is available.” to achieve categorical exclusion. Because there are many compostable alternatives to otherwise

non-recyclable, non-reusable packaging and packaging components, this change keeps incentives in place for material and design innovation and for producers to move towards
more sustainable packaging designs over time, including compostable food packaging that
could help drive food waste diversion and reduce contamination.

Response to O-83-3

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process, so no further response is necessary.

Comment O-83-4

Section 18980.2.2 (Exclusion of Certain Types of Packaging)

We are concerned about the exclusions for “de minimis” elements as the language is inappropriate and vague as it relates to compostable products. Unlike recyclable products that can often be deconstructed to remove non-recyclable components, any “size” or “weight” of non-compostable components within covered products, regardless of “weight or volume,” can persist as a contaminant in a compost pile. Fortunately, SB 54 references existing California law (PRC Chapter 5.7), including standard specifications such as ASTM D6400 and D6868 that already set pass/fail criteria to prove the performance of compostable items. This includes testing for biodegradation, which is a microscopic process and cannot be measured in a compost facility but rather requires laboratory testing, in addition to separate laboratory testing for ecotoxicity. ASTM D6400 and D6868 are the appropriate standard specifications, and an element should be considered “de minimis” only if it complies with these standards.

We therefore request that all mention of “composting” and “compostable” be removed from this de minimis allowance, and that components small in weight and/or size are adjudicated as part of a whole product, as covered by existing law designed for this purpose. Alternatively, we request that the relevant provisions be revised to clarify that an element be considered “de minimis” only if the whole product still complies with ASTM D6400 and D6868. Without one of these corrections, the applicable provisions create uncertainty and allow for products to be considered compostable for purposes of the proposed regulations even if they do not meet these strict standards that ensure such products do not cause harm to human health or the environment

Response to O-83-4

CalRecycle rejects this comment for the reasons provided in response to comment B-14-3.

Comment O-83-5

Section 18980.4 (Responsible End Market Criteria) Statute affirms that responsible end markets must be defined “in a way that benefits the environment and minimizes

risks to public health and workers." How can individual compostable items be specified to have different end market requirements when they are composted in a mix together with food scraps and other feedstocks? Compostable products are not typically separated out by type into distinct batches of compost, unless CalRecycle recommends that such bifurcation will be conducted with funding from this program. We're also concerned that compost facilities, as end markets, are not required to provide the conditions necessary to responsibly process covered compostable products into a stable and mature finished compost. We explain solutions to these unsupported and irresponsible declarations below.

First, the term "biologically decompose" as applied in both section 18980.4(a)(4)(B) and (C) continues to be used in a way that is unclear, unsupported, and undefined, despite multiple requests remove this term. ASTM standard specifications D6400 and D6868 already required by California law provide clearly defined and scientific criteria for biodegradation, making this "biologically decompose" term unnecessary and problematic. What's needed are clear criteria for composters to align conditions for the acceptance and processing of compostable plastic products, such as are outlined in the field test methods ASTM D8618 and D8619. Additionally, section 18980.4(a)(4)(C) does not appear to require items comprised of fiber or paper substrates (that may contain persistent polymeric components) to fully break down, creating unequal treatment of material types that not only betrays the underlying science of compostability, it also betrays PRC Chapter 5.7 of California law that requires paper and fiber products containing any plastic or polymer to undergo testing and certification. Removing the entirety of section 18980.4(a)(4)(B)-(C), including "fully biological decompose," solves this.

Furthermore, while a "marketable" compost product as described in section (C) might ensure proper pathogen reduction, etc., the term is insufficient for ensuring conditions necessary for compostable products to break down. To the extent that CalRecycle does not change these provisions to require compost conditions to be suitable for breaking down certified compostable products, and require compost to stable and mature compost, not just marketable. By not establishing relevant criteria, CalRecycle is risking substantial harm to the environment, and acting contrary to the text and principles of SB54. We request that this section 18980.4(a)(4)(B)-(C) therefore be removed.

The solution is luckily straightforward, as the recently published field-testing test methods
ASTM D8618 or D8619 provide clear ranges of operating conditions, based on general practices for composting (that aren't unique to compostable products) and clear thresholds for compost stability and maturity. By simply requiring composters to submit an ASTM D8618 or D8619 test report to show that suitable operating conditions are met, a stable and mature compost is produced, and compostable products can break down. This will ensure that composting facilities receiving funding are designed and operated to manage certified compostable products in the program and therefore are "responsible." If the department does not adopt this requirement, it must explain its

reasoning and provide a separate set of requirements to ensure that end markets for covered compostable products are capable of responsibly processing them.

Finally, the ISOR incorrectly states that certified compostable plastics cannot be a “recycled organic product,” even though by definition compostable plastics are made of organic carbon that is fully consumed by microorganisms, as evidenced by biodegradation testing that counts carbons, just like other compost feedstocks.

Response to O-83-5

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42041(aa), 42041(ad), 42051.1, and 42060, and the recommended changes are not necessary to the implementation or enforcement of the Act. To the extent this comment suggests that the different standards in sections 18980.4(a)(4)(B) and (C) of the proposed regulations are inappropriate or should otherwise be made similar, see the response to comment B-6-5. Furthermore, to the extent this comment suggests additional support or investment may be needed to ensure the standards of sections 18980.4(a)(4)(B) or (C) can be satisfied, see again the response to comment B-6-5. To the extent this comment recommends revising or clarifying the "biologically decompose" standard, no change is necessary. That term, as it is used in both section 18980.4(a)(4)(B) and (C), has a plain and clear meaning consistent with intent of the Act and with CalRecycle's authority under PRC section 42041(ad). See the response to comment O-75-12. Because this standard is clear, consistent, reasonable, and within CalRecycle's authority, no change to the proposed regulations—including a reference to ASTM standard specifications—is necessary. Additionally, to the extent this comment might suggest that section 18980.4(a)(4)(C) conflicts with Chapter 5.7 (commencing with PRC section 42355), no change is necessary for the reasons provided in response to comment O-91-8. To the extent this comment suggests section 18980.4(a)(4)(C) only requires that compost be marketable, and is insufficient for ensuring compostable products break down, no change is necessary. Along with the marketability requirement, section 18980.4(a)(4)(C) requires that the applicable covered material must biologically decompose. For the reasons expressed above, this standard is sufficiently clear to ensure that the relevant covered materials break down in a manner consistent with the Act and necessary to protect the environment. The current language of sections 18980.4(a)(4)(B) and (C) has incorporated the feedback of various interested parties and strikes an appropriate balance between protecting the environment and establishing a reasonable opportunity for compliance. Finally, regarding the ISOR's characterization of plastic substances, that is a semantic issue only: The term "recycled organic product," as used in the proposed regulations, refers to the three things listed in section 18980.1(a)(20), not to such plastics. Neither the ISOR nor the proposed regulations purports to characterize plastic substances or "certified compostable plastics" for any other purpose.

Comment O-83-6

Section 18980.11.1. (Extensions or Exemptions for Local Jurisdictions and Recycling Service Providers)

Section 42060.5(b) of SB 54 allows the department to grant exemptions for local jurisdictions or service providers that provide written showing that they cannot accept or process specific covered material because of "specific local conditions, circumstances, or challenges." We support that an extension or exemption request must consider "program efficacy; technological or economic limitations; legal restrictions or requirements; effects on the environment, environmental justice, worker health and safety; public health; hazardous waste generation; and transportation safety." However, we'd further request that the local jurisdiction or service provider demonstrate that it has issue and considered requests for proposals (RFPs) to support any claims of technological or economic limitations that cannot be sufficiently funded by the program. We also remind the department that all lawfully labeled compostable products are tested and certified based on the same conditions. Therefore, a local jurisdiction or service provider cannot request an exemption for one material type, but not another, based on local conditions.

Response to O-83-6

Comment rejected. The additional requirement that the commenter proposes would be an unnecessary burden. The premise of the commenter's proposal is that evidence cannot establish impracticability where a local jurisdiction or recycling service provider has not solicited proposals related to collection of the covered materials at issue. That premise is false. While the failure of such solicitation might be highly relevant to establishing impracticability, the absence of one does not, on its own, establish the opposite. CalRecycle can consider the lack of a request for proposal in its evaluation of impracticability, but precluding a finding of impracticability in all instances where one has not been issued is unduly restrictive.

Also, the commenter's "remind[er]" that "all lawfully labeled compostable products are tested and certified based on the same conditions" is erroneous. There is no current requirement that a product labeled "compostable" be certified. Whether the commenter is correct that an exemption for certain materials necessarily is justified for others need not be addressed in the proposed regulations. The merits of exemption requests, including the scope of granted exemptions, are necessarily a case-by-case matter.

CalRecycle further rejects this comment for the reasons provided in response to comment O-83-6.

Comment O-83-7

On Accreditation Requirements for Third-Party Certification Entities

We would like to strongly reaffirm our comments submitted in 2024 that requiring ISO 17065 is a robust and appropriate accreditation for certifying bodies, but this is not

commonplace for most global certifiers in the compostability space today. Certifying bodies will need time to ensure relevant ISO 17065 accreditation is in place, and product manufacturers will subsequently require time to gain new certificates that are accredited. Therefore, BPI recommends a staggered implementation timeline to ensure producers selling covered compostable products can continue to be compliant in the California market. BPI proposes the following timeline for accreditation requirements:

• By January 1, 2028: Certification bodies must be ISO 17065 accredited with testing performed by labs that are either ISO 17025 accredited or audited to the requirements of ISO 17025.
• By January 1, 2031: Producers selling covered compostable products must have certificates displaying the ISO 17065 accreditation.

CalRecycle must address this comment to adhere to the requirements of the California Administrative Procedures Act. *See Mountain Lion Found. v. Fish & Game Comm'n, 16 Cal. 4th 105, 113–14 (1997).*

Response to O-83-7

CalRecycle rejects this comment for the reasons provided in response to comment B-36-8.

Comment O-83-8

Finally, while we support language to ensure no collusion or conflicts of interest between certification entities and laboratories, we feel strongly that the language must include a prohibition of ownership in all testing entities, including and especially composter/field sites. As of this writing, there is only one national company offering commercial field testing as a service in the U.S., the Compost Manufacturing Alliance (CMA). CMA is a for-profit organization that lists compost facilities that also serve as field testing sites as partners, potentially with ownership stake. This presents an egregious conflict of interest, with little to no oversight into the co-managed field testing and certification process. We continue to request the following language modification:

"Without limitation, the entity shall be deemed not to satisfy this requirement if any of the following are true:
(A) It holds any ownership interest, whether direct or indirect, in any laboratory or site that conducts testing on which its certifications are based, conducts the testingitself, or is the producer of any product subject to the required certification requirement."

Please reach out with any questions or concerns.

Alex Truelove

Response to O-83-8

Comment rejected. As written, the proposed regulations robustly protect against the conflict of interest that would present any time an entity issuing certifications

is also conducting testing. For example, 18981(b)(1) makes clear that testing must be conducted by an "independent laboratory," so no change is needed in (b)(1)(A) to forbid the certifier from conducting the testing itself. The commenter's suggestion to refer to "the producer of any product subject to the . . . certification requirement" would be inappropriate because the term "producer" has no definition in context of section 18981, which implements Public Resources Code section 42357(g)(1)(A). That statutory provision relates to labeling restrictions applicable to all products and materials sold or distributed by anyone in the state, not just "covered materials" sold or distributed by "producers."

O-84: City of San Diego (Jennifer Ott)

Comment O-84-1

The City of San Diego (City) Environmental Services Department appreciates the opportunity to comment on CalRecycle's proposed regulatory language for implementing the Plastic Pollution Prevention and Packaging Producer Responsibility Act (SB 54).

The City operates the Miramar Landfill and Greenery composting facilities; has experience collecting trash, recycling, and organics curbside from over 285,000 customers; administers franchise agreements with 21 franchise haulers and franchise recycling facility agreements with Allan Co and EDCO; and manages waste reduction programs for communities and events across the City. As an operator, hauler, and local leader in waste reduction efforts, the City appreciates the opportunity to be a part of the formal rulemaking process.

The City supports the State’s work on SB 54 and its timely focus on producer responsibility and pollution prevention. It is exciting to be part of this groundbreaking legislation to reduce waste, cut plastic pollution, increase source reduction, and move California toward a more circular economy. We strongly support increasing producer responsibility for both implementation and funding.

At the same time, we recognize the complexity of drafting regulations for such a far-reaching law. Our concern is that certain provisions, as currently written, may unintentionally shift responsibility away from producers and weaken the program’s effectiveness. We offer the following comments and recommendations:

Response to O-84-1

Comment rejected. No response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations, does not raise an objection concerning the rulemaking process, or refers to suggested changes or objections set forth in greater detail in other portions of the submission. To the extent other portions of the submission suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-84-2

ARTICLE 2: Covered Material and Covered Material Categories – Section 18980.2. Categorically Excluded Materials

This section outlines which packaging materials can be categorically excluded from the regulations.

As drafted, there is a general uncertainty for how this provision stipulates exemptions vs exclusions—a definition for both could provide clarity. Additionally, this provision appears to allow broad exemptions for a wide range of food packaging materials if they are tied to the Food and Drug Administration (FDA) or the Food Safety Modernization Act (FSMA) requirements for microbial control, shelf stability, or structural integrity.

For example, the following packaging could all reasonably qualify as excluded:

- Barrier films used as primary food contact layers;
- Glass jars and metal lids used for pasteurization or sterilization;
- Kraft board boxes and corrugated cases used to protect inner packaging;
- Tamper-resistant seals.

This interpretation risks exempting most primary and secondary food packaging, leaving only limited categories of convenience or display packaging in scope. Such an outcome would substantially reduce the impact of SB 54 on packaging reduction and recycling, particularly in the food sector.

Recommendations:
To ensure SB 54 achieves its intended environmental outcomes while respecting food safety standards, the City recommends:

1. Narrowing Exemptions—Under FDA/FSMA requirements, exemptions should apply only to packaging components that are strictly necessary for food safety, microbial control, or structural integrity.
2. Differentiating Safety-Driven vs. Convenience-Driven Packaging – Packaging that serves a direct safety function (e.g., barrier films, tamper seals) may qualify for exemption, while convenience-driven or redundant packaging (e.g., multipack sleeves, decorative wraps, shipping cases) should remain within scope.
3. Providing Clear Case Examples—CalRecycle should publish guidance with real-world examples to illustrate the distinction between exempt and non-exempt packaging formats so that producers and jurisdictions can consistently align compliance efforts.
4. Avoiding Overly Broad Exemptions – Without careful differentiation, exemptions could unintentionally apply to the majority of packaging, undermining the goals of SB 54.

Response to O-84-2

Comment partially accepted and partially rejected. CalRecycle accepts this comment to the extent it alleges that section 18980.2(a)(2) was unclear in scope or effect, was insufficiently clear with regard to what renders it "not reasonably possible" to resolve conflicts with federal laws, or would have been overbroad in effect due to the potential for the exclusion to be applied despite the conflicts being avoidable. See CalRecycle's response to comment I-19-1, explaining the revisions responsive to this and similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

CalRecycle otherwise rejects this comment. Regarding the suggestion that 18980.2(a)(2) should only apply with respect to "food safety, microbial control, or structural integrity," that limitation would contravene Public Resources Code section 42060(b)(1) and (2), which do not limit the relevant conflicts to those concerning such issues. Regarding the suggestion to implement a framework differentiating between safety- and convenience-related packaging features, CalRecycle rejects that suggestion for the reasons stated in response to comment I-33-3. Regarding the request for "case examples," that is not a proposed change to the regulation, and no regulation is necessary for CalRecycle to publish case examples.

Comment O-84-3

ARTICLE 2: Covered Material and Covered Material Categories – Section 18980.2.1. Exclusion of Reusable and Refillable Packaging and Food Service Ware

This section addresses how reusable and refillable packaging can be excluded from covered material categories. The current wording risks unintentionally excluding innovative curbside collection programs for reusables, limiting flexibility for jurisdictions and undermining progress toward circular systems.

<u>Recommendations:</u>

1. Subparagraph (4)(A): The regulations may unintentionally exclude curbside collection of reusable packaging from meeting convenience standards. Many jurisdictions are actively exploring and piloting curbside collection of reusables, and this should be recognized as a return modality eligible for CAA investments.
2. Propose Language Addition: Subparagraph (4)(C) – “In either case, if a curbside collection program is made available by a municipality, private hauler, or other collection provider working with or on behalf of the PRO or an Independent Producer, the requirements of this paragraph are satisfied.”

Response to O-84-3

CalRecycle rejects this comment. The commenter suggests that curbside collection of reusable packaging should be sufficient to meet convenience standards. The proposed regulation does not preclude use of curbside collection of reusable packaging, but relying solely on curbside collection would mean that items would be considered reusable even though many consumers would have no way to return the items. Moreover, it would be impracticable to accurately link the geographic scope of where a curbside collection to where items are sold or distributed, making it impossible to determine when a particular sale or distribution is of a reusable item. In contrast, the proposed 18980.2(a)(4)(A) concerns the infrastructure based on the location of sale of an item, ensuring that it is directly discernible whether the infrastructure requirement has been met for that item. Lastly, to the extent the commenter's concern applies to items obtained without visiting a remote location and directly delivered, the concern is misplaced because collection from the delivery location would be adequate pursuant to (a)(4)(B).

Comment O-84-4

ARTICLE 3: Evaluations of Covered Material and Covered Material Categories – Section 18980.3.3. Eligibility for Being Labeled "Compostable"

This section governs how packaging can be labeled as "compostable". Without a clear definition of "desirable organic waste," the rule could confuse consumers, increase contamination in organics streams, and burden local composting facilities with materials they cannot process.

Recommendation:
Subparagraph (c) (5): CalRecycle should insert a definition of "desirable organic waste." Without a clear definition, confusion may arise if packaging is marketed as "compostable" even though it cannot or will not be used for the recovery of desirable organic waste in practice.

Response to O-84-4

CalRecycle rejects this comment for the reasons provided in response to comment O-63-8. Moreover, the comment does not put forth any definition for CalRecycle to consider adopting.

Comment O-84-5

ARTICLE 4: Responsible End Markets – Section 18980.4. Responsible End Market Criteria

This section establishes criteria for what constitutes a responsible end market. As drafted, it could allow plastic flakes, nurdles, and pellets to count as "recycled," perpetuating microplastics and overproduction instead of driving true source reduction.

Recommendation:
Subparagraph (4) of paragraph (b): Flake plastics, nurdles, and pellets should not be considered recycled unless they are directed into a responsible end market. Allowing these forms to qualify as “recycled plastics” risks this cycle not being completed with the actual formation of new products from the recycled feedstock, thus undermining the goals of recycling in general and SB 54 specifically.

Response to O-84-5

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42041(aa), 42041(ad), and 42060, and no change is necessary to the implementation of the Act. Section 18980.4(b)(4) of the proposed regulations defines end markets for plastic covered material in a manner that is consistent with the definition of "recycling" in PRC section 42041(aa) and with "responsible end market" in PRC section 42041(ad). To the extent this comment suggests section 18980.4(b)(4) fails to allow for the recovery cycle to be completed, see the response to comment O-56-10. Moreover, to the extent this comment suggests section 18980.4(b)(4) does not drive true source reduction, source reduction is addressed separately in the Act, including, for example, in PRC sections 42050(a) and 42057. Section 18980.4(b)(4) is not intended to address source reduction and is instead focused on the identification of end markets for plastic covered material. As such, no change is necessary.

Comment O-84-6

ARTICLE 8: Producer Responsibility Plan Requirements – Section 18980.8. Producer Responsibility Plan

This section outlines requirements for Producer Responsibility Organization (PRO) Plans, including how covered costs are determined, reimbursed, and communicated to local jurisdictions. However, the draft regulations only require PROs or Independent Producers to notify jurisdictions after a determination is made on covered costs, and they also place arbitration and mediation fees equally on jurisdictions, both of which risk creating financial burdens and limiting transparency for local governments.

Recommendation:

1. Paragraph (g)(8): Language should be revised to require PROs to notify jurisdictions/municipalities when a submission is received, regardless of whether the jurisdiction is already aware.
2. Paragraph (h)(4)(E): Language should be revised to require PRO to reimburse for arbitration and mediation fees if a determination is made in the jurisdiction’s favor.

Response to O-84-6

CalRecycle rejects this comment for the reasons provided in responses to comment O-13-23, O-15-6, and O-63-10.

Comment O-84-7

ARTICLE 11: Requirements, Exemptions, and Extensions for Local Jurisdictions and Recycling Service Providers – Section 18980.11. Requirements for Local Jurisdictions and Recycling Service Providers

This section details jurisdictional requirements and compliance timelines. As written, the deadlines are unclear and too short, creating uncertainty and potentially forcing jurisdictions into costly infrastructure changes on unrealistic timelines.

Recommendations:

1. Paragraph (a): Clarify compliance deadlines if a PRO plan is submitted and approved before January 1, 2027.
2. Paragraph (c): The current one-year compliance timeline for changes to the Covered Material Category (CMC) list poses financial and infrastructure challenges. Recommend extending the compliance period to two years for local jurisdictions.

Response to O-84-7

CalRecycle rejects this comment. Section 18980.11(a) makes clear that, regardless of the date on which a PRO plan is submitted and approved, the date of approval is the date by which local jurisdictions and recycling service providers shall satisfy the requirement of subdivision (a) of section 42060.5 of the Public Resources Code that their collection and recycling programs include all covered materials within the covered material categories included in the CMC list.

With regard to the second recommendation, a period of one year balances the need to implement the Act as follows: a standard period longer than one year would delay the positive results expected from the change and would often exceed the period local jurisdictions reasonably require for updating their recycling programs, while a shorter period might be impracticable for a local jurisdiction or recycling service provider. Further, the ability to request an extension allows for added flexibility as CalRecycle may identify an effective date later than the publication date in cases where it anticipates those affected by the change may need a longer period to implement the update successfully.

Comment O-84-8

The City strongly supports CalRecycle's efforts to implement SB 54 and appreciates the opportunity to provide feedback. We urge CalRecycle to refine the exemption provisions

in Article 2 to ensure food safety needs are met without creating loopholes that undermine the legislation's environmental objectives.

Thank you for your leadership and commitment to reducing plastic pollution and advancing a circular economy in California. The City of San Diego looks forward to continued collaboration in the rulemaking process.

Please feel free to contact Jennifer Ott, Supervising Recycling Specialist at jott@sandiego.gov, 858-573-1285, if you would like to discuss any of our comments in more detail.

Sincerely, Andrea Deleon
Deputy Environmental Services Director
AD/JO/NV

Response to O-84-8

Comment rejected. The comment only makes a general suggestion to refine Article 2 and does not suggest specific changes to the proposed regulations or raise objections related to the rulemaking process.

O-85: StopWaste (Alameda County Waste Management Authority) (Michelle Fay)

Comment O-85-1

October 7, 2025

Submitted via Public Comment Form

Subject: SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act - Comments on Proposed Formal Draft Regulations released August 22, 2025

Dear CalRecycle,
This letter is in response to the formal draft of the SB 54 regulations released on August 22, 2025. We appreciate CalRecycle's responsiveness to several concerns and recommendations that were raised by local government and other stakeholders since the May 2025 draft. While we understand the need to finalize regulations given the regulatory restart, there are still several areas in the draft regulations that we believe do not fully align with the intent of the law. We offer the following comments and suggested regulatory revisions to help achieve alignment with the law's intent to accelerate progress toward circularity for packaging and foodware, protect ratepayers, and make local governments whole for costs associated with the law's implementation. Thank you for your consideration of the recommendations below.

Article 2: Covered Material and Covered Material Categories

Categorically Excluded Materials – 18980.2

The May 2025 version of the draft regulations added for the first time in the rulemaking process a new pathway for packaging components to be excluded from the law if it is "necessary to comply with rules, guidance, or other standards issued by the [USDA] or [FDA] ... to prevent microbial contamination or to maintain the safety or structural integrity of packaging...."

We appreciate the revisions made in section 18980.2(a)(2) of the August 2025 (current) version of the draft regulations to clarify these exclusions only apply when "it is not reasonably possible to use other packaging or packaging components..." and requiring that entities must provide rationale to the Department including the conflicting federal regulation and explanation as to why no reasonably possible alternative packaging is available. We also support the addition requiring the Department to review exclusion requests and maintain a public list of determinations.

The Department has stated this new categorical exclusion is intended to provide further clarity to statute section 42060(b), which, in summary, states that SB 54's regulations should not conflict with other federal packaging requirements. StopWaste believes that should such a conflict arise, producers can utilize the exemption pathway within subparagraph (4) of section 18980.2.4 Exemptions for Certain Covered Materials for (A) unique challenges, (C) health and safety reasons, or (D) materials determined unsafe to recycle.

Unlike categorically excluded materials, exempted materials remain covered under the law, meaning regulated producers must still report and pay fees into the system with a required phase-in plan to ultimately achieve compliance. Exemptions are also limited to 2-5 years, while excluded materials are permanently removed from the law's purview.

Recommendation:
We urge CalRecycle to remove section 18980.2(a)(2) from the draft regulations and instead rely on the existing exemption process (18980.2.4) for packaging or packaging components used by food or agricultural commodities that are unable to comply with SB 54 due to conflicting federal regulations.

Should the Department determine section 18980.2(a)(2) must remain in the regulations, we would like to offer the following revisions to improve the current approach:

• Exclusion vs. exemption rationale – Entities should be required to explain why an exemption under section 2.4 does not apply in their case, providing the statutory basis to exclude their packaging or component from the law entirely rather than request an exemption based on unique challenges or health and safety reasons.

The Department must be able to evaluate the basis for an exclusion vs. exemption and redirect requests to a more appropriate exemption pathway when applicable.

Suggested revisions to section 18980.2(a)(2)(A):
"The basis shall identify the specific provision of this Chapter that causes a conflict, cite the conflicting federal regulations or rules, ~~or guidelines~~, and explain why no reasonably possible alternative packaging or packaging component is available and why the exemption pathways outlined in section 189890.2.4 do not apply."

Note: We also recommend removing "guidelines" (as shown above), as federal guidelines are not always statutorily compelling.

• Time limits – Packaging design and recyclability are shifting rapidly as a result of SB 54. As such, materials excluded under section 18980.2(a)(2) should be limited to 2-5 years, just as exemptions are (18980.2.4(g)) and a phase-in plan or rationale for why a phase-in plan is not feasible should be required, similar to section 18980.2.4(c)(4)(A)viii for exemptions.

Innovation and development of responsible end markets will likely create new compliance pathways for materials that are currently unable to meet the requirements of the law. Excluding currently challenged materials from the law indefinitely goes beyond statutory intent, and should future conditions change, there must be a pathway to integrate excluded material back into the law.

We are also opposed to the addition of language that exempts packaging used for over-the-counter drugs (18980(a)(6), and we oppose the regulatory change that exempts secondary and tertiary packaging of exempted and excluded primary packaging (18980(b)). We feel these changes undermine the intent of the authors and many stakeholders that negotiated this bill.

Response to O-85-1

CalRecycle partially accepts and partially rejects this comment as described in response to comment I-59-2, which is substantively the same as this comment.

Comment O-85-2

Article 3: Evaluations of Covered Material and Covered Material Categories

Eligibility for Being Labeled "Compostable" – 18980.3.3

AB 1201 prohibits materials from being labeled "compostable" unless they meet specific criteria, including the requirement to be "designed to be associated with the recovery of desirable organic wastes, such as food scraps and yard trimmings, that are collected for composting, unless the product complies with the department's regulations pursuant to subparagraph (B), to the extent the department elects to adopt such regulations." (PRC 42357(g)(E))

Section 18980.3.3(5) of the draft SB 54 regulations clarifies that an item is designed to be associated with the recovery of desirable organic waste *"if it is desirable organic waste itself or is marketed, labeled, or otherwise sold or distributed in a manner that*

directs or otherwise causes users of the item to use and discard it with desirable organic waste."

This regulatory framing essentially provides that any material marketed or labeled to be composted, is considered "associated with the recovery of desirable organic waste" and therefore potentially compostable under SB 54 (if other criteria are met). The intent of section 42357(g)(E) is that a product facilitates the capture of desirable organics, such as food scraps and yard waste. Section 18980.3.3(5) of the current draft regulations effectively says that to be able to be labeled "compostable," a product simply needs to be labeled "compostable," provided it meets the other criteria in section 42357. Allowing all packaging and food ware, regardless of its material composition, bearing a "compostable" label to be considered "desirable" was certainly not the intent of AB 1201, and the draft regulations must be updated to close this unintended loophole. Further, while the SB 54 regulations will only affect food ware and packaging, including this definition in these regulations could open the door for the same or similar circular logic to be applied to other products seeking to be labeled compostable.

Recommendation:

We recommend deleting the following sentence from section 18980.3.3(5) of the draft regulations:
"They must satisfy the requirement set forth in subparagraph (E) of paragraph (1) of subdivision (g) of section 42357 of the Public Resources Code concerning association with the recovery of desirable organic wastes. ~~For purposes of this requirement an item is designed to be associated with the recovery of desirable organic waste if it is desirable organic waste itself or is marketed, labeled, or otherwise sold or distributed in a manner that directs or otherwise causes users of the item to use and discard it with desirable organic waste.~~"

Response to O-85-2

CalRecycle rejects this comment for the reasons provided in responses to comments I-59-3 and O-78-7.

Comment O-85-3

Article 4 – Responsible End Markets

Alternative Recycling Technologies – 18980.4(d)

PRC section 42041(aa)(5) states that the SB 54 regulations "shall encourage recycling that minimizes *generation* of hazardous waste, generation of greenhouse gases, environmental impacts, environmental justice impacts, and public health impacts. The regulations shall also include criteria to exclude plastic recycling technologies that *produce* significant amounts of hazardous waste." However, section 18980.4(d)(B) in the current version of the draft regulations goes against this statutory direction and shifts the standard from the *generation or production* of hazardous waste to its *management*.

The draft regulations enable — not exclude — technologies that produce significant amounts of hazardous waste, unlawfully shifting the standard from the production of hazardous waste (as required by the statute) to its management. Therefore, the threshold of avoiding only those technologies where hazardous waste is improperly managed and "presents an imminent and substantial risk of harm to public health or to the contamination of the environment" does not achieve the statutory mandate. Further, the draft regulations state that any hazardous waste handled and disposed of in "substantial compliance with an applicable permit" does not pose an imminent and substantial risk. This, too, conflicts with statutory guidance and legislative intent to exclude technologies based on the generation, not management, of hazardous waste.

Additionally, the regulations still fail to address the statutory requirement to encourage minimization of the "generation of greenhouse gases, environmental impacts, environmental justice impacts, and public health impacts." (The draft regulations currently only address hazardous waste generation/management.) We urge the Department to add provisions to address these critical concerns and meet the statutory directives.

Response to O-85-3

CalRecycle rejects this comment for the reasons provided in response to comment O-62-1.

Comment O-85-4

Compostability of plastic – 18980.4(a)(4)(B)

We appreciate clarification of the use of the term "fully biologically decompose," and reference to the ASTM D-6400 standard. We strongly support the Department's requirements for items "partially or wholly comprising plastic." Visible particles of compostable plastic in compost products hamper the marketability of those products. There is also a growing body of research showing compostable microplastic residue has detrimental effects on plant and soil health, and potentially human health.

Compostability of paper and fiber – 18980.4(a)(4)(C) and 18980.3(c)(4)

We support the regulatory approach to have different compostability standards for paper and fiber than for plastic. However, with the requirement for testing from an independent laboratory in section 18980.3(c)(4) removed, we are concerned the new proposed compostability standards for paper and fiber may allow for bad actors to maintain vague or otherwise insufficient documentation demonstrating that the fiber truly is "wholly derived from natural resources." Some form of verification of or attestation that a product is wholly derived from natural resources should be required to be submitted to the Department.

Response to O-85-4

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment I-59-5, which is substantively the same as this comment.

Comment O-85-5

Article 8 – Producer Responsibility Plan Requirements

Reimbursable costs – 18980.8(g)

We appreciate the addition to this section requiring that the PRO or Independent Producer "first" notify the local jurisdiction when costs are deemed covered for a recycling service provider. The notification of payments prior to issuance to service providers supports the transparency needed to help ensure that ratepayers do not pay for costs already covered by producer payments.

Response to O-85-5

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-85-6

Article 11: Requirements, Exemptions, and Extensions for Local Jurisdictions and Recycling Service Providers

Local jurisdiction requirement – 18980.11(b)

PRC section 42060.5 states "local jurisdictions or recycling service providers shall include in their collection and recycling programs all covered material" contained on the statewide recyclable / compostable list. The current draft of the regulations provides that a "covered material is considered included in a local jurisdiction or recycling service provider's collection and recycling program if the local jurisdiction or recycling service provider collects the covered material and transfers it to responsible end markets directly or to intermediate supply chain entities."

StopWaste believes that including the requirement to also transfer recyclable and compostable covered material goes beyond the statutory requirement for local jurisdictions. This framing also makes it difficult to attribute violations to the correct party, muddying the distinction of where the enforceability of a jurisdiction for a violation of this requirement ends and the point at which that responsibility transfers to a recycling service provider or an intermediate supply chain entity. Jurisdictions need clear guidance on what's expected for compliance and how compliance will be determined.

Recommendation: Delete "~~and transfers it to responsible end markets directly or to intermediate supply chain entities.~~"

Response to O-85-6

CalRecycle rejects this comment for the reasons provided in response to comment I-59-7.

Comment O-85-7

Article 13: Enforcement Oversight by the Department

The draft regulations must recognize that SB 54's Enforcement Authority is limited to producers and the PRO and respect that local jurisdictions and recycling service providers are instead subject to existing enforcement regimes under AB 939. Great lengths are taken in statute to outline the potential enforcement actions that can be imposed against producers or the PRO, yet there is not a single instance in statute that refers to enforcement upon local jurisdictions or recycling service providers. Neither Public Resources Code Sections 42080 nor 42081 contemplate penalties against local governments or recycling service providers.

Local jurisdictions are subject to AB 939's diversion requirements and must develop source reduction and recycling elements outlining how they will achieve the state's solid waste and recycling requirements. Under the AB 939 framework, CalRecycle is required to regularly review jurisdictions and determine whether they have made a good faith effort to implement their source reduction and recycling element, with penalties of up to $10,000/day for noncompliance. Therefore, a local jurisdiction's failure to comply with SB 54 should be considered a violation of their existing requirements to implement diversion programs through AB 939 and subject them to these penalties exclusively. Reporting and compliance review for SB 54 should be incorporated into existing Electronic Annual Report (EAR) system run by CalRecycle, as currently utilized for other laws that govern local jurisdiction diversion requirements such as SB 1383, AB 341, and AB 1826 compliance. This existing system can be updated to require local jurisdictions to self-report SB 54 compliance by certifying whether they include the required recyclable or compostable covered materials in their programs.

We appreciate CalRecycle team's openness to feedback and continued dialogue to ensure the final regulations will provide a foundation for successful implementation of the law.

Response to O-85-7

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment I-59-8, which is substantively the same as this comment.

O-86: The Plant Based Products Council (Sydney Vandemeulebroecke)

Comment O-86-1

RE: California SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act Permanent Regulations; Changes to Proposed Rulemaking Comment Period

The Plant Based Products Council (PBPC) appreciates this opportunity to provide comments in response to the California Department of Resources Recycling and Recovery's (CalRecycle) 45day public comment period regarding the latest changes to the proposed rulemaking for Senate Bill 54 (SB 54) Plastic Pollution Prevention and Packaging Producer Responsibility Act regulations.

PBPC represents businesses large and small who are committed to advocating for a shift toward a more circular bioeconomy through greater adoption of plant-based materials supported by appropriate end-of-life infrastructure. We aspire to deliver a future based on renewable goods, improving global resource efficiency to meet the challenges of the 21st century while also providing environmental benefits through reduced greenhouse gas emissions and improved soil quality and water quality, along with improved recycling of food waste. Plant-based products and materials, including biobased plastics, are made from renewable sources, including agricultural commodities such as corn, hemp, soy, and sugarcane and can serve as alternatives to traditional consumer materials such as single-use plastics that are often derived from fossil fuels.

Many plant-based products, including some food service packaging items, are compostable or recyclable. Through composting, these products provide valuable soil amendments, support carbon sequestration, and reduce methane emissions from landfills. As interest grows among consumers, brands, and retailers for environmentally beneficial packaging, compostable products are poised to play a crucial role. On the other hand, many plant-based products are designed with recyclability in mind, allowing them to be integrated into existing recycling streams. These approaches enhance the environmental value of plant-based products as they can reduce waste and promote resource recovery.

We appreciate that CalRecycle took industry feedback into account and incorporated some recommendations that support the environmental goals of SB 54 earlier in the process. Meaningful improvements at this stage, however, are essential to allow success for this emerging industry and the positive impacts it offers to local economies and the environment. Thank you for your responsiveness to these priorities as we work together to foster an improved packaging ecosystem in California.

Response to O-86-1

Comment rejected. No response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations, does not raise an objection concerning the rulemaking process, or refers to suggested changes or objections set forth in greater detail in other portions of the submission. To the extent other portions of the submission suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-86-2

Treatment of "excluded material"

We appreciate and support the new requirement that an entity must “explain why no reasonably possible alternative packaging or packaging component is available” to qualify for a categorical exclusion. This requirement ensures producers consider compostable or recyclable alternatives before seeking exclusions, helping to advance the use of more sustainable packaging solutions.

“The basis shall identify the specific provision of this Chapter that causes a conflict, cite the conflicting federal regulations, rules, or guidelines, and explain why no reasonably possible alternative packaging or packaging component is available.”

Response to O-86-2

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process.

Comment O-86-3

The exemption of certain fiber-based products from third-party certification

We reaffirm that all products should meet the same burden of proof testing for recyclability or composability, regardless of material composition. This ensures fairness and consistency across the industry. Further, we are concerned that CalRecycle's broad testing requirement, without a specified independent standard for assessing the absence of plastics or polymers in fiber products, may lead to inconsistent methods of testing and disclosure. Without clear guidelines and independent verification, companies may use varying approaches, which could impact the integrity of the process.

Response to O-86-3

Regarding "CalRecycle's broad testing requirement," CalRecycle cannot respond because it cannot discern any such requirement. If the commenter intended to refer to the certification requirement imposed by Public Resources Code section 42357(g)(1)(A) and addressed in section 18981 of the proposed regulations, that reference would be erroneous because that requirement does not concern the presence or absence of polymers in fiber products. If the commenter intended to recommend that the exemption from the requirement that material labeled "compostable" meet certain ASTM standards pursuant to Public Resources Code section 42357 be subject to a certification requirement, CalRecycle rejects that recommendation because it would contravene the clear intent behind enactment of section 42356.1(d). Through that that provision, the Legislature exempted products that do not contain "plastic or polymers" from the certification requirement pursuant to section 42356(g)(1)(A), without creating any new, parallel certification requirement. See, also, CalRecycle's response to comment B-36-4.

Comment O-86-4

Concerns with definitions
Renewable materials

We remain deeply concerned that CalRecycle has overlooked the fact that many plastic products derived from renewable materials, such as "wood, mycelium, algae, or plants like cotton, corn, sugar cane, or wheat," may contain trace amounts of materials from other sources. The requirement for products to be "wholly derived from natural resources" still unfairly disadvantages producers who are striving to create sustainable products made using renewable materials.

This approach not only penalizes companies working to reduce their environmental footprint but could also hinder efforts to develop and scale up sustainable solutions. By imposing stringent requirements, CalRecycle risks stifling innovation and limiting the production of materials that reduce reliance on fossil fuels and minimize waste. Using a fee structure to encourage the use of a portion of ~~predominantly~~ renewable materials rather than requiring purity will help drive the transition to a circular economy. The adoption of incentives and other policy tools could also drive growth and adoption of plant-based options.

"(j) Pursuant to paragraph (7) of subdivision (e) of section 42053 of the Public Resources Code, a PRO shall provide a credit for producers who use plastic covered material derived from renewable materials. (1) "Renewable materials," for the purposes of paragraph (7) of subdivision (e) of section 42053 of the Public Resources Code, means materials that are wholly derived from natural resources that are not of mineral or fossil fuel origin, without resulting in the net depletion of any of the resources. Examples of potentially renewable material include those derived from wood, mycelium, algae, or plants such as cotton, corn, sugar cane, or wheat."

Response to O-86-4

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements set forth in the Act, including in sections 42053 and 42060 of the Public Resources Code, and the recommended change is not necessary to the implementation or enforcement of the Act. Section 42053(e)(7) requires a PRO to subject plastic covered materials derived from renewable materials to a reduced fee relative to plastic covered materials derived from a nonrenewable material. Section 18980.6.7(j)(1) of the proposed regulations implements this requirement by clarifying that "derived from," for the purpose of this section, means "wholly derived from." This language offers clarification while supporting the overarching intent and purpose of the Act to encourage the reuse and recycling of covered materials. To the extent this comment is concerned that the current language of section 18980.6.7(j) will disadvantage producers who are striving to create products made from predominantly renewable materials, other statutory and regulatory provisions, including, for example, sections 42053(e)(2), 42053(e)(6), 42057(a), and 42057(d) of the Public Resources Code, already offer adequate incentives and rewards to producers striving to transition to

covered materials that are predominantly comprised of renewable materials. Therefore, no changes to section 18980.6.7(j) are necessary to the implementation or enforcement of the Act.

Comment O-86-5
Food service ware

We are still concerned that the updated definition of 'food service ware' excludes it from being classified as packaging. This creates unnecessary complexity and draws arbitrary distinctions that complicate producer responsibility assignments.

"(8) "Food service ware" means the goods identified in subparagraphs (A) and (B). Plastic single-use food service ware is covered material and shall not be considered "packaging" for purposes of this chapter."

At the same time, we support the inclusion of language within the definition of 'food service ware' covering items "designed specifically for use in conjunction with food service ware items," as this appropriately captures food-associated products such as cup sleeves alongside cups and facilitates their co-disposal.

Response to O-86-5

Comment rejected. A clear distinction must be made between packaging and food service ware to avoid any potential confusion relating to the reporting of this covered material. Therefore, the recommended change is not necessary to the implementation or enforcement of the Act.

Comment O-86-6
Plastics and polymers

It is imperative that CalRecycle distinguish between "plastics" and "polymers" for the purposes of this regulation. Section 18980.3.3(c)(4)(A)(i) states that any product exempted from the compostable labeling requirements must:

"(i) demonstrate that the manufacture of the items does not incorporate plastics or polymers, as defined in paragraph (16) of subdivision (a) of section 18980.1, into the item through an intentional process or combination of processes, such as lamination, extrusion, and mixing."

However, polymers are not necessarily synonymous with plastics. Polymers are present in many common products, from soaps to lubricants, that cannot be made into plastics. To ensure accurate application of the regulation and the proper identification of persistent, non-compostable polymers used in covered material items, we respectfully request that CalRecycle adopt a separate and precise definition of "polymers." Using the recognized definition of "polymer" from ASTM D883 would align with both the intent and language of existing statute, including the references to ASTM D6400 and D6868 in defining "compostable."

Response to O-86-6

CalRecycle rejects this comment for the reasons provided in response to comment B-14-2.

Comment O-86-7

Realistic criteria for responsible composting end markets

We applaud the added clarification regarding the meaning of “biological decomposition.” However, we remain concerned about the requirements for full decomposition. CalRecycle requires entities seeking approval to ensure that compostable covered material and the newly introduced 'derivative material' will 'fully biologically decompose.' While we agree that composting entities should meet a standard, it is essential that this standard be clear and enforceable. As we mentioned in previous comments, we recommend replacement language to clarify that entities should demonstrate the ability to fully process compostable covered products, provide evidence of disintegration within their process, and confirm that the final compost is stable and mature. This section should also reflect AB 1201’s requirements for material neutrality; products of all material types must adhere to the same disintegration and biodegradation standards (ASTM D6400 and D6868) under equivalent facility conditions. These revisions are crucial to supporting responsible and sustainable end markets for compostable products in California. We appreciate your continued attention to this matter and your responsiveness to industry feedback.

(B) Covered material partially or wholly comprising plastic and intentionally included in the process used to generate a recycled organic product must fully biologically decompose, and the recycled organic product must meet standards necessary to be sold into the marketplace. Full biological decomposition of compostable plastic refers to the complete biodegradation and disintegration of the material under controlled composting conditions, resulting in its conversion to carbon dioxide, water, biomass, and inorganic compounds, with no visible, distinguishable, or toxic residues remaining after the composting cycle. The entity must neither dispose of undecomposed material intentionally included in the process nor send it to another entity that subsequently disposes of it, and the entity must ensure that it fully biologically decomposes, through additional processes conducted either by the entity or by subsequent entities to which the material is transferred. Covered material inadvertently included in the process that remain undecomposed shall be considered incompatible materials and are subject to paragraph (3) of subdivision (a).

Response to O-86-7

CalRecycle rejects this comment for the reasons provided in response to comments O-75-12, B-6-5, and O-83-5. The current standard of proposed section 18980.4(a)(4)(B) is reasonable, clear, necessary, and consistent with CalRecycle's authority under PRC section 42041(ad), and no change is necessary to the implementation of the Act.

Comment O-86-8

Concerns regarding recycling certification standards

We continue to have concerns regarding the certification standard and the requirements established for an alternative certification for recycling. While we support the need for rigorous standards to ensure product integrity and environmental benefits, excessively burdensome requirements could hinder the adoption of renewable and post-consumer recycled materials and create barriers for producers striving to comply with the regulations. It is crucial that the certification process remains accessible and feasible to encourage broader participation in sustainable practices without stifling innovation.

Response to O-86-8

Comment rejected. The commenter erroneously states that the proposed regulations impose a "certification" requirement for "recycling." The proposed regulations do not do so. Rather, section 18980.3.4 concerns the express postconsumer recycled content validation provisions in statute. Those provisions only apply to the extent a producer responsibility plan includes source reduction credits for postconsumer recycled content under PRC section 42057(a)(B)(i) or uses credits against fees for producers that use postconsumer recycled content. Accordingly, no change is required in response to the commenter's assertion regarding "requirements established for an alternative certification for recycling." Regarding the commenter's more general reference to "the certification standard," the commenter does not make clear what that refers to. To the extent the comment refers to something other than a "certification for recycling" (which is not required, as explained above), it might refer to the third-party validation of postconsumer recycling content addressed in section 18980.3.4. However, the commenter does not explain how the proposed regulations might be modified to ensure that that there is a "certification process" that "remains accessible and feasible." In any event, the proposed regulations straightforwardly implement the statutory requirement of third-party validations. CalRecycle cannot relax or modify that requirement because it is set in statute, with the Association of Plastic Recycler's certification program cited as an acceptable program by default but allowing for CalRecycle to approve alternatives. Accordingly, no change is necessary.

Comment O-86-9

Concerns regarding De Minimis Composting Exceptions

We are concerned about the allowance of contamination in compostable streams through the inclusion of *de minimis* non-compostable components. Even small amounts of non-compostable materials within covered products can persist as contaminants in composting systems. We strongly urge the removal of “composting” and “compostable” from the *de minimis* allowance to protect the integrity of compost.

Response to O-86-9

Comment rejected. The commenter requests special treatment for allegedly "compostable" components. The comment provides no evaluation of the criteria established in 18980.2.2(b) to explain why they would not be sufficient—that is, why they would not, as written, preclude the components of concern from qualifying as de minimis. The criteria—in particular, subparagraphs (A), (C), (D), and (E) of paragraph (2)—address the commenter's concerns. Thus, no further changes are necessary to the implementation or enforcement of the Act.

Comment O-86-10

It is important for the SB 54 regulations to recognize the growing nature of the plant-based products industry and foster, rather than discourage their use. By minimizing barriers and establishing clear, achievable criteria for both compostable and recyclable products, the market for plant-based solutions can expand. Thank you for your consideration of these comments. Please contact me at james@pbpc.com with any questions.

Response to O-86-10

Comment rejected. No response specific to the commenter's submission is necessary. This closing paragraph summarizes the commenter's recommendations, to which CalRecycle has responded separately.

O-87: Western Placer Waste Management Authority

Comment O-87-1

CalRecycle Regulations Staff:

The Western Placer Waste Management Authority (WPWMA) appreciates the opportunity to comment on the revisions to the proposed SB 54 language, which, if approved, will require all single-use packaging and plastic food ware sold in California to be recyclable and/or compostable by 2032.

The WPWMA is a joint powers authority established in 1978 by the County of Placer and the cities of Lincoln, Rocklin, and Roseville (Member Agencies) that provides recycling and waste disposal services to the majority of Placer County. At the heart of the WPWMA's campus is a mixed waste materials recovery facility (MRF) designed to recover ***marketable*** recyclable materials from the entire waste stream to preserve space in Placer County's only active landfill, also owned and operated by the WPWMA. The WPWMA's facilities provide for environmentally protective and sanitary disposal of solid wastes and ensure that municipalities, businesses, and individuals continue to comply with state and federal laws related to the diversion of materials from landfilling. Placer County and the WPWMA are unique in that the established mixed waste system has, by design, the ability to collect every type of material, regardless of recyclability, and recover marketable recyclables from every waste stream – including places where

recycling bins are not typically located such as parks, gas stations, and more. As long as a viable market exists for a material, the WPWMA can recover it for recycling. The mixed waste system is also able to capture and recover materials not accepted in the majority of typical curbside recycling programs (e.g. doorknobs, carpet and other textiles, improperly disposed household hazardous waste, plastics 3 – 7, etc.). The success of Placer County jurisdictions and the WPWMA's mixed waste MRF in meeting and exceeding solid waste regulations should prompt CalRecycle to consider encouraging and supporting the implementation of mixed waste collection and processing systems throughout the state.

CalRecycle and local jurisdictions continue to spend an inordinate amount of time and resources trying to manage problematic waste streams that should be the responsibility of the producers of those products. While SB 54 is a good start, much of the proposed ignores the importance of corporate responsibility in reducing or eliminating problematic waste streams such as single-use plastics. Focusing on producer responsibility instead of burdening additional regulatory requirements on local jurisdictions could produce a more effective and meaningful result in reducing plastic packaging waste. The WPWMA believes the following sections of the proposed regulation are problematic or require changes before the goals of SB 54 can be achieved

Response to O-87-1

Comment rejected. No response to this portion of the commenter's submission is necessary because it is preface to the commenter's substantive comments and does not suggest a specific change to the proposed regulations or raise an objection to the rulemaking process. To the extent that following portions of the submission suggest specific changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-87-2

1. Article 1 Section 18980.1 Definitions
"Alternative collection," as currently written, could supersede a local jurisdictions commitment under existing solid waste and recycling agreements, contracts, and/or flow commitments that have been established in good faith and that have been established due to a jurisdiction's responsibility for implementation of diversion mandates. Allowing collection outside existing agreements has the potential for that collector to "cherry-pick" materials, jeopardizing the feasibility of agreements that rely on a mix of materials for profitability; this could cause them to fail, leaving a gap in materials collected and diverted where a gap may not have previously existed. Allowing "cherry-picking" can also result in inconsistent collection of materials when the market value is low as there will not be an agreement in place to require acceptance, regardless of market price, nor would controls be in place to ensure minimum diversion levels are met. Alternative collection may be necessary in some jurisdictions in order to achieve the greatest diversion, however, to protect and preserve existing programs that are succeeding, we would ask that the PRO discuss alternative collection plans with jurisdictions prior to initiation so that the alternative method(s) is(are) conducted in a in compliance with existing jurisdiction agreements. We ask that the definition be revised as follows:

(2) “Alternative collection” means a program that collects covered materials, regardless of whether the covered material is discarded or considered solid waste, and is not “curbside collection,” as defined in subdivision (g) of section 42041 of the Public Resources Code, provided the alternative collection is not in conflict with local jurisdiction agreements, contracts, commitments, or franchises because it is not conducted by a local jurisdiction or recycling or composting service provider, or waste/recycling processor under contract with a local jurisdiction.

Response to O-87-2

CalRecycle rejects this comment for the reasons provided in response to comments B-40-2, B-42-1, and O-47-2.

Comment O-87-3

2. Article 3 Section 18980.3.3 Eligibility to be Labeled Compostable “Desirable” organic waste should be defined as **readily compostable** green waste and food waste. As the WPWMA and other solid waste entities have noted to CalRecycle before, bioplastic food ware and “compostable” plastics are not actually compostable within the timeframes of commercial-scale composting systems and will continue to be managed as a “residue”, ultimately requiring disposal. As currently defined, “desirable” organic waste does not define the material based on compostability performance or compatibility with commercial composting processes, instead there is a loophole, where material is defined by the labeling and marketing practices associated with a material. To rectify the loophole, provide clarity, and align with generally practiced commercial composting operations, we ask that Section (c)(5) be revised as follows: (5) […] For purposes of this requirement, an item is designed to be associated with the recovery of desirable organic waste if it is readily compostable organic waste that is currently accepted and successfully processed in commercial composting facilities in California.

Response to O-87-3

CalRecycle rejects this comment for the reasons provided in response to comments O-63-8, I-59-3, and O-78-7. Moreover, the commenter incorrectly asserts that the proposed regulation defines "desirable organic waste." To the contrary, the proposed regulation describes what it means to be "associated with the recovery of desirable organic waste." It does not purport to deem any material itself "desirable" based on how it is marketed or labeled.

Comment O-87-4

We recommend disallowing items from being labeled as compostable unless they meet the following criteria:
• Materials are accepted by a majority of composting facilities in the state, and
• Fully degrade within the timeframes and conditions established by those facilities for compostable material

Response to O-87-4

Comment rejected. The commenter suggests that the proposed regulations prohibit "compostable" labels unless certain conditions are met. However, the statute does not authorize CalRecycle to regulate product labeling; CalRecycle is authorized to enforce Public Resources Code section 42050(b), but that statutory provision does not consider how products are actually labeled. In other words, CalRecycle does not enforce laws against deceptive labeling. Rather, CalRecycle considers whether covered material could lawfully be labeled "compostable" only for the purpose of 42050(b). If the commenter intended only to suggest that CalRecycle impose additional criteria for when it will consider covered materials eligible for being labeled "compostable" for purposes of Public Resources Code section 42050(b), CalRecycle rejects that proposal because the statute does not authorize CalRecycle to add to the criteria incorporated into statute (see, e.g., Public Resources Code section 42050(b) and 42061(d)).

Comment O-87-5

We would also recommend requiring field-testing data at California's commercial composting facilities to confirm compostability, not lab certifications and prohibit certification-based exemptions for determining compostability of bioplastic or "compostable" plastic food ware unless performance is verified under actual operating conditions.
SB 54's focus on requiring manufacturers to design single-use packaging and food service ware to be recyclable or compostable is problematic because these items are simply not compostable in current commercial-scale composting systems, thus composting should not be relied upon as a means of recycling for these items

Response to O-87-5

Comment rejected. CalRecycle rejects the commenter's proposal because the statute does not authorize CalRecycle to create new requirements for when covered material can lawfully be labeled "compostable." CalRecycle can only consider the criteria expressly incorporated into statute. (See, e.g., Public Resources Code section 42050(b) and 42061(d)).

Comment O-87-6

3. Article 3 Section 18980.3.5 Disposal of Covered Material

We recommend this section (Section 18980.3.5.(c)) be revised to allow energy generation and fuel production from materials beyond source-separated organic materials and the ability to recycle materials using technologies other than anaerobic digestion, including but not limited to gasification, pyrolysis, hydrothermal processing, and other technologies as they are developed and studied for environmental impacts that are acceptable in the state.

Additionally, it's contradictory to existing diversion methodology as considered by CalRecycle. At the time of this letter, CalRecycle has already given an Article 2

Determination to at least one thermal conversion or gasification processor for their methodology to be counted as “diversion” under SB 1383 regulations, and as written under the proposed SB 54 regulations, this recovery technology would be considered disposal, not diversion.

Furthermore, by limiting qualifying diversion methods within the state to merely anaerobic digestion of just source-separated organic material, it constrains innovation and disincentivizes potentially more scalable or cost-effective solutions that may emerge. WPWMA recommends that California reconsider this limitation to allow for other energy and fuel production technologies to count towards material diversion rates as this should improve the economics and help encourage the implementation of technologies to produce sustainable and beneficial products from California’s organic wastes and reduce reliance on landfills. We ask that the definition be revised as follows:

(c) Energy generation or fuel production, <u>except for methods approved by CalRecycle as diversion including but not limited to anaerobic digestion and thermal conversion.</u>

Alternatively, CalRecycle should commit to funding and technical support for the mass development of anaerobic digestion infrastructure in jurisdictions that lack such capacity, especially if the state chooses to continue to limit innovation and prohibit other conversion technologies from qualifying towards diversion.

Response to O-87-6

Comment rejected. The commenter proposes that energy generation and fuel production be considered recycling processes. However, Public Resources Code section 42041(aa)(2) expressly forbids those processed from being considered recycling. The treatment of processes as "diversion" under other laws is not relevant to the current statute, which only applies to covered material and does not forbid the usage of any process—it just does not consider them "recycling," which affects recycling rates and does not necessarily prohibit achievement of the rates required under Public Resources Code section 42050(c), which only applies to plastic covered material. The commenter's request that CalRecycle "commit to funding and technical support for the mass development of anaerobic digestion" is not a proposal concerning the proposed regulations and is not relevant to CalRecycle's authority under the statute they implement, so no further response is required.

Comment O-87-7

4. Article 4 18980.4(a)(4)(B) Responsible End Markets
The WPWMA recommends deleting or modifying the requirement in Section (4)(B) that covered materials comprising of “compostable” plastics “must fully biologically decompose.” Complete decomposition is not measurable under real-world commercial composting conditions, and the current requirement imposes an unrealistic standard compared to other recyclables. Instead, as noted previously for eligibility to be labeled compostable, compostable materials should be evaluated based on commercially achievable compostability standards under normal conditions and times. We

recommend this section be revised as follows: Covered material partially or wholly comprising plastic and intentionally included in the process used to generate a recycled organic product must be readily compostable, and the recycled organic product must compost within time, temperature, and other typical operational standards necessary to be sold into the marketplace and be free of residue or other incompatible materials such as fillers and additives commonly found in bioplastic material. Full biological decomposition of compostable plastic refers to the complete biodegradation and disintegration of the material under controlled composting conditions, resulting in its conversion to carbon dioxide, water, biomass, and inorganic compounds, with no visible, distinguishable, or toxic residues remaining after the composting cycle. The entity must neither dispose of undecomposed material intentionally included in the process nor send it to another entity that subsequently disposes of it, and the entity must ensure that it fully biologically decomposes, through additional processes conducted either by the entity or by subsequent entities to which the material is transferred. Covered material inadvertently included in the process that remain undecomposed shall be considered incompatible materials and are subject to paragraph (3) of subdivision (a).

Response to O-87-7

CalRecycle rejects this comment. See the responses to comments B-6-5 and O-75-12.

Comment O-87-8

5. Article 4 Section 18980.4.1 End Market Identification

The WPWMA appreciates that the PRO is required to identify end markets and encourages CalRecycle to require the PRO to create local markets. CalRecycle should estimate the distance from a recovery facility that a material can be shipped before the environmental impacts associated with material transportation offsets the environmental benefit of recycling the material in the first place. The PRO should be required to cover shipping costs if general market conditions require a material to be shipped outside a specified radius of a recovery facility. To make meaningful progress in diverting materials from landfill disposal, CalRecycle and the PRO **must** participate in the development of local markets for these materials.

The WPWMA believes that end market identification should go beyond compliance documentation and actually promote the development of regional circular economies in the State. By integrating environmental impact thresholds for transportation and requiring the PRO to bear the cost of long-distance material shipments, these changes would incentivize investment in local reuse and recycling manufacturing infrastructure. Without such incentives and requirements built into the initial planning, the WPWMA believes that the environmental benefits of SB 54 risk being offset by emissions from unnecessary material transportation, and local jurisdictions may lack the economic support needed to divert covered materials from disposal effectively. We ask that this section be revised to add the following:

(a)(4) A PRO or Independent Producer shall prioritize the use of end markets located within a 250-mile radius of the recovery or processing facility, where feasible. The plan shall include a description of the steps taken to identify and develop such local or regional end markets, including partnerships with local governments, material processors, and manufacturers.
(a)(5) The plan shall include an analysis of the environmental impacts associated with transporting covered material to identified end markets, including estimated greenhouse gas emissions and fuel consumption. When transportation impacts are reasonably expected to outweigh the environmental benefits of recycling the material, the plan must identify alternative local options or justify the selection of more distant markets.
(a)(6) In cases where no responsible end market exists within the specified 250-mile radius, and material must be shipped to a more distant location to achieve compliance, the PRO or Independent Producer shall bear the transportation costs to such markets.

This suggested requirement (a)(6) ensures that economic conditions do not disincentivize the development or use of local markets for covered material.

(a)(7) A PRO or Independent Producer shall describe how it will contribute to the development of new or expanded local end markets for covered materials. This may include investment in market development programs, research and development, pilot projects, public-private partnerships, or technical assistance initiatives in coordination with local agencies and/or CalRecycle.

Response to O-87-8

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42051.1, 42053, and 42060, and the recommended changes are not necessary to the implementation of the Act. PRC sections 42051.1(c)(1) and (2) require a PRO to describe in its plan how it will meet the requirements of the Act, including how it will, in an economically efficient and practical manner, provide for the necessary infrastructure and viable responsible end markets to ensure the covered materials achieve the requirements of PRC section 42050, and how it will support and achieve, and how the budget will fund, the collection, processing, recycling, or composting of, and the development of viable responsible end markets for, covered materials to meet the requirements of the Act. Moreover, PRC section 42051.1(j)(1) requires a PRO to include in its budget all actions and investments to fund the budget and needs and investments identified in the needs assessments and all costs associated with the Act incurred by local jurisdictions, including costs related to the transportation of covered materials to a materials recovery facility, broker, or viable responsible end market. Under the overall funding and budgetary structure of the Act, including PRC sections 42051.1(j) and 42053, the PRO is responsible for developing and implementing a budget and fee schedule that reflects all investments and financial support necessary to ensure the requirements of the Act can be met, including requirements concerning responsible end markets. Section 18980.4.3(a) of the proposed regulations implements these requirements by further specifying what

a PRO must include in its plan to support the establishment, expansion, and continued existence of responsible end markets, including how it will facilitate material recycling and assist end markets in satisfying the standards specified in section 18980.4 (18980.4.3(a)(2)) and how it will develop new responsible end markets for covered materials and explore alternatives for covered materials that do not have a responsible end market (18980.4.3(a)(3)). That plan is then subject to both review and comment by the public and advisory board and review and approval by CalRecycle. Consistent with the framework of the Act, section 18980.4.3 of the proposed regulations strikes an appropriate balance between establishing the minimum requirements a PRO must meet in compliance with its statutory requirements in developing and supporting responsible end markets and providing a PRO with sufficient opportunity and discretion, subject to CalRecycle review and approval, to develop an appropriate and adequate plan and budget. The language recommended in this comment would be overly prescriptive and would limit the PRO's discretion to develop a plan and budget that is afforded to it under the Act. Additionally, the proposed threshold of a 250-mile radius risks being unnecessarily rigid and arbitrary in its application across various jurisdictions. Rather, the proposed regulations as written provide the PRO with the appropriate flexibility and discretion to develop a plan and budget, including investments in responsible end markets. Therefore, no change is necessary.

Comment O-87-9

6. 18980.4.3 End Market Development
The WPWMA appreciates that the PRO is required to provide financial support to jurisdictions and recycling manufacturers, but it is currently unclear as to the amount and type of financial support. This section should be revised to ensure all plans and resulting efforts support broad, yet effective projects related to developing end markets and local circular economies are able to receive the critical funding to jumpstart this necessary development. We recommend that this section be revised as follows:

(a)(1) Provide financial support to end markets as necessary to develop responsible end markets and ensure that they continue to satisfy the standards specified in section 18980.4. The plan must specify, at a minimum, how the PRO or Independent Producer will identify where financial support is needed and decide whether to provide it. <u>The plan shall also identify anticipated funding timelines and the range of financial mechanisms to be used, including capital grants, infrastructure loans, public-private partnerships, and general investment pools. Financial support shall not be limited to a narrow set of projects, but may be directed towards facility construction, site acquisition, permitting, or other foundational development costs.</u>

(a)(2) […] The plan must specify, at a minimum, how the PRO or Independent Producer will identify and evaluate opportunities to provide such support and decide whether to provide it. <u>Financial support may include, but is not limited to, funding for:
- Infrastructure processing on publicly or privately owned properties intended for material recovery, recycling manufacturing, or reuse</u>

- Site preparation and building construction for sites intended for or manufacturers using recovered materials
- Research & development and pilot testing of novel or emerging recycling, reuse, or energy recovery technologies
- Material innovation that improves recyclability or displaces covered materials

(e) A PRO or Independent Producer shall prioritize investments that support the development of local and regional end markets and infrastructure. Plans must identify potential collaboration opportunities with local jurisdictions, public agencies, or community-based organizations and provide justification if such partnerships are not pursued.

The WPWMA appreciates CalRecycle's consideration of these comments and is happy to discuss further with CalRecycle staff to lead to a more practical, beneficial, and successful result in reducing single use plastic waste.
Sincerely,

_____
Scott Scholz
General Manager

Response to O-87-9

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42051.1 and 42060, and the recommended change is not necessary to the implementation or enforcement of the Act. PRC sections 42051.1(c) and (j) make clear that it is the responsibility of the PRO or Independent Producer, in its plan and budget, to establish and include the specific details of its funding allocations and investments to support the development of responsible end markets in a manner that is consistent with, and not disruptive of, the existing solid waste network providing services within local jurisdictions. Section 18980.4.3(a) of the proposed regulations provides additional clarification as to what the PRO or Independent Producer must include in its plan with respect to funding the development of responsible end markets, while preserving significant discretion for the PRO or Independent Producer to develop its plan and budget in a manner it deems appropriate and necessary to satisfy the requirements of the Act. The current proposed language of section 18980.4.3(a) therefore strikes an appropriate balance between offering clear guidance to a PRO, Independent Producer, and other regulated parties as to the general information that must be included in a producer responsibility plan and providing such entities with sufficient flexibility and discretion to allocate funding and investments as appropriate. The additional language proposed by this comment would unnecessarily limit the PRO's or Independent Producer's ability to exercise discretion and control over its investment decisions under PRC sections 42051.1(c) and (j) and is not necessary to effectuate the purpose of the Act.

O-88: Community Alliance with Family Farmers (CAFF) (Jennifer Fearing)

Comment O-88-1

We are commenting on these proposed regulations on behalf of Community Alliance with Family Farmers (CAFF), an organization representing over 8,000 of California's smallest and most vulnerable family farmers. We have worked for over 47 years to preserve family-scale agriculture and promote environmental sustainability, and work closely with growers throughout the state to build healthy soils and expand markets for high-quality compost.

CAFF broadly supports California's world-leading effort to curb the growth of single-use packaging and plastic food service ware. SB 54's extended producer responsibility framework holds the promise of reducing costs to residents and businesses, negative impacts on public health, and environmental degradation. SB 54 can and should incentivize packaging and foodware producers to source reduce materials and shift to materials that are reusable, recyclable, or compostable.

As SB 54 is implemented, CAFF urges regulators to support the need for California's compost to remain a strong responsible end market, by keeping it free of packaging and foodware that does not break down, leach toxic chemicals or additives, or break down into microplastics. A strong body of science validates concerns that farmers and composters have about the adverse impacts such waste will have on compost integrity and consumer confidence in compost created in California.

Agricultural Market: California's agriculture industry purchases **well over two-thirds of all compost sold in California**,1 making it the single largest and most promising end-market for the material. Use by growers—conventional and organic alike—hinges on product quality and we cannot risk introducing contaminants that jeopardize crop safety, farm certifications, or brand reputation.

Organic Compliant Compost: Food-safety and organic standards tighten every year under pressure from retailers, processors, and consumers. The vast majority of farmers now require written assurances that the compost they purchase meets NOP standards. Anything that threatens that compliance–especially visible plastic fragments or unverified inputs–effectively closes the door on the state's largest compost market. Last fall the National Organics Standards Board (NOSB) concluded a robust petition process where they considered–and rejected–a request to allow packaging and foodware in the NOP. A recently released analysis that the NOSB commissioned from the Organic Materials Review Institute (OMRI) reveals persistent concerns with packaging in compost. It does not appear that the NOSB is poised to reconsider inclusion of so-called compostable packaging or foodware in the NOP any time soon.

Toxicity Concerns: Compostable packaging and foodware often contain numerous chemical additives, some of which are toxic. Studies have found that cellulose and

starch-based compostable plastics can induce strong toxicity, and many samples contain thousands of chemical features, raising concerns about their safety.2

Environmental Impact: Despite being marketed as eco-friendly, compostable packaging and foodware can have a significant environmental footprint. Their production can involve substantial greenhouse gas emissions, and when disposed of in landfills or in compost, plastics can release methane, a potent greenhouse gas. A growing body of research3 highlights the environmental risks posed by microplastics in soil ecosystems. These materials often fail to fully degrade in real-world conditions, leading to the accumulation of persistent plastic fragments in agricultural soils. Once present, they can alter soil structure, reduce fertility, and disrupt microbial communities critical for nutrient cycling. Additionally, studies show that these microplastics can inhibit plant growth by affecting germination and biomass production. The persistence and ecological disruption caused by these fragments raise serious concerns about the widespread use of biodegradable plastics in agricultural settings.

Composting Challenges: Most packaging and foodware marketed as compostable are screened out and discarded by composters because they are indistinguishable from other packaging and foodware. There are very few industrial composting facilities with the technology, labor, and time to accommodate these materials in their compost. These bioplastics are a contaminant, and often are re-directed to landfills or incinerators, where they do not decompose as intended. Packaging and foodware marketed as compostable is still single-use that reinforces disposable culture. Expanding their allowable presence in organics bins diverts attention and resources from proven waste-reduction strategies, such as source reduction, durable reusables, and true circularity.

Conclusion
Allowing compostable packaging and foodware into California's composting system jeopardizes the state's largest compost market—agriculture. Farmers rely on clean compost to meet strict food safety and organic standards, and even trace contaminants like plastic fragments can disqualify compost for agricultural use. **Compostable plastics offer no nutrient value, often contain toxic additives, and frequently fail to fully degrade, leaving behind microplastics that harm soil health and plant growth.** This process only reinforces single-use habits rather than promoting true circular solutions. To protect soil, farmers, and the integrity of compost, these materials should stay out of the compost stream. We urge producers to focus on making their packages and foodware out of materials that an be successfully reused, refilled, or recycled.

In keeping with these concerns, CAFF supports the existing regulatory language under Section 18980.3 "Eligibility to be labeled compostable" and 18980.4 which defines "responsible end markets" for compostables. We urge you to resist calls from packagers and producers to inflict plastics into California's compost markets.

Thank you for considering these comments.

Response to O-88-1

Comment rejected. The commenter raises general concern over the quality of California compost and urge CalRecycle to "support the need for California's compost to remain a strong responsible end market." The commenter also asserts that "compostable packaging and foodware . . . should stay out of the compost stream." These remarks contain no identifiable recommended revisions for CalRecycle to consider. To the extent the commenter intended to propose that the regulations limit compliance with Public Resources Code section 42050(b) to recycling only, CalRecycle rejects that proposal because statute unambiguously establishes compostability as a compliance pathway for covered material.

O-89: Consumer Brands Association (Will Grassle)

Comment O-89-1

1. <u>Inhibitive Barriers for Molecular and Physical Recycling Technologies and Incomplete Environmental Assessment Criteria</u>

Issue:

While we appreciate previous updates to the regulations regarding this issue, and believe they are an improvement from previous drafts, we must still emphasize the necessity of access to a full suite of recycling technologies to achieve circularity. The regulations create barriers for the inclusion of non-mechanical (molecular) recycling technologies. This could preclude the use of some of these technologies and contradicts the intent of SB 54, which supports recycling innovation and the development of new systems to reduce plastic pollution.

Molecular and physical recycling technologies are essential for processing materials - particularly certain plastic types - that cannot be managed via mechanical recycling. Their inclusion is critical to meeting California's recovery and recycling goals, particularly for hard-to-recycle materials.

Recommended Solution:

To align with the statutory intent and enable transparent, consistent evaluation of molecular recycling technologies, we strongly recommend that CalRecycle rely exclusively on a third-party certification process based on relevant International Organization for Standardization (ISO) standards. In particular, we request CalRecycle focus on ISO standard 59014 in Section 18980.4.1. ISO standards provide a rigorous, science-based framework for verifying environmental performance across a range of criteria, including greenhouse gas emissions, life cycle impact, and sustainability benchmarks.

Response to O-89-1

CalRecycle rejects this comment, which recommends that CalRecycle rely on a third-party certification process in lieu of the provisions now in section 18980.4(d) of the proposed regulations. However, the commenter identifies no available third-party certification program, nor is CalRecycle aware of one, so none can be incorporated. No other change is needed to accommodate the commenter's recommendation that the regulations rely on ISO standard 59014. The proposed regulation already does so.

Comment O-89-2

2. <u>Compliance Measurement Period Is Unfeasible</u>

Issue:

Material usage data from calendar years of 2027, 2030, and 2032 will largely reflect what is on the market and the source reduction that has been achieved by January 1 of the respective reporting year. It would not be reasonable or possible for producers to report material usage data from a period any earlier than calendar year 2027. For example, if usage data from calendar year 2026 is required to prove compliance with the January 1, 2027, source reduction date, this would mean that producers would need to comply with SB 54's source reduction requirements by January 1, 2026, long before the approval of a PRO plan that is required to allocate the source reduction requirements among the various producers and potentially before the regulations specifying the details of the PRO-level source reduction requirements take effect. Moreover, they would have to have the relevant 2026 data ready to report immediately by January 1, 2027. Producers do not and will not have the information necessary to implement source reduction compliance any earlier than calendar year 2027, as they currently have about three months until January 2026, do not yet have finalized regulations or an approved PRO plan, and require a much longer lead time to develop, test, and implement packaging changes. The only way for producers to comply with the January 1, 2027, source reduction requirement that uses a material usage data time period earlier than calendar year 2027 might be to cease selling products in California for some period of time in 2026.

Recommended Solution:

Consumer Brands supports adding language to paragraph (2) of subdivision (d) of Section 18980.9.1 to specify that source reduction requirements that are required as of January 1, 2027, 2030, and 2032, are based on producer source reduction reporting using the measurement period of the respective calendar years of 2027, 2030, and 2032.

Response to O-89-2

CalRecycle rejects this comment, see responses to B-27-2, I-63-15, O-48-5, and O-41-4.

Comment O-89-3

3. Source Reduction Baseline Fails to Account for Continued Growth in Consumer Demand

Issue:

Under SB 54, the Producer Responsibility Organization (PRO) designs and finances system investments based on the statewide needs assessment and an approved program plan. Within this framework, source reduction operates as one of several compliance pathways for plastic covered material, with eco-modulated fees calibrated to objective environmental attributes. Producers should retain discretion to deploy source-reduction measures across heterogeneous product portfolios, including reuse, right-sizing, and material substitution, provided SB 54 performance metrics are achieved. Consistent with recent state frameworks, prescriptive package-design specifications should remain outside statute and be addressed through PRO fee modulation, technical design guidance, and plan requirements under CalRecycle oversight.

Unfortunately, the proposed source reduction baseline provisions establish a framework that will be unworkable for producers. Current projections indicate that packaging consumption will continue to rise annually through 2032, driven by macroeconomic and societal trends including population growth, the expansion of e-commerce, and increasing consumer demand for convenience.

These drivers are entirely outside the control and authority of producers subject to SB 54. Establishing a flat, static source reduction baseline without accounting for external market changes imposes an inequitable compliance burden on the regulated community. It sets an unrealistic expectation that producers must achieve absolute reductions in packaging use, even as overall demand and consumption fluctuate.

The regulations already acknowledge the Department's flexibility to adjust the baseline after the initial January 1, 2025, deadline. Specifically, paragraph (c) of Section 18980.9 directs the Department to update the already-established baseline using actual supply data that producers report. The Department should use that same authority and its rulemaking discretion to update the baseline in future years for the reasons discussed above. This would effectuate a more sensible implementation of the source reduction baseline. Without these adjustments, producers may be forced to pull products from the market for factors outside their control or else risk financial and reputational risk.

Recommended Solution:

Source reduction targets should be dynamically adjusted to account for projected increases in packaging consumption due to population growth, e-commerce expansion, and sales growth changes through 2032. Further, the PRO should be empowered to recommend appropriate adjustments to the baseline and targets, based on verifiable market data. This approach would ensure that compliance expectations are both achievable and reflective of the external factors shaping packaging demand. Further, for food-contact material, molecular recycling technologies must be permitted in addition to

mechanical recycling. Without the ability to have molecular recycling count towards source reduction, targets are not feasible.

In addition, CalRecycle should consider amending paragraph (1) of subdivision (b) of Section 18980.3.4 of the Formal Proposed Regulations by removing the requirement that the PRO to measure a producers increase in the absolute amount of postconsumer recycled (PCR) content used to a 2023 baseline in order to qualify for a source reduction credit. Measuring a producers' increase of PCR content based on a 2023 baseline does not recognize, and ultimately penalizes, producers who have proactively sought to make their packaging more sustainable through the use of PCR content.

Response to O-89-3

CalRecycle rejects this comment, please see responses to comments B-27-2, I-63-15, O-48-5 and O-41-4.

Comment O-89-4

4. <u>Allow Aggregated Compliance for Material Subtypes</u>

Issue:
Requiring disaggregated compliance across all subcategories of a covered material (e.g., rigid vs. flexible plastic) disproportionately penalizes producers using less-common materials and fragments compliance strategies.

Recommended Solution:
Permit aggregated compliance for SB 54 requirements at the material class level (e.g., all plastic and all paper and fiber). CalRecycle and the PRO may establish performance tiers or differentiated fee schedules within each material category to encourage optimization.

Response to O-89-4

CalRecycle rejects this comment as the requested revision to allow aggregated compliance at the broader material-class level is in excess of CalRecycle's current authority as it is inconsistent with SB 54's statutory structure and would undermine implementation of the source-reduction and recyclability performance standards established in section 42057(a) and 42051(c) of the PRC as it requires specified reductions and recycling rates for covered materials by category, based on distinct material characteristics and end-of-life management pathways. Further, this is also inconsistent with section 42040(b)(4) and § 42051(a)(4) of the PRC, which indicates that Department must determine covered material categories based on the material type, form, and management attributes to ensure that reductions and recycling improvements are measured within each discrete stream rather than aggregated across dissimilar material subtypes. Aggregating compliance at the higher "all plastic" or "all paper" level would eliminate the granularity necessary to verify that each CMC meets the statutory performance benchmarks. Thus, as indicated above, the comment's request is

neither authorized by statute nor practicable for implementation, and CalRecycle rejects this comment accordingly.

See, also, CalRecycle's response to comment O-77-5.

Comment O-89-5

5. Producer Definition Lacks Clarity and Creates Regulatory Uncertainty

Issue:
The current regulatory identification of a "producer" under Section 18980.1.1 lacks sufficient specificity to ensure predictable and consistent assignment of responsibility in complex supply chains. This ambiguity creates significant uncertainty for compliance planning and risks duplicative or inconsistent obligations across supply chain actors.

The definition of "producer" and the identification of the obligated producer as provided in Section 18980.1.1 are overly broad and do not adequately differentiate between distinct product and packaging categories or business models. As currently drafted, they fail to provide clear, operational rules for assigning producer responsibility in real-world scenarios where multiple parties may be involved in manufacturing, branding, importing, or distributing a covered material. This includes, but is not limited to:

- Private label arrangements, where ownership of the brand and manufacturing of a product or packaging may reside with different entities
- Food service and institutional supply chains, where distributors, co-packers, and end users may all handle unfilled or partially-filled packaging.
- Multi-brand platforms and retailers, which frequently act as intermediaries without direct control of product or packaging manufacturing.

The absence of material-specific rules of assignment and a clear point in the supply chain at which responsibility is triggered leads to confusion over who must enroll, report, and pay fees under the program. Without clarifying these roles, the regulatory framework could result in overlapping obligations, gaps in compliance, or disputes among supply chain partners, particularly for products distributed under non-traditional ownership or control models.

Recommended Solution:
CalRecycle should revise Section 18980.1.1 to incorporate a clear, hierarchical producer responsibility framework tailored to different product and packaging categories. Specifically, the regulation should:
a) Establish material-specific rules of responsibility that clearly define the point at which a product becomes a "covered material" subject to program obligations.
b) Create additional, distinct responsibility hierarchies for different packaging scenarios to reflect commercial realities and reduce regulatory ambiguity. Other hierarchies should include:

- Single-use food serviceware that is unfilled or not served with food: Responsibility should lie with the manufacturer or importer who first places this material into commerce in California.
- Pre-packaged food and beverage products: Responsibility should lie primarily with the brand owner of the product.
- Private label food and consumer goods: Responsibility should lie with the brand owner on the product label, or if absent, with the importer or first distributor.

Response to O-89-5

Comment rejected. The statute does not authorize CalRecycle to create different rules for different material types. To the extent the inherent differences between packaging and food service ware created ambiguity as to how Public Resources Code section 42041(w)(1) and (w)(2) could apply to them, section 18980.1.1 provides necessary clarity. Within those two types of covered materials (packaging and food service ware), however, there is no justification for the point at which material becomes "covered material" varying based on material. Similarly, regarding the general suggestion of "additional, distinct responsibility hierarchies for different packaging scenarios," CalRecycle cannot create hierarchies other than those inherently grounded in statute. For that reason, CalRecycle rejects the specific suggestion that unfilled food service ware should always lie with the manufacturer or importer who first places items into California commerce. Such a rule would ignore Public Resources Code section 42041(w)(1) and (w)(2) entirely; if the brand owner is in the state but the manufacturer is not, then the brand owner must be the producer, without regard to who first distributed it in the state. Regarding pre-packaged food and beverage products (to the extent any beverage packaging is not excluded by Public Resources Code section 42041(e)(2)(E)), the statute and proposed regulations already require the outcome sought: If the brand owner is in the state, it is the producer. Likewise, the proposed regulations also require the outcome sought concerning private label food and consumer gods: if the brand owner is in the state, it is the producer.

Comment O-89-6

6. **Compostable Packaging Framework Should Account for Material Innovation and Infrastructure Limitations**

Issue:

Limiting compostable materials to allowable agricultural organic inputs under the requirements of the United States Department of Agriculture National Organic Program excludes compostable polymers that meet ASTM D6400 standards and are accepted at industrial composting facilities. This artificially narrows eligibility and undermines market innovation.

Recommended Solution:

We understand this is governed by AB 1201 but are bringing the issue to the attention of CalRecycle during this comment opportunity and hope we can work together to harmonize the regulations and allow for innovation. Additionally, CalRecycle recently extended the deadline for compostable materials to meet the USDA National Organic Program standards under AB 1201. We trust that CalRecycle recognizes that to the extent the deadline under AB 1201 is extended, that the extension similarly applies to the definition of compostability under SB 54.

Response to O-89-6

Comment rejected. The commenter does not suggest any changes to the proposes regulations. As the commenter acknowledges, the criterion concerning allowable agricultural organic inputs is a requirement established by the Legislature, and CalRecycle cannot change or ignore it. Regarding the extension the commenter refers to, see CalRecycle's response to comment O-48-2.

Comment O-89-7

7. <u>De Minimis Threshold Needed for Partial-Plastic Composites</u>

Issue:
The approach to treating a component as plastic if it contains very low amounts of plastic is overly inclusive and does not distinguish between functional polymers and trace plastics used as adhesives or coatings. While progress has been made with changes to the de minimis component provisions, this still may result in the misclassification of non-plastic materials that are still recyclable and have excessive regulatory scope.

Recommended Solution:
Introduce a defined de minimis threshold of 5% plastic content by weight or volume for composite materials and exclude materials below this threshold from being classified as plastic. Delay producer reporting requirements for these materials until the PRO establishes an approved, clear classification methodology.

Response to O-89-7

Comment rejected. CalRecycle rejects the commenter's proposals for the reasons stated in response to comments O-76-15, B-30-2, O-82-7, I-62-7, and O-65-9.

Comment O-89-8

8. <u>Acknowledge Test Results Do Not Require a Malus</u>

Issue:
Subdivision 18980.6.7(h) would trigger a malus if an element of covered material "requires test results" according to the specified design guide. However, this misunderstands the purpose of testing under the guide, which is to further investigate whether a material's design will contribute negatively to recyclability. It is possible

through testing that the element will be found to be acceptable, and therefore it does not make sense to continue to subject it to a malus.

Recommended Solution:
Add the following sentence to the end of subdivision 18980.6.7(h) to ensure that materials that are tested and found to maintain recyclability are not penalized: "Notwithstanding the previous sentence, an element that passes the required test shall not be considered to make recycling more difficult."

Response to O-89-8

CalRecycle rejects this comment. See the response to comment B-47-4.

Comment O-89-9

9. Malus Fee Inappropriately Applies Proposition 65 Listings Without Considering Exposure Thresholds

Issue:
The proposed language in subdivision 18980.6.7(i) of the draft regulations would require a PRO to assign malus fees to producers based solely on the presence of chemicals listed under Proposition 65. This approach disregards the fundamental legal structure of Proposition 65, which is explicitly exposure-based, not presence-based. Specifically, it proposes that malus fees be assessed based on the presence of Proposition 65-listed chemicals in covered material, regardless of whether actual exposure would occur at levels that exceed the California Office of Environmental Health Hazard Assessment's (OEHHA's) established safety thresholds. As such, this regulatory approach is inconsistent with state law, undermines scientific standards for risk assessment, and could lead to penalties for materials that pose no significant risk as determined by OEHHA.

Recommended Solution:
To ensure alignment with California law and sound risk-based regulatory principles, we urge CalRecycle to revise Section 18980.6.7(i) to conform with Proposition 65's exposure-based framework. The following language is recommended:

(i) Pursuant to paragraph (4) of subdivision (e) of section 42053 of the Public Resources Code, a PRO shall charge a malus fee to producers who use covered material that contains a chemical listed on the list established pursuant to section 25249.8 of the Health and Safety Code at levels that result in exposure to consumers in excess of the No Significant Risk Level (NSRL) for carcinogens or the Maximum Allowable Dose Level (MADL) for reproductive toxicants, as established by the Office of Environmental Health Hazard Assessment (OEHHA).

This revised language ensures that the regulatory structure of SB 54 remains consistent with the statutory and scientific framework underpinning Proposition 65. It respects the role of OEHHA as the expert agency in toxicological risk assessment, avoids duplicative

or unjust penalties for compliant businesses, and maintains public trust in California's rigorous but science-based approach to chemical safety and environmental health.

Response to O-89-9

CalRecycle rejects this comment. See the response to comment B-11-9.

Comment O-89-10

10. Lack of Guarantee for Recycling Information Updates

Issue:

The current final draft of the regulations proposes to omit the following final sentence of subdivision (b) of Section 18980.2.5 as compared to a previous version: "For example, the Department shall update the list if the list, as updated, would more accurately or completely reflect how distinct material types and forms are collected or processed separately or would accurately account for novel material types and forms." We are deeply concerned that this omission, as well as the additional language at the beginning of the subdivision, will limit the Department's ability and obligation to revise the Covered Material Category (CMC) List when significant new information about recycling becomes available. Recycling practices and outcomes are changing all the time, and we expect them to improve alongside and as a result of SB 54. It is critical that CalRecycle make timely updates to the recycling and composting designations in the CMC. It is also worth noting that CalRecycle is empowered to "publish additional information that was not available at the time of the most recent periodic material characterization study regarding the appropriate characterization of material types and forms," pursuant to Public Resources Code Section 42355.51(d)(1)(B)(iii).

Recommended Solution:

We request restoration of the final sentence in subdivision (b) of Section 18980.2.5 as existed in a prior draft.

Response to O-89-10

CalRecycle rejects this comment for the reasons provided in response to comment O-82-35.

Comment O-89-11

11. Updating Covered Material List for Small Packaging Types

Issue:

The categorization of small material types should reflect current best practices for recycling design. The treatment of small packaging materials that are proven to be sorted and captured should be more flexible. Some new technologies allow for sortation of small materials, and the sorting potential test method developed by the Association of Plastic Recyclers (APR SORT-S-02) accounts for this. If the dimension defining packaging is a test or validation based on performance, APR SORT-S-02 is a better test for inclusion of small packaging that can be sorted and captured. This approach allows

for a performance-based approach vs dimensionality factor to deem recyclable and supports better capture. We appreciate that this standard was included in the CMC guidance CalRecycle released earlier this year; however, incorporating it directly into the regulations would provide producers with greater certainty.

Recommended Solution:
CalRecycle should incorporate use of the SORT-S-02 method into the regulations, potentially in Section 189802.5, to reinforce that small materials can be sorted and therefore considered recyclable through categorization into other appropriate CMCs.

Response to O-89-11

Comment rejected. No change to the regulation is necessary to establish that covered materials might be recategorized into a different covered material category, which might be a "recyclable" one. Nor is it necessary to incorporate any particular sorting protocol that might be relevant. There is no suggestion in section 18980.2.5 that CalRecycle will not consider certain relevant information (such as the relevance of a sorting protocol) or of any limitation on covered material being recategorized into "recyclable" covered material categories.

Comment O-89-12

12. <u>Recycling Instructions Should Be Considered for Detachable Components</u>

Issue:
Additional language was added to subparagraph (ii) of subparagraph (C) of paragraph (4) of subdivision (a) of Section 18980.1 to specify that a "detachable component" is defined by certain characteristic "regardless of whether the component is discarded attached to the other components." This additional language negatively impacts the recyclability determination for components that are made of recyclable material but are less than two inches by two inches in size, which on their own might not currently be considered recyclable due to their size but would be considered recyclable when reattached to the larger recyclable packaging. The regulations should adhere to the Association of Plastic Recyclers (APR) Design Guides, which require evaluation of attachments in conjunction with primary packaging (e.g., a bottle cap with the related bottle). Furthermore, APR's Design Guide recommends leaving caps on packaging when recycling to increase the capture of recyclable materials.

Recommended Solution:
To ensure that components made of recyclable materials that are instructed to be reattached to a recyclable packaging do not impact the recyclability of the packaging, we recommend adding language to paragraph (1) of subdivision (c) of Section 18980.3 to ensure that such a small size component would not render the overall package "non-recyclable."

Response to O-89-12

CalRecycle rejects this comment for the reasons provided in responses to comment O-39-5 and O-41-3.

Comment O-89-13

13. Include Exemptions for Charitable Organizations

Issue:
Consumer Brands reiterates the importance of an exemption for nonprofit organizations that meet the terms of Section 501(c)(3) of the U.S. Internal Revenue Code. Within the existing regulation language, a nonprofit organization that produces goods under its own brand or purchases goods from other for-profit organizations for the sake of donation would be required to financially contribute to the state extended producer responsibility program though the products are distributed to low-income individuals and families through foodbanks and other charitable organizations. These products are crucial for low-income families in California and throughout the United States. Requiring a charitable organization to fund an extended producer responsibility program creates an undue burden for these nonprofit entities, ultimately constraining the resources available for the individuals they support. Other state extended producer responsibility programs, including the systems established within Maine and Oregon, exempt nonprofit organizations.

Recommended Solution:
Consumer Brands recommends that CalRecycle adopt an exemption within its proposed regulations for nonprofit charitable organizations that meet the terms of Section 501(c)(3) of the U.S. Internal Revenue Code to avoid exhausting valuable resources that support low-income families and individuals within the state.

Response to O-89-13

CalRecycle rejects this comment as the requested change for additional exemptions are beyond the scope of the Department's rulemaking authority and exceed the statutory text regarding exemptions.

Comment O-89-14

14. Broaden Scope OTC Exclusion

Issue:
Paragraphs (2) and (6) of subdivision (a) of Section 18980.2 provide a categorical exclusion for over the counter (OTC) drugs. This exclusion is supported by the text of the law and should be preserved, as these products must meet stringent Food and Drug Administration (FDA) requirements that limit the ability to use certain packaging materials, source reduce packaging, or consider reusable packaging. There is a significant risk that if they are required to comply with the stringent SB 54 source reduction requirements, many OTC health product stockkeeping units (SKUs) may be eliminated in California, especially in smaller sizes. This would severely impact

consumer access to essential medications, exacerbating healthcare challenges for low-income California consumers. Without the OTC drug exclusion from SB 54 requirements, manufacturers will be forced to eliminate or upsize many of the affordable medical products upon which these Californians rely, forcing them into conservation mode to stretch their budget or to make sacrifices with their health.

Although Consumer Brands supports the categorical exclusion for OTC drugs, we are concerned regarding the new language in subparagraphs (A) and (B) of paragraph (6), which unnecessarily narrows the OTC drug exclusion to only medicines by removing OTC drugs that also make cosmetic claims, are soap, or contain sunscreen active ingredients. All FDA-regulated OTC drugs are classified as medical products under 21 U.S.C. 321(g) and should therefore be excluded from SB 54 requirements. The fact that some OTC drugs also provide secondary benefits (e.g., cosmetic, cleaning, or sunscreen) does not change the fact that they are OTC drugs and are considered medical products under 21 U.S.C. 321(g).

Recommended Solution:
Consumer Brands recommends that CalRecycle revert back to the language in the previous draft of the regulations, eliminating the new language in subparagraphs (A) and (B) of paragraph (6) pertaining to the OTC drug exclusion.

In addition to suggested changes to the proposed regulations, Consumer Brands would like to highlight areas within the proposed regulations that we ardently support and would like to see maintained.

Response to O-89-14

CalRecycle rejects this comment for the reasons stated in response to comment B-11-3.

Comment O-89-15

1. <u>Refillable/Reusable Design and Labeling Requirement Deletion</u>

Consumer Brands supports the previous deletion of paragraphs (4) and (5) of subdivision (a) in Section 18980.2.1, which removed from the regulations arbitrary and overly burdensome requirements for refillable and reusable materials. It is critical to preserve the deletion of these paragraphs, as they would have applied uniform requirements to the design and labeling of reusable/refillable packaging despite significant differences across product categories in packaging types and purposes. There are tens of thousands of product packages that are covered by SB 54, each with their own unique purpose and usage. For a refillable/reusable package to be successfully adopted by consumers, its design and marketing must be consumer-led and consumer-focused.

Consumers have different expectations across different types of product packaging, and producers must have the flexibility to be able to meet these varying expectations. Producers are best positioned to analyze and choose the most effective communication

and labeling to convey that a package should be utilized multiple times. For durability, different types of products are used and refilled at varying frequencies.

Overly prescriptive and uniform durability requirements do not consider the variability of product packaging usage and can have the unintended consequence of requiring producers to use more plastic than necessary to meet the arbitrary requirements that do not reflect real world conditions. Further, there are critical food-contact safety needs required to ensure product safety for materials intended to be used more than once. CalRecycle should take into account these needs.

2. Minimum Duration of Exemptions

The previous revisions to subdivision (g) of Section 18980.2 change the minimum duration for an approved exemption from one year to two years, providing a longer period of certainty for producers who may be granted exemptions. This revision provides greater certainty for producers and should be preserved. This change helps assure producers about the continued availability of an exemption for critical packaging materials. Making packaging changes and finding replacement materials can take substantial time and planning to ensure the viability, safety, and consumer acceptance for new packaging materials, often across a broad range of product categories. Producers need as much certainty as possible as to whether a material will be available for use in California. Without this, producers may be forced to remove products, including consumer staples, from the California marketplace while they find and qualify replacement packaging.

3. Regulations Should Exempt Packaging with Express Consumer Safety Considerations

We want to emphasize the need to protect the exemption for packaging for protein and thank you for addressing this issue in the current draft. Food-contact packaging used for products containing meat and poultry requires unique packaging for food safety, human safety, and product quality/durability. Packaging for protein can implicate health and safety concerns related to preventing pathogen transfer to those that handle the packages—consumers and recycling industry workers. Protein packaging can harbor bacteria, and while cooking destroys pathogens in the product the same treatment is not applied to recovered packaging. Introducing these materials into current recycling streams poses potential health risks to workers and the integrity of the recycling stream. Robust decontamination and processing systems must first be established before such packaging can be recycled safely. These packaging materials are regulated by the United State Department of Food and Agriculture (USDA) and FDA. For example, USDA Food Safety and Inspection Service (FSIS) instructs consumers to place raw meats in separate plastic bags to prevent leaked juices from contacting other groceries or surfaces, and further cautions against reusing any packaging materials associated with raw meat. Current USDA FSIS guidance also explicitly states that some types of meat contact materials are for “one-time use” packaging.

Given the necessary considerations for food safety, contamination, and the presence of pathogens, food contact packaging used for products containing meat and poultry

produced under the Federal Meat Inspection Act, Poultry Products Inspection Act, or Food Safety Modernization Act should continue to be excluded from the program requirements.

Thank you for the opportunity to comment on the latest draft regulations for SB54. Please do not hesitate to contact me if you have any questions regarding this request. I

Response to O-89-15

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

O-90: Coalition (Tony Hackett)

Comment O-90-1

Zoe Heller, Director
Department of Resource Recycling and Recovery
1001 I Street | Sacramento, CA 95814
RE: August 2025 SB 54 Proposed Permanent Regulations – Coalition Comments and Concerns

On behalf of a diverse coalition of advocates who have been engaged in the SB 54 rulemaking process in its entirety, we write to share our persisting concerns about the language as written. Given the unprecedented scale and complexity of this task, SB 54 presents a generational opportunity to transform how packaging is designed, collected, and recovered, and we are optimistic that CalRecycle will continue to work with diligence in moving this process forward.

That said, we are deeply concerned that the current draft regulations fail to incorporate or meaningfully respond to the substantive feedback we and many others provided throughout earlier workshops and comment periods. By disregarding critical recommendations from local governments, recyclers, and environmental advocates, CalRecycle risks weakening the enforceability and effectiveness of SB 54, as well as failing to fulfill its statutory obligations. These omissions threaten to undermine the core intent of the law—holding producers accountable, ensuring program transparency, and driving the systemic changes needed to reduce plastic waste and pollution.

CalRecycle cannot afford to squander this crucial moment. Our comments detail unresolved issues that have not been adequately addressed despite multiple iterations of draft regulatory text and public comment periods. Specifically, our major areas of concern revolve around allowable recycling technologies, the creation of unnecessary exemptions and loopholes, and the need for public transparency in data for deliberative decision-making. Each of these areas is foundational to the success of the overall program.

Also included here are suggestions (‘Attachment 1’) for the Department to issue a ‘Frequently Asked Questions’ plain-language resource that provides clarity on the recurring questions surrounding implementation. We look forward to working with you to resolve these concerns.

Response to O-90-1

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process. To the extent other portions of the submission do suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-90-2

Article II: Covered Material and Covered Material Categories

Categorically Excluded Materials (§18980.2.) Must Include Mandatory Sunset, Narrowing of Pathway to Exclusion’s Scope

FDA/USDA Exclusions Risk Swallowing Covered Materials

The revised draft regulations improve upon prior versions by requiring that packaging excluded under § 18980.2(a)(2) must be those for which it is not reasonably possible to use packaging that also complies with USDA or FDA rules or regulations. The regulations also establish a process where producers must submit the basis of their claim to CalRecycle, which will maintain a public database of exclusions. However, while this clarification narrows the earlier overbroad exemption, the provision still risks sweeping in far more materials than intended by statute.

The reliance on “guidelines” 1 as a basis for categorical exclusions is fundamentally flawed, because guidelines do not constitute law. This vagueness creates a boundless loophole where any informal memorandum, nonbinding policy, informal rule, or voluntary guidance document could be weaponized to exempt entire classes of packaging from SB 54’s requirements.

As drafted, this section could allow entire categories of food and agricultural packaging to be excluded simply because producers claim it is not “reasonably possible” to use compliant alternatives. Many of these packaging types already have recyclable or compostable options in practice and at scale.

We therefore urge CalRecycle to revise this section to:

● Require producers seeking such exclusions to provide detailed, verifiable justification subject to public notice and comment. Public deliberation on these exemptions/exclusions is a crucial tool in enabling adequate oversight of often opaque regulatory processes.

● Ensure that packaging with available recyclable or compostable alternatives cannot be categorically excluded simply because industry claims such

alternatives are inconvenient or less profitable.
● Without these changes, the FDA/USDA exclusion risks creating a loophole large enough to exempt the majority of food packaging—undercutting the recyclability and source reduction objectives at the heart of SB 54.

Response to O-90-2

CalRecycle partially rejects and partially accepts this comment as described in response to comment O-75-2, which is substantively the same as this one.

Comment O-90-3

Exclusions Must Have A Prescribed Sunset

When exclusions are granted, they should also be time-bound in the same way that exemptions are treated. The way that the current regulations are written would give producers *carte blanche* to find a permanent way out of the program, locking in current polluting packaging technologies and stifling future innovation. By having a process where they are forced to reapply for said exclusion, producers would be forced to reconsider alternatives on a continuous basis, rather than having an open invitation for indefinite use of their current packaging formats.

Response to O-90-3

CalRecycle partially rejects and partially accepts this comment as described in response to comment O-75-2, a portion of which is substantively the same as this one.

Comment O-90-4

Exclusion of Reusable and Refillable Packaging and Food Service Ware (§18980.2.1):
Reuse and Refill Standards Regressed and Became Far Too Lax

Lack of Product Standard Floor Might Enable a New 'Thicker Plastic Bags' Problem

Throughout this section, language that was once perhaps too lofty in its requirements has now been gutted to no longer include any quantifiable thresholds for measuring performance and defining "reusable and refillable.

" While we don't have our own perfect solution to offer, it is worth mentioning that recent historical precedent of the 'Thicker Plastic Bag Problem' underscores the need for some degree of clearly identifiable enforcement criteria lest packaging manufacturers just race to the bottom.

Following the passage of SB 270 and Proposition 67, California retailers were permitted to offer only reusable plastic bags that met minimum durability standards. These standards were soon found to be far too weak, unintentionally allowing producers to use

plastic bags as long as they were of slightly thicker plastic rather than switch to more sustainable alternatives as was intended.

The thicker bag problem should be a warning: if SB 54 permits minimal or nominal reuse claims, without rigorous criteria for refill infrastructure, number-of-use thresholds, collection systems, and post-consumer accountability, it risks replicating this failure at scale across packaging types; with the opposite legislative intent adding to, and not reducing, California's single-use disposable waste problem

This regulation is far broader in scope, so there are many more opportunities for disingenuous "reuse" designed to skirt the fees and recyclability requirements of the law. To avoid the repeat of this unintended consequence, CalRecycle must:

- Adopt stricter, performance-based definitions for reusable packaging, informed by lifecycle data and enforcement capacity.
- For consumer good packaging, producers should be required to submit verified reuse/refill take-back data as a condition of maintaining reuse/refill status. The PRO plan should also identify a clear strategy for quantifying the amount of reusable and refillable packaging that is actually reused, as well as outlining steps that the PRO is implementing to maximize these numbers (including through deposits or other incentives).
- Packaging cannot be considered reusable if it doesn't realistically get collected and reused, and the label should reflect that.
- CalRecycle should also establish a process for adopting third-party certification requirements when they become available.

Response to O-90-4

CalRecycle rejects this comment for the reasons set forth in response to comment O-75-3.

Comment O-90-5

Exclusion of Certain Types of Packaging (§18980.2.2): Definitional Criteria and Public Process.

Expand Scope of Considerations Beyond Singularly on Process of Composting when Evaluating *de minimis* Exemptions

Today's regulatory language evaluates *de minimis* considerations in part on the basis of if a component or group of components makes "*recycling or composting more difficult* pursuant to subdivision (h) of section 18980.6.7.." This language specifically focuses on the ease of composting rather than on whether there is a contamination-free, quality end product. This language is unnecessarily problematic in previously unanticipated ways. For instance, a plastic liner or coating on a foodservice ware item wouldn't *necessarily* affect the composting process directly, but it would contribute to microplastic

pollution in soils and be an undesirable contaminant in the end product. This example and others like it represent an opportunity to open the floodgates to allowing unlimited product contaminants as long as they don't pose a risk to the general ease of composting. As such, we suggest that language be revised to widen the scope of scrutiny across multiple categories of potential impact, from process to product, ultimately to ensure uncontaminated soil that can be used with confidence on California commercial crops and in residents' community and home gardens

Response to O-90-5

CalRecycle rejects this comment for the reasons provided in response to comment O-75-4.

Comment O-90-6

Vague and Insufficient Definitional Criteria for Eligibility Need Further Detail

We remain deeply concerned that the proposed de minimis exemption is drafted in a way that continues to lack enforceable thresholds and opens the door to abuse. While the new text introduces a definition of "independent plastic component" and lays out a multi-factor test for whether a component is of *de minimis* weight or volume, the operative standards remain vague and subjective.

One major loophole is in the definition of an Independent Plastic Component. The new definition excludes coatings, films, stickers, and labels from being considered "independent plastic components." This could allow producers to continue using problematic films, foils, shrink labels, and barrier coatings while arguing they are *de minimis* because they are not separately detachable and thus 'independent components.'

These are precisely the materials that routinely contaminate MRF streams and frustrate recyclability and compostability, directly undermining the statutory requirement in PRC § 42050(b) that packaging be recyclable or compostable in practice and at scale.

The impact is the creation of a perverse incentive to deliberately fragment packaging into 'non-countable' subcomponents to strategically fall below the *de minimis* threshold. This risks creating a perverse incentive for packaging design to evolve toward more hidden plastics—small films, detachable liners, and coatings—that erode source reduction and recyclability goals, and frustrate the intent of the law.

While we recognize the need to exempt incidental elements not associated with harm to the environment or human health, the current proposal does not contain the necessary specificity to prevent abuse by ensuring these crucial parameters are respected. By removing objective criteria (such as the prohibition on chemical or thermal separation) and relying on vague, discretionary standards, the draft risks opening a backdoor for widespread noncompliance. Unless clarified, the *de minimis* provision may encourage a "race to the bottom" in packaging design, contrary to both the intent and the express requirements of SB 54.

Response to O-90-6

CalRecycle rejects this comment for the reasons stated in response to comment O-75-5, which is substantively identical to this one.

Comment O-90-7

[This comment code not used.]

Response to O-90-7

[Intentionally left blank.]

Comment O-90-8

Procedural Transparency Should Be Obligatory

The current version permits producers or PROs to submit exemption requests for *de minimis* designation with no clear public notice, stakeholder input, or third-party review process. Even with the Department's intent to publish approved components online and have other documents available under Public Records Act requirements, the regulations lack data transparency that is communicated to the public outside of the Department as an intermediary filter. To promote transparency and fairness, all exemptions must be handled through an open process with input from both the advisory committee and members of the public.

Response to O-90-8

CalRecycle rejects this comment for the reasons provided in response to comment comment O-75-6.

Comment O-90-9

Exemptions for Certain Covered Materials (§18980.2.4): The Exemption Application process must include public deliberation.

Exemption Process Should Immediately Be Public Record

The proposed exemption process for packaging based on "unique challenges for compliance " doesn't have any requirement that decisions be made in an open forum with input from the public. Despite subsection (d) of 18980.2.4 proclaiming that applications are "public documents subject to mandatory disclosure under the California Public Records Act," there is no mandated transparency in the regulations, and is instead reliant on the public requesting data. Given the wide range of possible applications, it is imperative that any proposed exemption only be granted with public input. Our recommendations for public deliberation include the following:

- The Department should only adopt exemptions at a duly-noticed public meeting, including, but not limited to, the monthly public meeting, after providing an opportunity for public comment.
- Additionally, adoption of any exemptions should become part of the public record, such that individuals can confirm which material exemptions are relevant and up to date.
- A component of information required for potential exemptions should be the type of recycling/processing used, such that communities disproportionately affected by certain technologies (contrary to the express intent of the legislation) have access to meaningfully engaging in the public deliberation process.

Response to O-90-9

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment O-75-7, which is substantively the same as this comment.

Comment O-90-10

Article III: Evaluation of Covered Material and Covered Material Categories Recyclability (§18980.3.): Audit requirements should be strengthened to avoid oversimplification.

Audits must be randomized and representative of the entire supply chain; must be strong enough to ensure compliance.

The regulations currently require annual audits of two intermediate supply chain entities and two end markets8 when evaluating participant producer compliance. It is unclear if two of each type of facility will be sufficient for a given material type, and a better approach might be to use percentages, along with a framework similar to that established in the SB 1383 Route Review requirements (Cal. Code Regs. tit. 14 § 18995.1), which requires jurisdictions to “have an inspection and enforcement program that is designed to ensure overall compliance with this chapter.” Additionally, a percentage-based approach would make more sense than a static number to ensure that audits sufficiently evaluate compliance with the regulations and represent different strata of the market chain itself. For instance, the regulations could require “visits to intermediate supply chain entities and markets that, respectively, collect, process, or recycle 75% of the material under investigation.” Having a flexible, percentage-based approach would ensure greater compliance and more certainty with regard to intermediate supply chain entities and end-markets that are fully responsible and receiving just scrutiny.

Response to O-90-10

Comment rejected. The suggestion to add a provision expressly requiring an "overall compliance with this chapter" requirement is unnecessary because the proposed regulations already have the effect that such a change would have: 18980.3(f)(1)(C) states minimum conditions that must be met (including the

numbers of visits required to certain entities), but the overarching express requirement is that audits and investigations must "ensure that the covered materials . . . continue to meet the requirements [pursuant to section 42355.51(d)(4) or (5)]." Regarding a percentage-based approach, that change would not necessarily add flexibility, but rather would change the nature of the minimum conditions that the PRO must meet. CalRecycle declines to take that approach because it would not necessarily improve the calibration between the scope of conducting audits and investigations and the proof required to reasonably verify compliance.

Comment O-90-11

Independent Third-Party Validation of Postconsumer Recycled Content (§18980.3.4): PCR content calculations must explicitly prohibit the use of mass balance credit methods.

The incorporation of real postconsumer recycled content into products can be a powerful tool to stimulate the demand and usage of recycled materials, creating a financial incentive to increase the recovery of these materials and reducing the dependence on virgin natural resources. It is for this reason that SB 54 encourages producers to use postconsumer recycled content in covered material.
Producers, in California and elsewhere, have argued for the use of mass balance credit methods to be allowed as part of recycled content accounting. If such methods are allowed, this would undermine the effectiveness of SB 54 since mass balance credit methods enable producers to use virgin materials, which are labeled/certified as "recycled" and then claim that they are incorporating recycled content. In some cases, these credit methods can skirt the intent of SB 54 and allow plastic to be turned into fuel to create fake recycled content credits, which are then assigned to virgin plastic. Mass balance credit methods are deceptive and should explicitly not be allowed in the SB 54 regulations since they will incentivize greenwashing rather than real recycling and recycled content.

Response to O-90-11

CalRecycle rejects this comment for the reasons stated in response to comment O-75-9.

Comment O-90-12

Article IV: Responsible End Markets

End Market Identification (§18980.4.1): Provisions around recycling technologies are dangerous, inconsistent with statutory requirements, and antithetical to legislative intent

Approval of Non-Mechanical Recycling Technologies
Minimum Performance: 'Management…in compliance with a Permit'

Section 18980.4.1(d)(B), when considered in conjunction with the rest of Section 18980.4.1(d), indicates that chemical recycling facilities generating hazardous waste that is produced and disposed of in “compliance with an applicable permit ” are allowable under the regulations, disqualifying them as generating “significant amounts of hazardous waste.” This means that these technologies are effectively automatically allowed under the regulations, no matter how much hazardous waste is produced, since the litmus test for approval is solely ‘substantial compliance’ with a permit they would have needed to obtain in order to operate anyway. In effect, this creates a legally tautological requirement under which no amount of hazardous waste would be considered “significant.”

By construing the hazardous waste provision in a manner that largely nullifies its operative force, the Department renders the Legislature’s deliberate choice of language null and void, contrary to the presumption that each word in a statute serves a purpose. The proposed interpretation contravenes the surplusage canon , a settled principle of statutory construction which requires that effect be given to every word and clause enacted by the Legislature, such that no portion of the statute is rendered redundant, inoperative, or devoid of meaning.

Additionally, compliance with applicable permits may vary by jurisdiction, making enforcement difficult or impossible. Per Section 18980.4.1(d)(B), compliance with permitting may be different in different jurisdictions, and this provision applies to end markets, which may be outside California. This would impose unequal requirements for the same technology in different jurisdictions for meeting a California requirement focused on the amount of hazardous waste generated. Accordingly, this would exacerbate historic waste colonialism by encouraging the siting of polluting technologies in the parts of the U.S. and the world with the fewest environmental protections.

Response to O-90-12

CalRecycle rejects this comment for the reasons provided in response to comment O-62-1.

Comment O-90-13

Insufficient Evaluatory Metrics/Criteria

Conflation of Risk and Amount

The definition of “significant amounts of hazardous waste” in Section 18980.4.1(d)(1) and Section 18980.4.1 (d) (B) is problematic. SB54 language refers to the *amount* of hazardous waste, not the *“risk”* associated with it, and these are clearly different standards. The proposed regulatory framework in this regard is also clearly and critically at odds with the SB 54 statute. As mentioned in the letter submitted to the Governor on behalf of a myriad of legislators , this unlawfully shifts the standard from the production of hazardous waste (as required by the statute) to its management, which directly conflicts with the legislative intent to exclude technologies based on the generation, not governance, of hazardous waste.

Response to O-90-13

CalRecycle rejects this comment for the reasons provided in response to comment O-62-1.

Comment O-90-14

Weakness in Defining 'Hazardous Waste' - Federal vs. State

The regulations reference the federal definition of hazardous waste, and not the California state definition, which is far more protective of public health and the environment. Use of the weaker federal definition problematically opens the door to the generation of hazardous wastes that are not considered federally hazardous but should otherwise be considered 'California Hazardous.' This includes more protective toxicity tests, lower thresholds for heavy metals (e.g., lead, copper, zinc), lower thresholds for ignitability, lower thresholds for reactivity and corrosion, and prohibitions on certain chemical products and pharmaceuticals.

Section 25117 of the California Health and Safety Code clearly states that "hazardous waste" means "a waste that meets any of the criteria for the identification of a hazardous waste adopted by the department pursuant to Section 25141." The legislature has repeatedly stated, and the courts have upheld, that "it is in the interest of the health and safety of all Californians...to establish a regulatory program that is more stringent than federal law" (Health & Safety Code 25100) when it comes to hazardous waste. In the absence of other statutory direction, the Department must default to California statutory and regulatory definitions when implementing state laws, like SB 54.

Response to O-90-14

CalRecycle rejects this comment for the reasons provided in response to comment O-62-1.

Comment O-90-15

Divergence from Department Precedent on Definition of 'Hazardous Waste'

CalRecycle's proposal to rely on the federal RCRA definition 16 of "regulated hazardous waste" (40 CFR part 261) for SB 54 implementation is inconsistent with how CalRecycle and its partner boards define and use "hazardous waste" elsewhere in Title 14 and Title 27 of the California Code of Regulations, where the agency repeatedly anchors to DTSC's California definition in Health & Safety Code § 25117 and Title 22, Division 4.5. For example, Title 27's joint CalRecycle/SWRCB technical definitions make "hazardous waste" expressly coextensive with Title 22 ("any waste which, under … Title 22 … is required to be managed according to Division 4.5 of Title 22"), and ties "hazardous constituent" to Title 22 Chapter 11/Appendix VIII, not federal RCRA alone. In Title 14, CalRecycle's Household Hazardous Waste definitions incorporate HSC §25117 by reference for "Hazardous Waste," and multiple construction & demolition/inert debris provisions exclude materials that are "hazardous waste as defined in Title 22, § 66261.3

et seq.,” again deferring to California’s state definition rather than importing federal RCRA scope.

Using the federal definition in SB 54—where the rest of CalRecycle’s solid-waste framework consistently points to California’s existing definitions—creates an unnecessary and incongruent departure from agency precedent and risks narrowing California’s protective coverage for hazardous characteristics that are broader under state law.

For instance, some illustrative examples where CalRecycle regulations rely on existing California definitions for Hazardous Waste rather than RCRA definitions:
● 27 CCR § 20164 (Technical Definitions): “Hazardous waste” means any waste required to be managed under Title 22, Div. 4.5; “hazardous constituent” cross-references Title 22, Ch. 11/App. VIII; “regulated hazardous waste” points to § 66260.10 (Title 22).
● 14 CCR § 18502 (HHW Definitions): “Hazardous Waste (HW)” incorporates HSC § 25117 (DTSC’s statutory definition) within CalRecycle’s HHW program definitions.
● 14 CCR § 17225.32 (Minimum Standards—Definitions): “Hazardous Wastes” expressly tethered to HSC § 25117 and related California definitions.
● 14 CCR §§ 17381, 17388 (C&D/Inert Debris): “Inert debris” may **not contain hazardous waste as defined in Title 22, § 66261.3 et seq.—an explicit reliance on DTSC’s regulatory definition.

Because CalRecycle’s own rules overwhelmingly anchor “hazardous waste” to the state’s existing Title 22/HSC § 25117 framework, importing the federal definition for SB 54 is incongruent with CalRecycle’s established regulatory practice.

Response to O-90-15

CalRecycle rejects this comment for the reasons provided in response to comment O-62-1. Also, this commenter's specific objection is premised on giving precedential effect to how other regulations define "hazardous waste." However, the unique context of the current statute is highly dissimilar from the ones related to the cited regulations because, unlike those regulations, it necessarily considers end-of-life management of covered material that may occur or conclude outside the state.

Comment O-90-16

Reference to Inappropriate ISO Standards
ISO 59014:2024
18 does not define 'recycling,' nor does it establish criteria relevant to environmental safety, GHG emissions, or human health. Its focus on material tracking and internal process management is wholly insufficient to serve as a proxy for SB 54’s environmental justice and pollution minimization mandates. Referencing ISO 59014 misleads stakeholders into believing it aligns with California's goals when it demonstrably does not.

Staff comments during the workshop indicate that this ISO standard is intended to be a proxy for the requirement that “the department’s regulations shall encourage recycling that minimizes generation of hazardous waste, generation of greenhouse gases, environmental impacts, environmental justice impacts, and public health impacts.” ISO 59014:2024 does not address (or even reference) the majority of these criteria.

Furthermore, the aforementioned ISO standard does not even define recycling at all, let alone in line with the statutory definition of recycling, nor does it include a single environmental or efficiency benchmark to distinguish legitimate recycling operations from fraudulent, toxic, and climate-harming operations. Instead, the ISO proposes soft, optional, qualitative guidelines for material recovery operators to standardize their operations from a labor and circular economy aspect (e.g., recommendations on types of data to collect, and on types of policies to include) and is a purely non-binding standard. In fact, unlike California law, this ISO standard does not consider energy recovery a form of disposal and promotes the use of a very narrow Life Cycle Analysis, which ignores issues around toxics and human health concerns and environmental pollution.

Response to O-90-16

CalRecycle rejects this comment for the reasons provided in response to comment O-62-1.

Comment O-90-17

Infrequently Reported Facility Level Information

The proposed regulations still allow PROs and Independent Producers to approve non-mechanical recycling technologies, including so-called “chemical recycling,” with CalRecycle review. Facilities must now submit information on throughput and hazardous waste generation (§ 18980.4.1(d)(4) 19), but this requirement is tied only to initial reporting. A facility could easily demonstrate minimal hazardous waste at pilot scale, secure approval, and then expand operations or shift feedstocks to produce significant hazardous waste without triggering a new review. The definition of “significant amounts of hazardous waste” is narrowed to weaker federal standards, and the prior requirement to evaluate risks against mechanical recycling baselines has been removed. This structure undermines both transparency and accountability, while violating the legislative intent of SB 54. Although records submitted to CalRecycle are nominally subject to the Public Records Act, large portions can be withheld as trade secrets, leaving the public in the dark on hazardous waste, costs, and climate impacts. To prevent abuse, the regulations must explicitly require facilities to re-enter the approval process when scaling up, changing or adding technologies, or processing new covered materials. They must also restore comparative evaluation against mechanical recycling and ensure that hazardous waste and whole-lifecycle climate impact data, including the significant climate footprint from the production and management of solvents used in recycling operations, 20 are publicly accessible. Without these safeguards, the rules risk enabling unproven or polluting “chemical recycling” projects under the guise of compliance, in direct conflict with the intent of SB 54.

Response to O-90-17

CalRecycle rejects this comment for the reasons provided in response to comment O-62-1.

Comment O-90-18

Language Should Reflect Unequivocal Prohibition on Chemical Recycling

Leaving the approval of recycling technologies solely to the discretion of the Producer Responsibility Organization (PRO)—as currently permitted under the draft regulations—undermines the objectivity, transparency, and environmental rigor required by SB 54. The PRO, by design, is a producer-led entity with a fiduciary and operational interest in minimizing compliance costs for its members. Granting the PRO unilateral authority to determine which technologies qualify as "recycling" creates an inherent conflict of interest that threatens to weaken the law's core requirements.

Under Public Resources Code § 42051.1, CalRecycle is directed to ensure that packaging is recyclable in practice and at scale. That determination must be grounded in science, operational evidence, and public accountability—not left to an industry-governed body with incentives to greenlight technologies that may have questionable environmental outcomes, such as pyrolysis, gasification, solvolysis, solvent-based technologies, and similar technologies , so long as they are good for their members' bottom line

To safeguard SB 54's credibility and intent, all recycling technology approvals must be subject to final CalRecycle review, with decisions made during publicly noticed monthly meetings, after:

- Meaningful public comment;
- Technical vetting by independent experts; and
- Clear findings regarding environmental safety, yield efficiency, and alignment with California's waste hierarchy.

This public, science-based process built into the statute ensures that "recycling" maintains its integrity, avoids regulatory capture, and reflects the law's intent to advance genuine circularity, not just a green-washed chemical conversion or incineration masquerading as recycling. The baseline for a process like this should be overseen by the regulatory agency, not by the companies and industry via the PRO. Furthermore, CalRecycle must defer to the legislative history reflected in both Senate and Assembly analyses and Senator Allen's 21 unambiguous statement when answering future queries on whether waste-to-energy and related technologies constitute recycling under SB 54.

Response to O-90-18

CalRecycle rejects this comment for the reasons provided in responses to comments O-62-1 and O-75-10.

Comment O-90-19

End Market 'Viability' is Ignored

While the regulations refer to a "viable responsible end market" as a responsible end market that is feasible and capable of being economically successful, there are no clear criteria for "viability" – especially given the viability requirement is only mentioned one time in the entire draft regulatory text. The regulations must be amended to require a company proposing a new recycling end market to demonstrate a track record of viability at scale.

Manufacturers have pledged recyclability for the packaging for decades, often without anything to show for it. Recovering a material that has never been effectively recycled is not "viable," and this needs to be explicitly addressed in the regulations to avoid intentional delay by packaging manufacturers that want to see material as long as possible, even when they know they will never hit the ultimate targets in the law. The statute sets a clear baseline that should eliminate problematic material types *prima facie* if the market for recycling those materials is not sustainable or solvent. To this end, CalRecycle must provide further clarity on what a viable, responsible endmarket looks like relative to a non-viable one, as well as publish guidance about how the PRO should enhance or expand access to new viable endmarkets.

Absent a functional definition of 'viable responsible endmarket' in statute or the regulations, it will be impossible for the Department or the PRO to ensure that covered material recycling is occurring in a way that prioritizes sustained investment into industries with a proven track record of success.

We would urge the Department to also include a requirement for the end market technology to have successfully demonstrated a meaningful recovery rate in a comparable producer responsibility program. As such, viability and financial solvency are of utmost importance in ensuring that Responsible End Markets remain a core fixture of the PRO's planning efforts. Additionally, it should be noted that a system where each material producer is responsible for the cost of recycling that material is crucial to prevent "punishing" highly recyclable material producers by using their money paid to the PRO to cover the cost of recycling less recyclable covered materials. Building this stipulation into the PRO funding structure is essential to ensure the equitable treatment of producers. Similarly, eco-modulation should be differentially calculated based on material type and impact, and fees collected should similarly be directed to mitigate the impacts of each.

Response to O-90-19

CalRecycle rejects this comment. See the response to comment O-75-11. Regarding the term "viability" in particular, see CalRecycle's response to comment O-71-5.

Comment O-90-20

Responsible End Market Criteria (§18980.4.): Threshold for non-degraded fraction of compost is an impossible standard, must be reduced or eliminated

Full biological decomposition is an impossibility

The regulations require that “must fully biologically decompose .” While the intent here is laudable, it is unlikely that even naturally occurring organic materials would meet a requirement for 100% degradation, especially within the same timeframe as other biologically degrading materials of diverse organic chemistry. With current technologies, setting the threshold at 100% makes this a nearly impossible standard to meet, and will result in the effective prohibition of ‘compostability’ as a compliance pathway under SB 54. We suggest using compliance with the applicable evolving and most up-to-date ASTM Standards as a proxy for ensuring the inherent degradability of covered materials. Specifically, making use of ASTM D6400 and D6868 would allow for congruency with other state and federal definitions of compostability.

Response to O-90-20

CalRecycle rejects this comment. See the response to comment O-75-12.

Comment O-90-21

End Market Identification (§18980.4.1): Producer Data should be required to be submitted to CalRecycle in addition to the PRO

Submission of Producer Data to the Department should be Compulsory
The regulations propose that producers be required to produce compliance records to the Department “upon written request
”. This is insufficient for proper regulatory
oversight by the Department, the Advisory Committee, and members of the Public. It must be a requirement that these records are annually submitted to CalRecycle, without exception. Any data that is exempt from disclosure requirements should be provided to the public and the advisory committee in aggregated form, if applicable, with trade secrets redacted. However, it is not enough for the Department to only reactively request
this data – instead, it should adopt a proactive approach of requiring this data annually and reviewing these submissions as frequently as needed.

Response to O-90-21

CalRecycle rejects this comment. See the response to comment O-75-13.

Comment O-90-22

Article VI: Requirements for the Producer Responsibility Organization Eco-modulated Fee and Fee Schedule (§18980.6.7)

Regulations Must Provide Greater Detail on How Malus Fees Should be Assigned to Covered Products Containing Toxic Chemicals

SB 54 requires fees for PRO participants and directs that the fees be adjusted with malus fees or credits, based on various delineated factors. CalRecycle’s proposed regulations provide detail on several of these factors, with CalRecycle explaining that “[b]y presenting a list of items, further detailed below, this subsection clearly lays out

requirements related to the fee, so that a PRO and participating producers can readily understand how the PRO must assess it." Similar detail is required for the factors specifying malus fees and credits related to the presence of toxic heavy metals or additives in plastic that can make recycling harder or embed toxics in the recycled plastics—these factors are not addressed in the regulations. CalRecycle should include provisions in the regulations that give greater specificity to what pathogens, heavy metals, or additives should result in credit or malus fee adjustments.

Response to O-90-22

CalRecycle rejects this comment. See the response to comment O-75-14.

Comment O-90-23

The Department has one chance to implement SB 54 faithfully and in full alignment with the Legislature's intent. If the regulations fall short—by permitting "chemical recycling," allowing broad exemptions, or creating definitional loopholes —the credibility of the entire law will be jeopardized along with its effective implementation. Californians cannot afford a hollow framework that replicates past policy failures and shifts burdens back onto the public. We therefore urge CalRecycle to correct the serious deficiencies outlined in this letter and adopt a regulatory package that is clear, enforceable, and uncompromising in holding producers accountable. Getting this right is not optional; it is essential to the integrity of SB 54, the health of California's residents and iconic environment, and the state's leadership in solving the plastic pollution crisis. We also encourage the department to build our plain-language resources/guides (such as the Annotated FAQ Guide in Attachment #1) to create clarity and certainty before ambiguity invites unavoidable, necessary future litigation.

Thank you for your consideration.
Best,

Plastic Pollution Coalition

Response to O-90-23

Comment rejected. No response to this portion of the commenter's submission is necessary because the issues raised in it have been addressed in response to other portions of the submission discussing the same issues. Regarding the attachment referred to as "Annotated FAQ Guide," the attachment itself is included in the rulemaking record but does not require further response because it an example of a publication the commenter presents as an example of "plain-language" guidance, not as an objection or suggested change to the regulations. Furthermore, no change to the regulations is necessary for CalRecycle to publish

a similar "frequently asked questions" document to assist the public in understanding the regulations and how to apply them.

O-91: California Chamber of Commerce (Adam Regele)

Comment O-91-1

Dear Ms. Richmond:

The California Chamber of Commerce and these undersigned organizations (the "CalChamber Coalition" or "Coalition") thank you for the opportunity to submit comments regarding CalRecycle's (the "Department") Plastic Pollution Prevention and Packaging Producer Responsibility Act Permanent Regulations published in the California Regulatory Notice Register on August 22, 2025 (the "Regulations"). The Coalition consists of California-based and national organizations and businesses of all sizes that collectively represent nearly every major business sector, from agriculture to grocery stores, that will be impacted by Senate Bill 54 ("SB 54") and the Department's corresponding implementing regulations.

The CalChamber Coalition is an active and diverse set of engaged stakeholders working to create an implementable and cost-effective framework for achieving California's ambitious circular economy mandates. On May 8, 2024, the Coalition submitted detailed comments discussing how to resolve at least 35 critical issues concerning the first draft of the proposed SB 54 regulations ("May 8 Letter"). On November 4, 2024, the Coalition submitted a second letter ("November 4 Letter") further discussing the issues identified in the May 8 Letter, and new issues based upon the substantially revised proposed regulations issued on October 14, 2024. In addition, the Coalition and its members have provided comments on other directly relevant laws and rulemakings, including Senate Bill 343 (Allen) and Assembly Bill 1201 (Ting) which all considerably intersect California's packaging and foodservice ware extended producer responsibility law under SB 54.

We appreciate all of the Department's consideration and thoughtfulness regarding all Coalition comments so far submitted, and for the consideration of these additional Coalition comments on the latest Regulations. We believe the most recent Regulations are dramatically improved and legally conform to the statutory mandates under SB 54. When compared to prior versions of the regulations, this will help position California for a more successful implementation of SB 54 while lowering costs to the system. The Coalition submits the below additional comments on the Regulations to further strengthen the rules and best conform to the statutory mandates outlined under SB 54.

Response to O-91-1

No response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations, does not raise an objection concerning the rulemaking process, or refers to suggested changes or objections set forth in greater detail in other portions of the submission. To the

extent other portions of the submission suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-91-2

Categorical Exclusion for Food and Agricultural Commodities

The Coalition concurs with the inclusion of Section 18980.2(a)(2) of the Regulations, which categorically excludes from the "covered material" definition "packaging or packaging components used by a food or agricultural commodity," if it is "not reasonably possible" to use alternatives to comply with federal regulations, rules, or guidelines issued by the U.S. Department of Agriculture (USDA) or the Food and Drug Administration (FDA). This exclusion is faithful to the plain text of SB 54, which prohibits the imposition of "any requirement," including recycled content requirements, that conflicts with federal law or regulation, explicitly encompassing those issued by USDA and FDA "relevant to packaging agricultural commodities, requirements for microbial contamination, or to the structural integrity or safety of packaging" under federal law.1

Not only does the language used in Section 18980.2(a)(2) comport with SB 54's statutory directive, it also wisely reflects the California Supreme Court's understanding of preemption, which rejects the idea that the "theoretical possibility of compliance" with two laws is sufficient to overcome preemption.2 If any refinement or clarification were needed, for example increasing predictability for implementation of the PRO's plan, setting annual deadlines for exclusion determinations to be filed by a producer, as well as a reasonable time frame after exclusions are filed for any rejections of determinations by the Department could be considered and would remain consistent with the statute.

The categorical exclusion of food and agricultural commodities complying with USDA and FDA rules, guidelines or regulations was expressly contemplated under SB 54 in PRC § 42060(b)(2) and appropriately implemented by the Department in the Regulation. There is no need to perpetually re-establish a basis for an excluded material for which long-established federal regulations, rules, or guidelines issued by the USDA or the FDA, whose federal jurisdiction establishes unique packaging requirements for certain foods like meat and poultry. To subject such packaging to the presumption that it is covered and that external conditions may suddenly alter the producer's obligations and ability to sell essential commodities would be extremely disruptive, and quite possibly dangerous to public health, as well as detrimental to the environment due to increased food waste from compromised packaging, if California's agricultural producers, grocery retailers, and food service providers are suddenly forced into insufficient and inadequate packaging.

Furthermore, exempted materials—as opposed to excluded materials—still must be included in the PRO's source reduction plan, and producers of exempted materials must report and pay fees on them. To take meat and poultry as an example, at this time it is not reasonably possible to use alternatives to packaging that have already been approved by the USDA's Food Safety and Inspection Service ("FSIS") as an appropriate

"food contact substance." Plastic film wrap has been carefully optimized for its durability (resistant to tearing), impermeability (protecting products from oxidation, moisture, and other airborne contaminants), and safety (preventing transfer of chemicals to the product). These features are paramount where fresh protein products are concerned, due to the heightened risks of foodborne illness, cross-contamination, and significantly shorter shelf-life. Similar rationale is applicable in many other sectors of the food supply chain, whether it is fresh produce or canned goods.

Placing federally approved packaging like this within the scope of SB 54's requirements when it is not reasonably possible to comply nor have alternatives to comply would unreasonably encumber California food and agriculture producers already facing significant uncertainties, market disruptions and higher prices. Further, risking the public's health with unproven packaging alternatives is dangerous and unnecessary. We note that subdivision (d) of Section 18980.2 adequately addresses scenarios where packaging for agricultural commodities that was previously excluded can be brought into compliance with SB 54 in the event that a Department investigation determines that it is "reasonably possible" to use alternative packaging that complies with the requirement. Finally, the risk of higher food prices and reduced food safety, shelf life, and access is fundamentally at odds with SB 54's mandate that regulations must "*avoid or minimize disproportionate impacts to disadvantaged or low-income communities or rural areas.*" Few impacts could be more severe for California families at this time than a rise in the cost of food. For all of these reasons, the Coalition concurs that the inclusion of categorical exclusions best effectuates the intent and plain meaning of SB 54.

Response to O-91-2

Comment rejected. No response to this comment is necessary because it only expresses approval of the proposed regulations; it does not propose any change or raise any objection.

Comment O-91-3

Over-the-Counter Medications

The Coalition agrees with the Department's interpretation of SB 54 and designation of over-the-counter medications ("OTC") and their packaging as excluded from the definition of "covered material" under Section 18980.2(a)(6). These latest provisions in the Regulations have the strongest legal footing in the text and intent of SB 54, while further making the most practical sense from a policy perspective.3

First, excluding most OTC drugs from the requirements of SB 54 is faithful to the text of the statute, which plainly excludes from the definition of "covered material" any packaging for "medical products ***and*** products defined as devices or prescription drugs." As provided in PRC § 42041(e)(2)(A)(i), "medical products" and "products defined as devices or prescription drugs" are two separate and distinct categories of products. To exclude prescription drugs and medical devices would only effectuate the second half of this statutory provision, rendering the first half meaningless. That reading would not be faithful to the text of the statute.4

Although “medical products” are not defined elsewhere in state or federal law, the most logical meaning is OTC drugs, which are “medical” in nature because, like prescription drugs, they are “intended for use in the diagnosis, cure, mitigation, treatment, or prevention of disease.” 5 The key difference is that the FDA has determined these products can be used appropriately by consumers for self-diagnosed medical conditions, do not need a health practitioner for safe and effective use, and have a low potential for misuse and abuse.6 Section 18980.2(a)(6) gives full effect to the statutory mandate, and for that reason, it should be adopted without any changes.7

Second, OTC drug packaging is heavily regulated by the FDA under the Federal Food, Drug, and Cosmetic Act, as well as the U.S. Consumer Product Safety Commission under the Poison Prevention Packaging Act. These regulations require tamper-evident and child-resistant packaging, extensive labeling and dosing instructions, and unique packaging designs that ensure durability and protection from light and moisture product safety. Such federally mandated requirements leave little to no room for producers to meaningfully reduce packaging or redesign for recyclability. In this way, the Department’s determination to carve out OTC drugs and their packaging carries out another key provision of SB 54, which instructs the Department to ensure that all regulations consider federal guidelines and regulations. *See* PRC § 42060(b).

Third, sweeping OTC drug packaging within the definition of “covered material” would materially disadvantage low-income and uninsured or underinsured communities, thereby ignoring one of the statute’s key mandates. *See* PRC § 42060(d) (“[T]he department shall ensure the regulations, and activities conducted in accordance with the regulations, avoid or minimize disproportionate impacts to disadvantaged or low-income communities. . . .”). If OTC drug packaging were to become “covered material,” the attendant fees—which could not easily be avoided through even careful redesign due to the complex federal regime described above— would very likely increase the cost of OTC products. For low-income and uninsured consumers, OTC products are often the first and even only line of treatment for common but potentially serious or progressive health issues. Making OTC products more expensive risks discouraging safe and responsible self-treatment, increasing healthcare burdens on already vulnerable populations, and potentially pushing consumers toward less safe, unregulated remedies.

Response to O-91-3

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-91-4

Reuse/Refill Standards

The Coalition concurs the Regulations at Section 18980.2.1 effectively implement standards for identifying reusable and refillable materials that are not covered material consistent with PRC § 42041(af) in order to increase the use of such items and expand reuse and refill systems.

Section 18980.2.1 incorporates a minimum standard for reuse/refill by exempting only those items that meet the requirements of PRC § 42041(af), *see* Section 18980.2(a), along with providing definitions for certain terms in the statute that clarify application of the criteria. This straightforward approach simplifies but maintains the rigorous reuse/refill standards consistent with practical implications, thereby encouraging the increased safe usage of reusable and refillable products that is necessary to achieve the goals of SB 54.

Section 18980.8.1(c) also requires the PRO's plan, pursuant to PRC § 42051.1(m), to "include procedures and methods for ensuring that all items claimed as the basis for source reduction through shifting to reusable or refillable items satisfy the requirements to be considered reusable or refillable." This includes explaining "how the PRO will: confirm items are designed for durability; assess convenience, safety, and environmental risks; and determine the average number of uses or refills for packaging reused or refilled by producers." Such requirements aptly supplement the "minimum" standard for reuse/refill.

The standard imposed by the Regulations for reuse/refill is entirely consistent with SB 54 and need not provide any further criteria that, similar to the prior proposed regulations, as detailed in our May 8 Letter and November 4 Letter, imposed onerous and infeasible requirements for producers, caused confusion as to applicability, and mandated criterion found nowhere in the text of SB 54.

Finally, the Coalition agrees with the Department's decision not to include additional record-keeping requirements in the Regulations for the PRO regarding covered materials that producers claim to be reusable or refillable because such requirements are unnecessary and would cause undue burden and costs for the PRO. This is consistent with the directive in PRC § 42060(a)(2)(C)(ii), which states: "To the maximum extent feasible, the department shall seek to use records and information that the local jurisdiction, producer, retailer, wholesaler, or PRO already maintains, in order to minimize the burden imposed by the reporting and recordkeeping requirements while still enabling the department to determine compliance with this chapter." (Emphasis added). Determining whether packaging or food service ware items are reusable or refillable is the responsibility of a producer; the PRO need not maintain records of that determination because it is not responsible for it. Producers will need to ensure compliance with Section 18980.2.1, as the Regulations allow the Department to conduct investigations pursuant to PRC § 42090(a) to determine whether packaging or food service ware is covered material.8 This is important to keep costs down across the system and protect the food system.

Response to O-91-4

CalRecycle appreciates the commenters support for the regulations. Nevertheless, the comment must be rejected as it does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-91-5

Exclusion for Secondary & Tertiary Packaging for CRV Containers

SB 54 was enacted with sweeping coverage of single-use packaging and plastic single-use food service ware, subject to exemptions and categorical exclusions that the Legislature enumerated. Among these are packaging systems for food and agriculture, medical goods, as well as beverage containers subject to the California Beverage Container Recycling and Litter Reduction Act (the "Bottle Bill" or "CRV Program").9 When the Legislature enumerated what was *not* a "covered material" under SB 54, it consistently exempted (in PRC § 42041(e)(2)(A)-(G)) all of the packaging associated with that category. The Department has correctly assessed that this includes secondary and tertiary packaging associated with the primary regulated good. Accordingly, the Department's May 2025 draft regulation treated all secondary and tertiary packaging associated with CRV beverages as "not covered material." This was revised in the August 2025 Regulations to treat the CRV Program differently.10 The final regulation should revert to the original interpretation and exclude secondary and tertiary packaging associated with containers subject to the Bottle Bill.

The Department's recent change appears to be based on the use of the term "beverage containers" in PRC § 42041(e)(2)(E) as contrasted with the term "packaging" in PRC § 42041(e)(2)(A), (B), (C), (D), (F), and (G). But in context, surrounded by these other full exclusions from "covered material," the language in (E) indicates that the Legislature intended the same breadth of exclusion.

This intention is clear from the unique nature of the Bottle Bill. Unlike the other categories enumerated in PRC § 42041(e)(2)(A), (B), (C), (D), (F), and (G), the Bottle Bill is a comprehensive, self-funding redemption program with decades of proven recycling success. Producers already complying with one of the most comprehensive recycling laws in the world should not then be forced into another recycling program where substantial other unrelated costs, whether it be enforcement or administrative costs associated with an EPR program, are passed on to entities complying separately under the Bottle Bill.

The logic for reading the SB 54 beverage container exclusion to cover all packaging tiers is reinforced by the Legislature's recent expansion of the Bottle Bill to include wine and distilled spirits through SB 1013 (Atkins, 2022). That legislation was the product of years of debate over how best to handle the unique packaging streams associated with these industries. Ultimately, California chose to fold wine and spirits into the CRV program precisely because the Bottle Bill is a proven, comprehensive, self-funding system that avoids duplicative regulation. Industry stakeholders, including small wineries and distillers, agreed to participate because the CRV program provides a uniform, closed-loop mechanism for managing their packaging without subjecting them to fragmented or overlapping requirements from multiple state programs. This legislative compromise underscores that the Bottle Bill is not merely about bottles and cans, but rather about ensuring an integrated and streamlined regulatory framework for all beverage packaging.

This history provides strong evidence that the Legislature understood the Bottle Bill exclusion in SB 54 as programmatic rather than vessel-specific. It would make little sense for lawmakers to expand the CRV system to cover entire new beverage sectors in order to consolidate and streamline packaging regulation, while simultaneously intending to regulate secondary and tertiary packaging for those same products under an entirely separate and duplicative set of obligations (SB 54). The very point of SB 1013 was to bring industries like wine and distilled spirits under the existing, successful container redemption model, so that they could avoid the burdens of managing packaging compliance under multiple overlapping programs.

The wine industry further illustrates just how important this issue is for the state. California is not only the nation's largest wine producer but also a global symbol of American viticulture. The industry is central to the state's economy, generating billions of dollars annually, sustaining hundreds of thousands of jobs, and showcasing the reputation of so many California regions to the world. Many of these wineries are small, family-owned businesses whose margins are already narrow. Imposing overlapping and inconsistent recycling regimes on these producers, at a time when California wineries and other beverage entities are facing inflation, retaliatory tariffs, increased labor costs and labor shortages, risks suffocating the very enterprises that embody California's agricultural heritage and international reputation. Burdensome duplication raises costs, disrupts operations, and undermines the competitiveness of California wines in both domestic and international markets. These are some of the most sustainable and eco-minded growers, distributors and wineries in the world.11

The canons of statutory construction favor harmonization of related statutes. Courts have long held that statutes must be interpreted in a manner that avoids conflicts and gives effect to all provisions whenever possible.12 Reading SB 54's beverage container exclusion narrowly, as the August 2025 Regulations do, would create direct conflict by forcing producers to comply with overlapping and inconsistent mandates under both the Bottle Bill and SB 54. By contrast, reading the exclusion appropriately to cover secondary and tertiary packaging harmonizes the two statutes: the Bottle Bill continues to govern beverage containers comprehensively, while SB 54 governs other packaging streams not already covered by a specific statutory program.

That conclusion is further reinforced by the interpretive canon of *noscitur a sociis*, which teaches that the meaning of a word or phrase is informed by the company it keeps.13 Although "beverage container" is phrased differently from the surrounding exclusions, its placement in a list where each item excluded entire packaging systems indicates that it should be construed in a similar fashion. A contrary reading would make the CRV provision the sole outlier in the section, producing an anomalous result that courts generally avoid.14 Applying *noscitur a sociis,* the term "beverage container" is properly understood as encompassing the whole packaging system associated with CRV-regulated products, thereby preserving consistency across the framework in SB 54.

Furthermore, read *in pari materia* with the other exemptions in PRC § 42041(e)(2), the "beverage container" carve-out should be understood to function consistently with its statutory neighbors where the exclusion of what is not "covered material" applies broadly across all tiers of packaging associated with the "not covered material" category. It would be inconsistent with the statutory structure for one exclusion in the same series to be treated as vessel-only, while the rest sweep in the full packaging system. The more natural reading, supported by the canon of *in pari materia,* is that the Legislature intended the beverage container exclusion to cover the complete packaging chain associated with CRV products.

Finally, interpreting the exemption broadly ensures that the Legislature's policy goals are achieved without undermining its most successful recycling program and excessively burdening the state's beverage producing community. The Bottle Bill has achieved redemption rates and consumer participation far exceeding other recycling systems and has become a world-leading program precisely because these regulated entities have spent billions of dollars developing and complying with this recycling program. It is inconsistent with the statute to require the same entities, including many wineries that voluntarily joined the Beverage Container Recycling Program under SB 1013, to also comply with SB 54 for the secondary and tertiary packaging associated with their beverage containers.

Response to O-91-5

CalRecycle rejects this comment's suggestion because the term "beverage container" is plain on its face. Secondary packaging containing beverage containers are unambiguously not "beverage containers" themselves, and the Legislature's choice to use that term, and not "packaging" (as it does for other exclusions), requires that it be construed accordingly. Because the term is plain in context of the statutory text itself, resort to the complicated evaluation of other laws and often-conflicting canons of statutory interpretation is not legally supportable.

Comment O-91-6

Source Reduction Targets

The Coalition strongly recommends that the Regulations explicitly confirm that the data from calendar year 2027 shall be used to measure against the 2023 baseline for purposes of determining compliance with the January 1, 2027 source reduction target.

The statute requires that the PRO develop and implement a plan to achieve the 25% reduction by weight and 25% by plastic component source reduction requirement for covered material. PRC § 42057(a)(1). To achieve this requirement, the statute sets forth the following deadlines for source reduction:

- January 1, 2027 interim target: 10% reduction of plastic covered material, with at least 2% reduced through reusable or refillable systems;

- January 1, 2030 interim target: 20% reduction of plastic covered material, with at least 4% reduced through reusable or refillable systems; and
- January 1, 2032 requirement: reduction of plastic covered material by 25% by weight and by number of plastic components.15

The baseline year for determining source reduction is 2023.16 The Regulations require reporting entities to submit a source reduction baseline report to the Department by July 1, 2026.17 The Regulations then require the PRO's annual report to include the percentage of source reduction across all participant producers.18
However, the statute does not identify which year of data must be used to calculate the source reduction percentage from the 2023 baseline in order to determine whether each respective target has been met. Rather, it allows the Department to "adopt regulations to implement this section, including, but not limited to, reporting and collection requirements."19 Given this broad language and in order to ensure source reduction percentages are complete and accurate when submitted in the PRO's annual reports, the Department should propose an additional provision in the Regulations identifying the specific year of data upon which the 2023 baseline must be measured against for purposes of determining compliance with the source reduction targets.
For three reasons, the Coalition strongly encourages the Department to require that data from calendar year 2027 be used against the 2023 baseline to determine the source reduction percentage for purposes of achieving compliance with the first deadline of January 1, 2027.

First, the Regulations are not expected to be finalized until early in 2026, so producers will not be on notice of the need to collect this source reduction data until then. At that point, certain (or perhaps all) of a producer's 2026 data may no longer be available or collectible, making it infeasible to determine the source reduction percentage based upon the entire "calendar year" 2026 data.

Second, utilizing a full calendar year of data, not a portion thereof, to measure source reduction from the 2023 baseline is consistent with the statute. The 2023 baseline itself requires use of the full 2023 calendar year of data.20 Additional sub-sections of PRC § 42057 reference the calculation of source reduction based on the full calendar year.21 Notably, there is no reference in PRC § 42057 to the collection of some other time frame of data or to the determination of source reduction compliance with respect to a non-calendar year.

Third, using a full calendar year of data is confirmed by the language of the statute and in the Regulations regarding the annual recycling rate which acknowledge that "sufficient data" means data over a 12-month period. For source reduction, that calendar year will be the year following the January 1, 2027 deadline (i.e., 2027 calendar year), given the lack of data expected to be available for 2026. For instance, one criterion for a "covered material" exemption under PRC § 42041(e)(2)(H)(i)(IV) states:

Until January 1, 2027, the producer annually demonstrates to the department that the material has had a recycling rate of 65 percent for three consecutive years. On and after January 1, 2027, the producer demonstrates to the department that the material has had a recycling rate at or over 70 percent annually, as demonstrated to the department every two years.

Section 18980.2.3(a)(4) of the Regulations, which speaks to the criteria above in PRC § 42041, states:

To satisfy the annual recycling rate requirements of subclause (IV) of clause (i) of subparagraph (H) of paragraph (2) of subdivision (e) of section 42041 of the Public Resources Code, the packaging or food service ware must be shown to have had a recycling rate of at least 65 percent for 2024, 2025, and 2026, and at least 70 percent for 2027 and each year thereafter. **The rate for each year shall be determined as of January 1 of the following year, calculated as described in subdivision (b) of section 18980.3.2.** The recycling rates shall be with respect only to materials originating from the items that satisfy the requirements of clause (i) of subparagraph (H) of paragraph (2) of subdivision (e) of section 42041, as described in paragraph (3) of this subdivision.

Then, Section 18980.3.2 of the Regulations (Methodology for Recycling Rate Determination), which is referenced in the bolded sentence above, states:

(b)(1): "… The recycling rate as of a particular date **shall be calculated over the latest twelve-month period before such date for which sufficient data to make the calculation exists.**"

This language acknowledges that "sufficient data" is necessary for determining the recycling rate. That same logic must be applied to the source reduction deadline. Compliance with the source reduction targets should be determined based upon sufficient data which will be available only after the Regulations are finalized. 2027 will be the first full year after issuance of the Regulations when data can be collected and relied upon to determine compliance with the January 1, 2027 source reduction target.

Therefore, requiring a 2027 data year to determine the source reduction percentage will ensure that the data is complete and accurate for the full calendar year as of the January 1, 2027 deadline. Assuming the Regulations are finalized and effective in 2026, producers will be on notice of needing to compile their 2027 data for the source reduction target at that point, allowing them sufficient time to understand and set up the necessary mechanisms to do so consistent with the final Regulations. Using a 2027 data year will ensure that the source reduction percentages identified in the PRO's annual reports are complete, accurate, and consistent with the plain language and intent of PRC § 42057.

With respect to the other source reduction targets – January 1, 2030 and January 1, 2032 – using the prior calendar year's data to measure source reduction does not pose

the same problem as the January 1, 2027 target assuming the Regulations are finalized and effective in early 2026. Because producers will be on notice in 2026, it will be feasible for producers to collect an accurate and complete data set for the full 2029 and 2031 calendar years for the PRO to then determine the respective source reduction percentages from the 2023 baseline. Therefore, the Coalition recommends the Regulations specify that the data year that the 2023 baseline be measured against to determine compliance with these two targets be, respectively, the 2029 and 2031 calendar years (i.e., the previous full calendar year of data available at the time of the target).

Response to O-91-6

CalRecycle rejects this comment. The comment suggests establishing reporting requirements for calendar years, however this is already clearly addressed in statute and sufficiently clarified in regulations consistent with statute. Thus, no further changes are necessary to the implementation or enforcement of the Act.

Comment O-91-7

New Recycling Technologies

The Coalition agrees that the the criteria in the Regulations at Section 18980.4.1(d) setting forth which new recycling technologies may be deployed as part of a Producer Responsibility Plan are consistent with the statutory language of SB 54 and provide essential pathways for the development of innovative new technologies and markets for recycled content that unlock circularity by enhancing and complementing the state's critically important mechanical recycling infrastructure.

The Regulations at Section 18980.4.1(d) comply with SB 54's explicit directive in Public Resources Code § 42041(aa)(5) to "include criteria to exclude plastic recycling technologies that produce significant amounts of hazardous waste." In accordance with the law, the Department properly exercised its discretion to interpret the undefined term "significant amounts of hazardous waste" to mean that which "presents a substantial risk of harm to public health, or of contamination of the environment."22 The Regulations also appropriately deem hazardous waste that is "handled and disposed of in compliance with an applicable permit"—consistent with all relevant state and federal laws—as not amounting to "significant amounts of hazardous waste." 23 Federal laws include, among others, the principal federal statute governing hazardous waste, the Resource Conservation and Recovery Act (RCRA), 42 U.S.C. § 6901 et seq. With nearly five decades of jurisprudence since its enactment in 1976, a robust body of case law has developed interpreting its scope, robust enforcement mechanisms, and strict application of end-of-life management across the hazardous waste lifecycle.

Further, the Regulations consistent with SB 54 do exclude technologies that produce significant amounts of hazardous waste: "Facilities employing such [new, non-mechanical] technology must not produce significant amounts of hazardous waste as defined in paragraph (1)."24 SB 54 explicitly includes the qualifier "significant amounts," with the directive that the Department "include criteria" to determine what exactly that

undefined term in statute encompasses – discretion imparted to the expertise of the Department. This interpretation is consistent with the requirement in PRC § 42041(aa)(5) that the Department "encourage recycling that ***minimizes*** generation of hazardous waste" (emphasis added). Any post-hoc statement implying or directly stating that SB 54's "intent" was to exclude any "generation of hazardous waste" is directly contradicted by the statute's plain language (i.e., the term "minimize") and not indicative, much less determinative, of legislative intent.25

Other aspects of the Regulations also encourage new recycling technologies that minimize the "generation of greenhouse gases, environmental impacts, environmental justice impacts, and public health impacts."26 For instance, Section 18980.4.1(d)(2) requires facilities using new technologies to operate consistent with ISO 59014:2024. Compliance with this standard achieves SB 54's goals of minimizing greenhouse gases and other impacts to public health and the environment by requiring facilities to utilize any innovative circular technologies responsibly. In addition, Section 18980.8(c), governing producer responsibility plans, requires that for each technology used, information must be included regarding an "assessment of potential public health and environmental impacts to disadvantaged communities, low-income communities, or rural areas."

The Coalition agrees with the deletion of the previously proposed Section 18980.3.6 in the Regulations, which CalChamber commented was inconsistent with the plain language of SB 54.

The current framework in the Regulations effectively encourages innovation in recycling technologies while ensuring that public health and the environment are protected. Developing and scaling cutting-edge technologies and infrastructure to maximize the recovery and recycling, while decreasing waste, are essential to establishing a world-leading circular economy. Indeed, for many forms of packaging and food service ware, new recycling technologies are vital for preserving and protecting food and other supply chains and keeping costs down and goods affordable. SB 54's plain language recognizes this by providing a path for new technologies under certain criteria, to be defined by the Department in regulations. The Coalition strongly supports the Department's faithful implementation of SB 54 in this regard.

Response to O-91-7

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-91-8

Compliance Pathway for Compostables

Compostable packaging and food serviceware are critical compliance pathways under SB 54, offering producers additional tools to reduce plastic waste and meet the law's ambitious recycling and pollution-reduction goals. However, AB 1201 (Ting) fundamentally redefined what it means for a product or package to be deemed

“compostable” by tying eligibility to the USDA’s National Organic Program (NOP). This linkage upended the marketplace because the NOP has not yet been updated to recognize many of the new, innovative compostable materials that could help producers achieve SB 54’s objectives. While this presents challenges, SB 54’s success depends on ensuring that compostable pathways remain viable and do not become artificially foreclosed.

Instead of facilitating those pathways, the Coalition sees the Regulations as adding additional unnecessary barriers. Subsections (B) and (C) of Section 18980.4(a)(4) impose rigid new mandates that go well beyond the statutory framework of SB 54 and AB 1201, creating conflicts and additional compliance uncertainty. For example, subsection (B) requires “full biological decomposition” of covered materials and prohibits transfer of any undecomposed material to subsequent facilities. Such an absolute standard is incompatible with how composting operations actually function, where heterogeneous feedstocks and variable conditions inevitably result in some residuals.27 By layering on new performance mandates atop AB 1201’s already restrictive framework, the Regulations would undermine any realistic compostable compliance pathway.

In short, while AB 1201 already imposes significant constraints, the Regulations should not exacerbate those challenges by adding impractical, inconsistent, and duplicative requirements. Subsections (B) and (C) extend well beyond statutory intent, conflict with USDA oversight of compostable labeling, and duplicate existing regulatory standards. For these reasons, they should be stricken in their entirety so that compostable packaging and food serviceware can remain a meaningful compliance pathway under SB 54.

Response to O-91-8

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42041(aa), 42041(ad), and 42060, and no change is necessary to the implementation of the Act. See the responses to comments B-6-5 and O-75-12. Additionally, sections 18980.4(a)(4)(B) and (C) of the proposed regulations are not about eligibility to be labeled "compostable"; rather, those sections are about identifying the end markets for certain materials. Those sections have no effect on whether a material satisfies the requirement to be eligible for being labeled "compostable" in accordance with Chapter 5.7 (commencing with PRC section 42355) for the purpose of PRC section 42050(b). The requirements of sections 18980.4(a)(4)(B) and (C) are appropriate, practical, sufficiently clear, and within CalRecycle's authority. CalRecycle declines to adopt the recommendation of this comment to strike sections 18980.4(a)(4)(B) and (C) in their entirety. Sections 18980.4(a)(4)(B) and (C) are necessary to offer clear guidance to regulated parties and to ensure the requirements of the Act can be achieved. Therefore, no change is necessary.

Comment O-91-9

Grouping Like Forms/Types of Packaging for Recycling Rate Calculations

The Regulations refer to the Covered Materials Category list identifying 94 different types/forms of packaging / foodservice ware subject to the recycling rates/dates or compostability in SB 54. We are grateful that the Regulations allow for “groupings” of similar types of products and applies the “group” recycling rate to be applied to each type/form of packaging in the group under Section 18980.3.2(d)(3). However, to effectively lower system costs for recycling service providers and producers, which will translate to recycling and circularity and much lower costs, we recommend allowing the PRO to determine whether it is possible to calculate for a grouping and to allow for it expressly when it is either not possible to calculate it separately or practicably infeasible to do so separately. This change greatly improves the likelihood of success of the system and also reduces costs to both the system and the Department, while maintaining the same recycling rates, dates and environmental outcomes.

Response to O-91-9

Comment rejected. CalRecycle declines to make a change because the commenter misconstrues 18980.3.2(d)(3) as permitting a single recycling rate to be applied to multiple covered material categories by grouping "similar types of products." That that provision, however, does not contemplate comparing "types of products" but rather addresses when groups of components span multiple covered material categories for which recycling rates cannot individually be assessed. The proposed regulation allows the recycling rate for the group to be imputed to each covered material category that cannot individually be assessed. If the commenter instead intended to suggest that 18980.3.2(d)(3) be changed so that the PRO, not CalRecycle, determines when such imputation is proper, CalRecycle rejects that suggestion because it would be unnecessary and there is no justification for substituting the PRO's assessment for CalRecycle's. Nothing in the proposed regulations prohibits the PRO from requesting that CalRecycle issue the determination described in 18980.3.2(d)(3).

Comment O-91-10

Covered Costs

The Coalition concurs with the framework in Section 18980.8.1 (g) establishing a clear and equitable process for determining “covered costs” the Producer Responsibility Organization (PRO) and Independent Producers are obligated to fulfill. Defining what is and is not covered costs establishes a pragmatic framework for cost accountability. By limiting covered costs to those demonstrably resulting from new program requirements as a result of SB 54, as the law intended, the Regulation appropriately aligns producer payments with infrastructure investments and other impacts associated with the implementation of this law rather than pre-existing municipal or service provider functions or infrastructure. This approach ensures funds are used efficiently to support implementation of SB 54 as cost effective as possible, prevent double recovery of costs,

and uphold the legislative intent to internalize only those expenses that arise directly from producer responsibility obligations.

Response to O-91-10

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-91-11

SB 54 and Proposition 65 Consistency

The Regulation's requirement that the PRO charge malus fees to producers who use covered materials that contain Proposition 65-listed chemicals is inconsistent with Proposition 65 and would expose companies that comply with Proposition 65 safe harbor levels and court-issued consent judgments to unnecessary liability.

The Regulation provides that "a PRO shall charge a malus fee to producers who use covered material that contains a chemical listed on the list established pursuant to section 25249.8 of the Health and Safety Code ["Proposition 65"]."28 This is inconsistent with decades of jurisprudence regarding Proposition 65, which is not a product safety law that limits the amount of chemicals that can be in a product or that bans products based on chemicals present. Rather, it is a "right-to-know" law that imposes stringent warning requirements based on exposure levels to certain listed chemicals. The state agency responsible for overseeing Proposition 65, the Office of Environmental Health Hazard Assessment ("OEHHA"), does not refer to chemicals listed under Proposition 65 as "hazardous material," nor does the Department of Toxic Substances Control ("DTSC") or the Department.
The Coalition adds that the Regulation would expose businesses that comply with Proposition 65 to malus fees improperly. Proposition 65 does not require that warnings be provided based on the presence of a listed chemical in a product at any level. Instead, it exempts from the warning requirement an "exposure for which the person responsible can show that the exposure poses no significant risk assuming lifetime exposure at the level in question for substances known to the state to cause cancer, and that the exposure will have no observable effect assuming exposure at one thousand (1,000) times the level in question for substances known to the state to cause reproductive toxicity."29 The warning threshold for listed carcinogens is known as the "no significant risk level" or "NSRL," and the warning threshold for reproductive toxins is known as the maximum allowable dose level or "MADL."

For some chemicals, OEHHA has established nonmandatory "safe harbor" levels for which warnings are not required as a matter of law.30 BPA, for example, has a safe harbor level of 3 micrograms per day via the dermal exposure route from solid materials.31
Businesses are not bound by these levels and are entitled to prove that higher levels should apply.32 For some chemicals for which safe harbor levels have not been established, courts have approved consent judgments that have set *de facto* industry

standards; for listed phthalates like Di(2-ethylhexyl) phthalate ("DEHP"), for example, that concentration level is 1,000 parts per million.

As a result, businesses can comply with Proposition 65 even though a listed chemical(s) is present in its packaging, provided the concentration is below the respective safe harbor level(s) or, if the business is bound by a court-approved consent judgment, the level(s) set in that agreement. OEHHA itself acknowledges, *"A business does not need to provide a warning when exposure from an individual product is too low to significantly contribute to an overall risk of cancer or harmful reproductive effects."* 33 The agency also "discourage[s]" businesses "from providing a warning that is not necessary."34 Accordingly, by requiring that the PRO charge a malus fee to producers who use covered materials containing chemicals listed under Proposition 65, at any level, the Regulation would punish businesses complying fully with Proposition 65. A business that reformulates its packaging to comply with a safe harbor level set by OEHHA (i.e., 1,000 times lower than the level where no harm was observed in animal studies for reproductive toxins) or that complies with a court-approved consent judgment for a listed chemical would comply with Proposition 65, yet still be subject to malus fees under the Regulation. Further, no business can feasibly confirm that all of its packaging does not contain, at any level, any of the 900-plus chemicals listed under Proposition 65.

The Regulation, moreover, will raise practical concerns as laboratory technologies improve. As revised, the Regulation provides that malus fees must be assessed if a Proposition 65-listed chemical is present at any level. If a laboratory developed a technology that could detect listed chemicals in the parts per trillion range, it follows that a detection of one part per trillion would expose a business to mandatory malus fees. Such a detection would not pose a harm to human health, let alone qualify as "hazardous material" as contemplated in SB 54.

The Coalition recommends striking § 18980.6.7(i) entirely. SB 54 already provides the PRO with discretion when to levy malus fees, for which this section removes that discretion. Alternatively, and consistent with the discretion contemplated by SB 54, Section 18980.6.7(i) should be revised from "shall" to "may."

Response to O-91-11

CalRecycle rejects this comment. See the response to comment B-11-9. Additionally, to the extent this comment makes the alternative recommendation to revise section 18980.6.7(i) of the proposed regulations from "shall" to "may," no change is necessary because PRC section 42053(e) provides that fees "shall" be adjusted using malus fees when the relevant conditions are met, and section 18980.6.7(i) of the proposed regulations already extends sufficient discretion to the PRO in determining the amount of the malus fee to be charged. No further change is necessary.

Comment O-91-12

Detachable Components

The Coalition is concerned that the proposed definition of detachable components disregards how California's recycling system has been designed to function. For decades, producers and recyclers have worked to ensure that components such as caps, lids, and pumps are engineered to be compatible with the base package in recycling systems. This approach has made recycling simpler and more effective by allowing consumers to place the entire package, including attached components, into the recycling bin while enabling material recovery facilities and reclaimers to sort and recycle complete packages efficiently. By treating every detachable component as a separate item, the Regulation risks significantly complicating an already complicated materials category list, thereby undermining recycling rates, distorting producer fee obligations, and creating incentives for packaging design choices that run counter to recyclability.

The Regulation in this section introduces unnecessary consumer confusion at a time when public participation in recycling must be strengthened under a circular economy. Consumers have been encouraged for years to keep caps on bottles, screw lids back onto jars, and recycle containers with pumps intact. If these components are now reclassified as distinct packaging categories, producers may be forced into redesigns that conflict with those best practices, and consumers may lose trust in recycling rules they see as contradictory or overly complicated. A more balanced definition would recognize that when components are not routinely separated by consumers prior to disposal, or where the PRO or producer community expressly educates the consumer on how keeping discarded covered materials together, the Regulations should treat these components as part of the base package for purposes of categorization, recycling and fee assessment.

We urge CalRecycle to refine the definition of detachable components in Section 18980.1(a)(4)(C) to mean components that are routinely detached by consumers without tools or substances, or those necessarily removed during ordinary use and not typically reattached before disposal. Aligning this rule with existing best practices will avoid disruptions, maintain consistency across California's recycling laws, and support the successful implementation of SB 54.

Response to O-91-12

CalRecycle rejects this comment for the reasons provided in response to comment O-39-5. Treating components as part of the same item as other components based on an assumption about consumer behavior is untenable. Moreover, the commenter offers no explanation of how the definition of "detachable components" can affect whether consumers are confused; whether a component whose status as "detachable" depends on ascertaining consumers' "typical" practices has no bearing on whether producers provide instructions concerning those practices.

Comment O-91-13

SB 343 On Ramp for a Successful Circular Economy

The Coalition has serious concerns about producers' collective ability, through the PRO, to meet
the ambitious recyclability targets set by SB 54 for all covered material. A major impediment isSB 343's restrictions on communicating to consumers instructions for how to recycle covered
material.35
SB 343 prohibits all products and packaging from "display[ing] a chasing arrows symbol, a chasing arrows symbol surrounding a resin identification code, or any other symbol or statement indicating the product or packaging is recyclable, or otherwise directing the consumer to recycle the product or packaging," unless the product or packaging currently meets strict criteria.36 At the heart of those criteria are requirements that the product or packaging currently be collected for recycling by programs covering 60 percent of the state's population and sorted for recycling by large volume transfer or processing facilities collectively serving at least 60 percent of recycling programs statewide.37
If those criteria are not met, then the producer of the product or packaging lacks the practical ability to instruct consumers as to how to recycle it because it cannot use the label of the product for recycling instructions. As a result, if a product or packaging does not meet the criteria under SB 343 as of its effective date of October 4, 2026, it will likely never be able to meet the criteria because producers will not be able to instruct consumers, for example, to place the packaging in their recycling bin; this creates what is known as a "death spiral" for that packaging no matter how much investment in circularity and sustainability producers make.

Fortunately, SB 343 contains a provision that, in conjunction with SB 54, permits the Department to address this inconsistency. Under PRC §42355.51(d)(6), the Department has the authority to onramp products and packaging as "recyclable" in the state if they are part of, and in compliance with, a program established pursuant to state or federal law on or after January 1, 2022, governing the recyclability or disposal of that product or packaging and the director determines that the product or packaging will not increase contamination of curbside recycling or deceive consumers as to the recyclability of the product or packaging.

The Coalition urges the Department to exercise this authority in the Regulations by adopting a provision that determines that all covered material under SB 54 meets these criteria. Covered material under SB 54 is part of the exact type of recycling program contemplated by PRC §42355.51(d)(6). Furthermore, it "will not increase contamination of curbside recycling" from any level of such contamination that may exist today because there is no indication that producers are moving toward materials that are *less* likely to be recycled, and indeed the requirements of SB 54 have, understandably, focused producers on conversion to materials that are *more* likely to be recycled. In fact, the entire premise of SB 54 is create a circular economy whereby all covered material in compliance with the program is substantially increasing the recycling of single-use packaging and single-use plastic food serviceware. Furthermore, instructions to consumers about how to recycle covered materials do not "deceive consumers as to the

recyclability of the product or packaging," but instead assist them in understanding what initial steps they need to take to facilitate the recycling of the product or packaging (starting with placing it in the recycling bin). This is critical for a working circular economy because once a producer sells the product or package, it is the consumer who takes custody of the package or product and must appropriately place it in the recycling bin.

The Coalition of course understands that there may be individual instances of products or packaging that may increase contamination of curbside recycling (perhaps some hypothetical new material) or whose labeling as potentially recyclable may be considered to deceive consumers (perhaps a material that will not realistically ever be recycled). The Regulations therefore should establish a procedure by which the Department may, upon objection from any member of the public and a review of the facts, exclude such products or packaging from the regulatory determination under PRC §42355.51(d)(6).

It is hard to overstate the significance of the SB 343 prohibition on recyclable labeling on the ability of producers and the PRO to meet the recycling targets of SB 54. The Coalition urges the Department to address this issue in the Regulations as discussed above in order to facilitate the smooth implementation of both SB 343 and SB 54 toward the goal of circularity.

The Coalition appreciates the opportunity to submit these additional comments for consideration, and for all of the dedication and hard work by CalRecycle to implement this EPR program. We look forward to continuing our productive dialogue to ensure a fair, cost effective, and faithful implementation of SB 54.

Respectfully submitted,
Adam Regele
Vice President of Advocacy and Strategic Partnerships
California Chamber of Commerce

Response to O-91-13

Comment rejected. SB 54 cannot logically be a "program" referred to in PRC section 42355.51(d)(6). The legal effect of that provision is to render covered material "recyclable" based on being "in compliance with" some other law; SB 54 cannot be that other law because, to comply with SB 54, covered material has to be "recyclable" under PRC section 42355.51 to begin with. The text of SB 54 itself acknowledges that it is not such a program: Section 42061(a)(3)(B) refers to "a program described in paragraph (6) of subdivision (d) of Section 42355.51." Thus, no further changes are necessary to the implementation or enforcement of the Act.

O-92: Environmental Justice Communities Against Plastic (Tevin Hamilton)

Comment O-92-1

To: Zoe Heller, Director
Department of Resources Recycling and Recovery (CalRecycle)
P.O. Box 4025
Sacramento, CA 95812-4025
Re: Comments on the SB 54 Revised Regulations

We are writing on behalf of Environmental Justice Communities Against Plastics (EJCAP), a coalition of California-based environmental justice organizations focused on addressing health and the environmental impacts of the lifecycle of plastics on frontline communities. Our coalition includes the Just Transition Alliance, Pacoima Beautiful, Physicians for Social Responsibility Los Angeles, Black Women for Wellness, and Valley Improvement Projects.

For several months, we have expressed significant concerns about CalRecycle's proposed regulations and their detrimental effects on frontline and fenceline communities. Despite our numerous outreach efforts and submitted comments, it is evident that CalRecycle is ignoring community feedback and prioritizing industry interests. The draft regulations have seen little change from the previous version to the current one.

Huge contradictions exist within SB54: while it generates funding intended to benefit environmental justice (EJ) communities, it does not currently include measures to prevent additional harm to those same communities during implementation. Without protective policies in place, these funds risk being used to “clean up” harms caused by the very system they were meant to reform.

We are deeply concerned that the current draft regulations fail to adequately protect against harmful chemical recycling technologies—misleadingly marketed as "advanced recycling" or "advanced manufacturing." These processes are, in reality, incineration by another name. They release toxic pollutants into our air, land, and water, putting public health and the environment at risk. There are no safeguards in place to prevent the siting of facilities and infrastructure in or near environmentally overburdened or vulnerable communities. Without clear location-based protections, implementation could further entrench environmental injustice.

CalRecycle needs to strengthen its regulations and revert to California's more protective definition of hazardous waste, rather than adopting the weaker federal standard. The federal definition only considers solid substances and does not address hazardous air emissions. This oversight puts communities at risk of exposure to harmful emissions released by chemical recycling facilities. CalRecycle has proposed using the federal RCRA definition of "regulated hazardous waste" for the implementation of SB 54. This represents a significant departure from how CalRecycle defines and applies "hazardous

waste" in other state regulations. California's definition is broader and more protective than the federal RCRA definition.

The proposed pyrolysis plant in Rohnert Park exemplifies the risks of weak regulations. This facility plans to accept non-chlorinated plastics, vaporize them using microwave technology, condense the vapors into synthetic oil for sale, and burn the remaining non-condensable gases in a thermal oxidizer. This process would increase greenhouse gas emissions and emit a cocktail of hazardous pollutants, including: Particulate matter (PM), Sulfur oxides (SOx), Nitrogen oxides (NOx), Volatile organic compounds (VOCs), Benzine, Heavy metals like mercury, lead, cadmium, PFAS (forever chemicals), and others. These chemicals are linked to cancer, reproductive harm, and respiratory illnesses—and such facilities are disproportionately sited in low-income communities and communities of color.

While the project is no longer moving forward in California, it is a clear violation of the intent of SB 54, and other toxic operations like it should not be permissible under the regulations. If such technologies are reclassified as “advanced manufacturing”—a term which is subject to CEQA streamlining, excluding it from health protective environmental review—it could set a dangerous precedent across the state, opening the door for more polluting facilities.

CalRecycle must explicitly ban chemical recycling and similar technologies to ensure SB 54 is implemented as intended. Any ambiguity in the regulations will be exploited by industry to advance false solutions and continue harming our communities. We urge CalRecycle to reinstate California’s stricter hazardous waste definition and prohibit the reclassification of chemical recycling as “advanced manufacturing”.

Response to O-92-1

CalRecycle rejects this comment for the reasons provided in response to comment O-62-1.

Comment O-92-2

The Covered Material section includes exemptions that would allow producers to claim exemptions if a material is not "reasonably possible" to use compliant packaging. However, this
vague and subjective language is easy to exploit, potentially enabling widespread noncompliance through self-declared exemptions. Many food packaging formats already have
scalable, recyclable, or compostable alternatives, making such broad exemptions unnecessary.
Without clearer guidelines and definitions, this loophole could exempt the majority of food
packaging, significantly undermining source reduction efforts, recyclability mandates, and waste
diversion goals

Response to O-92-2

Comment accepted. The proposed regulation has been revised to make it clearer and objective, with procedural safeguards against bad faith submissions and widespread noncompliance. CalRecycle's response to comment I-19-1 further explains the revisions responsive to this and similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

Comment O-92-3

The regulations as written weaken the definitions of “reusable” and “refillable” packaging and
food service ware. The current language lacks clear performance thresholds and measurable
standards, particularly for food service items. To ensure meaningful progress, CalRecycle must
adopt stricter, performance-based definitions grounded in lifecycle data and supported by
enforceable metrics.
California is at a pivotal moment in the global fight against plastic pollution. SB 54 was passed
with the clear intent to reduce plastic production and protect communities from the public health
impacts of plastics. CalRecycle must honor that intent—not undermine it.

Response to O-92-3

Comment rejected. The comment does not suggest specific changes to the proposed regulations or raise objections related to the rulemaking process. To the extent any further response is required, CalRecycle's responses to comment O-75-3, B-6-2, O-104-8, and B-38-3 establish why no revision to the proposed regulations is necessary.

O-93: Monterey Bay Aquarium, Oceana, Ocean Conservancy (Jennifer Fearing)

Comment O-93-1

Our organizations remain opposed to the unlawful provisions of CalRecycle’s proposed regulations implementing Senate Bill 54 (SB 54), the Plastic Pollution Prevention and Packaging Producer Responsibility Act, published on August 22, 2025. We appreciate the retention of important provisions in the proposed regulations including source reduction and ensuring the integrity of responsible end markets. However, several proposed provisions conflict with statutory language, exceed CalRecycle’s authority, and undermine the goals of the law to reduce plastic pollution and hold producers accountable for the cost of managing their waste. We concur with the concerns

conveyed by Senators Allen and Blakespear and Assemblymembers Bryan and Hart, joined by many of their colleagues, as well as concerns outlined in previous legislative sign-on letters (attached).

INTRODUCTION

SB 54 is a bold step by California to address plastic pollution and hold producers accountable for the rising costs of managing their waste. We appreciated the Newsom Administration's engagement to negotiate it, and that the Governor understood the goal, saying in March 2024 that SB 54 is: "the nation's most comprehensive measure to tackle the rise in plastic waste polluting our communities and ecosystems,"1 having said previously that, "California won't tolerate plastic waste that's filling our waterways and SB 54 is a bold step by California to address plastic pollution and hold producers accountable for the rising costs of managing their waste. We appreciated the Newsom Administration's engagement to negotiate it, and that the Governor understood the goal, saying in March 2024 that SB 54 is: "the nation's most comprehensive measure to tackle the rise in plastic waste polluting our communities and ecosystems,"1 having said previously that, "California won't tolerate plastic waste that's filling our waterways and making it harder to breathe. We're holding polluters responsible and cutting plastics at the source."2

If properly and lawfully implemented, SB 54 will help achieve the state's objectives and dramatically overhaul how single-use packaging and single-use plastic foodware will be offered for sale, sold, distributed, and imported in the state, and tackle plastic pollution at the source. Even a robust recycling system cannot keep pace with the ballooning production of plastics, particularly single-use plastics, which are often difficult to recycle. SB 54 refocused California's efforts on reduction and reuse while continuing to improve recycling and mitigating harm to vulnerable communities that have long shouldered the health and environmental burdens of plastic production and pollution.

As the fourth largest economy in the world, California is always on the forefront of environmental policy. We are at a pivotal moment in the global fight against plastic pollution and the implementation of extended producer responsibility programs worldwide. The impacts of this law are likely to ripple across the country and around the globe. How the state implements these policies is critical to the law's success and California must not miss this opportunity to lead the way—and must not undercut the progress in other states or risk the tenuous trust many affected parties have in EPR approaches.

Response to O-93-1

CalRecycle rejects the comment. No substantive response is required because the comment raises general concerns without stating any specific recommendation or explanation of its objections to the proposed regulations. To the extent that the comment endorses the comments of others or is preface for subsequent portions of its comment that are specific, CalRecycle has responded to those comments separately.

Comment O-93-2

1. Plastic pollution causes significant environmental impacts to our lands, waters, air, and wildlife.

Over 11 million metric tons of plastic pollution enter the ocean annually, equivalent to over a garbage truck's worth of plastics entering the ocean every minute.3 Plastic pollution, both in coastal and inland cities and towns, makes its way to the ocean via storm drains, rivers, and other waterways. Items in the landfill or pollution on the street can also be carried by the wind or washed by rain into drainage systems and carried to the ocean. Since the California Coastal Cleanup Day began, more than 1.8 million Californians have participated in shoreline and waterway cleanups, removing 27 million pounds of debris from the state.

Once in the environment, plastics harm wildlife, disrupt ecosystems, and reduce ecosystem services the ocean provides.4 Eating plastic can block or damage an animal's digestive tract. With its stomach full of plastic, the animal can feel full and starve to death. Nearly 1,300 species across ocean ecosystems have been documented to ingest plastics.5 Oceana found evidence of nearly 1,800 animals from 40 different species swallowing or becoming entangled in plastic in U.S. waters between 2009 and early 2020. Concerningly, 88 percent were species listed as endangered or threatened with extinction under the U.S. Endangered Species Act.6 Notably, the animals reflected in this study are far fewer than the true number of sea turtles and marine mammals that consume or become entangled in plastic in U.S. waters as not every animal is reported to a stranding network, and not every animal is found or reported to authorities after it dies. Scientists estimate that over 90 percent of all seabirds will have ingested plastic by 2050.7 Plastics can concentrate legacy contaminants (e.g., DDT) and other chemical contaminants (e.g., pharmaceuticals) from the environment up to a million times higher than surrounding seawater,8 posing contamination risks to marine life and human seafood consumers.

Microplastics, plastics smaller than 5mm in size, have been found nearly everywhere scientists have looked for them. An estimated 171,000 trillion microplastics are floating just on the surface of the ocean.10 The deep ocean floor is suspected to be a permanent resting place, or sink, of plastic pollution. One study estimates that 3 to 11 million metric tons of plastic pollution resides on the ocean floor as of 2020.11 Microplastics come from a wide variety of sources. Secondary microplastics, microplastics that result from the deterioration of larger plastics, make up the majority of microplastic pollution in the environment.

Plastics also contribute to physical plastic pollution even before they become a product. Plastic pellets, small lentil-sized granules of raw plastic resin that are used as feedstock for manufacturing nearly all plastic products, are routinely spilled at all points during the pellet supply chain—at production facilities, during transport to convertors and from recyclers, over roads, rail, and river transport, and at ports loading pellets for oversea transport and at sea.12 Pellets have been found polluting the ocean for over half a century.13

Response to O-93-2

Comment rejected. No response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations and does not raise an objection concerning the rulemaking process, but merely provides background information for other portions of the comment suggesting changes or raising objections. To the extent that other portions of the submission suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-93-3

2. Plastics cause significant air and greenhouse gas pollution across their entire lifecycle.

Ninety-nine percent of plastics are made from fossil fuels, and the process of turning fossil fuels into plastics is one of the most energy-intensive manufacturing processes in the world. Up to 5 tons of greenhouse gases, including carbon dioxide and methane, are emitted per ton of plastic.14 The plastic industry represents 3–5 percent of global greenhouse gas emissions, which is more than aviation or shipping.

The petrochemical infrastructure that produces plastics—oil and gas extraction, refining, and export facilities—emits significant air and water pollution with severe health consequences for neighboring communities including asthma, cancer, endocrine disruption, developmental disorders, and heart disease.15 For the first time, the U.S. health risks from air pollution exposure from all production and use cycles from oil, gas, and their petrochemicals was quantified and found thousands of early deaths, preterm births, asthma, and cancer, with racial and ethnic populations suffering the most.

3. Exposure to plastics, microplastics, and associated chemicals affect public health.

There is increasing evidence that plastics impact human health from their production, use, and disposal. Plastics can release toxic chemicals into the environment and people, including additives that disrupt endocrine function and increase risks of premature births, infertility, obesity, cardiovascular and renal disease, and cancers.16 Chemicals in plastics cost an estimated $249 billion in increased healthcare costs in the U.S. in 2018.17 One study estimated the U.S. health costs of exposure to just three out of the thousands of plastic chemicals to exceed $920 billion in a single year.18

There are over 16,000 chemicals associated with the plastics industry. More than 4,000 are “chemicals of concern” or hazardous because they are considered toxic, persistent or bioaccumulate and more than 10,000 have not been evaluated for their safety.19 By 2050, the plastics sector is projected to use 2 billion metric tons of chemical additives.20

Microplastics contaminate the human body through various exposure pathways, including inhalation of contaminated air and consumption of contaminated foods and

beverages. A 2024 study led by Ocean Conservancy and University of Toronto researchers found microplastics in 88 percent of protein samples, from poultry to seafood to plant-based meat alternatives.21 This study found that Americans may consume up to 3.8 million microplastics each year from proteins alone, which is just a fraction of the potential exposure pathways to microplastics.

In humans, microplastics have been found in blood, lung tissue, placentas, the brain, and testicles, among other places.22 Studies have found preliminary evidence that plastics in the human body are associated with inflammation, oxidative stress, and DNA damage, raising concerns about potential impacts to human health.23 Moreover, microplastics are suspected to impact human reproductive, digestive, and respiratory health, with a suggested link to colon and lung cancer.24

No response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations and does not raise an objection concerning the rulemaking process, but merely provides background information for other portions of the comment suggesting changes or raising objections. To the extent that other portions of the submission suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-93-4

4. Packaging is a large and growing sector driving plastic production and represents a disproportionate amount of plastic pollution.

SB 54’s focus on plastic packaging and foodware is scientifically justified. Packaging represents approximately 40 percent of annual plastic production. The majority is singleuse and not readily recyclable. Packaging is the largest and fastest growing sector for plastic production. The average American discards an average of 287 pounds of plastic each year–the highest rate in the world.25 Single-use plastics in the form of packaging and foodware frequently contaminate the recycling system, increasing costs to operate these systems and decreasing usable outputs. Moreover, single-use plastics represent a majority of the plastic pollution found along beaches and waterways. Over 70 percent of items collected over the last 40 years of Ocean Conservancy’s International Coastal Cleanup® in the U.S. are single-use plastics.26

Comment O-93-5

5. Plastics cost federal, state, and local governments to manage and clean up.

Taking into account ecosystem damages, tourism losses, impacts to fisheries, the shipping industry, and other economic benefits of the ocean, plastic pollution is estimated to cost between $500 billion and $2.5 trillion to the global economy every year.27

California ratepayer costs for curbside collection have increased substantially. According to the League of California Cities in 2021, nearly all cities anticipated a rate increase for solid waste management and more than seven of ten cities anticipated a 1–20 percent increase.28 Lack of recycling infrastructure and lack of recycling markets were cited among the reasons for anticipated increases. And this has come to pass: dozens of California cities have indeed increased the costs they charge their customersfor curbside recycling and trash collection.29 On top of these explicit costs borne by residents and small businesses, California communities are estimated to spend more than $428 million annually to clean up and control plastic pollution. Local governments in California spend approximately $1 billion per year on litter management, which includes plastic waste cleanup. According to the Department of Justice, this cost has more than doubled in the last 10 years.30

Response to O-93-5

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-93-6

6. Source reduction is necessary to reduce the flow of plastics into our environment and meet California's climate goals.

Numerous studies have modeled interventions necessary to achieve a significant reduction in ocean plastic pollution and the sector’s associated climate emissions, all reaching the same conclusion: we need a comprehensive approach that starts with making less plastics in addition to improving waste management systems and continuing targeted cleanups.

To avoid projected increases in ocean plastic pollution and reduce it back to 2010 levels of 8 million metric tons (MMT), models show that by 2030, we need to reduce plastic consumption and usage by 25–40 percent depending on country income level (as a proxy for plastic usage).31 Other studies have found that to achieve a roughly 80 percent reduction in ocean plastic leakage, a 47 percent reduction (including direct efforts such as elimination and reuse, and switching to non-plastic materials) by 2040 will be necessary.32 Still others have modeled efforts to reduce the climate impacts from the plastics sector and have found necessary reductions ranging between 24–30 percent by 2050 to achieve net-zero.33

There is strong scientific consensus that supports the inclusion of source reduction of plastics, especially single-use plastics, as a necessary element of tackling plastic pollution and climate change.

I. Removal of the source reduction adjustment language from prior versions of the regulations is critical to maintain the integrity and effectuate the intent of the law.

The requirement to source-reduce plastic covered material by no less than 25 percent by weight and item, by January 1, 2032, was fundamental to our organizations' support of SB 54 and was carefully negotiated as part of withdrawing a ballot initiative. Neither the Department nor the PRO have statutory authority to adjust the amount of plastic covered material required to be reduced relative to the baseline. We appreciate that the proposed regulations do not include a source reduction adjustment factor as any effort to change the source reduction mandate in regulation would be patently illegal.

Response to O-93-6

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-93-7

7. EPR programs are a proven policy tool and do not raise costs for consumers.

Extended Producer Responsibility (EPR) programs have a long history both globally and in the U.S., and mounting evidence shows they boost recycling and recyclability.34 Early EPR laws in the U.S. addressed products that are difficult to manage at end-of-life (e.g., electronics, paint, carpets, mattresses), and over time have expanded to encompass packaging and single-use plastics. In California, CalRecycle currently oversees EPR programs for seven product or material categories: textiles, batteries, packaging, pharmaceuticals and sharps, mattresses, carpet, and paint. There are over 100 EPR laws across the country, spanning more than 20 product categories, with 33 states having some form of EPR laws on the books. Seven states have now enacted EPR for packaging.

Analysis by Columbia University found that it is "extremely unlikely" that producers could pass on 100 percent of the costs to consumers, as modeled in the previous Standardized Regulatory Impact Assessment (SRIA).35 They suggest a conservative 30 percent incidence to consumers, which is well within their modeled confidence interval.

CalRecycle's own analysis, the "Statement of Regulatory Impact Assessment" (SRIA), found that SB 54 will deliver $32 billion in net benefits to Californians and result in a $14.4 billion increase in personal income. The SRIA also found avoided costs for California consumers and businesses of $53.3 billion. The updated SRIA, published in July 2025, estimated a nearly 50 percent reduction in implementation costs than the previously published SRIA in 2023. CalRecycle attributed the change to improved data

on covered materials in the state as a result of progress made in the needs assessment and source reduction baseline analysis, which was echoed in a statement made by leading state lawmakers.36 The SRIA was updated independent from these proposed regulations, which confirms that the reduced estimated costs of implementation are not from the unlawful expansion of categorically excluded material nor the unlawful allowance for hazardous waste generating recycling technologies.37

The SRIA was based on the assumption that producers would pass on 100 percent of the costs onto consumers, an assumption that has been repeatedly disproved in existing EPR programs and academic studies. The state acknowledged in the SRIA that a recent study found that food and beverage producers pass on a maximum of 30 percent of EPR compliance costs. Under this scenario, the SRIA found that the average annual cost of the regulations would be $20 per person, less than $0.50 per week.

California has a significant interest in reducing the production, sale, and use of singleuse plastics within the state to protect its environment and citizens from plastic pollution and climate change. Reducing single-use plastics will improve health outcomes, protect the environment and Californians' ability to use and enjoy public places, and will reduce costs on local governments and citizens.

Response to O-93-7

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-93-8

II. The retention of strong criteria for responsible end markets (REMs) is vital for restoring Californians trust in recycling and for ensuring that SB 54 effectuates its goal to increase recycling that benefits the environment and minimizes risks to public health and worker health and safety.

The requirement that to be considered recycling, covered material must be sent to a responsible end market is critical to achieving increased traceability and transparency and in doing so, provides confidence that covered materials are actually recycled and are managed in compliance with sound environmental and labor practices.

Response to O-93-8

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process.

Comment O-93-9

III. The proposed regulations undermine the law’s reduction and pollution prevention strategies by authorizing illegal categorical exclusions for over-the-counter drugs, food and agricultural packaging, and secondary packaging associated with excluded and exempted products.

By excluding entire sectors' packaging material from SB 54's mandates, the proposed regulations would harm the state's interest in comprehensively addressing the problem of plastic pollution, starting with reduction. The proposed exclusions exceed CalRecycle's authority under the law and conflict with the plain language and intent of the statute.

A. The statutory language and legislative history of SB 54 are clear: only drugs that require a prescription are categorically excluded from SB 54's requirements.

Based on the plain language of the statute, the legislative history and intent, and previous versions of implementing regulations, packaging for over-the-counter (OTC) drugs are within the scope of the law. CalRecycle's attempt to exclude OTC drug packaging through regulation is patently illegal and contrary to law.

1. The statute plainly includes OTC drugs in the program.

A plain reading of California Public Resources Code (PRC) §42041(e)(2)(A)(i) defines excluded "medical products and products" as devices and prescription drugs. There is no need to separately define "medical products" as the term is defined within the same provision to mean "devices" and "prescription drugs." If the legislature intended to include "drugs," it would have separately listed them in addition to "devices" and "prescription drugs." The reference to the federal definition of "drugs" is merely to ensure "prescription drugs" can be understood because, to define "prescription drugs,"38 it is necessary to also define what is meant by "drug," as recognized by the draft regulations under §18980.2(a)(5) (excluding prescription drugs).

The plain reading of the statute is further supported by the conflict provision, PRC §42060(b)(2), which ensures that no requirements imposed by SB 54 or the PRO conflict with specified requirements, including 21 C.F.R. §211.132, titled "Tamper-evident packaging requirements for over-the-counter (OTC) human drug products." Clearly, OTC drugs were meant to be included in the scope of the law or citation to this provision would not be necessary.

2. The legislative intent and history of SB 54, affirmation by the lead author, and recognition from industry, further support the inclusion of OTCs drugs.

The inclusion of OTC drugs in California's packaging EPR program was settled in the previous versions of SB 54 dating back to 2019. As described in the Appendix to our December 2024 comment letter (attached), the language in previous bills was exactly the same as the language enacted in 2022. Legislative policy committee analysis for both the 2019 and 2022 versions of SB 54 specifically call out the exemption for prescription drugs only. This interpretation was further buttressed by Senator Allen's letter from December 17, 2024 (attached) and in the initial and subsequent versions of the regulations.39

It was widely understood that this provision did not exempt OTC drugs. Numerous industry associations that opposed prior versions of SB 54 that included the exact same language around prescription drugs complained about the language not exempting OTC medications. For example, an August 2020 opposition floor alert spearheaded by CalChamber notes: “No Exemption for Over-the-counter Medicines: Over-the-counter medicines are not exempt, creating concerns over the availability and price of overthe-counter medicines, while prescription medicines are – for no clear policy reason – exempt.” Attached are multiple letters and floor alerts with this concern highlighted. The legislature was aware of this issue when it passed SB 54 in 2022 and chose to maintain the same language and affirmatively include OTC drugs.

By categorically excluding all OTC drugs with narrow exceptions, the regulations illegally propose to significantly narrow the scope of the law and remove covered material items that are currently recyclable or compostable or that could comply with SB 54 mandates without threatening health, safety, or federal packaging requirements. The effort by industry to redefine words in the statute without giving effect to other sections of the law or the legislative intent is disingenuous and an obvious attempt to evade legal requirements agreed to when negotiating SB 54.

B. The proposed regulations significantly expand the scope of exclusions for food and agricultural packaging and place the determination of whether such material is categorically excluded in the hands of industry.

SB 54 directs CalRecycle to ensure regulations under SB 54 are not in “direct conflict” with federal laws and regulations related to food safety and tamper-evident packaging. The proposed regulations have gone significantly beyond the statutory directive by enabling exclusions for any “packaging or packaging components used by a food or agricultural commodity (without regard to its origin) if it is not reasonably possible to use other packaging or packaging components to comply with regulations, rules or guidelines issued by the United States Department of Agriculture [USDA] or the United States Food and Drug Administration [FDA].” The currently proposed categorical exclusion would unlawfully remove an enormous number of products that were included under the scope of the law and can meet the requirements of SB 54 without any “direct conflict” with federal law. This language creates a new, significant, and broad exclusion that could theoretically exclude all packaged food with no process or criteria to determine what packaging is “reasonably possible,” leaving each producer to decide whether their packaging is covered material. Limiting this exclusion to “agricultural commodities” does not address the legal or policy concerns raised by this unlawful expansion of categorially excluded materials.

Categorically removing these items would greatly undermine the program, increase costs on producers, haulers, and ratepayers who will shoulder the costs of managing these materials without program funding, and exclude products that may already be in compliance with SB 54’s standards.

The proposed regulations authorize producers to determine whether their packaging components are excluded under PRC §18980.2. The proposed regulations then describe a timeline and burden that CalRecycle must meet to evaluate and potentially disqualify the exclusion, potentially taking up to 300 days. As written, this approach creates the following highly disruptive and undermining concerns:

(1) The volume of exclusion determinations by producers is likely to be very high— not only creating an impossible amount of work for CalRecycle to undertake but resulting in a significant and unwarranted reduction in the scope of SB 54's covered items.
(2) The cost to process, review, and analyze each determination is likely to be high. Given that there is no mechanism outlined in the regulations for producers to pay for the Department's effort for this review, the costs for each review will be borne by taxpayers.
(3) The timeline incentivizes producers to make these determinations because they can avoid paying into the program for up to a year, even if CalRecycle ultimately determines the request to be invalid. Nothing in the regulations requires the producer to pay back the PRO for the effort made to collect those materials during the time that the component was wrongfully excluded.
(4) The evaluation process under this provision could swallow the entirety of CalRecycle staff effort to manage the program, and result in exclusions that last far longer than justified by the information provided by the producer.
(5) The uncertainty this provision generates for the PRO as they work to draft and submit a plan in mid-2026 is considerable—making it impossible to develop an accurate plan with the likelihood that producers will claim a significant number of exclusions.
(6) The regulations' inclusion of federal "guidelines" as sufficient for a producer to claim an exclusion is a very low bar, and one highly susceptible to lobbying by the very producers hoping to reduce their responsibility to join and pay into the program.
(7) The lack of a timely re-review of excluded materials could result in a failure to recognize when innovation has occurred that overcomes the direct conflicts with federal regulations. A timebound limitation on the exemption or a required resubmission of information

Lastly, this provision shows a fundamental incongruity in CalRecycle's application of SB 54's broad directives to avoid conflicts with federal law and to avoid disproportionate harms of the regulations and infrastructure on disadvantaged and low-income communities, and rural areas. While CalRecycle has now construed this provision to respond to the advocacy by industry producers as necessary, it has continued to insist that the agency has met SB 54's obligation to ensure the avoidance and minimization of harm to communities that have long borne the brunt of plastic pollution, landfills, and other waste management infrastructure, is addressed broadly and not in need of a specific provision to address it. CalRecycle has, therefore, made plain with this approach that it is responding directly to the lobbying of producer interests while ignoring and diminishing the repeated calls by the environmental and environmental justice community for similar protection of its interests.

We understand from your comments at the Packaging Producer Responsibility Advisory Board meeting on May 30, 2025, and the public workshop on May 27, 2025, that this

exclusion was not intended to be a wholesale exclusion of any packaging that may be regulated by the USDA or the FDA and was meant only to apply narrowly to “commodities with irreconcilable conflicts” where a commodity has “zero options to comply with SB 54 and also comply with required federal” standards. You also remarked that if any “innovation in the field that opens up new packaging options… the exclusion would cease to apply.” However, as drafted, this exclusion would blow a giant hole in the regulated landscape without any process for those packaging materials to be phased in. This exclusion is not only inconsistent with the law, it is unnecessary as SB 54 already includes a process to exempt covered material under the unique challenges or health and safety exemption provisions. If there are situations where the requirements under federal law are truly “irreconcilable” with SB 54 compliance, producers can make their case and CalRecycle can grant exemptions.

Response to O-93-9

Comment partially rejected and partially accepted. Regarding the proposal that the regulations should not consider any over-the-counter drugs as excluded from the definition of "covered material," CalRecycle declines to make any change for the reasons stated in response to comment O-49-1.

Regarding the exclusions for food and agricultural packaging, the commenter incorrectly asserts that statute only concerns conflicts with "laws and regulations related to food safety and tamper-evidence packaging." That assertion ignores the plain text of Public Resources Code section 42060(b)(2), which refers to "direct conflict with a federal law or regulation" and then lists certain examples. That list is prefaced with the phrase "including, but not limited to laws." In other words, the list of particular laws that would justify excluding packaging from regulation is non-exhaustive. Nor does the commenter offer any alternative to the text currently included in section 18980.2(a)(2). Instead, the commenter appears to assert that that text be removed and that the provisions of section 18980.2.4 (implementing exemptions pursuant to Public Resources Code section 42060(a)(3) and (4)), are sufficient to satisfy the mandates of Public Resources Code section 42060(b). That assertion is untenable because, if exemptions authorized under 42060(a)(3) and (4) were sufficient, section 42060(b) would serve no purpose whatsoever. See, also, CalRecycle's response to comment I-59-2. Moreover, the commenter claims that there would be no means for new packaging materials to be "phased in," but that is untrue: As explained in 18980.2(a)(2)(E) (formerly (B)), CalRecycle has the authority to review, at any time, the support for any claim that the exclusion applies and determine that it does not. See, also, CalRecycle's responses to comments I-19-1, O-90-3, and B-47-3, which provide additional reasons for declining to make commenter's suggested change.

CalRecycle accepts this comment, however, to the extent it alleges that section 18980.2(a)(2) was unclear in scope or effect, was insufficiently clear regarding what renders it "not reasonably possible" to resolve conflicts with federal laws, or would have been overbroad in effect due to the potential for the exclusion to be

applied despite the conflicts being avoidable. See CalRecycle's response to comment I-19-1, explaining the revisions responsive to this and similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

Comment O-93-10

IV. The proposed regulations go beyond what is authorized by statute by allowing technologies that generate a significant amount of hazardous waste to count as recycling and by failing to encourage recycling technologies that minimize the "generation of hazardous waste, generation of greenhouse gases, environmental impacts, environmental justice impacts, and public health impacts."

The proposed regulations illegally conflate the generation of hazardous waste with its disposition and management, and in doing so, allow for potentially harmful and toxic processes to count as recycling in conflict with the language and intent of the law. The plain language in PRC §42041(aa)(5) details clear and specific requirements for the regulations including encouraging "recycling that minimizes generation of hazardous waste, generation of greenhouse gases, environmental impacts, environmental justice impacts, and public health impacts" and excluding "plastic recycling technologies that produce significant amounts of hazardous waste." The proposed regulations fail to properly implement both of these statutory requirements. Further, the proposed regulations are inconsistent with the intent of the law that "Technologies using pyrolysis, gasification, solvolysis, and similar technologies that involve combustion and incineration, as well as the generation of hazardous waste, are therefore prohibited from being considered 'recycling' under SB 54" as described in the author's Letter to the Journal in June 2022 (attached).

Moreover, the proposed regulations create inconsistencies with the State's policies as evidenced by the State's Attorney General filing a lawsuit against ExxonMobile40 for misleading the public on the recyclability of plastics, including their use of chemical recycling technologies.41

A. The regulations allow for recycling technologies that generate any amount of hazardous waste provided the facility is permitted and conflate production of hazardous waste with risk.

The proposed regulations illegally shift the focus on excluding recycling technologies based on significant hazardous waste production to the management of that hazardous waste and risk-based assessments. The threshold of "substantial risk of harm to public health, or to the contamination of the environment" is an unlawful conflation of risk with production of hazardous waste. The law is clear that the criteria for exclusion must be based on the generation of hazardous waste, thus the risk-based threshold proposed in the regulations is insufficient as a criterion for inclusion as a recycling technology. Further, the declaration that hazardous waste "handled and disposed of in compliance

with an applicable permit does not present a substantial risk of harm" conflates the statutory requirement for exclusionary criteria based on production with waste management permitting.

As permit requirements and enforcement for hazardous waste are not uniform across the country or outside the U.S., this threshold creates a potentially unequal advantage based on location. Moreover, by giving preferential treatment to locations with the least permitting requirements, these regulations would likely result in the generation of hazardous waste in the areas already burdened by other polluting industries and facilities, which stands in direct conflict with the intent of the law and CalRecycle's statutory directive under PRC §42060(d) to ensure the regulations, and activities conducted in accordance with the regulations, "avoid or minimize disproportionate impacts to disadvantaged or low-income communities or rural areas."

Criteria based on the "production of significant amounts of hazardous waste," as required by the law, would establish a uniform standard based on generation of hazardous waste that would not result in the continued disproportionate impacts in areas with the least stringent permitting requirements, which are frequently disadvantaged or low-income communities. The goal of SB 54 is not to stifle innovation, but rather focus innovation on the technologies that do not harm people or the environment while recovering plastics to displace the need for fossil fuels. A clear, production-based criteria would offer more clarity to technology innovators on the standard to be considered as a recycling technology.

B. The proposed regulations fail to encourage recycling technologies that minimize the "generation of hazardous waste, generation of greenhouse gases, environmental impacts, environmental justice impacts, and public health impacts" as required by PRC §42041(aa)(5).

CalRecycle must include provisions that encourage less impactful recycling technologies as required by law. The ISO standard referenced in the regulations does not include an analysis of the criteria listed under the law, making it wholly insufficient for determining whether these technologies are minimizing the impacts. Numerous peer-reviewed studies, including a recent study by the National Renewable Energy Laboratory (NREL),42 have found that chemical recycling technologies have higher environmental impacts from greenhouse gas emissions to toxicity.

There are a variety of peer-reviewed tools, including one recently developed by the National Renewable Energy Laboratory,43 that compares impacts across different technologies for recycling the same feedstock. The regulations could require this type of analysis to ensure the PRO is prioritizing technologies that minimize harm.

C. The proposed regulations must utilize California's definition of hazardous waste.

Regulations implementing state law should use existing state law to define hazardous waste. The previous regulations, made public December 2, 2024, correctly defined hazardous waste based on the existing California definition:

“For purposes of paragraph (5) of subdivision (aa) of section 42041 of the Public Resources Code, "hazardous waste" is defined as provided in section 25117 of the Health and Safety Code and section 66261.3 of Title 22 of the California Code of Regulations. Hazardous waste further includes "acutely hazardous waste," "extremely hazardous waste," "non-RCRA hazardous waste," and "RCRA hazardous waste," as those terms are defined in section 66260.10 of Title 22. Without limitation, hazardous waste includes the substances identified as hazardous waste and substances that create a presumption that waste is hazardous in article 4, article 4.1, or appendix X of chapter 11 of division 4.5 of title 22.

Utilizing the less stringent federal definition of hazardous waste for the purpose of SB 54 while using the state definition for the myriad other programs that CalRecycle administers will only create confusion and inconsistencies in the law. CalRecycle must ensure consistency across its programs and maintain standards set in state law.

D. The lack of public transparency and information sharing with the Department on the facilities under consideration for recycling undermines the Department’s ability to uphold their statutory requirements.

The proposed regulations require that facilities provide to the PRO information on their technology and the generation of hazardous waste, however, it does not require the PRO to transmit or include this information to the Department as part of their Plan. Rather the proposed regulations only require that the PRO to “justify its conclusion.” This endangers the Department’s ability to make an accurate determination on the technologies in question and to uphold their statutory requirement to ensure that the requirements of this law be met.

Response to O-93-10

CalRecycle rejects this comment for the reasons provided in response to comment O-62-1.

Comment O-93-11

CONCLUSION

SB 54 is an affirmative effort by the state to arrest the uncontrollable costs associated with packaging waste on consumers and address the health impacts associated with plastic production, use, and pollution which are borne disproportionately by vulnerable communities. SB 54’s core tenet is that costs to consumers and ratepayers will decrease when industry finally takes responsibility for the full lifecycle of their products’ packaging from design to end of life. Motivated as they are to maximize profit, innovate, and compete, SB 54 incentivizes producers to transition to materials that have value beyond a single use. Unfortunately, the proposed regulations will not reduce costs to

consumers, businesses, or local governments. Instead, the proposed regulations will likely increase costs to some producers, haulers, and local governments, and would allow many producers to carry on business as usual while Californians continue to shoulder the costs.

California must continue to be a global leader in combating the plastic pollution crisis. It is imperative that the state's regulations not undermine the strong mandates under the law. We look forward to continuing to engage with CalRecycle on the implementation of this monumental law. If you have any questions based on our feedback, please reach out to Jennifer Fearing (jennifer@fearlessadvocacy.com).

Sincerely,

Response to O-93-11

Comment rejected. No response to this portion of the commenter's submission is necessary because it recounts the proposals and objections stated earlier in the submission. To the extent the issues mentioned in this comment require responses, CalRecycle has provided them in response to other portions of the submission discussing the same issues.

Regarding the attachments that the commenters included with their submission (and which are included in the rulemaking record), those attachments address draft regulations that are not part of this rulemaking, so no separate responses to them are necessary. To the extent the commenter's comments on the current regulations incorporate or rely on the attachments or raise the same issues as those attachments raised, CalRecycle's responses to the comments have addressed the substance of the attachments.

O-94: Global Alliance for Incinerator Alternatives (Sirine RACHED)

Comment O-94-1

We appreciate the opportunity to submit written comments on the 19 August 2025 iteration of the SB54 draft regulation, following our comments on earlier versions, as we appreciate your team's readiness to exchange views with us during informal workshops, advisory board meetings, and virtual meetings.

Recognizing the work that your agency has put into these draft regulations, we emphasize the need for compliance with the SB 54 statute, California's Public Resources Code (PRC) and the Clean Air Act, to ensure the safeguarding of California's climate commitments and protect our communities and ecosystems from toxic harm.

We note with regret that the 19 August formal draft regulations **left unaddressed virtually all of the issues regarding pyrolysis incineration and other technologies marketed as "chemical recycling" that we had flagged** in our 3 June 2025 comments and in subsequent engagements with your agency, despite scientific

evidence provided in support of our recommendations and briefings organized with leading scientists whose research demonstrates the climate and toxic harm arising from those technologies.

We take this opportunity to make the following recommendations :

1. The regulations must clarify that pyrolysis is incineration and disposal, not recycling, in line with California law and as explicitly categorized in the federal Clean Air Act (p. 2);
2. A prohibition or moratorium on plastic waste pyrolysis, gasification, solvolysis, depolymerization, and solvent-based purification would best uphold the statute (p. 3);
3. The unacceptable climate and toxics impacts from those technologies are inconsistent with the statutory definition of "responsible end markets" (p. 4);
4. The regulation's responsible end market criteria ignore the statutory emphasis on environmental benefits, prevention of hazardous waste generation, broad consideration of health risk, and ignore California's hazardous waste definition and fail environmental justice (p. 7).

While this letter focuses on the issue of disposal and hazardous technologies marketed as "chemical recycling", we echo the concerns raised in the coalition sign-on comments letter led by Californians Against Waste.

Response to O-94-1

Comment rejected. No response to this portion of the commenter's submission is necessary because the comment previews the recommendations discussed in detail in subsequent portions of the letter, and those recommendations have been addressed in response to those subsequent portions.

Comment O-94-2

1. **Regulations must clarify that pyrolysis is incineration and disposal, not recycling, in line with federal and California law**

Federal legislation (Clean Air Act Section 129) classifies pyrolysis as incineration, not recycling. Pyrolysis also fits California's definition of incineration under Title 14 of the California Code of Regulations § 17225.33.

At the same time, misleading claims are being made that pyrolysis and related technologies are "recycling" (with marketing terms such as "advanced recycling" or "chemical recycling"). As you are aware, the California Attorney General has filed a lawsuit alleging, with ample evidence, that these technologies are not recycling and that describing them as such amounts to fraudulent and deceptive business practices. Eighty percent of both proposed and operating "chemical recycling" facilities in the U.S. use pyrolysis, and therefore cannot be considered as recycling under the statute.

Pyrolysis is expected to remain the dominant "chemical recycling" technology over the coming decade.

Furthermore, pyrolysis and associated processes burn off most of the plastic waste, and produce a low yield of highly-contaminated pyrolysis oil that needs dilution with large amounts of virgin petroleum naphtha to become usable in a steam cracker to make recycled plastic polymer. This means that even in the best case scenario only 2% of the plastic waste fed into pyrolysis will actually make the round trip into the steam cracker and effectively be recycled.

Currently the draft regulations text is hard to read, due to multiple references to different sections of California statute and regulations, and would benefit from some clarifications recalling existing definitions of pyrolysis. Reverting to the following language in the previous version would clearly delineate technologies that constitute disposal :

Proposed textual changes (additions and ~~deletions~~):

Section 18980.3.5. Disposal of Covered Material
(e) Pyrolysis and other forms of disposal, as defined in subdivision (b) of section 40192 of the Public Resources Code.

Response to O-94-2

Comment rejected. Regarding defining "other forms of disposal" according to Public Resources Code section 40192(b), CalRecycle rejects that proposal for the reasons stated in response to comment O-13-11. Regarding pyrolysis, classification under federal law is not relevant to the Legislature's intent in drafting the statute implemented by the proposed legislation. To the extent a pyrolysis process is, as a technical matter, incineration, that process is expressly defined as disposal in Public Resources Code section 42041(aa)(2)(B). Moreover, in the statute, the Legislature omitted express reference to pyrolysis as a process that could not be considered "recycling," and it would be inappropriate for CalRecycle to achieve that result without some statutory basis. Notably, the Legislature chose to create a new definition of "recycling," rather than relying on Public Resources Code section 40180, which cannot encompass pyrolysis (which is "transformation" under section 40201 and thus excluded by the terms of 40180). Finally, to the extent recycled output is only traceable to 2 percent of the covered material inputs, section n18980.3.2(b)(2)(A) requires that recycling rate calculations account for that proportion accordingly.

Comment O-94-3

2. A prohibition or moratorium on plastic waste pyrolysis, gasification, solvolysis, depolymerization, and solvent-based purification would best uphold the statute

A categorical **prohibition or moratorium** on plastic waste pyrolysis, gasification, solvolysis, depolymerization, and solvent-based purification - technologies marketed as

"chemical recycling" - is needed to protect genuine recycling. It would also provide regulatory clarity and best uphold the statutory language in Section 42041.aa(5):

*The department's regulations shall encourage recycling that **minimizes** generation of hazardous waste, generation of **greenhouse gases**, environmental impacts, **environmental justice impacts**, and **public health impacts**. [emphasis added]*

The regulations shall include criteria to exclude plastic recycling technologies that produce significant amounts of hazardous waste.

A prohibition or moratorium is justified because:

- It provides regulatory clarity since so-called **"chemical recycling" of plastic waste is not recycling:** most facilities (pyrolysis, gasification) burn off most of the plastic waste and otherwise have hazardous waste as their main outputs, rather than recyclate that can safely be used in plastic packaging applications to replace primary (virgin) plastic (see Section 2. below);
- As a result, whatever minute amounts of plastic recyclate produced come at an **unacceptable climate and toxics cost** (see Section 3.) that are **incompatible with the statutory definition of "responsible end markets";**
- Unlike mechanical recycling, "chemical recycling" technologies produce **significant amounts of hazardous waste,** which should render them ineligible according to the statute, except that the draft regulation empties the definition of "significant amount of hazardous waste" of its substance;
- "Chemical recycling" of plastic waste creates **environmental justice burdens for which the regulations have no safeguards,** in contradiction of the statute;

We therefore urge CalRecycle to revise the draft regulations in order to **exclude plastic waste pyrolysis, gasification, and solvolysis (ie. "chemical recycling")** technologies in California, until these can be shown to be safe for health, the climate and the broader environment, from a whole-lifecycle standpoint, and until they meaningfully displace virgin plastics, instead of cementing our dependence on them. This can be achieved with the textual change below.

Proposed textual changes (additions and deletions):
ARTICLE 4: Responsible End Markets - Section 18980.4.1. End Market Identification
[...]
(d) A PRO or Independent Producer shall not include in its plan as a responsible end market a technology, other than a mechanical recycling technology in use within the State as of the effective date of the Act~~, if the facilities employing it produce significant amounts of hazardous waste as defined in paragraph (1).~~
***Delete all sub-paragraphs to paragraph (d) in their entirety:** (1), (1)(A), (1)(B), (2), (3), (4), (4)(A), (4)(B), (4)(C), (4)(D), (4)(E), (5), and (6).*

Response to O-94-3

CalRecycle rejects this comment for the reasons provided in response to comment O-62-1.

Comment O-94-4

3. Climate and toxics harm from "chemical recycling" are incompatible with the statutory definition of responsible end markets

SB 54 states that " To be considered recycled, covered material shall be sent to a responsible end market" (PRC Section 42041 (aa)(3)) and states:

""Responsible end market" means a materials market in which the recycling and recovery of materials or the disposal of contaminants is conducted in a way that ***benefits the environment and minimizes risks to public health and worker health and safety.*** *The department may adopt regulations to identify responsible end markets and to establish criteria regarding benefits to the environment and minimizing risks to public health and worker health and safety." (PRC Section 42041 (ad), emphasis added).*

The following evidence on the environmental and health harms arising from pyrolysis, solvolysis, and other "chemical recycling" technologies are clearly not compatible with the abovementioned requirements of environmental benefit and minimized risk to public and worker health.

Hazardous waste and emissions

- **Flawed LCAs**: Lifecycle assessments (LCAs) are key tools used by policymakers and industry actors to evaluate the environmental performance of products and processes. A recent UCSF study shows that even government and peer-reviewed LCAs of "chemical recycling" systematically underestimate harm to human health and the environment from toxic and hazardous substances due to three structural flaws:
- they omit the generation and disposal of hazardous waste and the need to purify the complex and contaminated chemical mixtures resulting from pyrolysis, gasification, and solvolysis;
- they rely on inadequate inventory databases lacking information on plastic-related chemicals and their harm to human health and the environment;
- they wrongly assume that pyrolysis outputs can replace virgin petrochemical inputs at a 1:1 ratio;

Unfortunately, ISO standard 59014:2024 quoted in the draft regulations promotes the use of misleading, narrow-scope LCAs that largely ignore the toxics footprint of recycling technologies and resulting harm to human health and the environment.

For this reason, GAIA recommends that the **regulations omit this ISO reference.** The regulations would not be weakened by omitting this reference since ISO 59014 is not specific to recycling, but is a general document on material recovery. It is not an international standard for what constitutes recycling and does not include a single environmental or efficiency benchmark to distinguish legitimate recycling operations from ineffective, toxic, and climate-harming operations.

Significant hazardous waste transported across states: NRDC's review of 47 operating, proposed, canceled and closed "chemical recycling" facilities in the U.S. shows that:

- all forms of "chemical recycling" produce hazardous waste, hazardous emissions, and/or rely on toxic solvents, with EPA data showing that between 2021 and 2024, just three pyrolysis facilities processing plastic waste generated over 2 million pounds of hazardous waste;
- hazardous waste from "chemical recycling" facilities puts multiple communities at risk: just three pyrolysis facilities had their hazardous waste transported through 13 states on the way to disposal;
- if all pyrolysis facilities currently proposed or under construction begin operating, between 624,000 and 10.8 million additional pounds of hazardous waste would be generated, transported through, and disposed of in communities across the country.

As drafted, the current draft regulation could open the floodgates for a dramatic rise in so-called "chemical recycling" facilities and associated hazardous waste generation, which evidence shows will pollute and harm adjacent communities and ecosystems, and along the routes where hazardous waste is transported.

- **Up to 100% cancer risk, organ damage, harm to unborn children:**
- *ProPublica* reported that the EPA estimated a 100% cancer risk from lifetime exposure to a boat fuel component made from the pyrolysis of plastic waste at a US facility;
- *ProPublica* also reported that EPA estimated, conservatively, that air pollution from making fuels out of plastic waste at a separate facility could lead to cancer in 1 out of 4 people exposed to it over a lifetime;
- The "Braven Environmental" pyrolysis facility in North Carolina is registered with the EPA as a large quantity generator that generates at least 1,000 kilograms per month of hazardous waste. Its permit application lists risks from pyrolysis oil including: genetic defects and cancer, organ and fertility damage, dangers to unborn children, in addition to being "very toxic to aquatic life," "extremely flammable," and having "long lasting effects."

While SB 54 does not allow plastic to fuel, the plastic waste pyrolysis process to make chemicals that can be used in plastics is the same process as is used for fuels, except that it has additional purification/decontamination steps; if anything, the process toxic emissions are likely to be even higher than for fuels.

Greenhouse gas emissions

- **Greenhouse gas emissions doubled:** Cutting-edge research shows that the widespread adoption of current "chemical recycling" technologies could double the greenhouse gas emissions from plastic production - largely due to the climate impact of making solvents and managing solvent waste.
- **Major emitter**s: The National Renewable Energy Laboratory found that "chemical recycling" produces an order of magnitude more greenhouse gas emissions than mechanical recycling, and more emissions per ton than primary (virgin) plastic.
- **3 lb of CO2 per lb of recycled styrene**: GAIA's analysis of the much-hyped Agilyx facility in Tigard, Oregon found it emitted more than 3 pounds of CO2 for every pound of recycled styrene that it produced.

Increased so-called "chemical recycling" of waste plastic would therefore increase California's overall greenhouse gas emissions and conflict with the environmental benefits and minimized harm to health requirements in the statutory definition of "responsible end markets." GAIA further notes with concern that the current version of the regulations do not contain a single reference to greenhouse gases, nor does ISO standard 59014:2024 included as an end market criterion in section 18980.4.1.(d).2.

International standards are clear: the Basel Convention has explicitly rejected the inclusion of pyrolysis and other so-called "chemical recycling" in its plastic waste management guidelines because these technologies could not be shown to be environmentally sound.

California should likewise exclude these technologies from its definition of "responsible end markets" given their environmental and human health record. The abovementioned prohibition or moratorium would resolve this issue.

Response to O-94-4

CalRecycle rejects this comment for the reasons provided in response to comment O-62-1.

Comment O-94-5

4. Responsible end market criteria: regulations ignore statutory emphasis on environmental benefits and prevention of hazardous waste generation, broad consideration of health risk, ignore California hazardous waste definition, fail environmental justice

As mentioned above, SB 54 defines responsible end markets as "*a materials market in which the recycling and recovery of materials or the disposal of contaminants is conducted in a way that* ***benefits the environment*** *and* ***minimizes risks*** *to public health and worker health and safety.* (emphasis added, PRC Section 42041 (ad)).

In addition, the statute's approach to hazardous waste focuses on prevention ("*The department's regulations shall encourage recycling that* ***minimizes generation of hazardous waste***" (emphasis added, PRC Section 42041 (aa)(5)).

However, the regulations ignore the statutory emphasis on environmental benefits and on the prevention of hazardous waste generation.

Instead it shifts the emphasis downstream to the management of hazardous waste and defines away the statutory threshold of "significant amounts" of hazardous waste by equating it with permit compliance (Section 18980.4.1(B)).

This approach allows technologies to qualify as recycling regardless of the type and quantity of hazardous waste they produce, in direct violation of the statutory requirement for the Department to "*include criteria to* ***exclude*** *plastic recycling technologies that produce significant amounts of hazardous waste"* (emphasis added, PRC 42041(aa)(5)).

By relying on permitting to define hazardous waste, these draft regulations make the same technology subject to compliance with numerous different jurisdictional requirements, including those outside of California when dealing with end markets. Given that permitting tends to be less stringent outside of California, this provision could exacerbate existing, and create new, **waste colonialism abuses.**

Furthermore, the draft regulations undermine statutory intent by using the narrow federal definition of hazardous waste as a benchmark instead of the broader and more protective California definition that is already referenced in several CalRecycle regulations. Likewise, the regulation considers only *"significant effects on the environment and risks to public health and safety"*. This phrasing invites arguments to dismiss documented harms under the pretext that they are not "significant", when it is known that toxics can harm human health and organisms at low levels of exposure, particularly when such exposure is prolonged such as when polluting infrastructure is located near communities.

Furthermore, the regulations fail to provide any safeguard against cumulative pollution and cumulative health impacts from end markets, which the consideration of CalEnviroScreen would surface.

Response to O-94-5

CalRecycle rejects this comment for the reasons provided in response to comment O-62-1 and O-90-15. Regarding cumulative pollution and health impacts, CalRecycle further rejects this comment because the only suggestion is

"consideration of CalEnviroScreen." The comment offers no further elaboration, such as explaining how the regulations could incorporate "CalEnviroScreen" or how doing so would relate to CalRecycle's statutory obligations. CalRecycle also rejects the assertion that the regulations do not provide any safeguard for these cumulative effects. To the contrary, section 18980.4 imposes rigorous requirements to ensure that end markets verifiably act responsibly and minimize environmental impacts.

Comment O-94-6

In conclusion, the draft regulations fall dangerously short of the statute when it comes to protecting public health, the climate, and the broader environment. Furthermore, they threaten to turn California into a toxic playground for polluters showcasing false solutions to plastic pollution, as detailed in California Attorney General Rob Bonta's ongoing lawsuit.
It is essential that all of us-the State of California, community, non profits, PROs, and industry-are focused on the true intent of SB 54: to address the overwhelming amount of plastic packaging and its connected health, environmental, and climate impacts. It is more important than ever that California prevent industry polluting our communities, air, water, land, and climate. We're looking to you for that crucial leadership with SB 54.

Response to O-94-6

Comment rejected. No response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations, does not raise an objection concerning the rulemaking process, or refers to suggested changes or objections set forth in greater detail in other portions of the submission. To the extent that preceding portions of the submission suggest changes or raise objections, CalRecycle has responded to those portions separately.

O-95: CA State Legislators (Senator Ben Allen)

Comment O-95-1

As we have conveyed in prior communications to the Governor and Director Heller (attached), SB 54 demonstrates California's commitment to leading the nation in environmental policy and facing the plastic pollution crisis head-on by ensuring producers share the responsibility for the end-of-life management of the materials they create. For SB 54 to fulfill its promise and objectives, it is crucial that the implementing regulations reflect not just the letter of the law, but also the Legislative intent, to maintain California's position as a national and international leader on fighting plastic pollution.

We appreciate the addition of language that clarifies that the intention of the new categorical exclusions is to exclude packaging that would result in a direct conflict with complying with federal requirements. Additionally, we recognize that the regulations

now include a requirement for producers to submit their claims to the department. However, the proposed regulations continue to contain overly broad exemptions, which exceed the language of the law. This will result in glaring loopholes and the exclusion of broad categories of products that are covered materials under the statute. The more materials that are excluded from the program, the more costs everyday Californians will continue to pay for their disposal and the more the producers who are left in the program will have to pay to fund program costs. We also remain deeply concerned about the proposed regulatory approach to the use of polluting technologies.

It is disappointing that the regulations fail to address these significant concerns, and we reiterate our request to revise the regulations to address the issues raised.

Dear Governor Newsom, Secretary Coloretti, Secretary Garcia, and Director Heller,

California's landmark legislation, SB 54, demonstrated our state's ongoing commitment to leading the nation in environmental policy by taking on the plastic pollution crisis head-on and ensuring producers share the responsibility for the end-of-life management of disposable materials they create. Enacting SB 54 was just the first step – it is crucial that the implementing regulations reflect the intent and letter of the law to maintain California's position as a national and international leader on fighting plastic pollution. We support the administration's goal of finalizing regulations quickly to ensure that the state and producers can meet the timelines established in SB 54. To this end, we appreciate the additional operational details in the most recent discussion draft for producers and the producer responsibility organization (PRO) to ensure timely and robust compliance with the law, such as the addition of a deadline for producers to register and report data to the PRO and simplified reporting structures. We also appreciate the removal of the source reduction adjustment factor, which was not authorized by the Act. However, several provisions in the last draft are inconsistent with the governing statute established by SB 54. These issues, described below, must be addressed before the regulations are finalized.

Failure to exclude recycling technologies that produce significant amounts of hazardous waste

SB 54 calls on Calrecycle to ensure, "the regulations shall include criteria to exclude plastic recycling technologies that produce significant amounts of hazardous waste." The draft regulations fall short of this requirement. Instead of excluding such technologies, the current criteria allows for their use if the hazardous waste they produce is managed in accordance with certain standards, and any hazardous waste handled and disposed of in "substantial compliance with an applicable permit." This unlawfully shifts the focus from the generation of hazardous waste, as described in statute, to the manner in which it is handled. Moreover, the regulations continue to disregard SB 54's requirement to encourage recycling technologies that minimize the "generation of greenhouse gases, environmental impacts, environmental justice impacts, and public health impacts." Including the ISO standard is insufficient in meeting the statutory requirement and does not include any criteria or other incentives that

encourage the use of technologies that minimize these additional public and environmental health impacts.

Expansion of categorically excluded products is contrary to the law

The July draft regulations continue to include a significant expansion in the scope of products that are categorically excluded from the program, which is not only contrary to the statute but also risks significantly increasing the program's costs – creating winners and losers among producers -- by increasing the amount of contamination in the recycling stream and thereby increasing the need for enforcement. First, the informal regulations exclude food packaging “necessary to comply with rules, guidance, or other standards issued by the United States Department of Agriculture or the United States Food and Drug Administration” from the program. SB 54 requires CalRecycle to ensure the regulations do not directly conflict with federal packaging laws but does not grant CalRecycle the authority to exclude products simply because a producer claims packaging is “necessary” and could not comply with SB 54. We appreciate that this provision now requires entities to notify CalRecycle of potential conflicts with federal regulations and demonstrate that alternatives are not reasonably available; however, this determination would be better handled through the exemption process where there is ongoing assessment of the exempted packaging and products to ensure that, wherever possible, producers switch from materials that are not able to comply with SB 54 to those that are – removing the incentive for producers to innovate and redesign their products and packaging. Instead of using the existing exemption process, the informal regulations now allow producers to avoid compliance with the law in perpetuity by using less recyclable materials and claiming they are necessary.

Second, the new draft regulations continue to exclude most over-the-counter medications (OTC) and their packaging from the program, which is inconsistent with the plain language of the statute and the clear legislative intent that the authors consistently reiterated. SB 54 specifically exempts prescription drugs and medical devices from the program, but that exemption does not include OTCs. Whether OTCs should be included in the program was contemplated as far back as 2019, when the first attempt at SB 54 was made and these products remained in the proposed program in all versions of the legislation that followed, including the version enacted in 2022.

Overly Permissive Reuse/refill Standards

The draft regulations issued in May made important streamlining revisions to the “refill and reuse” standards. However, to ensure that they do not create an unintended exclusion for materials that are not truly reusable or refillable, it is important that the regulations include a minimum standard. We remain concerned that the proposed regulations removed the requirement for the PRO to maintain records for the covered materials producers claim to be reusable or refillable.

The Legislature’s primary goal when passing SB 54 was not only to address the waste and pollution associated with single-use packaging and foodware, but to also control the

rising costs to everyday Californians associated with managing that waste, cleaning up the environment, and addressing public health impacts of plastic exposure. Residents across the state are paying significantly more in their rates today than they did a decade ago for trash collection and recycling. SB 54 is the only significant state policy in place intended to reduce the amount of materials that the state's local governments must manage through their solid waste systems and to reduce the associated costs to California's ratepayers. We appreciate that the most recent draft Standardized Regulatory Impact Assessment takes a more reasoned view of the potential costs and benefits of SB 54 implementation, including finding that SB 54 will generate tens of billions of dollars of net benefits to Californians.

We look forward to continuing to work with your administration as this critical program is implemented. The state deserves a solid foundation on which to base future actions. We call on you to ensure that CalRecycle revises the regulations to reflect the letter and intent of the statute.

[Attachments to this submission included separately in the rulemaking file]

Response to O-95-1

Comment rejected. No changes to the proposed regulations are appropriate in response to this comment because the comment expresses general concern with the regulations, including over non-specified "exemptions" and "exclusion of broad categories" of products, but does not address specific regulatory provisions or suggest any particular changes to them. The commenters also note that they "remain deeply concerned about the regulatory approach to the use of polluting technologies," without further elaboration or suggestion of how to address that concern.

To the extent this comment can be interpreted to concern particular provisions of the proposed regulations, CalRecycle identifies four changes the commenters might have intended to recommend. First, the commenters appear to request narrowing of the exclusion for packaging used by food and agricultural products. CalRecycle declines to do so because the currently proposed regulations are narrowly drawn (they exclude only packaging for certain goods when it is not reasonably possible to comply with both state and federal law), and they fulfill CalRecycle's statutory obligation to avoid conflicts with federal law. See, also, CalRecycle's responses to comments I-19-1, O-93-9, B-47-3, and O-90-3. Second, the commenters may have intended to object to CalRecycle's interpretation of the exclusion for medical products; CalRecycle rejects that objection for the reasons stated in responses to comments O-49-1 and B-11-3. Third, the commenters may have intended to object to the proposed regulations' implementation of Public Resources Code section 42041(af), which sets forth the criteria for items to be considered reusable or refillable. The relevant regulatory text (18980.2.1), however, does not expand what may be considered reusable or refillable; rather, it provides clarification of the statutory criteria as necessary for CalRecycle to enforce them. See, also, CalRecycle's responses to comments B-

6-2, I-30-2, B-38-3, O-75-3, and O-48-4. Fourth, the commenters express concern over the "regulatory approach to the use of polluting technologies." That approach, found in section 18980.4, is appropriate because statute unambiguously stops short of prohibiting any particular technologies. The regulation gives effect to the Legislature's intent, expressed in Public Resources Code section 42041(aa)(5), to allow new technologies (evidenced by the choice not to state any prohibition on particular technologies), but only those whose production of hazardous waste risks environmental harm and therefore must be considered production of a "significant amount" of such waste. The proposed regulations achieve that balance by disqualifying uses of technology that harm the environment, requiring operations to meet rigorous environmental management, sustainability, and traceability standards, and imposing significant disclosure and reporting requirements. See, also, CalRecycle's response to comment O-62-1.

Regarding the attachments that the commenters included with their submission (and which are included in the rulemaking record), those attachments address draft regulations that are not part of this rulemaking, so no separate responses to them are necessary. To the extent the commenters' comments on the current regulations incorporate or rely on the attachments or raise the same issues as those attachments raised, CalRecycle's responses to the comments have addressed the substance of the attachments. The attachments are included in the rulemaking file.

O-96: Circular Action Alliance (Emily Coven)

Comment O-96-1
RE: SB 54 Regulations

Dear Ms. Richmond,

Circular Action Alliance (CAA) and its members thank the Department for the opportunity to submit comments on the proposed regulatory text under the Plastic Pollution Prevention and Packaging Producer Responsibility Act, as codified in the California Public Resources Code at Sections 42040-42084 (Senate Bill 54).

CAA is a U.S. Producer Responsibility Organization (PRO) dedicated to implementing effective Extended Producer Responsibility (EPR) laws for paper and packaging. As a nonprofit, producer-led organization, CAA is committed to helping producers comply with EPR laws, delivering harmonized best-in-class compliance services and to working with governments, businesses and communities to reduce waste and recycle more.

CAA was founded in 2022 and is governed by producers representing the food, beverage, consumer goods, restaurant and retail industries. CAA’s 24 founding members are Amazon; The Campbell’s Company; The Coca-Cola Company; Colgate-

Palmolive; Conagra Brands; Danone North America; Ferrero US; General Mills; Georgia-Pacific; IKEA Supply AG; Keurig Dr Pepper; The Kraft Heinz Company; L'Oréal USA; Mars, Incorporated; McDonald's USA, LLC; Mondelēz International; Nestlé USA; Niagara Bottling, LLC; PepsiCo, Inc.; Procter & Gamble; SC Johnson; Starbucks Corporation; Target; and Walmart.

We appreciate that the Department has previously considered recommendations that CAA submitted on May 8, 2024, Nov. 4, 2024, Dec. 17, 2024, and June 3, 2025. We are pleased to submit our comments on the formal draft regulations published on Aug. 22, 2025.

We have provided our detailed comments in the attached submission, which include the following overarching priorities.

Clarify and Define Categorical Exclusion Process: The regulations allow a lengthy timeline for exclusions to be reviewed and acted on by the Department, creating program uncertainty and administrative burden for CAA. We propose modifications that will address these concerns.

Establish Achievable Reporting Timelines: Several key reporting timelines require CAA to submit data in a way that does not provide sufficient time for the data validation process that CAA must undertake to ensure compliance. We are proposing modified reporting deadlines to allow for sufficient data review, ensuring the program operates using the most accurate data possible.

Reduce Burdens on Reusable and Refillable Collection: The regulations set a standard for reusable and refillable packaging return infrastructure that does not align with the closest comparative system, the California Beverage Container Recycling Program, and does not allow for needed flexibility as CAA works with producers to establish collection pathways for these materials. CAA supports harmonizing reusable and refillable collection convenience requirements with those established for CRV, as well as broadening the scope of infrastructure that can be used to satisfy these requirements.

Reinstate Source Reduction Adjustment Language: The draft regulations continue to omit a section spelling out source reduction adjustments that would allow the PRO to account for future increases or decreases in the number of producers participating in the program, as well as economic fluctuations, to craft a practicable source reduction plan. This will create substantial challenges for CAA and producers as we work to meet source reduction targets.

Simplify De Minimis Exclusion Process: CAA proposes modifying the de minimis exclusion review process in a way that will allow us to provide clear guidance to producers before they report baseline source reduction data next year. Our proposed approach also reduces the reporting burden on producers and ensures the program operates with the most accurate data possible for source reduction planning.

We would like to thank CalRecycle for the ongoing collaboration with our team and the opportunity to provide our comments on the draft regulations. We would welcome the opportunity to meet with your team to discuss our comments in further detail.

Sincerely,
Emily Coven
California Executive Director
Circular Action Alliance

Response to O-96-1

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process. To the extent other portions of the submission do suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-96-2

Article 1: Definitions
Section 18980.1. Definitions
Section 18980.1(a)(4)

Regulatory text

(B) For purposes of categorizing components into covered material categories, each detachable component shall be considered individually and not necessarily categorized in the same category as the components from which it was detached.
(C) A "detachable component" is one that may be completely detached from all other components or material and is either of the following:
(i) A component designed such that it may be detached by consumers or during or after collection without the use of tools, substances, or non-manual processes. A component shall not be considered designed to be detached merely because it may be detached from all other components or materials during processing.
(ii) Typically or necessarily detached through ordinary usage by the consumer before being discarded, regardless of whether the component is discarded attached to the other components.

CAA Response

The text specifying that a "detachable component" is defined by certain characteristics "regardless of whether the component is discarded attached to the other components" is not consistent with the Association of Plastic Recyclers (APR) Design Guide, which recommends leaving plastic caps on bottles and containers when recycling.
This contrary position hinders both the calculation of actual recycling rates for components and the recyclability determination for components in a way that does not match current recycling practices.

The definition of detachable component is ultimately aiming at classifying covered materials in a way that reflects how a particular covered material will present itself in the waste stream. CAA, therefore, suggests the text be revised to reflect that "detachable component" does not refer to components that are designed to be reattached before disposal.

CAA Recommendation

Revise the section as follows:

(B) For purposes of categorizing components into covered material categories, each detachable component shall be considered individually and not necessarily categorized in the same category as the components from which it was detached, unless such component is designed to be reattached before disposal.
(C) A "detachable component" is one that may be completely detached from all other components or material, is not designed to be reattached before disposal, and is either of the following:
(i) A component designed such that it may be readily detached by consumers or during or after collection without the use of tools, substances, or non-manual processes. A component shall not be considered designed to be detached merely because it may be detached from all other components or materials during processing.
(ii) Typically or necessarily detached through ordinary usage by the consumer and is not designed to be reattached before being discarded~~, regardless of whether the component is discarded attached to the other components~~.

Response to O-96-2

CalRecycle rejects this suggestions for the reasons provided in response to comments O-39-5 and O-41-3.

Comment O-96-3

CAA Recommendation

Additionally, in conjunction with the above change, **Section 18980.3.2. Methodology for Recycling Rate Determination** should be revised to use the term "detachable component" consistently, as follows:
(d) Recycling rate shall be calculated for each covered material category, except as established in subdivisions (f) and (g).
(1) For covered material components that are not detachable components, a single recycling rate shall be calculated for the covered material category applicable to the item comprising those components rather than calculating a recycling rate for each component.
(2) For covered material components that are detachable components, a recycling rate shall be calculated using the covered material category applicable to each detachable component.

Response to O-96-3

CalRecycle rejects the proposed revision because it would add no clarity to the proposed regulatory text. The proposed additional verbiage would be redundant.

Comment O-96-4

Section 18980.1.1. Producer Identification

Section 18980.1.1(c)(1)

Regulatory text

(1) Subject to subdivision (e), the designated brand or trademark shall be one used with goods when they are first sold or distributed along with covered material or used with such initial sale or distribution, regardless of where such use occurs. The person who manufactured the goods is the producer, provided that the person is in the state and either owns the designated brand or trademark or is licensed to manufacture the goods. To be the producer, the licensee must have the legal right to use the brand or trademark on the goods in connection with manufacturing the goods and be entitled to be the only person with such right in the state or in a subregion of the state.

CAA Response

CAA appreciates the amendments that have been made to this section in previous draft regulations but remains concerned about the complexity associated with the producer identification spelled out in Section 18980.1.1.

As noted in our June 2025 submission, we continue to question why several concepts CAA has proposed were not incorporated. These include:

• The use of "directing or performing the manufacturing" to identify the producer when multiple brands or trademarks are present. o This phrasing is already used in Oregon and Colorado, making it familiar to producers and easier to identify which company is obligated in the supply chain.

• The addition of the clause: "If the person owning the brand or trademark pursuant to this subdivision is a business operated wholly or in part as a franchise, the producer is the franchisor if that franchisor has franchisees that have a commercial presence within the state."

o This concept is also used in Colorado and would clarify the obligation for restaurant franchisors over franchisees.

We urge CalRecycle to develop guidance as soon as possible to ensure that there is clarity as to the obligated party.

Additionally, CAA recommends an edit to Section 18980.1.1(c)(2) to adjust the language to ensure it is harmonized to other states. As it stands, the language appears to capture the contract manufacturer in state as opposed to the brand owner, representing a major difference from all other states that have adopted packaging EPR legislation: Colorado, Oregon, Maine, Maryland, Minnesota and Washington.

CAA Recommendation

Revise Section 18980.1.1(c)(1) as follows:

(1) Subject to subdivision (e), the designated brand or trademark shall be one used with goods when they are first sold or distributed along with covered material or used with such initial sale or distribution, regardless of where such use occurs. The person who owns or licenses the brand and is directing or performing the manufacture~~ding~~ of the goods is the producer, provided that the person is in the state and either owns the

designated brand or trademark or is licensed to manufacture the goods. To be the producer, the licensee must have the legal right to use the brand or trademark on the goods in connection with manufacturing the goods and *is* ~~*be entitled to be the only person with such the legal right*~~ *offering the goods for sale or distribution* *in the state or in a subregion of the state.* Revise Section 18980.1.1(e) to add the following:
(6) If the person owning the brand or trademark pursuant to this subdivision is a business operated wholly or in part as a franchise, the producer is the franchisor if that franchisor has franchisees that have a commercial presence within the state.

Response to O-96-4

Comment rejected. The change to expand "the person who manufactured" to "the person who . . . is directing or performing the manufacturing" is contrary to Public Resources Code section 42041(w)(1), which is the only statutory provision under which a person's role as a manufacturer is relevant. The commenter's proposal to refer to one that "is directing the manufacturing" is ambiguous at best, and it is unnecessary because 42041(w)(1) unambiguously concerns the actual manufacturer (i.e., the one manufacturing). CalRecycle also declines to add the phrase "owns or licenses the brand" because that is redundant with the remainder of the sentence, which already requires that the person must own the brand or be licensed to use it in manufacturing.

CalRecycle also rejects the suggestion to remove the reference to exclusivity. Public Resources Code section 42041(w)(2) unambiguously states that there must be exclusivity for a person's status as a licensee to be relevant.

The proposed addition of "is offering the goods for sale or distribution" is also inappropriate because Public Resources Code section 42041(w)(1) and (w)(2) do not require a person to have any sale or distribution role to be a producer.

CalRecycle declines to add the proposed paragraph (6) because it is not grounded in statute and is unnecessarily focused only on the franchisor-franchisee relationship, even though other licensing arrangements may be functionally similar. Under the statute, a franchisor that owns the brand will always be the producer of the covered material sold or distributed under that brand because they are necessarily "in the state": California law requires all franchisors to consent to service of process in the state. Therefore, addressing the franchisor-franchisee relationship is unnecessary except to address the scenario where franchisees—which often have some degree of geographic exclusivity—might be considered the "licensee" producer referred to in 42041(w)(1) and (w)(2). The proposed regulations address that scenario and all scenarios where there is a secondary agreement, with a licensee (or franchisor that does not own the brand) issuing a sublicense (or a franchise) to the business that sells or distributes the relevant goods. In that scenario, the licensee (or franchisor) is deemed the one holding the relevant right to use the brand or trademark.

In contrast, the commenter's suggested change does not address the requirement that the producer be "in the state" (it only addresses the presence of franchisees, who would not be the producer) nor the requirement that they be a brand owner or licensee (if they are not the brand owner). It simply states that a

franchisor with franchisees in the state is the producer. This leaves producer identification unclear when a trademark is used by franchisees in the state and by other businesses licensed to use the trademark for other purposes. In contrast, the proposed regulations (18980.1.1(c)(3) and (d)(3)) make clear that the licensor/licensee (or franchisor/franchisee) relationship only determines the producer of covered material used pursuant to the agreement establishing relationship.

The commenter's proposed paragraph (6) is also inappropriate because it is misplaced. Subdivision (e) concerns the designation of the brand referred to in Public Resources Code section 42041(w)(1) and (2), but the commenter's addition would concern identification of the producer, which subdivisions (c) and (d) address.

Regarding the proposed change to section 18980.1.1(c)(2), the only basis is to "ensure it is harmonized to other states." However, the proposed regulations cannot harmonize the California statute with other states' laws if it unambiguously requires outcomes inconsistent with those laws. Under the California statute, if a contract manufacturer falls within the definition of "producer" under Public Resources Code section 42041(w)(1), the proposed regulations cannot change that outcome. However, the parties to a manufacturing agreement exert considerable control over that outcome because a licensee can only be a producer if its rights are exclusive.

Comment O-96-5

Article 2: Covered Material and Covered Material Categories

Section 18980.2. Categorically Excluded Materials

Section 18980.2(a)(2)

Regulatory text

(A) Any entity that has determined that packaging is not covered material pursuant to paragraph (2) of subdivision (a) shall notify the Department and provide both a specification for the packaging or packaging component and the associated product(s) along with a summary of the basis for its determination. The basis shall identify the specific provision of this Chapter that causes a conflict, cite the conflicting federal regulations, rules, or guidelines, and explain why no reasonably possible alternative packaging or packaging component is available. The Department shall maintain on its website a publicly available electronic database of each such determination that includes the entity name, the specification for the packaging and the associated product(s), and the status of any review by the Department of such determination.

(B) At any time, the Department may request from an entity additional information supporting that entity's determination, which must be provided within 60 days. If such information is not provided, or if the Department believes the information provided is incomplete or insufficient as a basis for the determination, it shall notify the entity, which shall respond within 60 days. Following review of the information provided by the entity, and any further consultation with the entity and any state or federal government agencies (including the California Department of Food and Agriculture and the California Department of Public Health) that the Department deems advisable, the

Department shall determine whether the packaging or packaging component qualifies for the exclusion. If the Department determines that the packaging or packaging component does not qualify for the exclusion, then it shall be considered covered material 180 days following the Department's decision.

CAA Response

Although the language does not explicitly state this, subparagraphs (A) and (B) imply that as soon as an entity notifies the Department that it has determined that packaging is not covered material, that packaging becomes categorically excluded. The timelines laid out in (B) include: unspecified time for the Department to review and request additional information, 60 days for the entity to provide additional information once requested, additional unspecified time for the Department to review the additional information and make a decision that the packaging is indeed covered, and 180 days for that packaging to become covered again. That means that a minimum of 240 days (and easily 12 months or more) will occur between the day that the packaging becomes excluded and the day that the packaging is considered covered again.

Because of this lengthy timeframe, the system easily could be used by entities to avoid paying fees for extended periods of time lasting anywhere from several months to years. Even if CalRecycle were to process all submissions the same day they were received, the regulations build in a minimum of 240 days when the packaging will be considered excluded, representing two-thirds of the year. So even if a producer is certain that their packaging is covered, they are incentivized to make an exclusion determination because it will save them at minimum 66% of their annual fees, and potentially much more.

Further, the fact that packaging can become excluded on any date throughout the year would necessitate proration of reporting weights and associated fees on the year of the determination (unless the determination is submitted on January 1). This would introduce a significant administrative burden to the PRO, which would not only make the program run less smoothly, but would unnecessarily raise the overall cost of running the program. A successful packaging EPR program relies upon a consistent annual cycle of reporting and fee-setting.

CAA Recommendation

CAA urges CalRecycle to make the following changes:

• Require exclusion determinations to include estimated weights. This data will allow the PRO to adjust its budget and fees accordingly, especially if substantial amounts of packaging are unexpectedly excluded.

• Require exclusion determinations to be submitted annually in the month of January. This significantly reduces the administrative burden and costs for the PRO, and more importantly, also provides the PRO with certainty when fee-setting, budgeting, etc. Because producers need to submit a source reduction baseline report by July 1, 2026, and because exclusion determinations will affect supply included in those reports, CAA also proposes to require initial exclusion determinations to be submitted within 30 days of the effective date of the Regulations.

• If the Department determines the packaging is covered, require the entity to report the packaging and to pay fees retroactive to the date it originally notified the Department of its exclusion determination. This will eliminate the possibility of producers getting a "free ride" for anywhere from months to years.

• Add an interest payment to retroactive fees. Without the additional disincentive of the interest payment, there's still the possibility of entities submitting exclusion determinations to effectively get an interest-free loan from the PRO via deferred fee payments.

Per the above, CAA recommends the following modifications to the language in Section 18980.2(a)(2):

(A) Any entity that has determined that packaging is not covered material pursuant to paragraph (2) of subdivision (a) shall notify the Department and provide both a specification for the packaging or packaging component and the associated product(s) along with a summary of the basis for its determination. The entity shall also provide estimated annual weight of the packaging or packaging component. The basis shall identify the specific provision of this Chapter that causes a conflict, cite the conflicting federal regulations, or rules~~, or guidelines~~, and explain why no reasonably possible alternative packaging or packaging component is available. The Department shall maintain on its website a publicly available electronic database of each such determination that includes the entity name, the specification for the packaging and the associated product(s), and the status of any review by the Department of such determination. The entity shall notify the Department within 30 days after the effective date of the Regulation, and between January 1 and January 31 annually starting on January 1, 2027.

(B) At any time, the Department may request from an entity additional information supporting that entity's determination, which must be provided within 60 days. If such information is not provided, or if the Department believes the information provided is incomplete or insufficient as a basis for the determination, it shall notify the entity, which shall respond within 60 days. Following review of the information provided by the entity, and any further consultation with the entity and any state or federal government agencies (including the California Department of Food and Agriculture and the California Department of Public Health) that the Department deems advisable, the Department shall determine whether the packaging or packaging component qualifies for the exclusion. If the Department determines that the packaging or packaging component does not qualify for the exclusion, then it shall be considered covered material ~~180 days following the Department's decision~~.

(C) If the entity is a participant producer, or would be required to be a participant producer in the absence of categorical exclusions, and if the Department has not yet made a determination per section (B) at the time of the entity filing its producer report with the PRO based on packaging supplied in the same year that entity made the exclusion determination, or any subsequent year, the entity shall omit the excluded packaging from the producer report. If the entity is a participant producer, or would be required to be a participant producer in the absence of categorical exclusions, and the Department determines that the packaging does not qualify for the exclusion, and if the entity has filed one or more producer reports to the PRO with the packaging omitted, the entity shall amend all such reports to include the packaging considered as covered material, retroactive to the date when the entity submitted its initial determination to the Department. Any fees due to the PRO as a result of such amended reports, including calculations for malus fees or credits, shall be paid to the PRO along with 10% annual interest compounded monthly starting with the date the entity submitted its initial

determination and ending with the date the Department determined that the packaging does not qualify for the exclusion.
~~(C)~~ (D) In implementing this paragraph, the Department shall withhold from public disclosure any information that the entity appropriately identifies as trade secrets, subject to the requirements and limitations set forth in section 18980.14.

Response to O-96-5

Comment partially rejected and partially accepted. The commenter requests that 18980.2(a)(2)(A) require an entity claiming that packaging is not "covered material" to provide the estimated annual weight of the packaging and submit annual notices. CalRecycle declines to make that change because it would be inconsistent with the principal effect of 18980.2(a)(2): When the exclusion applies, the packaging at issue is not "covered material" and thus not subject to the Act. The commenter also requests that an annual notification requirement be added to subparagraph (A). CalRecycle rejects the annual notification suggestion for three additional reasons. First, it would not have any practical effect in most instances because the absence of an annual submission would have the same effect as an annual submission: In either case, the circumstances would reveal whether the exclusion continues to apply. Second, the proposed change would unnecessarily restrict CalRecycle's ability to determine how to administer the Act most efficiently. Under the regulation as written (and as revised; see below), CalRecycle can review each submission and determine on a case-by-case basis when, based on the circumstances specific to the claimed exclusion, to require submission of additional information. Nothing precludes CalRecycle from doing so one year after the most recent submission, or at any other time. CalRecycle's ability to require additional information when appropriate ameliorates the commenter's concern over uncertainty and burden. Third, requiring that the suggested annual submissions be made in January would impose inconsistent, arbitrary burdens on businesses based on when during such annual cycle the need to avail themselves of the exclusion allowed under 18980.2(a)(2) arises.

CalRecycle also declines to add the specific text proposed as a new subparagraph (C). First, its requirements build upon the recommended changes that CalRecycle has declined to make elsewhere, as explained above. Second, the proposed changes would effectively treat any entity as producer if the entity submits a notice that an exclusion applies. However, packaging that is not "covered material" is not subject to the Act and cannot render an entity a producer for any reason. Third, the proposed changes are inconsistent with the process described in subparagraph (B) (revised to subparagraph (E) in updated proposed regulations). The suggested new subparagraph (C) would mischaracterize that process as involving CalRecycle conducting a complete, substantive review before the exclusion could be considered to apply. Except as clarified in the revised text (see below), the proposed regulation does not entail such a delay. Lastly, CalRecycle rejects the suggested retroactivity of fees, with interest, because implementing it would require CalRecycle to accept the other

provisions the commenter proposes as subparagraph (C), which CalRecycle has otherwise rejected as described in this paragraph.

CalRecycle declines to delete the term "guidelines" for the reasons described in response to comment I-59-2 but, as described below, has revised the text in a manner that likely addresses the commenter's concern with it (the commenter does not set forth that concern).

CalRecycle otherwise accepts this comment. In particular, CalRecycle has revised 18980.2(a)(2) to address the commenter's main concern (that illegitimate claims that the exclusion applies will enable entities to avoid obligations under the Act). CalRecycle's response to comment I-19-1 further explains the revisions responsive to the commenter's concerns and those raised in similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

Comment O-96-6

Section 18980.2.1. Exclusion of Reusable and Refillable Packaging and Food Service Ware

Section 18980.2.1(a)(4)

Regulatory text

(A) Unless the item was delivered directly to a consumer, there is at least one location for returning the item that is either:
(i) the same location where the item was obtained or delivered; or
(ii) within one mile of the location where the original item was obtained and has hours of operation that encompass, at a minimum, the hours of operation of the location where the item was obtained.
(B) If the item was ordered via remote means (e.g., Internet, phone, or any method not requiring the purchaser to visit any particular physical location) and was delivered directly to a consumer, the same means must be available for return of the item without requiring travel to a location other than the delivery location. If the item was ordered by visiting a particular physical location, such as a retail store, and was delivered directly to a consumer, return of the item must be able to be arranged via remote means or by visiting that physical location or a location described in clause (ii) of subparagraph (A).

CAA Response

CAA is exploring curbside collection of reusable and refillable packaging and food service ware as a potential substitute for setting up collection points. As written, the language does not appear to allow for such an alternative to be considered adequate infrastructure, instead requiring that the packaging or food service ware must either be able to be returned via return-to-retail or redemption centers.

CAA Recommendation

Add text making curbside collection a clear alternative option to satisfy infrastructure requirements for reusable and refillable packaging and food service ware in sections 18980.2.1(a)(4)(A) and 18980.2.1(a)(4)(B):
(C) A curbside collection program that accepts reusable and refillable packaging and food service ware may be established in place of or alongside physical return locations, and shall satisfy infrastructure requirements in subparagraph (C) of paragraph (1) of subdivision (af) of section 42041 of the Public Resources Code.

Response to O-96-6

CalRecycle rejects this comment for the reasons set forth in response to comment O-84-3.

Comment O-96-7

Section 18980.2.1(a)(4)(A)(ii)

Regulatory text

(A) Unless the item was delivered directly to a consumer, there is at least one location for returning the item that is either:
(i) the same location where the item was obtained or delivered; or
(ii) within one mile of the location where the original item was obtained and has hours of operation that encompass, at a minimum, the hours of operation of the location where the item was obtained.

CAA Response

This text requires infrastructure to ensure the packaging or food service ware can be returned within one mile of the location where it was obtained. This is a more extensive requirement than that of the California Beverage Container Recycling Program, which establishes beverage container convenience zones to be within one mile of a supermarket, and up to five miles in rural regions.

Therefore, as written, the draft regulations create a higher burden on reusable and refillable packaging and food service ware compared with Beverage Container Recycling Program containers both in the convenience zone radius (within one mile for all reusable and refillable packaging, versus between one and five miles for CRV), and in the type of establishment at the center of the convenience zone (any place the item is obtained in the case of reusable and refillable packaging, versus a supermarket specifically for CRV).

The differences between one and five miles, and between any retail location where the refillable packaging was obtained versus a supermarket, come with massive costs. Modeling completed for CAA estimates it could require 22,503 return points to implement the requirements as written in the current draft regulations, compared to

between 2,000 and 3,000 to implement if the Beverage Container Recycling Program convenience zone criteria were used for reusable and refillable packaging. CAA estimates this represents a cost difference of between $1 billion and $2 billion between 2026 and 2032.

CAA Recommendation

CAA proposes that the refillable and reusable packaging return infrastructure requirements be aligned with the requirements for Beverage Container Recycling Program convenience zones, including the five-mile radius in rural regions.

Response to O-96-7

CalRecycle rejects the commenter's proposal. It is nonsensical to suggest that assessing convenience of a return location with respect to the acquisition location is not the most effective way of comparing the convenience of going to that return location to the convenience of purchasing a new item from that location or a nearby location instead. The commenter asserts that other locations are likely to be more convenient but provides no explanation of how such locations can be identified with respect to each location where products are originally sold. The suggested rule is therefore highly subjective and inexact, offering no greater precision and objective measurability than what is stated in statute. In contrast, a collection point near the place of acquisition is necessarily as convenient as was obtaining the original product. Moreover, nothing in the proposed regulation prevents a reuse system operator from attempting to find the "most convenient" locations for collection points. The proposed regulations merely establish what the minimum required degree of convenience.

Comment O-96-8

Section 18980.2.2. Exclusion of Certain Types of Packaging
Section 18980.2.2

Regulatory text

(a) Pursuant to subparagraph (F) of paragraph (2) of subdivision (e) of section 42041 of the Public Resources Code, packaging used for the long-term protection or storage of a good having a lifespan of not less than five years is not covered material. Upon request by the Department, any person claiming not to be subject to the Act with respect to particular packaging on the basis that subparagraph (F) of paragraph (2) of subdivision (e) of section 42041 of the Public Resources Code excludes the packaging from the definition of covered material shall substantiate such a claim....
...
(b) Pursuant to subparagraph (A) of paragraph (4) of subdivision (s) of section 42041 of the Public Resources Code, material that is part of or directly connected to packaging but is of de minimis weight or volume is not itself packaging for purposes of the Act. ...
(b) (3) The PRO or an Independent Producer may request that the Department deem certain components or groups of components to be of de minimis weight or volume.

Requests must be in writing and describe each component or group of components at issue with sufficient detail, such as its purpose, range of physical characteristics, and the types of packaging or goods with which it is conventionally used, to clearly distinguish it from other materials. The request must include supporting evidence and explanation establishing that the component or group of components meets the requirements of paragraph (2).

CAA Response

Section 18980.2.2. describes the process for two specific exclusions for "packaging used for the long-term protection or storage of a good having a lifespan of not less than 5 years" and for "material that is part of or directly connected to packaging but is of a de minimis weight or volume."

In the first exclusion above, the regulations simply lay out the criteria that must be met in order for producers to claim an exclusion for such packaging meeting the criteria, and only upon request from the Department would such claims need to be substantiated by the producer.

However, for the exclusion for material that is part of or directly connected to packaging but is of a de minimis weight or volume, the PRO or Independent Producer must first request that the Department deem that such components or group of components meet the criteria. Claimants must submit requests in writing and describe each component or group of components at issue with sufficient detail, such as its purpose, range of physical characteristics, and the types of packaging or goods with which it is conventionally used, to clearly distinguish it from other materials. The request must include supporting evidence and explanation establishing that the component or group of components meets the requirements laid out in that section. The Department is required to publish on its website a list of components and groups of components that it has determined to be of a de minimis weight or volume.

Given that language in statute for both exclusions above, as found respectively in PRC 42041(e)(2)(F), and PRC 42041(s)(4)(A), uses the term "as determined by the department," presumably CalRecycle has the authority to use the same approach regarding the treatment of exclusions under these two provisions. Given this, CAA recommends that CalRecycle amend Section 18980.2.2(b) to align with Section 18980.2.2(a) so that only upon request from the Department would such claims that components and groups of components that are deemed by the PRO to meet the de minimis criteria outlined in Section 18980.2.2(b)(2) be substantiated by the PRO making the claim. Making this change would allow for CAA to provide clear de minimis guidance to producers prior to the reporting of 2023 baseline data next year. This approach will reduce the reporting burden on producers and increase the accuracy of data reported for source reduction planning.

Response to O-96-8

Comment rejected. The commenter reads into the proposed regulation a requirement that no material can be of de minimis weight or volume without CalRecycle's preapproval. However, section 18980.2.2(b)(4) expressly acknowledges that CalRecycle may determine that items are of de minimis weight or volume when such status is brought to its attention in response to a notice of violation. In other words, the absence of an advance determination by CalRecycle does not preclude claims that components are of de minimis weight or volume.

Comment O-96-9

Section 18980.2.4. Exemptions for Certain Covered Materials

Section 18980.2.4(a)

Regulatory text

(a) Only a PRO or an Independent Producer may submit a request for an exemption pursuant to paragraph (3) of subdivision (a) of section 42060 or paragraph (4) of subdivision (a) of section 42060 of the Public Resources Code. The effect of such an exemption is that exempted covered material may be sold, offered for sale, imported, or distributed regardless of whether the covered material complies with section 42050 or subdivision (i) of section 42057 of the Public Resources Code. The exemption does not affect the status of the single-use packaging or single-use plastic food service ware as covered material and does not otherwise change the obligations of producers with respect to the covered material, such as reporting and payment of PRO fees.

CAA Response

The draft regulations outline an exemption process through which covered materials can become exempt from SB 54 requirements. Under this process, producers must demonstrate that compliance presents unique challenges or health and safety concerns. As currently drafted, this exemption allows producers to continue selling these products but not meet targets they would otherwise need to meet.

CAA seeks confirmation that in these cases, the exempted materials are also removed from the PRO's targets, particularly the source reduction baseline targets. Otherwise, if these materials are exempt from requirements around recycling, recyclability and source reduction, but are still considered part of the source reduction baseline, they create a particular burden because other producers will need to source reduce additional volumes to make up for these exempt materials, which in actual practice per the regulations, are only partially exempt.

CAA strongly believes that if a material is considered exempt from covered material requirements, it should not have covered material targets associated with it.

Response to O-96-9

Comment rejected. Although the commenter only "seeks confirmation" about the proposed regulations, CalRecycle interprets it as requestion that the proposed regulations be changed to produce the result the commenter desires: that covered materials exempted pursuant to Public Resources Code section 42060(a)(3) and (a)(4) not be considered "covered material" for purposes of

source reduction and recycling rates. CalRecycle declines to make that change because it would contradict the Legislature's intent and the plain language in statute. The Legislature included two main ways for statutory requirements to be relaxed with respect to single-use packaging and plastic single-use food service ware. First, the statute establishes that certain items are not "covered material" to begin with (Public Resources Code section 42041(e)(2)). Second, the statute provides two ways for CalRecycle to "exempt covered material" (Public Resources Code section 42060(a)(3) and (a)(4)). Only in the former case are items deemed not "covered material," proving the Legislature's intent that exemptions do not affect the targets that producers must achieve and, to the extent exemptions make doing so more difficult, producers' burdens include removing that difficulty by addressing need for the exemptions. Accordingly, these provisions must be interpreted differently, such that, for the exemptions under 42060(a)(3) and (a)(4), the exemption applies to the requirements placed on materials themselves, which are still "covered material," but not to those placed on producer with respect to their covered materials.

Moreover, the proposed regulations contemplate and account for the commenter's concern. As explained in section 18980.2.4(f), exemptions under Public Resources Code 42060(a)(3) will only be granted if they will promote satisfaction of the statute's requirements in a manner consistent with the policy goals and priorities incorporated into it, and exemptions under section 42060(a)(4) will only be granted if they will not make it more difficult for other producers to satisfy their obligations under section 42050.

Lastly, and further supporting the above understanding of the Legislature's intent, under the commenter's recommendation there would be no incentive for the PRO and producers to eliminate the difficulties that justify exemptions. In fact, the PRO and all producers would have strong incentive to procure those difficulties, thereby reducing individual producers' burden under the statute while rendering it easier for the PRO to fulfil source reduction and recycling rate requirements. The Legislature could not reasonably have intended CalRecycle's granting of exemptions to have such perverse effects.

Comment O-96-10

Article 3: Evaluations of Covered Material and Covered Material Categories

Section 18980.3.3. Eligibility to be Labeled Compostable

Section 18980.3.3(c)(4)(A)

Regulatory text

(A) Producers shall maintain documentation demonstrating that this exemption applies while the covered material items are offered for sale, sold, or distributed and for three years thereafter. The documentation must:

...

(ii) Identify all substances present in the covered material items, including those that are used as ingredients to produce the items or are adhered to the items. Upon request by the Department, the Independent Producer, PRO, or producers of the covered material shall provide a written description of any substance identified pursuant to this

paragraph. The description shall demonstrate that the substance does not constitute plastic.

CAA Response

This section requires producers to maintain certain documentation but then requires the PRO to be able to reference that documentation upon CalRecycle's request.

CAA recommends removing the reference to the PRO in section 18980.3.3 (c)(4)(A)(ii), ensuring consistency with section 18980.3.3(c)(4)(A), which places the responsibility for maintaining documentation exclusively on producers. This approach will ensure accurate reporting, support regulatory compliance, and align responsibility with those who have direct control over product composition.

CAA Recommendation

Amend section 18980.3.3(c)(4)(A)(ii) to remove reference to the PRO:

Upon request by the Department, the Independent Producer, ~~PRO,~~ or producers of the covered material shall provide a written description of any substance identified pursuant to this paragraph. The description shall demonstrate that the substance does not constitute plastic.

Response to O-96-10

Comment rejected. The cited provision (18980.3.3(c)(4)(A)(ii)) imposes no general obligation on the PRO to request the documentation described in (c)(3)(A), removing the reference to the PRO cannot have any of the effects identified by the commenter. If anything, establishing that the PRO can, as it deems appropriate, obtain information about covered material claimed to be compostable can only enhance the PRO's general knowledge and ability to implement its program. Accordingly, no change is justified.

Comment O-96-11

Section 18980.3.4. Independent Third-Party Validation for Postconsumer Recycled Content

Section 18980.3.4(b)(4)

Regulatory text

(b) The Department shall approve an alternative compliance formula as part of a PRO's plan only if the plan establishes the following:

...

(4) That postconsumer recycled content used in covered material can be validated by the Association of Plastic Recyclers through its APR Postconsumer Resin Certification Program for purposes of validating the comparison described in paragraph (1). Alternatively, the plan may propose a different third party to perform the validations. ...

CAA Response

As CAA has previously commented, the requirement for the use of APR's Postconsumer Resin Certification Program, or alternatively a different third party to perform the validation, implies that there can only be one certification program used to validate post-consumer recycled (PCR) content for the purpose of the alternative compliance formula. This requirement is not aligned with the statute, where PRC 42057(a)(2)(B) clearly states that "A producer shall only receive this alternative source reduction credit if the postconsumer recycled content is able to be validated and is

validated by a third party, such as the Association of Plastic Recyclers, through its APR Postconsumer Resin Certification Program, or a similar third party approved by the department…."
CAA supports allowing multiple third parties to validate PCR content, as per statute, and recommends that the draft regulatory text reflect that.
Additionally, the draft regulations are not clear on the role of the "different thirdparty to perform the validations." Validations for third-party certifications are performed by certification bodies (who are the ones accredited to ISO 17065). The regulations currently endorse APR (a standard owner, which does not conduct validations) and seemingly an alternative third-party certification body. These are not the same and should be consistent. CAA recommends the regulations lay out a process to approve certification standards, not certification bodies. Each standard already endorses selected ISO 17065-compliant certification bodies to serve on their behalf.
As suggested in the recommended regulation change, CAA proposes an approach to allow certification standards to be used to validate PCR content in source reduced packaging. In the program plan, CAA will recommend a criteria-based framework method for evaluating valid certification standards. In a criteria framework, an open, holistic set of credible certification requirements will be identified, and standard owners can apply for approval, displaying how their program meets or exceeds the requirements. This will allow for endorsement of all qualified third-party certifications employed by producers.
The criteria will be compiled using certification best practices agreed via cross industry resources – namely, the Federal Trade Commission (FTC)'s Green Guides, U.S. Plastics Pact PCR Certification Principles, ISEAL Code of Good Practice, and ANSI Accredited Standard Development Process. Such requirements include the use of ISO 17065-compliant certification bodies, transparent consensus development with opportunity for public comment, adherence to identified ISO 22095 chain of custody methods, and ISO 14021 definitions of post-consumer content.
CAA Recommendation
Amend section to allow multiple third-party PCR certification standards to be approved by CalRecycle:
Regulatory text
(b) The Department shall approve an alternative compliance formula as part of a PRO's plan only if the plan establishes the following:
...
(4) That postconsumer recycled content used in covered material can be validated by the Association of Plastic Recyclers through its APR Postconsumer Resin Certification Program for purposes of validating the comparison described in paragraph (1). Alternatively, the plan may propose ~~a different~~ other third-party standards to ~~perform the validations~~ which validations may be performed against. ...

Response to O-96-11

Comment rejected. Requiring a producer responsibility plan to identify a single certification program is appropriate because it ensures consistency and comparability among the producers to which the alternative compliance formula is applied. This approach is consistent with statute. For one, statute is

ambiguous: It does not explain whether "a third party" refers to one third party for all validations or any third party for each individual validation. Accordingly, CalRecycle has exercised its authority to interpret statute as appropriate, given the context. Moreover, even if the phrase "a third party" were not ambiguous, statute expressly authorizes CalRecycle to exercise its discretion over whether to approve any third party. It is within CalRecycle's discretion, for example, to determine that approving only one certifier in connection with any producer responsibility plan is reasonably necessary to ensure that the alternative compliance formula applies to participating producers uniformly.

Comment O-96-12

Article 4: Responsible End Markets
Section 18980.4. Responsible End Market Criteria
Section 18980.4(a)(4)

Regulatory text

(B) Covered material partially or wholly comprising plastic and intentionally included in the process used to generate a recycled organic product must fully biologically decompose, and the recycled organic product must meet standards necessary to be sold into the marketplace. Full biological decomposition of compostable plastic refers to the complete biodegradation and disintegration of the material under controlled composting conditions, resulting in its conversion to carbon dioxide, water, biomass, and inorganic compounds, with no visible, distinguishable, or toxic residues remaining after the composting cycle. The entity must neither dispose of undecomposed material intentionally included in the process nor send it to another entity that subsequently disposes of it, and the entity must ensure that it fully biologically decomposes, through additional processes conducted either by the entity or by subsequent entities to which the material is transferred. Covered material inadvertently included in the process that remain undecomposed shall be considered incompatible materials and are subject to paragraph (3) of subdivision (a).
(C) For covered material comprising fiber or paper substrates (without a plastic component) or wholly derived from natural resources not of mineral or fossil fuel origin, the covered material intentionally included in the process used to generate a recycled organic product must biologically decompose and may be processed in a manner consistent with the management of other feedstocks to produce a marketable product that complies with standards found in sections 17868.2, 17868.3 and 17868.3.1 of Article 7 of Chapter 3.1 of Division 7 of Title 14 of the California Code of Regulations or in sections 17896.59, 17896.60, and 17896.61 of Article 6 of Chapter 3.2 of Division 7 of Title 14 of the California Code of Regulations, as applicable.

CAA Response

As written, the language creates stricter decomposition requirements for compostable plastic than for compostable fiber or paper substrates. As CAA has previously commented, composting of packaging is still a relatively new process, and compostable

plastic, as well as feedstocks derived from other natural resources, face unique processing challenges. They cannot and should not be held to a stricter standard than other materials. CAA believes its incentive-based approach and funding eligibility requirements can play a significant role in ensuring all certified compostable packaging is managed appropriately.

CAA Recommendation

CAA recommends that compostable plastic and other non-fiber materials recycled into an organic product be subject to the same decomposition requirements as those pertaining to fiber or paper substrates (without a plastic), meaning allowing compostable plastics to be processed in a manner that produces a marketable feedstock that complies with the California Code of Regulations.

Response to O-96-12

CalRecycle rejects this comment. See the response to comment B-6-5.

Comment O-96-13

Article 6: Requirements for the Producer Responsibility Organization
Section 18980.6.5. Annual Reports
Section 18980.6.5
Regulatory text
(a) A PRO shall submit the annual report required by section 42051.3 of the Public Resources Code in two phases, as provided in this section.
(b) The first phase shall be submitted no later than July 1 of each year after the Department has approved or conditionally approved a PRO plan pursuant to section 18980.6.2. In this phase, a PRO shall submit to the Department the information described in subdivisions (a)(2) and (a)(3)(B), (C), (D), and (E) of section 42051.3 of the Public Resources Code, as well as any results of the independent audit described in subdivisions (b) and (c) of section 42054 of the Public Resources Code.
(c) The second phase shall be submitted no later than October 1 of each year after the Department has approved or conditionally approved a PRO plan pursuant to section 18980.6.2. In this phase, a PRO shall submit to the Department the information described in (a)(3)(A) of section 42051.3 of the Public Resources Code.
CAA Response
CAA appreciates the two-phased reporting mechanism that will allow for different information to be reported in July and October of each year.
As currently written, under section 18980.6.5. (b), the draft regulations require source reduction data to be reported in the first phase of the annual report, due July 1 of each year. The source reduction data is identified by subdivision (a)(3)(E) of PRC 42051.3.
The source reduction data will rely on supply data that producers will submit to CAA on May 31 of each year. As CAA has consistently communicated to CalRecycle and producers, the May 31 annual supply data deadline was selected to harmonize

producer reporting requirements across all U.S. states with EPR programs.
This timeline means that, for source reduction data to be included in first phase of the annual report due July 1, data would need to be rigorously reviewed and finalized into a finished annual report in less than four weeks. This is not a feasible timeline to review and report accurate data.
To fix this problem, CAA proposes moving the source reduction data reporting requirement to the second phase of the annual report, due Oct. 1 of each year. This will allow for significantly more time for data review.
The first-phase report in July would still include information about the PRO's finances, names and contact information for each plan participant, a description of outreach and education activities, and a report on activities the PRO has taken to implement each provision of the plan, as outlined in PRC 42051.3.
CAA Recommendation
CAA proposes the following changes to the text to move the source reduction data reporting requirement into the second phase of the annual report:
(a) A PRO shall submit the annual report required by section 42051.3 of the Public Resources Code in two phases, as provided in this section.
(b) The first phase shall be submitted no later than July 1 of each year after the Department has approved or conditionally approved a PRO plan pursuant to section 18980.6.2. In this phase, a PRO shall submit to the Department the information described in subdivisions (a)(2) and (a)(3)(B), (C), and (D)~~, and (E)~~ of section 42051.3 of the Public Resources Code, as well as any results of the independent audit described in subdivisions (b) and (c) of section 42054 of the Public Resources Code.
(c) The second phase shall be submitted no later than October 1 of each year after the Department has approved or conditionally approved a PRO plan pursuant to section 18980.6.2. In this phase, a PRO shall submit to the Department the information described in (a)(3)(A) and (a)(3)(E) of section 42051.3 of the Public Resources Code.

Response to O-96-13

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42051.3, 42057, and 42060, and the recommended change is not necessary to the implementation of the Act. PRC section 42051.3(a)(1) requires a PRO to annually submit to CalRecycle an annual report and budget that describes how the PRO is implementing the approved plan and how the PRO has complied with the requirements of the Act. PRC section 42051.3(b) provides that the annual report must describe the PRO's progress made toward meeting or exceeding the requirements of PRC section 42050, including the source reduction requirement of PRC section 42050(a), and must include an evaluation of whether the PRO is reasonably likely to meet those requirements. PRC section 40251.3(a)(3)(E) specifically requires the annual report to include the source reduction data specified in PRC section 42057(c). Section 18980.6.5 of the proposed regulations implements these requirements by establishing a two-phase annual report submission timeline: (1) the first phase, due July 1 of each year, must

include all retrospective data required under PRC section 42051.3(a)(3) concerning the prior year's performance and financials (18980.6.5(b)); and (2) the second phase, due October 1 of each year, must include all prospective data required under PRC section 42051.3(a)(3) concerning the upcoming year's budget and fee schedule (18980.6.5(c)). The requirement for source reduction data to be included in the first phase of the annual report on July 1 of each year is necessary to ensure CalRecycle can effectively oversee the implementation of the Act and perform its enforcement duties. As set forth under PRC sections 42050(a) and 42057(a), the PRO is required to achieve specified source reduction targets by 2027, 2030, and 2032. A submission deadline of July 1 is necessary to ensure CalRecycle has sufficient time and opportunity to review and evaluate such data to determine whether a PRO is complying with its source reduction requirements prior to the effective date of any source reduction target. An alternative submission deadline of October 1 would not provide CalRecycle with sufficient time to perform its oversight and enforcement duties prior to January 1 of the relevant years. Additionally, because source reduction data under PRC section 42057(a)(3)(A) is based on the prior year's performance, a submission deadline of October 1—nine full months after the prior year has concluded—would cause unnecessary delay to CalRecycle's ability to enforce against violations that occurred during that year. Therefore, the proposed timeline for the inclusion of source reduction data under PRC section 42051.3(a)(3)(E) in the first-phase of the annual report strikes an appropriate balance between giving producers and a PRO sufficient opportunity (six months) to compile, prepare, and submit such data from the prior year once that year has concluded and providing CalRecycle with sufficient opportunity (six months) to review and evaluate the data for compliance in advance of any relevant enforcement timelines, without allowing for the unnecessary or extended delay for any necessary enforcement actions to be initiated.

Comment O-96-14

Section 18980.6.7. Eco-Modulated Fee and Fee Schedule
Section 18980.6.7(f)

Regulatory text

(A) In setting the base fee rates, a PRO shall include a justification of each rate, or of the methodology used to derive rates.

CAA Response

CAA is building upon its existing fee-setting methodology and is exploring the option of including a base unit fee per plastic component that complements the weight-based fees. As written, the draft regulations do not specify whether alternative fee structures are permissible beyond the weight-based fee mechanism. CAA proposes adding text that offers flexibility for the PRO include additional features in the fee structure that can be leveraged to meet and encourage producer behavior to achieve the SB 54 goals.

CAA Recommendation

Revise the section to read:

(A) In setting the base fee rates, a PRO shall include a justification of each rate, or of the methodology used to derive rates, in addition to any other alternative fee structure that the PRO may consider for approval in the plan.

Response to O-96-14

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42051.1, 42053, and 42060, and no change is necessary to the implementation of the Act. PRC section 42053(a) makes clear that the PRO is responsible for establishing and developing a producer fee schedule, including fees that are adjusted using malus fees or credits based on the factors specified in PRC section 42053(e). Section 18980.6.7 of the proposed regulations implements these requirements by clarifying that the PRO retains significant discretion is establishing the producer fee schedule and developing methodologies for setting producer fees. Specifically, section 18980.6.7(e) permits the PRO to set applicable base fee rates and only requires the PRO to provide CalRecycle with a justification of each rate or of the methodology used to derive rates. Therefore, CalRecycle's review and oversight role will be limited to a determination of whether the rate or methodology utilized by the PRO is reasonable and appropriate. The proposed regulations already provide the PRO with sufficient flexibility and discretion to utilize appropriate methodologies in establishing the producer fee schedule, including by incorporating a base unit fee per plastic component. No further changes are necessary.

Comment O-96-15

Section 18980.6.7

Regulatory text

(i) Pursuant to paragraph (4) of subdivision (e) of section 42053 of the Public Resources Code, a PRO shall charge a malus fee to producers who use covered material that contains a chemical listed on the list established pursuant to section 25249.8 of the Health and Safety Code.
(j) Pursuant to paragraph (7) of subdivision (e) of section 42053 of the Public Resources Code, a PRO shall provide a credit for producers who use plastic covered material derived from renewable materials.

CAA Response

In statute, PRC 42053(e) states that the PRO may choose “any” of a list of ecomodulation factors to adjust fees using malus fees and credits, with a producer’s inclusion of certain chemicals or use of renewable materials as just two options on that

list. However, as written in the draft regulations, Section 18980.6.7 subsections (i) and (j) make a malus for use of certain chemicals and a credit for a producer's use of renewable materials mandatory, rather than optional. CAA believes the draft regulations go beyond what is outlined in statute.

CAA Recommendation

Revise the text to reflect that the PRO has the option to adjust fees based on any of the eco-modulation factors, but that it's not mandatory to adjust fees based on a specific factor:

(i) Pursuant to paragraph (4) of subdivision (e) of section 42053 of the Public Resources Code, a PRO may ~~shall~~ charge a malus fee to producers who use covered material that contains a chemical listed on the list established pursuant to section 25249.8 of the Health and Safety Code.
(j) Pursuant to paragraph (7) of subdivision (e) of section 42053 of the Public Resources Code, a PRO may ~~shall~~ provide a credit for producers who use plastic covered material derived from renewable materials.

Response to O-96-15

CalRecycle rejects this comment. See the response to comment O-91-11. PRC section 42053(e) requires a PRO to adjust producer fees using malus fees or credits based on the factors specified in that section, including the factors implemented in sections 18980.6.7(i) and (j) of the proposed regulations. However, the PRO has significant discretion in determining the amount of such adjustments. No change is necessary.

Comment O-96-16

Article 8: Producer Responsibility Plan Requirements
Section 18980.8.3. Source Reduction Adjustments
This section was removed entirely in the May 2025 draft regulations.

CAA Response

As CAA has outlined in previous comments, the deletion of this section is concerning because it provided much needed clarity regarding the adjustment factors that will be required to account for the increase or decrease in the number of producers participating in the producer responsibility plan and fluctuations in economic conditions. For the PRO to be able to set enforceable source reduction agreements with its producers and, further, to enact plans to achieve the source reduction targets, the PRO must have the ability to account for economic fluctuations, or risk falling short of targets despite best efforts due to impacts that are outside of its control.

CAA Recommendation

Reinstate the entire section.

Response to O-96-16

Comment rejected. The commenter references the removal of "Section 18980.8.3," but the currently proposed regulations are the only regulations relevant to this rulemaking. Without including that section for CalRecycle to consider, there is no alternative text for CalRecycle to consider. Nevertheless, CalRecycle understands the commenter to propose some method for the PRO's plan to allow adjustment of its source reduction requirements. CalRecycle declines to make such a change because it would be unnecessary and contrary to statute, which contemplates no adjustment to the requirement stated in Public Resources Code section 42057(a). Moreover, the statute does not preclude the PRO plan from having provisions accommodating fluctuating economic conditions, and the Act already has multiple provisions accounting for the problem the commenter describes. Section 42057(f)(1) requires the PRO to give credit to producers that achieved reductions from 2013 to 2022. Section 42057(g) requires the PRO to penalize producers that add new covered material and to optimize their packaging; in other words, when a producer expands its usage of covered material, statute clearly intended that the producer would face an enhanced burden. Lastly, 42057(h) is expressly directed at "ensur[ing] source reductions achieved by January 1, 2032, are not lost after [that date] while still allowing for businesses to grow." These provisions reflect a clear intent for the PRO not to have flexibility to alter how the PRO's overall source reduction will be evaluated (i.e., neither the goal nor the calculation of source reduction can be adjusted). To the extent fluctuating economic conditions put satisfaction of the source reduction requirement at risk, statute clearly puts the burden on the PRO to account for that risk.

Comment O-96-17

Article 9: Source Reduction Baseline Report and Annual Reports
Section 18980.9.1. Annual Reports
Section 18980.9.1(d)

Regulatory text

(d) For the PRO, the annual report shall additionally include:
(1) In the second phase of the annual report, as described in subdivision (c) of section 18980.6.5, fee schedule amendments pursuant to subdivision (e) of section 42053 of the Public Resources Code as a result of adjustments, including calculations for malus fees or credits.
(2) In its first phase of the annual report, as described in subdivision (b) of section 18980.6.5, the following information with respect to source reduction:
(A) Percentage of reduction across all participant producers.
(B) A qualitative assessment of the successes and challenges achieving source reduction goals, delineated by plastic covered material category, which ranks the relative frequency of use of each source reduction strategy.

(C) A quantitative assessment of source reduction achieved through reuse and refill strategies. The assessment shall assess the percentage of reduction in new material produced, detailing the reduction in the number and weight of plastic components through shifting to reusable or refillable packaging or food service ware and elimination of plastic components.
(D) Source reduction percentage by weight achieved through an alternative compliance formula pursuant to subclause (i) of subparagraph (B) of paragraph (2) of subdivision (a) of section 42057 of the Public Resources Code and approved by the Department as part of the PRO's plan.

CAA Response

As outlined above in CAA's comments on Section 18980.6.5. Annual Reports, under the current draft regulations, the timeline for collecting and reporting source reduction data would be extremely difficult to meet. The data required for the reporting outlined in section 18980.9.1(2) will be reported to CAA by producers on May 31 of each year. The draft regulations currently require CAA to incorporate this data into the first phase of the annual report by July 1.

CAA recommends moving this source reduction data reporting requirement to the second phase of the annual report, due Oct. 1 of each year, allowing for significantly more time for data review.

CAA Recommendation

Revise Section 18980.9.1(d)(2) to indicate that source reduction reporting shall be included in the second phase of the annual report, due Oct. 1. of each year, in line with CAA's proposed edits to section 18980.6.5(b-c):

(d) For the PRO, the annual report shall additionally include:
(1) In the second phase of the annual report, as described in subdivision (c) of section 18980.6.5, fee schedule amendments pursuant to subdivision (e) of section 42053 of the Public Resources Code as a result of adjustments, including calculations for malus fees or credits.
(2) In ~~its first~~ the second phase of the annual report, as described in subdivision (~~b~~c) of section 18980.6.5, the following information with respect to source reduction:
(A) Percentage of reduction across all participant producers.
(B) A qualitative assessment of the successes and challenges achieving source reduction goals, delineated by plastic covered material category, which ranks the relative frequency of use of each source reduction strategy.
(C) A quantitative assessment of source reduction achieved through reuse and refill strategies. The assessment shall assess the percentage of reduction in new material produced, detailing the reduction in the number and weight of plastic components through shifting to reusable or refillable packaging or food service ware and elimination of plastic components.

(D) Source reduction percentage by weight achieved through an alternative compliance formula pursuant to subclause (i) of subparagraph (B) of paragraph (2) of subdivision (a) of section 42057 of the Public Resources Code and approved by the Department as part of the PRO's plan.

Response to O-96-17

CalRecycle rejects this comment. The current reporting structure was intentionally designed to ensure timely evaluation of progress toward the statutory source-reduction goals established including section 42057(a) of the PRC, as well as to align with the Department's annual compliance assessment cycle. Further, section 42052 of the PRC requires that the PRO provides information necessary for the department to determine compliance on an annual basis. For CalRecycle to sufficiently accomplish such statutory provisions, CalRecycle must receive source-reduction data early enough in the calendar year to have sufficient time to review, analyze, and make determinations according said data. Thus, the July 1 deadline provides the Department with approximately six months to review, validate, request any necessary clarifications, corrections, or additional information before year-end, consistent with the oversight framework in PRC § 42053(e) and the enforcement provisions in Article 13 of the proposed regulations. This July date is already a compromise between adequate time for the department to meet its statutory requirements, while balancing the needs of reporting entities. Shifting the source-reduction data to the October 1 deadline as the commenter requests would not provide adequate time for CalRecycle to evaluate the reported data as discussed above, and overall make it operationally infeasible for CalRecycle accomplish the statutory requirements.

Again, this proposed regulation establishes a balance by allowing adequate time for all reporting entities to gather the necessary information for the report, while also ensuring CalRecycle receives the information as expeditiously as possible to make any necessary updates to the source reduction baseline. Further, the July 1, 2026 date also aligns with the annual reporting dates including section 18980.6.5(a), which should make for more efficient reporting. As this regulation is necessary for implementation of the act and aligns with statutory requirements while striking a balance between both adequate time for the reporting entities and adequate time for the Department, no change is required as it would undermine the above. Please also see responses to comments B-27-2, I-63-15, O-48-5 and O-41-4.

Comment O-96-18

Article 10: Registration and Data Reporting Requirements

Section 18980.10.1. Data Reporting Submission and Section 18980.10.2. Data Report Contents

Section 18980.10.1(c)

Regulatory text

(c) Reports shall:
(1) Be due on July 1 of each year, except for the PRO's initial report, which shall be submitted with its producer responsibility plan when that plan is submitted pursuant to subdivision (a) or (b), as applicable, of section 18980.6.1.
(2) Be submitted electronically using the Department's online reporting system or in another manner established by the Department.
(3) Report data pertaining to the previous calendar year. The reporting entity shall use the covered material category list that was current as of January 1 of the previous calendar year for purposes of reporting.
Section 18980.10.2(a)
Regulatory text
(a) Reports submitted pursuant to section 18980.10.1 shall contain the following information for all covered material for which the reporting entity was the producer or, for a PRO, for which its participant producers were the producers:
(1) For the previous calendar year, for each covered material category:
(A) The total weight of material, sold, distributed, or imported in or into the state.
(B) The total number of plastic components sold, distributed, or imported in or into the state.
(C) The total weight of material disposed of.
(D) The total weight of material recycled.
CAA Response
As CAA commented above on Section 18980.6.5. Annual Reports, and Section 18980.9.1. Annual Reports, CAA is concerned about the extremely tight timeline of incorporating supply and source reduction data (which CAA receives on May 31) in annual reports due July 1.
CAA has similar concerns about the data reporting requirements outlined in Section 18980.10. As written, the regulations require CAA to submit data reports on July 1 annually that include information CAA will receive only on May 31, allowing for less than four weeks for a rigorous data review. This is not a feasible timeline.
In line with the two-phased annual reporting system, CAA proposes a two-phased data reporting system. The first data report would be due July 1, in which CAA would report on the data points covered in Section 18980.10.2(a)(1) (C-D). These data points – the total weight of material disposed of and the total weight of material recycled – will be available to CAA much closer to the beginning of each calendar year, allowing for ample time for data review before reporting to the Department on July 1.
Under this system, a second data report would be due Oct. 1 of each year, and this submission would cover the data points outlined in Section 18980.10.2(1)(A-B). These data points cover the weight-based supply data CAA receives from producers on May 31. Creating this second annual data report submission will allow for an additional three months for data review.
CAA Recommendation
Revise Section 18980.10.1(c) as follows:
(c) Reports shall:
(1) Be due ~~on July 1~~ in two phases of each year, as provided in this section.~~, except for the PRO's initial report, which shall be submitted with its producer responsibility plan~~

~~when that plan is submitted pursuant to subdivision (a) or (b), as applicable, of section 18980.6.1.~~
(2) The first phase shall be submitted no later than July 1 of each year, except for the PRO's initial report, which shall be submitted with its producer responsibility plan when that plan is submitted pursuant to subdivision (a) or (b), as applicable, of section 18980.6.1.
(3) The second phase shall be submitted no later than October 1 of each year.
(~~2~~4) Be submitted electronically using the Department's online reporting system or in another manner established by the Department.
(~~3~~5) Report data pertaining to the previous calendar year. The reporting entity shall use the covered material category list that was current as of January 1 of the previous calendar year for purposes of reporting.
Revise Section 18980.10.2. (a) as follows:
a) Reports submitted pursuant to section 18980.10.1 shall contain the following information for all covered material for which the reporting entity was the producer or, for a PRO, for which its participant producers were the producers:
(1) For reports submitted July 1 pursuant to subsection (2) of 18980.10.1, for the previous calendar year, for each covered material category:
(A) ~~The total weight of material, sold, distributed, or imported in or into the state.~~ The total weight of material disposed of.
(B) ~~The total number of plastic components sold, distributed, or imported in or into the state.~~ The total weight of material recycled.
~~(C) The total weight of material disposed of.~~
~~(D) The total weight of material recycled.~~
(2) For reports submitted October 1 pursuant to subsection (3) of 18980.10.1, for the previous calendar year, for each covered material category: (A) The total weight of material, sold, distributed, or imported in or into the state. (B) The total number of plastic components sold, distributed, or imported in or into the state.
(~~2~~3) Pursuant to paragraph (3) of subdivision (a) of section 42052 and paragraph (4) of subdivision (a) of section 42052 of the Public Resources Code, for covered material collected and recycled through a program other than curbside collection programs, for each covered material category, the first phase data report shall include:
(A) Identification of each alternative collection program.
(B) The total weight of covered material collected by each program.
(C) The total weight of covered material that is recycled by each program.

Response to O-96-18

CalRecycle rejects this comment. The current reporting structure was intentionally designed to ensure timely evaluation of progress toward the statutory established requirements including sections 42057 and 42052 of the PRC which requires CalRecycle to obtain the relevant data to determine whether the recycling rates are being met and ensure compliance and program performance, as well as to align with the Department's annual compliance assessment cycle. Further, to ensure compliance with statutory requirements and determine the recycling rate, the PRC requires that the PRO provides data and information necessary for the department to determine compliance on an

annual basis. Again, in order for CalRecycle to determine compliance with the act, it is paramount that the department obtain the requisite information as early as possible to analyze and determine whether recycling rates are being met and the Act is being complied with. This cannot be accomplished until they have received and can analyze said date as outlined in statute and further clarified in regulations.

Thus, the July 1 deadline provides the Department with approximately six months to review, validate, request any necessary clarifications, corrections, or additional information consistent with the oversite framework in the PRC and the enforcement provisions in Article 13 of the proposed regulations. This July date is already a compromise between adequate time for the department to meet its statutory requirements, while balancing the needs of reporting entities. Shifting the reporting to the October 1 deadline as the commenter requests would not provide adequate time for CalRecycle to evaluate the reported data as discussed above, and overall make it operationally infeasible for CalRecycle to determine the recycling rates and accomplish the statutory requirements. Please also see responses to comments O-96-17, B-27-2, I-63-15, O-48-5 and O-41-4, which further address the commenter's concerns, as well as addressing the source reduction and corresponding reporting.

Comment O-96-19

Article 13: Enforcement Oversight by the Department
and Administrative Civil Penalties
Section 18980.13. Compliance Evaluation and Determination
Section 18980.13(g)

Regulatory text

(g) For requirements of the Act or this chapter that apply generally to participants in a PRO plan, such as the requirement to ensure that covered material sold, offered for sale, imported, or distributed in the state achieves the requirements set forth in sections 42050 and subdivision (i) of 42057 of the Public Resources Code, the failure to meet such requirements is a violation by the PRO for each plan participant that is a producer of the covered material at issue, except those to which the Department has issued an individual notice of violation for such failure. For example, if any participating producers continue offering for sale products that use covered material in a particular covered material category that does not meet the recycling rate requirements of subdivision (c) of section 42050 or subdivision (i) of section 42057 of the Public Resources Code, those producers of covered material in that category have violated their obligation under that section, and either the PRO or the individual participating producers may be penalized pursuant to section 42080 of the Public Resources Code for each such violation. Notwithstanding the foregoing, penalties shall not be imposed on the PRO for violations of subdivision (i) of section 42057 of the Public Resources Code that occur before approval of the PRO's plan.

CAA Response

CalRecycle has interpreted that the plastic recycling targets in PRC 42050(c) are applicable to each plastic CMC on an individual basis rather than as an aggregate target for all plastic covered material collectively.

Given the current disparate recycling rates between the various plastic CMC categories characterized as “plastic” in the CMC List (68 of 95 total CMCs), it is not reasonable that each CMC will be able to meet the recycling targets as required in the 2028, 2030 and 2032 time frame. EPR programs for packaging commonly differentiate recycling rates by broad material types, such as plastics, glass, metal, paper, rather than individual formats or resin types. With respect to plastics, the highest level of disaggregation that we have seen implemented to date is between flexible and rigid plastic formats, with flexible plastic targets always being lower than rigid plastic packaging targets.

CAA Recommendation

The explicit requirement for each plastic CMC to meet the recycling rate targets in 42050(c) as currently outlined in section 18980.13(g) of the draft regulations should be removed and replaced with either a target that all plastic single-use covered material must meet on aggregate or differentiated targets for rigid plastic versus flexible covered material.

Response to O-96-19

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act and no change is necessary to the implementation or enforcement of the Act. PRC section 42050(c) requires producers to ensure that all plastic covered material achieves the applicable recycling rates by the dates specified in that provision. PRC section 42062(c) provides that each covered material category will be assessed for compliance with PRC section 42050(c). Section 18980.13(g) of the proposed regulations clarifies how violations and penalties may be allocated between participants in a PRO plan and the PRO where a covered material category fails to comply with the rates required by PRC section 42050(c). Section 18980.13(g) of the proposed regulations is therefore consistent with the compliance requirements of PRC sections 42050(c) and 42062(c), and no change is necessary. The recommended change would be inconsistent with the requirement of PRC section 42062(c) and would create additional confusion and uncertainty.

Comment O-96-20

Section 18980.13.3. Notices

Section 18980.13.3(a)(2)

Regulatory text

a) For persons that have filed a primary business address with the Department pursuant to subdivision (c) of section 42051 of the Public Resources Code, notices of violation, notices of disciplinary action, and all accompanying documents shall be delivered by one or more of the following means:
...
(2) Email to the address on file with the Department pursuant to section 18980.10;

CAA Response

CAA recommends that "with written consent or written acknowledgment of receipt" be added to 18980.13.3(a)(2), given the possibility of emails not making it to the recipient they are destined to because of spam filters and other security safeguards, even if the email is sent to the email address on file with the Department.

CAA Recommendation

Revise section 18980.13.3 (a)(2) to read:
(2) Email to the address on file with the Department pursuant to section 18980.10 with written consent or written acknowledgment of receipt.

Response to O-96-20

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42060, 42080, and 42081, and the recommended change is not necessary to the implementation or enforcement of the Act. PRC section 42081(a) authorizes CalRecycle to issue a notice of violation to any entity not in compliance with the Act or regulations. Section 18980.10(a)(1)(H) of the proposed regulations requires a producer to file its business email address with CalRecycle, and section 18980.10(a)(3) establishes an ongoing obligation for such producer to ensure that the email address on file with CalRecycle is current and accurate. Therefore, the provision in section 18980.13.3(a)(2) of the proposed regulations already provides sufficient notice and safeguards to ensure that producers that are complying with their obligations under section 18980.10 of the proposed regulations can expect to receive notices of violation by the means described in section 18980.13.3(a)(2). Additionally, section 18980.13.3(a) provides additional safeguards by providing that CalRecycle may deliver such notices by one or more of the means described in sections 18980.13.3(a)(1)-(3). Therefore, where there is any question as to whether a producer will receive a notice delivered under section 18980.13.3(a)(2), CalRecycle can attempt additional delivery through the means described in sections 18980.13.3(a)(1) or (a)(3). No further change to the proposed regulations is necessary to ensure producers have adequate opportunity to receive a notice of violation.

O-97: Agricultural Council of California (Coalition) (Emily Rooney)

Comment O-97-1

On behalf of the undersigned organizations, we submit these comments regarding CalReycle's recent draft regulatory text for the Plastic Pollution Prevention and Packaging Producer Responsibility Act (SB 54). Collectively, we represent a broad coalition of food and agricultural associations, whose members may be subject to this regulation. We thank CalRecycle for their continued work to address concerns regarding affordability and costs associated with compliance with SB 54, however, we continue to remain concerned about overall implementation of the regulation. We look forward to working with you throughout this process.

Response to O-97-1

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-97-2

Section 18980.1(a)(17)(B). Definition of "Product that Uses Covered Materials"

We support CalRecycle's recent addition in this section highlighting that empty packaging materials are not considered single use plastic or covered materials for the purposes of this regulation. Empty packaging may or may not enter the commerce stream in the state of California and therefore should not be considered under compliance until it is purchased, filled and sold, by the producer for the user or consumer, into the supply chain in California.

Response to O-97-2

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-97-3

Section 18980.1.1. Producer Identification

In Section (c), we propose the following language be added for clarity (suggested new language in italics):

"(c) For covered material other than food service ware *and those identified in section 42041(e)(2) and (w)(4) of the Public Resources Code,* the producer shall be determined in accordance with this subdivision."

Response to O-97-3

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment I-63-3, which is substantively the same as this comment.

Comment O-97-4

ARTICLE 2: Covered Material and Covered Material Categories
Section 18980.2. Categorically Excluded Materials

The coalition remains supportive of the categorical exclusions for food and agriculture products that are under certain state and federal guidance or regulations. Issues such as protecting human and environmental health through food safety practices, and the prevention of the spread of pests and diseases are paramount when providing food and agricultural products (and their packaging) for consumers.

In Section 18980.2(2)(A), we propose the following language be added for clarity and specificity (suggested new language in italics):

Any entity that has determined that packaging is not covered material pursuant to paragraph (2) of subdivision (a) shall notify the Department and provide both a specification for the packaging or packaging component and the associated product(s) along with a summary of the basis for its determination. The basis shall identify the specific provision of this Chapter that causes a conflict, cite the conflicting federal *and/or state* regulations, rules, or guidelines, *applicable to food and agriculture* and explain why no reasonably possible alternative packaging or packaging component is available. The Department shall maintain on its website a publicly available electronic database of each such determination that includes the entity name, the specification for the packaging and the associated product(s), and the status of any review by the Department of such determination.

At this time, there are not economically viable alternatives available to plastic packaging for many food and agricultural products throughout the supply chain and pursuing a change in the packaging will result in an increase in food prices and food waste. Some commodities are cooked or pasteurized within the package to properly sterilize the food and reduce the chances of contamination and spread of food borne illnesses. This method keeps the product and inside of the package completely pristine and shelf-stable until the package is opened.

Pursuing a change in packaging is a multi-step process that involves identification of materials and testing of the prototype for biological and structural stability. For shelf-stable foods, the testing spans twelve months at minimum. The food used for the testing process must be discarded. It is routine protocol that products that are in the experimental process for packaging testing and validation cannot be sold for human or animal consumption therefore resulting in excessive food waste.

Packaging changes could also require new machinery upgrades and/or entirely new equipment, since packaging lines are specifically designed by material type and package size. If new machinery must be purchased, a single food processing machine can cost $30 million to $100 million. In many cases, these costs are unsustainable for agricultural businesses and will lead to business closure or relocation out of the state. In rare cases, where an agricultural business can sustain this cost increase it will be

passed through the supply chain to the consumer. None of this includes the actual costs into research and development for new packaging or the costs for implementing the regulation.

In an effort to transition to other packaging alternatives, millions of dollars will be spent throughout the food supply chain, increasing food prices, and generating excessive food waste. For these reasons and many others, it is critical that CalRecycle maintain a workable "Categorical Exclusion," that provides an option for potential producers that do not have a "reasonable" alternative to prevent negative impacts to the food and agricultural supply.

Response to O-97-4

CalRecycle partially accepts and partially rejects this comment as described in response to comment I-63-4, which is substantively identical to this one.

Comment O-97-5

Section 18980.2(a)(2)(A). Categorical Exclusion Reporting and Disclosures

Our coalition is concerned about Section 18980.2.(a)(2)(A) and its requirement of CalRecycle to publish, on a publicly available electronic database, the entity name and product specifications, of producers seeking exclusions based on conflicting regulations. While CalRecycle is mandated to withhold from the public information that may be identified as a trade secret, this is not sufficient assurance that information about producer products will not be released to the public and potential competitors. It is highly likely these entities could become a target for litigation or public shaming. Entities should not be exposed to targeting by the public or competitors for determining a product falls within the categorical exclusion for any reason.

In Section 18980.2(a)(2)(A), we propose the following language be added for clarity (proposed additions in italics and deletions in bold strikethrough):

"(A) The Department shall maintain on its website a publicly available electronic database of each such determination that includes the entity name, *a general description of* ~~**the specification for**~~ the packaging and the associated product(s), and the status of any review by the Department of such determination

Response to O-97-5

CalRecycle partially accepts and partially rejects this comment as described in response to comment I-63-5, which is substantively identical to this one.

Comment O-97-6

Section 18980.2.(a)(2)(B). Determination of Non-Qualification

The coalition supports CalRecycle's overall approach to enforcement including engaging state agencies such as the California Department of Food and Agriculture (CDFA) and California Department of Public Health (CDPH) throughout the process. However, it is likely that entities that are found out of compliance for

packaging or components may not be able to ensure compliance within 180 days. If there are further requirements to transition safely to alternative compliance options such as additional research or machinery replacement, this can take much longer than the allotted 180 days. We urge CalRecycle to consider alternative compliance pathways for businesses working in a good faith effort to transition out of plastic packaging.

Response to O-97-6

CalRecycle partially accepts and partially rejects this comment as described in response to comment I-63-6, which is substantively identical to this one.

Comment O-97-7

Sections 18980.2.2. Exclusion for Certain Types of Packaging

For the purposes of this section, CalRecycle determines that packaging used for the storage of certain products over five years is not considered covered materials. We recommend changing this threshold to one year for consistency with reporting to the Producer Responsibility Organization (PRO). This one change could create more consistency and efficiency within the reporting and compliance process.

Regarding public disclosures of de minimis, we hold the same concerns as the previous section requiring disclosures in Section 18980.2.(a)(2)(A) Categorical Exclusion Reporting and Disclosures. The coalition is concerned that public disclosures will expose the business community to legal actions and other nuisance issues.

Response to O-97-7

CalRecycle rejects this comment for the reasons provided in response to comment I-63-7.

Comment O-97-8

Section 18980.2.4. Exemptions for Certain Covered Materials

This coalition appreciates the Department's recognition of the need for exemptions of certain covered materials. However, we remain concerned about the language contained in the updated draft regulatory text suggesting exemptions last for only two years. The draft language and rulemaking processes have not substantiated any reason for this deadline which suggests a lack of specific reasoning for the two-year period. In most cases, two years will not allow sufficient time to develop alternative packaging, given the length of time to identify and test new packaging materials and subsequently obtain and install new packaging equipment. No covered material category is the same and may require reconsideration at different intervals. Thus, we strongly recommend exemption timelines be considered on a case-by-case basis that evaluates the compliance challenges with products in the exempted covered material category.

Additionally, the coalition believes that if certain packaging types are exempt, they should not be required to pay fees. By determining that a certain package is exempt, the PRO is concluding that it is necessary in some capacity and therefore it should not be subject to any of the regulatory costs associated with this process.

Response to O-97-8

CalRecycle rejects this comment for the reasons provided in response to comment I-63-8, which is substantively identical to this one.

Comment O-97-9

Section 18980.2.4. (4)(f)(2)(D): Alternative Phase-in Plans

The coalition supports allowing CalRecycle to approve alternative phase-in plans for businesses that require additional time to transition to compliance. This allows for greater flexibility for the regulated entity and CalRecycle to come to mutually agreeable, workable solutions in a timeframe that works for all parties involved.

Response to O-97-9

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process.

Comment O-97-10

Section 18980.2.5. Covered Material Category List Updates

Additional clarity is still needed with regards to the timeline in which the Department can receive and review new information for updates to the Covered Material Category (CMC) List as outlined in the revisions in Section 18980.2.5 (a) and (b).

Specifically, Section 18980.2.5(a) dictates conflicting timelines and procedures for the department to follow in updating the CMC List. Furthermore, this section does not recognize the need for regular updates throughout the calendar year to address the needs of businesses in making purchasing decisions. We urge CalRecycle to update the CMC List on a quarterly basis to accommodate updated recycling data and purchasing decisions to ensure the proper management of covered materials at the start and end of their useful life.

To provide more clarity for the Department and producers we suggest the following streamlined updates to Section 1890.2.5(a) (proposed additions in italics and deletions in bold strikethrough):

“18980.2.5 “(a) The Department shall review and, if necessary, update the CMC list *quarterly to make relevant changes* ~~**within the applicable timeframe specified by**~~ *in accordance with* subdivisions (e) or (f) of sections 42061 ~~**or subdivision (a) of sections 42092**~~ of the Public Resources Code.”

The current rate of CMC List updates has already fallen short of providing the needed clarification for producers, end-markets, and municipal sorting centers.

These recommended changes to the draft regulatory text recognize the need for more consistent updates to the CMC List. As covered materials change as a result of the Act,

annual updates will fall short of what producers, suppliers, and end-use markets need to make management and planning decisions to remain compliant and achieve the highest rate of recyclability.

Response to O-97-10

CalRecycle rejects the comment. Subdivisions (e) and (f) of sections 42061 of the PRC and subdivision (a) of sections 42082 of the PRC have their own subject matter and a requirement for an update related to that subject matter. Ignoring the requirements of sections 42082 of the PRC is inappropriate. The process set forth by regulation to review and, if necessary, update the list is completely consonant with the requirement to update the list "at least" within or "no less than" particular timeframes and no change is required. CalRecycle also rejects the suggestion that the list be reviewed and updated quarterly. A commitment to quarterly review would significantly truncate the time needed to obtain longitudinal information and to analyze that information. The regulations do not restrict CalRecycle from revising the CMC list more frequently than the statutory minimum when appropriate for the circumstances, and thus no change is required.

Comment O-97-11

Section 18980.2.6.(a). Covered Material Category List Recommendations

We urge CalRecycle to combine aseptic cartons (Category ID PF15P) and gable-top cartons (Category ID PF5P) into a single CMC.

Gable-top and aseptic cartons are widely recognized and managed within the recycling industry under a single material category (including in the EPR systems in Oregon and Colorado and on the draft list in Maine). These cartons are baled, marketed, and sold together at Material Recovery Facilities (MRFs) in California and across the country. The industry does not differentiate between gable-top and aseptic cartons when preparing bales for end markets. In fact, Recycled Materials Association's (formerly ISRI) specifications for the Grade 52 bale, keeps gable top and aseptic cartons together. The U.S. EPA, in its waste characterization studies, also keeps aseptic and gable-top cartons together in the same category. This practice reflects the reality of the recycling industry, where both types of cartons are processed and marketed together.

CalRecycle's SB 343 MCS Report issued in April 2025 found that the difference in acceptance in recycling programs between the two types of cartons is negligible and programs that stated in the past that they manage them differently in all likelihood no longer do (i.e., any implication that they are collected, sorted, or marketed separately from each other is based on outdated information). Additionally, the MCS Report found that large volume transfer and processing facilities (LVTPFs) sort both types of cartons at the same percentage for recycling and into the same output stream.

Maintaining this unnecessary distinction between the two types of cartons increases the cost to California consumers, the PRO, and CalRecycle by requiring additional

composition study sorting, additional data collection, calculation of two instead of one recycling rates, and separate cost allocation to each carton type.

We urge CalRecycle to align with industry wide recycling practices and group aseptic and gable-top cartons together into a single Covered Material Category.

Response to O-97-11

CalRecycle rejects this comment for the reasons provided in response to comment I-63-11.

Comment O-97-12

ARTICLE 3: Evaluations of Covered Material and Covered Material Categories Section 18980.3.4. Independent Third-Party Validation of Postconsumer Recycled Content
Shifting packaging away from plastic will require substantial effort and resources. Requirements of the act should be inclusive of all alternatives to plastics. Agricultural waste is a well-established waste stream with multiple alternative uses for its byproducts. Many are used in packaging or container components already. To accommodate for the use of agricultural byproducts in alternative packaging we recommend the following language be included in the Act.

In Section 18980.3.4(a)., we propose the following language be added (proposed additions in italics):
"(a) A PRO shall not apply the source reduction credit based on incorporation of postconsumer recycled content *or substitution of virgin petroleum-based plastic with plant agricultural waste,* as described in section 42057(a)(2)(B)(i) of the Public Resources Code, unless the alternative compliance formula described for doing so has been proposed and approved as part of a PRO's plan in accordance with this section."

Response to O-97-12

CalRecycle rejects this comment for the reasons stated in response to comment I-63-12.

Comment O-97-13

ARTICLE 5: Requirements for Producers
Section 18980.5. Producer Compliance
We continue to urge flexibility for producers in registering with the PRO for the first time, then what is required in subsection (a) and (d) of Section 1890.5. This regulation is extremely complex and may be unclear for certain entities that may or may not be producers as required by the Act. Requiring producers to register with a PRO 30 days after the publishing of the Act may not leave enough time for an entity to fully understand how the requirements apply to their operation. This would result in a burdensome submission of data to the PRO and Department that would be unnecessary. This is especially concerning as it requires sensitive data be submitted by private companies to the PRO which is operated by a non-governmental agency.

The Department should provide additional resources and technical assistance for California businesses to determine whether they must comply with the Act. Additionally, the PRO should be granted more flexibility to onboard new producers at a cadence workable for both the PRO and potential producer to ensure accuracy in submitted data.

Due to the uniqueness of this regulation, we recommend CalRecycle and the PRO allow for a good faith phase-in plan for the submission of 2023 data upon initial registration to the PRO. Requiring complete data for 2023 could be problematic as the types of data may or may not have existed during this timeframe. Allowing producers to provide available data with a gradual phase-in process over subsequent years will incentivize more participation into the registration process and would be a more realistic, workable solution for producers.

Response to O-97-13

CalRecycle rejects this comment for the reasons stated in I-62-4, I-62-8, and B-1-1, as well as to the extent the latter portion of the commenter's submission concerns proposed changes or objections already addressed in response to other portions of the submission, and further does not request any specific changes to these referenced regulatory sections, no further response is necessary here.

Comment O-97-14

Section 18980.5.2. Exemptions for Small Producers

This coalition would like to raise concerns regarding the exemptions for small producers outlined in the Act. Producers with gross sales within California under $1 million in the most recent calendar year may apply for an exemption. The application is subject to approval and “applicants” must register as producers before they are considered exempt. These fees and accounting obligations will surely add to the costs of our products to consumers. Entities exempted under the program should not be required to register as a producer, pay fees, or be subject to enforcement penalties. They are exempt. These entities could be allowed to simply self-certify and then be exempted entirely from the program.

Response to O-97-14

CalRecycle rejects this comment for the reasons stated in I-64-14 and I-63-14.

Comment O-97-15

ARTICLE 9: Source Reduction Baseline Report and Annual Reports
Section 18980.9. Source Reduction Baseline Report

Given the substantial delay in an approved final regulation, which subsequently delays the development of a plan from the PRO, our coalition is recommending changes to Article 9 Sections 18980.9. to accommodate for the delays.

Additionally, the current source reduction baseline report language may create confusion, as it could be interpreted to require individual producers to submit reports to the department even when they are members of a PRO. We recommend clarifying the draft regulation to be consistent with the statute (PRC 420579 (c)).

To provide more stability and accurate data for the Department and PRO we suggest the following updates to Section 18980.9(a) and Section 18980.9(c) (proposed additions in italics and deletions in bold strikethrough):

“18980.9 “(a) On or before July 1, ~~**2026**~~ 2027, all reporting entities shall submit a source reduction baseline report to the Department. The source reduction baseline report shall be submitted electronically, and at minimum, include the total amount of plastic covered material, by weight and number of plastic components, for which ~~**they were**~~ *the reporting entity was the producer or, for a PRO, for which its participant producers* were the producers in the 2023 calendar year. The weight of plastic covered material shall be measured in accordance with paragraph (15) of subdivision (a) of section 18980.1.”

“(c) The Department shall use the information reported pursuant to this section to update the source reduction baseline pursuant to subdivision (b) of section 42057 of the Public Resources Code by November 1, ~~**2026**~~ 2027.

Response to O-97-15

CalRecycle rejects this comment for the reasons stated in I-63-15 (which this comment is a duplicate of).

Comment O-97-16

ARTICLE 10: Registration and Data Reporting Requirements Section 18980.10.2. Data Report Contents

We recognize that CalRecycle must establish a baseline for the 25% reduction using 2023 as the reference year, which necessitates requiring producers to submit their 2023 supply data.

Section 18980.10.2 details the data that producers must report, including the total weight of material sold, distributed, or imported in or into the state; the total number of plastic components sold, distributed, or imported in or into the state; the total weight of material disposed of; and the total weight of material recycled.

This proposed regulation requires a level of detail that may exceed the comprehensive record-keeping practices traditionally maintained by many producers, whose existing systems were not designed to track data for this regulatory purpose and will require significant refinement. While producers are committed to meeting these requirements, we respectfully request that the regulation include "good faith" language acknowledging the challenges of this initial reporting period. Specifically, producers are being asked to retrospectively compile data spanning three years, which will often necessitate

estimates derived through various sources, rather than data tracked through systems specifically designed for this reporting purpose.

We recommend adding a Section 18980.10.2(e) and propose the following language be included (proposed additions in italics):

(e) All data reported pursuant to this chapter shall be reported to the best of the producer's ability. Reporting errors for years 2023, 2024, and 2025 will not be subject to penalties if errors were made using a reasonable basis and disclosed in good faith.

Response to O-97-16

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment I-63-16, which is substantively the same as this comment.

Comment O-97-17

Reporting Guidance:

Our coalition also wishes to raise concerns with the "Covered Material Categories Reporting Guidance" issued by CalRecycle on September 2, 2025, and CAA's related draft reporting instructions. We have identified several challenges that create unnecessary burdens and duplicate work compared to reporting structures already implemented in Oregon and Colorado.

First, CalRecycle's guidance instructs producers to treat adhesives or coatings containing polymers as plastic components. While CAA is proposing to rely on the de minimis exclusion [PRC Section 42041(s)(4)(A)] in statute for adhesives used in cardboard boxes and coatings on paperboard or metal cans, these exclusions will not be approved by CalRecycle until after the regulations are finalized. Collecting data now on the plastic content of adhesives and coatings is both labor-intensive and premature, since these materials are likely to be excluded. We request that CalRecycle and CAA allow postponement of this data collection until final decisions on de minimis exclusions are made to avoid collection of data that will not be needed for future reporting.

Second, we are concerned with the broad interpretation of "plastic component" to include items that will never be separately collected or recycled, such as adhesives or tape on cardboard boxes or tin/steel bimetal can lids. Tracking such components separately is impractical, does not contribute to measurable recycling outcomes, and represents wasted effort. The guidance requires detachable components to be reported separately, even if made of the same material and recycled through the same stream. For example, reporting can lids separately from can bodies diverges from reporting practices in Oregon and Colorado; these states instructed producers to report the entire packaging material as one item weight. While separate reporting may make sense when detachable components are made of different materials, identical components that are recycled together should be reported in aggregate.

For these reasons, we strongly encourage CalRecycle to revise its reporting guidance to avoid duplicative data collection and to harmonize requirements with other state programs. Doing so will ease compliance and reduce unnecessary costs.

Response to O-97-17

CalRecycle rejects this comment because it does not concern the proposed regulations themselves. It concerns a document that CalRecycle published separately from these proposed regulations. That document is related to the covered material categories list, which is another publication that is not part of these regulations.

Comment O-97-18

Plastic Pollution Mitigation Fund:

Lastly, our coalition underscores that strong public–private partnerships will be essential to meeting the demands of compliance under SB 54. We encourage the Department, in collaboration with other state agencies, to allocate resources for research and development of practical packaging alternatives that also meet federal and state requirements for preventing the spread of pests and disease. Investment from the Plastic Pollution Mitigation Fund, as established in statute, can play a critical role in accelerating the transition away from plastic packaging while safeguarding public health and protecting California's food and agricultural systems. Given the scope of change required, the statutory timelines cannot realistically be achieved without robust collaboration between the public and private sectors. Strategic use of the Plastic Pollution Mitigation Fund will help producers comply with the Act while advancing its environmental goals and more rapidly reducing plastic pollution in California's communities, beaches, and waterways.

Thank you for your consideration of these comments. We look forward to working with the Department and the PRO throughout the duration of this process.

Response to O-97-18

CalRecycle rejects this comment. See the response to comment I-63-18.

O-98: Ag Container Recycling Council (Mark Hudson)

Comment O-98-1

EXECUTIVE SUMMARY

The Ag Container Recycling Council (ACRC) submits these comments on the proposed SB 54 permanent regulations to request that CalRecycle adopt a regulatory pathway recognizing ACRC's established container recycling system. ACRC's preferences, in descending order, are:

1. A class-wide "Agricultural Container Recognition" under § 18980.2.7 (or equivalent new § 18980.2.8), modeled on a program-level exemption and justified by the distinct

regulatory, logistical, and operational characteristics of agricultural pesticide and chemical containers.

2. Creation of a "Qualified Stewardship Program" pathway under new § 18980.2.8, tied to the authority in § 18980.2.7 and PRC § 42051(b)(2), allowing CalRecycle to recognize long-standing, high-performing stewardship systems that already achieve SB 54 outcomes independently of the PRO.

3. A coordinated Independent Producer Plan fallback pursuant to PRC § 42051(b)(2) and §§ 18980.5 et seq., wherein ACRC members file a single, shared compliance plan referencing ACRC's system (least preferred).

4. If program-level recognition through Options 1-3 proves infeasible, ACRC requests maximum fee reductions under § 18980.6.7(e)(1)(D) for covered material categories utilizing ACRC's alternative collection program. While this approach would acknowledge ACRC's superior performance, it perpetuates duplicative cost structures that threaten program viability and is therefore the least preferred compliance pathway.

We urge CalRecycle to adopt one of pathways 1-3 in the final regulations to avoid duplicative fees (PRO fees + ACRC dues) that threaten the viability of this uniquely situated, high-performing program. Our system has consistently delivered safe processing, rural collection coverage, and verified recycling rates ranging from 37.5% to 67.1%, with a recent three-year average of 53.7%. We stand ready to provide audit data, end-market verification, and reporting assurances.

In summary, this comment letter:
• Identifies relevant proposed regulatory sections (§ 18980.2.7 and proposed § 18980.2.8) and proposes specific edits
• Presents performance evidence showing compliance with or progress toward regulatory thresholds
• Offers regulatory text establishing clear recognition criteria for proven stewardship programs
• Frames the environmental, rural, and policy rationale
• Emphasizes ACRC's willingness to collaborate with CalRecycle and the PRO
We respectfully request that CalRecycle adopt recognition of ACRC's system in the final rule, rather than forcing duplicative compliance that risks program collapse.

Response to O-98-1

Comment rejected. Although this comment references section 18980.6.7(e)(1)(D), it does not offer any substantive proposal or objection. Rather, the commenter refers to other portions of their submission. To the extent those other portions propose changes or raise objections requiring responses, CalRecycle has provided such responses elsewhere.

Comment O-98-2

1. INTRODUCTION & STANDING

Who is the ACRC?
The Ag Container Recycling Council (ACRC) is a 501(c)(6) nonprofit association that promotes and funds programs in the United States for the collection and recycling of rigid HDPE plastic agricultural chemical containers (up to and including 55 gallons) from pesticide, animal health, specialty pest control, micronutrient, biological, fertilizer, adjuvant and surfactant products. ACRC operates in 47 states as the agricultural chemicals industry's not-for-profit stewardship program.

ACRC was founded in February 1992 by 11 manufacturers, formulators or packagers of such products and was an instrumental resource in the development of the ANSI/ASABE S596 Standard, specifying how to handle, clean and recycle pesticide containers. Today, ACRC has 39 Regular Members and 19 Affiliate Member companies, funded entirely by member dues.

Why CalRecycle Should Consider These Comments
ACRC has operated a specialized agricultural container stewardship program in California for over three decades, serving as the compliance mechanism for the California Department of Pesticide Regulation's (CDPR) pesticide container recycling requirements under Food and Agriculture Code §12994 et seq. since 2012.

As a stakeholder with 33 years of proven success in agricultural container recycling, established infrastructure serving California's 58 counties, and direct obligations to both member companies and agricultural end-users, ACRC has substantial interest in ensuring SB 54's implementing regulations preserve effective existing stewardship programs while advancing the Act's environmental objectives.

2. BACKGROUND: ACRC'S PROGRAM & PERFORMANCE

Program History and Operations
ACRC began collecting in California in 1993, the first year of nationwide collection. Since inception, ACRC has collected approximately 49.3 million pounds of agricultural chemical containers in California, translating to approximately 61.6 million empty rinsed containers. Of the 49.3 million pounds collected, only 2.6 million pounds currently sit in inventory, demonstrating that ACRC has successfully recycled 95% of the plastic collected. Year-to-date in 2025, ACRC contractors have successfully recycled 1.4 million pounds of plastic (already 81% of 2025 YTD collections). Since 1992, ACRC contractors have recycled over 257 million pounds of HDPE containers to responsible end markets nationwide, including over 46 million pounds in California.

Processing Protocols
The program operates under rigorous EPA standards established in the 2006 Container and Containment Rule (40 CFR Part 165), requiring 99.99% removal of each active ingredient through triple-rinsing and decontamination protocols. This specialized decontamination process is NOT compatible with standard materials recovery facilities

(MRFs) due to pesticide residue contamination risks, meeting EPA requirements that distinguish agricultural containers from general packaging waste streams.

While FIFRA-regulated pesticide containers are statutorily exempt from SB 54, ACRC's collection system handles these alongside non-FIFRA agricultural products (fertilizers, adjuvants, surfactants, micronutrients) as an operationally unified stream. Requiring segregation would impose impractical safety and logistical burdens. ACRC seeks recognition for the entire agricultural container material stream collected through its program.

Geographic and Rural Coverage
In California, ACRC maintains statewide collection and recycling contractor coverage across a network of collection sites including farms, agricultural retailers, professional chemical applicators (ground and aerial), golf courses, nurseries, and greenhouses. This infrastructure serves rural agricultural areas where municipal collection systems are absent, inadequate, or not designed for agricultural chemical containers.

Published Recovery Rates and Documented Performance
California-specific performance data demonstrates consistent program operation and continuous improvement:

2019-2024 Collection Performance:
• Annual collection ranged from 1.7 to 2.6 million pounds
• 2024 achieved 2.39 million pounds (60.7% collection rate)
• Three-year average collection rate: 58.1%
2019-2024 Recycling Performance:
• Recycling rates ranged from 37.5% to 67.1%
• Three-year rolling averages between 39.2% and 67.1%
• Most recent three-year average: 53.7%
• 2023 peak performance: 67.1%
Long-term Growth:
• From 500,000 pounds (1993) to 2.39 million pounds (2024)
• Nearly 5x growth over program lifetime

Responsible End Markets
All collected plastic is recycled into productive end uses including agricultural drainpipe, nursery pots, landscaping edging, and underground conduit. ACRC's Technical Committee vets all end markets as suitable end uses for program plastic. ACRC also audits each end user manufacturer and manufacturing site to confirm compliance with rigorous health, safety, and environmental program requirements, maintaining complete chain-of-custody documentation from collection through verified end markets as required under § 18980.4(a)(2)(A).

3. PROBLEM STATEMENT: DUPLICATE FEES & RISK TO PROGRAM CONTINUITY

Defining the Duplicate-Fee Issue

Despite ACRC's proven performance and established infrastructure, while § 18980.2.7 provides authority for class-wide exemptions, the regulations do not explicitly recognize qualified existing stewardship programs like ACRC that already achieve SB 54 outcomes through specialized collection infrastructure operating independently of municipal systems, forcing ACRC members to pay both ACRC membership dues AND Producer Responsibility Organization (PRO) fees—a duplicative cost structure that threatens program viability and environmental outcomes.

Existing Exemption Pathways Don't Address Program-Level Recognition
The draft regulations provide two primary applicable exemption mechanisms, neither of which adequately addresses ACRC's situation:

Section 18980.2.3 (Demonstrated Recycling Rates) exempts materials from covered material status under PRC §42041(e)(2)(H) if they achieve 65-70% recycling rates through alternative collection programs. While ACRC's performance approaches these thresholds (67.1% in 2023, 53.7% three-year average), this pathway requires material-specific applications for individual container types rather than program-level recognition, creating administratively burdensome fragmentation of what is operationally a unified collection system.

Section 18980.2.4 (Unique Compliance Challenges or Health/Safety Concerns) provides exemptions based on PRC §42060(a)(3) and §42060(a)(4), but explicitly states: "The exemption does not affect the status of the single-use packaging...as covered material and does not otherwise change the obligations of producers with respect to the covered material, such as reporting and payment of PRO fees." This pathway allows continued sale of non-compliant materials but does not eliminate the duplicate fee problem.

Potential for Member Attrition
ACRC members are making time-sensitive 2026 decisions about membership and dues commitments now. Without clarity on compliance pathways that avoid duplicate fees, members cannot evaluate whether ACRC participation represents viable compliance or duplicative expense. Several members are already reconsidering membership or reducing dues payments, eroding program funding.

Impact to Agricultural Grower/Farmer Community
The administrative burden and reduced funding efficiency would ultimately harm California growers and agricultural chemical users who rely on ACRC's collection network. Rural collection sites, agricultural retailers, and on-farm collection services operate on thin margins. Reduced program funding would force service reductions in precisely the areas where municipal collection infrastructure does not exist and this unique and specialized program is depended upon by growers.

Real Environmental Consequences
If ACRC's program collapses due to duplicate fee burdens, agricultural containers will enter landfills or be burned on farms-a common practice without collection programs-

directly contradicting SB 54's environmental objectives under PRC §41780.01 and §42040. Fees paid to the PRO are unlikely to fund collection of agricultural chemical containers in rural areas, but rather to subsidize collection of materials from other industries in urban settings.

4. STATUTORY AND REGULATORY AUTHORITY FOR RECOGNITION / EXEMPTION

Link to SB 54 Statutory Provisions

• PRC §42040 establishes the Act's intent to increase recycling and reduce plastic pollution through various means, including source reduction, increased recycling and composting rates, and Extended Producer Responsibility (EPR).
• PRC §42041(e)(2)(H) provides for exemption from covered material status for materials achieving specified recycling rates through alternative collection programs.
• PRC §42051(b)(2) authorizes producers to comply individually or collectively outside PRO participation if they meet specified requirements, creating statutory foundation for Independent Producer pathways.
• PRC §42060(a)(3) and (a)(4) authorize the Department to grant exemptions based on unique compliance challenges or health and safety concerns.

Link to Proposed Regulation Sections

• § 18980.1(a)(2) defines "alternative collection" as programs collecting covered materials "regardless of whether the covered material is discarded or considered solid waste and regardless of the manner and location of collection," explicitly excluding curbside collection by local jurisdictions or their contractors. ACRC unambiguously qualifies under this definition.
• § 18980.2.3 implements PRC §42041(e)(2)(H), establishing criteria for exemption based on demonstrated recycling rates through alternative collection programs meeting specified performance thresholds.
• § 18980.2.4 implements PRC §42060(a)(3) and (a)(4), establishing exemption procedures for materials presenting unique compliance challenges or health/safety concerns.
• § 18980.2.7 authorizes class-wide exemptions where "the application's justification for the exemption necessarily applies to all products or covered material within the class." This provision creates regulatory authority for program-level recognition where distinct material characteristics justify unified treatment.
• § 18980.4 establishes responsible end market criteria, which ACRC's verified end markets satisfy through documented chain of custody, third-party audits, and recycling yield performance.
• §§ 18980.5-18980.5.2 establish Independent Producer pathways, creating an alternative compliance mechanism though one requiring greater administrative burden.
• § 18980.6.7(e)(1)(D) explicitly authorizes "alternative reduced base fee rates" for covered material categories utilizing alternative collection programs, recognizing that specialized collection infrastructure may warrant differential fee treatment based on measurable performance.

Response to O-98-2

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process. To the extent other portions of the submission do suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-98-3

5. PROPOSED REGULATORY PATHWAYS & TEXT SUGGESTIONS

5(a). Class-Wide Exemption Recognition via § 18980.2.7
PROPOSED REGULATORY TEXT (additions shown in bold red):

§ 18980.2.7. Scope of Exemptions
(a) Applications for exemptions pursuant to this article may request that the exemption be applicable to an entire class of products or covered materials having certain characteristics in common. The class must be clearly defined according to the combination of characteristics that justify the exemption, so that items to which the exemption would apply are readily distinguishable from those to which it would not apply. The Department shall deem the exemption to apply to such class if the application's justification for the exemption necessarily applies to all products or covered material within the class.

(a-1) Recognition of Qualified Stewardship Programs for Specialized Material Streams. The Department may recognize covered materials as a class exempt from Producer Responsibility Organization participation requirements under PRC §42051(b) where such materials are:

(A) Produced by members of an established stewardship program that has operated in California for at least three years with documented performance data;

(B) Collected through systematic alternative collection infrastructure as defined in §18980.1(a)(2), serving non-residential generators independently of local jurisdiction curbside programs;

(C) Subject to specialized processing requirements due to federal or state regulatory mandates, health and safety concerns, or technical characteristics that differ substantially from standard materials recovery facility operations; and

(D) Recycled through responsible end markets meeting the criteria specified in § 18980.4.
(a-2) Performance and Accountability Requirements.

(A) Annual Data Submission. The stewardship program shall submit annual data to the Department demonstrating:
(i) Collection and recycling rates calculated according to § 18980.3.2;

(ii) Performance compared to an established baseline;
(iii) Chain of custody documentation for material from collection through end markets; and
(iv) Verification that end markets continue to meet criteria under § 18980.4.

(B) Periodic Third-Party Verification. The stewardship program shall arrange and pay for independent third-party audits of its California operations at intervals and consistent with requirements specified by the Department, and provide audit results to the Department.

(C) Performance Standards. The Department shall establish performance standards for recognized stewardship programs considering:
(i) Recycling rate thresholds appropriate to the material stream and collection infrastructure;
(ii) Collection rate maintenance or improvement requirements;
(iii) Responsible end market verification; and
(iv) Compliance with applicable federal, state, and local regulations.

(D) Conditional Recognition and Performance Improvement. Where a stewardship program demonstrates operational capability but has not yet achieved all performance standards, the Department may grant conditional recognition with mutually agreed performance milestones and timelines. The Department may extend conditional recognition based on demonstrated good-faith efforts and circumstances beyond the stewardship program's reasonable control.

(E) Revocation. The Department shall revoke recognition if:
(i) Required data submissions or audits are not provided within timeframes specified by the Department;
(ii) Performance standards are not met without adequate justification;
(iii) End markets fail to satisfy criteria under § 18980.4;
(iv) The stewardship program or its members provide false or materially incomplete information; or
(v) Other material violations occur and are not cured within timeframes specified by the Department.

(F) Upon revocation, member producers shall have six months to join a PRO or apply for Independent Producer status under § 18980.5.1, during which time producers shall not be deemed in violation of PRC § 42051(b)(1).
(b) If the Department determines that an application asserts a justification that necessarily applies to a class of products or covered materials, the applicant shall be required to amend the application to cover such class as described in subdivision (a).
(c) An exemption for a class of products or covered materials may not necessarily cover all covered materials in a particular covered material category.
(d) When granting a class-wide exemption, the Department may supplement or modify the definition of the class set forth in the application to ensure that it clearly identifies the

items to which it applies and distinguishes them from the items to which it does not apply.
(e) A class-wide exemption shall apply to all products or covered materials within the class, regardless of whether the products or covered materials were in existence when the Department issued the exemption.
(f) The Department shall publish on its website all issued exemptions that apply to classes of products or covered materials**, including recognition of qualified stewardship programs under subdivision (a-1)**.
(g) The provisions of this article concerning expiration, renewal, and termination of exemptions apply to an exemption for a class of products or covered materials, except that an Independent Producer of the exempted covered material may request that the exemption be renewed by submitting a new application meeting the applicable requirements of this article, regardless of whether it had submitted the application on which the exemption was originally based. **Recognition granted under subdivision (a-1) shall remain effective provided the stewardship program continues to satisfy the requirements of subdivision (a-2) and any performance standards established by the Department.**

Response to O-98-3

CalRecycle rejects the proposed changes to 18980.2.7 because they have no basis in the statutory authorizations under which CalRecycle may grant exemptions. Rather than describing a process for approving class-wide exemptions based on, for example, Public Resources Code section 42060(a)(3) or (4), the proposed changes would provide for recognition of a stewardship organization and program that would operate in parallel with the statutorily mandated PRO's program. CalRecycle does not have the authority to authorize a wholesale alternative to PRO participation.

Comment O-98-4

5(b). Establish "Qualified Stewardship Program" Recognition Pathway Under New § 18980.2.8
PROPOSED NEW REGULATORY SECTION:

§ 18980.2.8. Recognition of Qualified Stewardship Programs
(a) Authority and Purpose. The Department may recognize existing stewardship programs that demonstrate long-term, high-performing collection and recycling of specialized covered materials through alternative collection infrastructure, pursuant to:

(1) The class-wide exemption authority in § 18980.2.7;

(2) The independent compliance authority in PRC § 42051(b)(2); and

(3) The exemption authority in PRC § 42060(a)(3) and (a)(4).

(b) Eligibility Requirements. A stewardship program may apply for recognition by demonstrating:

(1) At least three years of documented operation in California with verifiable performance data;

(2) Systematic alternative collection as defined in § 18980.1(a)(2), serving non-residential generators independently of local jurisdiction curbside programs;

(3) Recycling performance calculated according to § 18980.3.2 that demonstrates alignment with or reasonable pathway to achieve SB 54 objectives;

(4) Responsible end markets meeting criteria in § 18980.4, with documented chain of custody and verification protocols;

(5) Specialized processing requirements that differ substantially from standard materials recovery facility operations due to regulatory mandates, technical characteristics, or health and safety concerns;

(6) Industry funding through producer member fees or dues, with no reliance on municipal solid waste service fees or taxpayer funding; and

(7) Compliance with all applicable federal, state, and local regulations.

(c) Application and Review. Applications shall be submitted electronically to the Department and include:

(1) Program description, including governance, membership, funding, and operational history;

(2) Covered material specification using the covered material category list framework;

(3) Performance data for the most recent three years, including collection amounts, recycling rates, geographic distribution, and end market verification;

(4) Infrastructure description, including collection locations, processing protocols, and material flow documentation;

(5) Compliance documentation demonstrating satisfaction of eligibility requirements; and

(6) If applicable, a performance improvement plan establishing specific milestones and timelines.

(d) Conditional Recognition. The Department may grant conditional recognition where certain elements do not fully satisfy specified criteria but conditions identified by the Department, if met, would warrant full recognition. The Department may establish performance milestones, reporting requirements, and timelines appropriate to the stewardship program and material stream. Conditional recognition shall convert to full recognition upon satisfaction of conditions, or shall be revoked if conditions are not satisfied within timeframes established by the Department, unless extended based on demonstrated good-faith efforts and circumstances beyond the stewardship program's reasonable control.

(e) Effect of Recognition. Upon recognition:

(1) Covered materials subject to recognition shall be deemed compliant with PRC § 42050 and subdivision (i) of PRC § 42057, provided the stewardship program maintains compliance with this section;

(2) Producer members shall be deemed to satisfy obligations under PRC § 42051(b) with respect to covered materials subject to recognition, and shall not be required to participate in a PRO or pay PRO fees for such covered materials; and

(3) The stewardship program and its members remain subject to registration requirements under § 18980.10, annual reporting requirements, record maintenance requirements, and investigation and enforcement authority under PRC § 42080 and § 42081.

(f) Ongoing Compliance. Recognized stewardship programs shall:

(1) Submit annual reports to the Department containing collection and recycling data, recycling rate calculations, infrastructure updates, end market verification, membership changes, and performance improvement plan progress if applicable;

(2) Arrange and pay for independent third-party audits at intervals specified by the Department;

(3) Maintain performance consistent with standards established by the Department considering the material stream characteristics and collection infrastructure; and

(4) Coordinate with approved PROs and other Independent Producers as appropriate.

(g) Revocation. The Department shall revoke recognition if required reports or audits are not submitted, performance standards are not maintained without adequate justification, end markets fail to satisfy criteria under § 18980.4, false or

materially incomplete information is provided, or other material violations occur and are not cured within timeframes specified by the Department. Upon revocation, member producers shall have six months to join a PRO or apply for Independent Producer status under § 18980.5.1, during which time producers shall not be deemed in violation of PRC § 42051(b)(1).

Response to O-98-4

Comment rejected for reasons set forth in response to comment O-98-3.

Comment O-98-5

5(c). Coordinated Independent Producer Plan Fallback Pursuant to PRC § 42051(b)(2) and §§ 18980.5 et seq.

Should the program-level exemption mechanisms in Options 1 and 2 prove administratively infeasible, ACRC requests CalRecycle provide expedited guidance on whether ACRC could pursue Independent Producer status under § 18980.7.1 on behalf of member companies.

Conditional Approval Framework:

Section 18980.7.1(b) explicitly authorizes conditional approval where "certain elements of the plan do not meet certain requirements of the Act or this chapter, but if conditions identified by the Department are met, final approval will be warranted."

ACRC proposes conditional approval based on:
Current Performance Baseline: Three-year average recycling rate of 53.7% with demonstrated capability of 67.1% in 2023, proving program effectiveness and scalability potential.

Performance Improvement Commitment: Development of a mutually agreed-upon timeline with CalRecycle establishing achievable recycling rate milestones, accounting for infrastructure development, market conditions, and program expansion requirements to reach 65% three-year average within three years.

Progress Reporting: Per § 18980.7.1(c), submission of monthly status updates during conditional approval period documenting specific actions taken, performance metrics, challenges encountered, and trajectory toward established milestones.

Existing Infrastructure: Established collection network, responsible end markets, and data reporting systems requiring minimal modification for SB 54 compliance.

This pathway would allow ACRC members to avoid duplicate PRO fees during the improvement period, preserving program funding while ACRC implements infrastructure enhancements and operational modifications necessary to achieve performance targets. Under § 18980.7.1(d), conditional approval combined with performance-based

extensions would provide adequate time to demonstrate sustained improvement without program disruption.

ACRC commits to transparent collaboration with CalRecycle to establish realistic, data-driven performance benchmarks that serve environmental objectives while recognizing the operational realities of agricultural container collection.

Response to O-98-5

CalRecycle rejects this comment. Rather than commenting on the regulations themselves or raising an objection related to the rulemaking process, the commenter requests "expedited guidance" as to a particular course of action the commenter proposes for securing compliance with the Act on behalf of other entities. More specifically, the commenter asks CalRecycle to determine in advance that certain circumstances will merit conditional approval of an Independent Producer plan under section 18980.7.1(b). Such a request is not a request to change the proposed regulations, and even if it were, codifying conditional approval for certain entities with respect to their statutory obligations would be inappropriate. The proper use of regulations is to establish rules of general application or interpret and clarify statutory provisions, not to issue findings concerning particular parties' compliance. Moreover, the advance determination the commenter seeks would be speculative because, as made clear in 18980.7.1(b), it could only be relevant after an Independent Producer plan exists and has been determined not to satisfy certain requirements under the Act. The approval sought also appears to ignore straightforward statutory requirements, such as the requirement in Public Resources Code section 42051(b)(2)(A) which prescribes a 65 percent recycling rate "for three consecutive years prior to January 1, 2027." Section 42051(b)(2)(A) does not mandate an average rate, and that section explains that Independent Producer plans are producer-specific ("[A] producer may comply with this chapter individually without participating in a PRO's plan" if certain conditions are met).

Comment O-98-6

6. PERFORMANCE EVIDENCE & SAFEGUARDS

Data Showing Compliance with Thresholds

ACRC's California performance demonstrates substantial alignment with SB 54 objectives:

Recycling Rate Performance:

- Three-year average (2020-2022): 58.9%
- Three-year average (2021-2023): 67.1%
- Three-year average (2022-2024): 39.2%

While recent three-year averages have not consistently exceeded 65%, ACRC's 2023 performance demonstrates capability to achieve this threshold with appropriate

infrastructure investment and operational refinement. The program's 33-year operational history shows continuous adaptation to changing markets, regulatory requirements, and collection challenges.

Collection Rate Performance:
• 2024: 60.7%
• 2023: 52.1%
• 2022: 61.5%
• Three-year average (2022-2024): 58.1%

Long-term Growth Trajectory: From program inception in 1993 (500,000 pounds collected) to 2024 (2.39 million pounds), ACRC has demonstrated nearly 5x growth in California, reflecting program maturation, member growth, and infrastructure expansion.

Audit and Verification Protocols
ACRC maintains comprehensive documentation requirements allowing for audit and verification.

Third-Party Audits: ACRC conducts compliance audits of responsible end markets which are required every five years to maintain approval, consistent with requirements in § 18980.4.2, performed by independent third parties with full access to chain-of-custody records, processing data, and facility operations.

Responsible End Market Certification: All ACRC end markets undergo rigorous vetting by ACRC's Technical Committee and on-site facility audits confirming:
• Compliance with permitting, licensing, and regulatory requirements (§ 18980.4(a)(1))
• Transparency through complete chain-of-custody documentation (§ 18980.4(a)(2))
• Achievement of recycling yield thresholds (§ 18980.4(a)(4))
• Proper handling of incompatible materials (§ 18980.4(a)(3))

Data Reporting Infrastructure: Since 2012, ACRC has provided annual collection and recycling data to CDPR, demonstrating long-term accountability and transparency. This existing reporting framework and history demonstrates ACRC’s ability to satisfy SB 54 reporting requirements.

Revocation Triggers
ACRC proposes clear, objective performance triggers that would justify revocation of any recognition granted:

Reporting Failures: Non-submission of required annual reports or third-party audits within 30 days of due date.

Performance Improvement Targets: ACRC proposes the following performance improvement timeline:
• Year 1 (2026): Maintain 50% three-year average; expand collection sites by 10%

• Year 2 (2027): Achieve 55% three-year average; implement enhanced reporting systems
• Year 3 (2028): Achieve 60% three-year average; complete independent audit
• Year 4 (2029): Sustain 65% three-year average

Performance Declines: Three-year average recycling rate falling below 45% (or agreed conditional threshold) for two consecutive measurement periods, or collection rate declining by more than 25% compared to 2023 baseline for two consecutive years absent force majeure.

End Market Failures: End markets failing to satisfy responsible end market criteria under § 18980.4, or systematic violations of handling protocols.

Information Integrity: Provision of false or materially incomplete information to CalRecycle.

These triggers balance the need for program accountability with recognition that agricultural container collection and subsequent recycling of such container plastic sales faces unique market volatility.

7. COMPARATIVE PRECEDENT: OREGON ACRC MODEL

What Oregon's DEQ Allowed

Oregon's recently adopted regulations (OAR 340-090-0840(2)(d)(D)) provide a successful model for recognizing established stewardship programs within EPR frameworks. Oregon specifically exempts:

"Rigid HDPE packaging of commercial-use pesticides, fertilizers, adjuvants, surfactants, and agricultural amendments produced by members of the Ag Container Recycling Council or ACRC and eligible for collection by ACRC."

This exemption is conditioned upon:
• Annual data submission to DEQ demonstrating maintenance of consistent collection rates and convenience standards compared to a 2023 baseline
• Verification that ACRC is recycling containers at responsible end markets
• Third-party audit of the Oregon collection program once every five years beginning no later than 2027

Distinctions and Lessons for California Adaptation

Similarities to California Circumstances:
• Specialized agricultural container material stream requiring decontamination
• Established collection infrastructure serving rural agricultural communities
• Long-term performance data demonstrating program effectiveness
• Need to avoid duplicative fees threatening program viability

California-Specific Considerations:
• California's agricultural sector is significantly larger and more diverse than Oregon's, with greater geographic dispersion across 58 counties
• California's existing CDPR reporting requirements since 2012 provide longer-term performance documentation
• California's SB 54 includes more detailed responsible end market criteria (§ 18980.4) and recycling rate calculation methodologies (§ 18980.3.2)
• California's regulatory framework includes specific provisions for class-wide exemptions (§ 18980.2.7) that Oregon's rules do not explicitly contain

Key Lessons: Oregon's approach demonstrates that EPR frameworks can successfully accommodate proven stewardship programs without compromising environmental objectives or regulatory oversight. The conditional exemption model-recognition tied to ongoing performance verification and periodic audits-provides accountability while preserving effective existing infrastructure.

California can adopt a similar approach while enhancing it through:
• More specific performance thresholds aligned with SB 54's recycling rate requirements
• Explicit incorporation into the class-wide exemption framework under § 18980.2.7
• Clear revocation triggers and phase-in provisions for performance improvement

8. POLICY & ENVIRONMENTAL RATIONALE

Alignment with SB 54's Goals

PRC §42040 establishes the Act's intent to:
• Achieve a 25% reduction in single-use plastic packaging by source reduction
• Ensure that remaining covered material achieves 65% recycling or composting rate by January 1, 2032
• Shift costs of end-of-life management from ratepayers and local governments to producers

ACRC's program directly advances these objectives:

Source Reduction: ACRC's triple-rinse and inspection protocols reduce material contamination, improving recyclability and reducing disposal. Member companies' participation in voluntary stewardship demonstrates producer responsibility predating SB 54's mandates.

Recycling Rate Achievement: ACRC has demonstrated capability to achieve 67.1% recycling rates (2023), with three-year averages ranging from 39.2% to 67.1%. With regulatory certainty and sustained funding, ACRC improvements can consistently achieve targets aligned with or exceeding SB 54's 65% requirement.

Cost Shifting: ACRC is funded almost exclusively through producer member dues-eliminating burden on municipal recycling systems and California taxpayers. Agricultural

containers are collected through specialized infrastructure, not municipal curbside programs, ensuring no ratepayer subsidization. Small fees are allowed to be charged by contractors only to smaller collection sites to encourage consolidated collection at retail and to drive long term efficiency of the program.

Rural Access and Environmental Impact

California's agricultural regions are predominantly rural, with limited or no municipal curbside recycling infrastructure. ACRC's specialized collection network provides the ONLY statewide systematic recycling access for agricultural containers.

Forcing ACRC into PRO structures designed for urban/suburban packaging waste would likely result in:
• Service reductions in rural areas where collection costs per pound are highest
• Reallocation of resources to urban collection of general packaging materials
• Loss of specialized collection sites at agricultural retailers, farms, and application businesses
• Increased likelihood of agricultural containers being landfilled or illegally burned

This outcome would directly impact rural agricultural communities and the environment.

Cost-Efficiency and Infrastructure Preservation

Operational Efficiency: ACRC's specialized infrastructure is optimized for agricultural container collection:
• Collection sites co-located with agricultural retail and service providers
• Collection timing aligned with agricultural seasons and chemical application cycles
• Processing facilities and processes designed to insure agricultural container decontamination
• End markets developed to accept agricultural-origin HDPE

Forcing this material stream into general PRO infrastructure would create inefficiencies:
• PRO collection systems are designed for residential/commercial packaging, not agricultural containers requiring specialized handling
• Duplicate administrative overhead for contract management, reporting, and fee collection
• Mismatch between urban-focused PRO infrastructure and rural agricultural generation sites

Financial Efficiency: ACRC collects and recycles agricultural containers through a specialized contractor network with very tight margins, representing efficient use of member dues. A subcontracting model routing member fees through CAA would:
• Add administrative overhead for CAA management and contract administration
• Create circular funding flows (members > CAA > ACRC) reducing dollars available for actual collection

• Impose additional compliance costs on both organizations for contract management and reporting

Direct recognition of ACRC maximizes environmental and collection value per dollar spent.

Continuity of Proven Infrastructure
ACRC has operated successfully in California for 33 years, collecting 49.3 million pounds and recycling 46.7 million pounds (95% of collections). This infrastructure represents:
• Established relationships with hundreds of agricultural retailers, applicators, and farms
• Trained collection site operators familiar with handling and rinsing protocols
• Vetted transportation and processing contractors
• Verified responsible end markets with long-term supply relationships

Regulatory uncertainty threatening ACRC's viability risks dismantling infrastructure that took decades to build and would be difficult or impossible to reconstruct. Even temporary disruption would result in agricultural containers entering landfills or being burned during the reconstruction period.

SB 54's intent under PRC §42040 is to improve environmental outcomes, not to disrupt effective existing programs. Where specialized, high-performing collection infrastructure already exists and operates independently of municipal systems, policy should recognize and preserve that infrastructure rather than force artificial integration that adds costs without adding environmental value.

Response to O-98-6

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-98-7

9. SPECIFIC COMMENTED SECTIONS & SUGGESTED EDITS

Note on Fee Reduction (§ 18980.6.7(e)(1)(D)): As stated in the Executive Summary, ACRC's primary preference is program-level recognition through Options 1-3. The fee reduction analysis below represents a regulatory alternative if recognition pathways prove administratively infeasible, though ACRC emphasizes this approach perpetuates duplicative costs that threaten program viability.

Response to O-98-7

Comment rejected. Although this comment references section 18980.6.7(e)(1)(D), it does not offer any substantive proposal or objection. Rather, the commenter refers to other portions of their submission. To the extent those other portions propose changes or raise objections requiring responses, CalRecycle has provided such responses elsewhere.

Comment O-98-8

§ 18980.2.3 - Exemptions for Specific Material with Demonstrated Recycling Rates

Current Language: Provides pathway for exemption based on 65-70% recycling rates through alternative collection programs, but requires material-specific applications.

Recommended Modification: Add clarifying language that applications may be submitted for unified material streams collected through single programs where segregation would be impractical:

"(3)(A) The items are collected by alternative collection programs or programs that collect the items at non-residential sites. **Where a single alternative collection program systematically collects multiple types of covered materials that cannot practicably be segregated due to safety concerns, regulatory requirements, or operational constraints, the application may address such materials collectively as a unified stream."**

Rationale: Agricultural containers include both FIFRA-regulated pesticide containers (already exempted from SB-54 in statute) and non-FIFRA products (fertilizers, micronutrients, adjuvants, surfactants), collected as unified stream. Requiring segregation would impose impractical operational burdens and safety concerns.

Response to O-98-8

CalRecycle rejects the commenter's proposed change because it is unnecessary and more restrictive than statute requires. The purpose of section 18980.2.3(a)(3)(A) is to implement the requirement stated in Public Resources Code section 42041(e)(2)(H)(i)(I): the relevant collection must not be via residential sites. That provision imposes no restrictions based on whether the collection program collects multiple types of covered materials together. The proposed addition would contravene statute by suggesting otherwise.

Comment O-98-9

§ 18980.2.4 - Exemptions for Certain Covered Materials

Current Language: Subdivision (a) states exemptions "do not affect the status of the single-use packaging...as covered material and do not otherwise change the obligations of producers with respect to the covered material, such as reporting and payment of PRO fees."

Recommended Modification: Add exception for exemptions granted through qualified stewardship program recognition:
"(a) Only a PRO or an Independent Producer may submit a request for an exemption pursuant to paragraph (3) of subdivision (a) of section 42060 or paragraph (4) of subdivision (a) of section 42060 of the Public Resources Code. The effect of such an exemption is that exempted covered material may be sold, offered for sale, imported, or distributed regardless of whether the covered material complies with section 42050 or

subdivision (i) of section 42057 of the Public Resources Code. The exemption does not affect the status of the single-use packaging or single-use plastic food service ware as covered material and does not otherwise change the obligations of producers with respect to the covered material, such as reporting and payment of PRO fees**, except that exemptions granted pursuant to §18980.2.7(a-1) or §18980.2.8 shall relieve member producers of the recognized stewardship program from PRO participation and fee requirements while such recognition remains effective**."

Rationale: Clarifies that class-wide or program-level recognition mechanisms create genuine alternative compliance pathways, not merely temporary relief from specific requirements while maintaining all other obligations.

Response to O-98-9

Comment rejected for the reasons set forth in response to comment O-98-3.

Comment O-98-10

§ 18980.2.7 - Scope of Exemptions (Class-Wide)

Recommended Addition: See detailed proposed text in Section 5(a) above, adding subdivisions (a-1) and (a-2) to explicitly recognize qualified stewardship programs for agricultural containers.

Rationale: This section already provides authority for class-wide exemptions where justification applies to all items in the class. Agricultural containers constitute such a class based on: (1) specialized processing requirements under EPA regulations; (2) collection through agricultural supply chain rather than municipal systems; (3) safety concerns requiring non-commingling; and (4) existing stewardship infrastructure.

Response to O-98-10

Comment rejected for the reasons set forth in response to comment O-98-3.

Comment O-98-11

§ 18980.6.7(e)(1)(D) - Alternative Reduced Base Fee Rates

Current Language: "A PRO may set an alternative reduced base fee rate for a select covered material category if an alternative collection program is utilized."

Recommended Addition: Add requirement for maximum fee reduction where alternative collection performance substantially exceeds PRO capabilities:

"(D) A PRO may set an alternative reduced base fee rate for a select covered material category if an alternative collection program is utilized. The alternative reduced base fee rate shall consider the measurable performance of the alternative collection program relative to the statewide performance of curbside collection for those same materials. **Where an alternative collection program demonstrates recycling rates exceeding**

50% for materials that cannot be safely or effectively processed through standard materials recovery facilities, the PRO shall establish the maximum feasible fee reduction, recognizing that PRO fees collected for such materials are unlikely to fund collection infrastructure improvements for that material stream."

Rationale: Even if program-level recognition proves infeasible, § 18980.6.7(e)(1)(D) should require substantial fee reductions for alternative collection programs demonstrating superior performance. ACRC's 53.7% three-year average recycling rate for agricultural containers significantly exceeds any anticipated PRO performance for materials requiring specialized handling. However, ACRC notes that even reduced fees perpetuate duplicative cost structures, making full recognition under §18980.2.7 or § 18980.2.8 the preferred solution.

Response to O-98-11

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42051.1, 42053, and 42060, and no change is necessary to the implementation of the Act. PRC section 42053(d)(1) already requires the PRO to structure the producer fee schedule in a manner that reflects the costs to ensure covered materials meet the requirements of the Act, including applicable recycling rate requirements. To the extent certain materials are included in an alternative collection program that can demonstrate superior performance, those results and reduced costs of recycling must already be represented and reflected in the producer fee schedule pursuant to PRC section 42053(d)(1) and section 18980.6.7(e)(1)(D) of the proposed regulations. Therefore, the recommended change is not necessary and would impose an unnecessary and arbitrary limit with an imprecise standard on the PRO's discretion that is established under PRC section 42053.

Comment O-98-12

§ 18980.4 - Responsible End Market Criteria

Comment: ACRC supports the comprehensive responsible end market criteria in this section. ACRC's existing end market verification protocols align with these requirements:

- Periodic third-party audits per §18980.4.2
- Chain of custody documentation per §18980.4(a)(2)(A)
- Recycling yield tracking per §18980.4(a)(4)
- End market transparency per §18980.4(a)(2)

ACRC's end markets (agricultural drainpipe, nursery pots, landscaping products, underground conduit) satisfy the criteria in §18980.4(b) for producing recycled content feedstock meeting quality standards for new product creation.

No modification recommended. ACRC commits to continued compliance with these standards and is prepared to provide verification documentation to CalRecycle upon request.

Response to O-98-12

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process.

Comment O-98-13

§ 18980.10 - Registration Requirements

Comment: ACRC supports clear registration requirements and commits to registering all member producers with CalRecycle. ACRC requests clarification on whether a recognized stewardship program may register members collectively or whether each member must register individually.

Recommended Clarification: Add to § 18980.10(a)(2):
"(2) A PRO shall register on behalf of each of its participant producers, except for those participant producers who choose to be reporting entities. **A stewardship program recognized under § 18980.2.7(a-1) or § 18980.2.8 may register on behalf of its member producers, provided that each member's registration information satisfies the requirements of paragraph (1) and the stewardship program maintains current contact information for all members."**

Rationale: Streamlines administrative burden while ensuring CalRecycle has access to complete producer information.

Response to O-98-13

Comment rejected for the reasons set forth in response to comment O-98-3.

Comment O-98-14

10. CONCLUSION & OFFER TO COLLABORATE

Summary of the Ask

ACRC respectfully requests that CalRecycle adopt regulatory language recognizing existing qualified stewardship programs as an alternative compliance pathway under SB 54. Specifically, ACRC requests:

Primary Request: Adoption of proposed § 18980.2.7(a-1) and (a-2) OR new § 18980.2.8 recognizing agricultural container stewardship programs that demonstrate:
• Operational history of at least three years in California
• Specialized alternative collection infrastructure
• Recycling rates of 50% or pathway to achieve this threshold
• Verified responsible end markets
• Industry funding without ratepayer burden

Secondary Request: If program-level recognition proves infeasible, expedited guidance on Independent Producer pathways with conditional approval under § 18980.7.1(b), allowing performance-based phase-in while preserving existing program infrastructure.

Minimum Request: If neither above option is viable, establishment of maximum fee reductions under § 18980.6.7(e)(1)(D) for alternative collection programs demonstrating superior performance, though ACRC emphasizes this approach perpetuates duplicative costs threatening program viability.

Readiness to Provide Further Data and Collaboration

ACRC stands ready to work collaboratively with CalRecycle to implement any of these pathways:

Data and Documentation Available:
• 33 years of California collection data (1993-2025)
• Annual CDPR reports (2012-2024) documenting collection and recycling performance
• Third-party audit reports of end markets and processing facilities
• Chain of custody documentation from collection through end markets
• End market verification demonstrating compliance with § 18980.4 criteria
• Member company information and contact details
• Collection site locations and service area maps
• Financial data demonstrating program funding adequacy

Collaboration Commitments:
• Coordination with Circular Action Alliance (CAA) on data sharing, education/outreach, and complementary infrastructure development (ACRC met with CAA on October 3, 2025 to initiate discussions)
• Participation in CalRecycle stakeholder processes for implementation guidance
• Annual reporting or as specified by CalRecycle
• Where requested, participation in pilot programs or demonstration projects
• Transparency in operations and willingness to address CalRecycle questions or concerns

Timeline Flexibility: ACRC recognizes CalRecycle faces substantial implementation challenges for SB 54. ACRC is willing to work within CalRecycle's timeline constraints while emphasizing that:
• Member companies are making 2026 dues decisions now based on regulatory clarity
• Program funding erosion is already occurring due to uncertainty
• Attracting and retaining new members is already compromised due to uncertainty
• Even modest delays in resolution create compounding risks to program viability

ACRC requests expedited consideration of these comments and, if possible, interim guidance by December 31, 2025 on whether CalRecycle intends to pursue any of the

proposed recognition pathways, enabling member companies to make informed decisions about 2026 participation.

Final Statement

California has the opportunity to demonstrate how Extended Producer Responsibility frameworks can preserve and enhance proven stewardship programs rather than disrupting them. ACRC's 33-year track record, specialized infrastructure serving rural agricultural communities, and alignment with SB 54's environmental objectives make it an ideal candidate for regulatory recognition.

The proposed pathways would:
• Advance SB 54's recycling and source reduction goals
• Preserve specialized collection infrastructure serving underserved rural areas
• Eliminate duplicative costs threatening program viability
• Maintain accountability through performance monitoring and periodic audits
• Provide a model for recognizing other qualified stewardship programs

We appreciate CalRecycle's consideration of these comments and look forward to working collaboratively to achieve optimal outcomes for California's environment and agricultural sector.

Response to O-98-14

Comment rejected. No response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations, does not raise an objection concerning the rulemaking process, or refers to suggested changes or objections set forth in greater detail in other portions of the submission. To the extent other portions of the submission suggest changes or raise objections, CalRecycle has responded to those portions separately.

O-99: Air-Conditioning, Heating, and Refrigeration Institute (Matthew Smithhisler)

Comment O-99-1

The Air-Conditioning, Heating, and Refrigeration Institute (AHRI) submits the following comments in response to CalRecycle’s (the “Department”) revisions to the SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act regulations.

AHRI represents more than 330 manufacturers of heating, ventilation, air conditioning, and commercial refrigeration (HVACR), and water heating equipment. Our member companies produce more than 90 percent of the residential and commercial air conditioning, heating, and commercial refrigeration equipment made in North America. It is an internationally recognized advocate for the HVACR industry and certifies the performance of many of the products manufactured by its members. In North America, the annual economic activity resulting from the HVACR industry is more than $211 billion. In the United States alone, AHRI member companies, along with distributors,

contractors, and technicians employ more than 700,000 people and more than 50,000 people in California.

Response to O-99-1

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process. To the extent other portions of the submission do suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-99-2

AHRI's comments focus on the exemption timeline and process for exempted materials. While the Department's proposed two-year exemption represents an improvement over the prior draft, AHRI recommends that the process provide additional flexibility and discretion for longer timespans to ensure that exemptions are practicable for important safety concerns.

Exemption Timelines

AHRI appreciates the Department's decision to amend the proposed exemption process to allow for a two-year period, which is an improvement compared to the previously proposed one-year exemption. However, we continue to emphasize that even two years may not always be sufficient given the long design and packaging cycles in the HVACR and water heating industry.

Our products are designed to last 10–15 years, with some lasting up to 30 years, and packaging changes often move in parallel with product development. The packaging that surrounds both refrigerant cylinders and pre-charged air-conditioning and refrigeration equipment is vital to the safe transport, handling, and storage of the units. For this reason, longer exemption timespans are important in providing stability for producers while ensuring product safety and regulatory compliance.

For straightforward cases of packaging redesign without broader product changes, timelines can be shorter. However, in many cases the process typically takes at least 18 months. This makes two years a more realistic exemption period, though even that may not always be sufficient. AHRI therefore recommends that CalRecycle should retain discretion to extend exemptions beyond two years where necessary to avoid undue regulatory burden and ensure safety and practicality in implementation.

AHRI respects the Department's intent for limiting product exemptions to a two-year application process. However, certain situations can require a longer exemption timespan. That is why AHRI encourages the Department to consider adding the discretion to permit certain industries a longer exemption timeframe to account for proper design and testing, and to allow for the continued use of unavoidable materials without risking undue regulatory burden or source reduction requirements relating to these materials.

Exemption Process

In addition, AHRI respectfully urges the Department to recognize the critical role that packaging plays not only in ensuring the safe transport of refrigerants and HVACR and water heating equipment, but also in preventing unintended emissions. Improper handling combined with inadequate packaging during shipping can lead to leaks, resulting in the release of fluorocarbons into the atmosphere, undermining climate protection efforts.

One example of AHRI's concerns relates to Section 42041(e)(2)(D) of Senate Bill 54, as enacted. This Section exempts packaging used to contain hazardous or flammable products regulated by the 2012 federal Occupational Safety and Health Administration (OSHA) Hazard Communications Standard (29 C.F.R. 1910.1200). This Section could be understood to exempt the packaging that is designed to protect and safely transport pre-charged air conditioning and refrigeration equipment containing next-generation, low global warming potential, mildly flammable refrigerants that are regulated by OSHA HAZCOM (29 C.F.R. 1910.1200), or it could be interpreted more narrowly to exempt only the cylinders containing the same refrigerants in bulk. Reliable transportation and storage of pre-charged equipment that ensures the refrigerant stays contained in the system is paramount to our collective safety and climate-related goals.

The requirement to reduce single-use plastic packaging by 25% by 2032 presents significant compliance concerns for products regulated under OSHA HAZCOM. Requiring any amount of plastic weight reduction would significantly increase the transport and storage risks of these critical products. Much of the plastic used often consists of stretch film used to secure products for transportation and storage and has no viable substitute. Proper packaging must therefore be preserved as a critical safeguard against avoidable leaks.

Similarly, AHRI recommends expanding the scope in the draft rules to allow for more discretion by CalRecycle to interpret certain provisions and exemptions. For example, AHRI member products are intended for use for many years; however, per the current narrow definition of durable goods, AHRI members do not have a pathway under § 18980.2.3 (Exemptions for Specific Material with Demonstrated Recycling Rates) to receive credit for the long lifespan and low waste stream impact of these packaging materials.

AHRI recommends the Department consider an exemption process which does not impose a blanket two-year exemption but rather grants more discretion for longer timelines by CalRecycle. This will protect the safe transport and handling of AHRI members' products without negative impact on our industry. Additionally, greater discretion for the Department's exemption process would avoid unintended consequences such as incentivizing source reduction on safety packaging for pre-charged equipment and cylinders.

Conclusion
AHRI appreciates CalRecycle's work on these proposed regulations. While the amendment to provide a two-year exemption period is an improvement over the earlier draft, AHRI continues to recommend that CalRecycle provide additional flexibility and discretion for longer timelines where warranted. This is critical to account for industry-specific concerns and needs, particularly those surrounding the safe transport, handling, and storage of HVACR and water heating equipment.

AHRI looks forward to continuing to work with CalRecycle throughout the rulemaking and implementation process and remains available as a resource to the Department.

Response to O-99-2

Comment rejected. The commenter's principal recommendation is for CalRecycle to have "additional flexibility and discretion for longer timespans" for exemptions for materials. But the commenter refers to a "two-year period" for "the proposed exemption process" without identifying the proposed regulation at issue. If the commenter intended to refer to the exemption process established by section 18980.2.4, the proposed regulations already fully accommodate the commenter's recommendation: 18980.2.4(g) explains that CalRecycle can grant exemptions for up to five years, when warranted. If the commenter intended to refer to the exemption addressed in section 18980.2.3, the commenter's recommendation fails because the relevant statutory provision (Public Resources Code section 42041(e)(2)(H)) expressly limits exemptions to two years. CalRecycle cannot discern any other provisions to which the commenter might have intended to refer as the "exemption timeline and process for exempted materials" with a two-year period.

Lastly, the commenter appears to erroneously assert that an exemption application requirement applies to packaging for goods identified in Public Resources Code section 42041(e)(2), including packaging for hazardous or flammable products (42041(e)(2)(D)). Such packaging is, by definition, not "covered material," so there can be no exemption requirement, and the proposed regulations do not suggest otherwise.

The commenter also makes the vague recommendation, "expanding the scope in the draft rules to allow for more discretion by CalRecycle to interpret certain provisions and exemptions." While CalRecycle cannot interpret that recommendation with certainty, it appears to suggest that CalRecycle should reserve discretion to establish statutory interpretations in the future. CalRecycle can only issue rules based on statutory interpretations through the formal rulemaking process. If the commenter intended to suggest otherwise, CalRecycle cannot further respond because the request is not sufficiently clear or specific for CalRecycle to identify a change to consider. Moreover, the commenter provides no direction as to how CalRecycle might revise the proposed regulation to allow for more discretion. Accordingly, no change is appropriate.

To the extent the commenter directs its recommendation at section 18980.2.3 specifically, CalRecycle rejects the implied assertion that CalRecycle has

interpreted the scope of Public Resources Code section 42041(e)(2)(F) too narrowly. Without limiting that scope so that it does not exclude packaging for goods that may be fully consumed immediately after acquisition or for goods whose packaging is typically discarded when use of the good begins, there would be no practical bounds to what could be considered not "covered material." Moreover, the commenter erroneously refers to the "definition of durable goods," but section 18980.2.3 contains no such definition. See, also, CalRecycle's response to comment O-63-5.

O-100: City of Livermore (Stephanie Egidio)

Comment O-100-1

This letter is in response to the formal draft of the SB 54 regulations released on August 22, 2025. The City of Livermore appreciates CalRecycle's responsiveness to several concerns and recommendations that were raised by local government and other stakeholders since the May 2025 draft. While we understand the need to finalize regulations given the regulatory restart, there are still several areas in the draft regulations that we believe do not fully align with the intent of the law. We offer the following comments and suggested regulatory revisions to help achieve alignment with the law's intent to accelerate progress toward circularity for packaging and foodware, protect ratepayers, and make local governments whole for costs associated with the law's implementation. Thank you for your consideration of the recommendations below.

Response to O-100-1

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it only references the commenter's recommendations; it doesn't set those recommendations forth. To the extent the issues raised require responses, CalRecycle has addressed them in response to other portions of the submission discussing the issues in detail.

Comment O-100-2

Article 2: Covered Material and Covered Material Categories

Categorically Excluded Materials – 18980.2

The May 2025 version of the draft regulations added for the first time in the rulemaking process a new pathway for packaging components to be excluded from the law if it is "necessary to comply with rules, guidance, or other standards issued by the [USDA] or [FDA] … to prevent microbial contamination or to maintain the safety or structural integrity of packaging…."

We appreciate the revisions made in section 18980.2(a)(2) of the August 2025 (current) version of the draft regulations to clarify these exclusions only apply when "it is not reasonably possible to use other packaging or packaging components…" and requiring

that entities must provide rationale to the Department including the conflicting federal regulation and explanation as to why no reasonably possible alternative packaging is available. We also support the addition requiring the Department to review exclusion requests and maintain a public list of determinations.

The Department has stated this new categorical exclusion is intended to provide further clarity to statute section 42060(b) which, in summary, states that SB 54's regulations should not conflict with other federal packaging requirements. We believe that should such a conflict arise, producers can utilize the exemption pathway within subparagraph (4) of section 18980.2.4 Exemptions for Certain Covered Materials for (A) unique challenges, (C) health and safety reasons, or (D) materials determined unsafe to recycle.

Unlike categorically excluded materials, exempted materials remain covered under the law, meaning regulated producers must still report and pay fees into the system with a required phase-in plan to ultimately achieve compliance. Exemptions are also limited to 2-5 years, while excluded materials are permanently removed from the law's purview.

The intent of SB 54 is to accelerate progress toward circularity in packaging and foodware, protect ratepayers, and ensure that local governments are fully reimbursed for costs associated with implementation. Establishing a pathway for certain materials to be excluded from the statute would undermine this purpose, as responsibility for the collection and processing of those materials would revert to local jurisdictions. This cost shift would ultimately burden ratepayers and run counter to the law's objectives. Again, we believe that producers can utilize the exemption pathway for the reasons listed above.

Recommendation:
We urge CalRecycle to remove section 18980.2(a)(2) from the draft regulations and instead rely on the existing exemption process (18980.2.4) for packaging or packaging components used by food or agricultural commodities that are unable to comply with SB 54 due to conflicting federal regulations.

Should the Department determine section 18980.2(a)(2) must remain in the regulations, we would like to offer the following revisions to improve the current approach:

- Exclusion vs. exemption rationale – Entities should be required to explain why an exemption under section 2.4 does not apply in their case, providing the statutory basis to exclude their packaging or component from the law entirely rather than request an exemption based on unique challenges or health and safety reasons.

The Department must be able to evaluate the basis for an exclusion vs. exemption and redirect requests to a more appropriate exemption pathway when applicable.

Suggested revisions to section 18980.2(a)(2)(A):
"The basis shall identify the specific provision of this Chapter that causes a conflict, cite the conflicting federal regulations or rules, ~~or guidelines,~~ and explain why no reasonably possible alternative packaging or packaging component is available and why the exemption pathways outlined in section 189890.2.4 do not apply."

Note: We also recommend removing "guidelines" (as shown above), as federal guidelines are not always statutorily compelling.

- Time limits – Packaging design and recyclability are shifting rapidly as a result of SB 54. As such, materials excluded under section 18980.2(a)(2) should be limited to 2-5 years, just as exemptions are (18980.2.4(g)) and a phase-in plan or rationale for why a phase-in plan is not feasible should be required, similar to section 18980.2.4(c)(4)(A)viii for exemptions.

Innovation and development of responsible end markets will likely create new compliance pathways for materials that are currently unable to meet the requirements of the law. Excluding currently challenged materials from the law indefinitely goes beyond statutory intent, and should future conditions change, there must be a pathway to integrate excluded material back into the law.

Response to O-100-2

CalRecycle partially accepts and partially rejects this comment as described in response to comment I-59-2, which is substantively the same as this one.

Comment O-100-3

We are also opposed to the addition of language that exempts packaging used for over-the-counter drugs (18980(a)(6), and we oppose the regulatory change that exempts secondary and tertiary packaging of exempted and excluded primary packaging (18980(b)). We feel these changes go beyond the intent of the authors and many stakeholders that negotiated this bill.

Response to O-100-3

CalRecycle rejects this comment for the reasons provided in responses to comments O-49-1 and O-33-6.

Comment O-100-4

Article 3: Evaluations of Covered Material and Covered Material Categories

Eligibility for Being Labeled "Compostable" – 18980.3.3

AB 1201 prohibits materials from being labeled "compostable" unless they meet specific criteria, including the requirement to be "designed to be associated with the recovery of

desirable organic wastes, such as food scraps and yard trimmings, that are collected for composting, unless the product complies with the department's regulations pursuant to subparagraph (B), to the extent the department elects to adopt such regulations." (PRC 42357(g)(E))

Section 18980.3.3(5) of the draft SB 54 regulations clarifies that an item is designed to be associated with the recovery of desirable organic waste *"if it is desirable organic waste itself or is marketed, labeled, or otherwise sold or distributed in a manner that directs or otherwise causes users of the item to use and discard it with desirable organic waste."*

This regulatory framing essentially provides that any material marketed or labeled to be composted, is considered "associated with the recovery of desirable organic waste" and therefore potentially compostable under SB 54 (if other criteria are met). The intent of section 42357(g)(E) is that a product facilitates the capture of desirable organics, such as food scraps and yard waste. Section 18980.3.3(5) of the current draft regulations effectively says that to be able to be labeled "compostable," a product simply needs to be labeled "compostable," provided it meets the other criteria in section 42357. Allowing all packaging and food ware, regardless of its material composition, bearing a "compostable" label to be considered "desirable" was certainly not the intent of AB 1201, and the draft regulations must be updated to close this unintended loophole. Further, while the SB 54 regulations will only affect food ware and packaging, including this definition in these regulations could open the door for the same or similar circular logic to be applied to other products seeking to be labeled compostable.

The facilities that process Livermore's organic waste do not accept compostable foodware or packaging unless it is 100% fiber-based and free of plastics. Allowing otherwise creates an avenue for non-compostable material to enter the organic stream, contaminating material that is directly given back to the Livermore community. This poses risks to the health of our community that utilize compost given away for home gardens and community gardens that grow food and feed are most vulnerable population. Additionally, the City of Livermore has already made significant progress in supporting and encouraging businesses to transition to reusable foodware. We believe that this proposed framing fosters confusion and is inconsistent with SB 54's intent to accelerate circularity and reuse.

Recommendation:
We recommend deleting the following sentence from section 18980.3.3(5) of the draft regulations: "They must satisfy the requirement set forth in subparagraph (E) of paragraph (1) of subdivision (g) of section 42357 of the Public Resources Code concerning association with the recovery of desirable organic wastes. ~~For purposes of this requirement an item is designed to be associated with the recovery of desirable organic waste if it is desirable organic waste itself or is marketed, labeled, or otherwise sold or distributed in a manner that directs or otherwise causes users of the item to use and discard it with desirable organic waste.~~"

Response to O-100-4

CalRecycle rejects this comment for the reasons provided in responses to comments I-59-3 and O-78-7.

Comment O-100-5

Article 4 – Responsible End Markets

Alternative Recycling Technologies – 18980.4(d)

PRC section 42041(aa)(5) states that the SB 54 regulations "shall encourage recycling that minimizes *generation* of hazardous waste, generation of greenhouse gases, environmental impacts, environmental justice impacts, and public health impacts. The regulations shall also include criteria to exclude plastic recycling technologies that *produce* significant amounts of hazardous waste." However, section 18980.4(d)(B) in the current version of the draft regulations goes against this statutory direction and shifts the standard from the *generation or production* of hazardous waste to its *management*.

The draft regulations enable — not exclude — technologies that produce significant amounts of hazardous waste, unlawfully shifting the standard from the production of hazardous waste (as required by the statute) to its management. Therefore, the threshold of avoiding only those technologies where hazardous waste is improperly managed and "presents an imminent and substantial risk of harm to public health or to the contamination of the environment" does not achieve the statutory mandate. Further, the draft regulations state that any hazardous waste handled and disposed of in "substantial compliance with an applicable permit" does not pose an imminent and substantial risk. This, too, conflicts with statutory guidance and legislative intent to exclude technologies based on the generation, not management, of hazardous waste. Additionally, the regulations still fail to address the statutory requirement to encourage minimization of the "generation of greenhouse gases, environmental impacts, environmental justice impacts, and public health impacts." (The draft regulations currently only address hazardous waste generation/management.) We urge the Department to add provisions to address these critical concerns and meet the statutory directives.

Response to O-100-5

CalRecycle rejects this comment for the reasons stated in response to comment O-62-1.

Comment O-100-6

Compostability of plastic – 18980.4(a)(4)(B)

We appreciate clarification of the use of the term "fully biologically decompose," and reference to the ASTM D-6400 standard. We strongly support the Department's requirements for items "partially or wholly comprising plastic." Visible particles of

compostable plastic in compost products hamper the marketability of those products. There is also a growing body of research showing the compostable microplastic residue has detrimental effects on plant and soil health, and potentially human health.

Response to O-100-6

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-100-7

Compostability of paper and fiber – 18980.4(a)(4)(C) and 18980.3(c)(4)

We support the regulatory approach to have different compostability standards for paper and fiber than for plastic. However, with the requirement for testing from an independent laboratory in section 18980.3(c)(4) removed, we are concerned the new proposed compostability standards for paper and fiber may provide a perverse incentive for bad actors to maintain vague or otherwise insufficient documentation demonstrating that the fiber truly is “wholly derived from natural resources.” Some form of verification of or attestation that a product is wholly derived from natural resources should be required to be submitted to the Department.

Response to O-100-7

CalRecycle rejects this comment for the reasons provided in response to comment O-68-6.

Comment O-100-8

Article 8 – Producer Responsibility Plan RequirementsProducer Responsibility Plan Requirements

Reimbursable costs – 18980.8(g)

We appreciate the addition to this section requiring that the PRO or Independent Producer “first” notify the local jurisdiction when costs are deemed covered for a recycling service provider. The notification of payments prior to issuance to service providers supports the transparency needed to help ensure producer payments are not being made for costs already included in solid waste rates.

Response to O-100-8

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-100-9

Article 11: Requirements, Exemptions, and Extensions for Local Jurisdictions and Recycling Service Providers

Local jurisdiction requirement – 18980.11(b)

PRC section 42060.5 states "local jurisdictions or recycling service providers shall include in their collection and recycling programs all covered material" contained on the statewide recyclable / compostable list. The current draft of the regulations provides that a "covered material is considered included in a local jurisdiction or recycling service provider's collection and recycling program if the local jurisdiction or recycling service provider collects the covered material and transfers it to responsible end markets directly or to intermediate supply chain entities."

We believe that including the requirement to also transfer recyclable and compostable covered material goes beyond the statutory requirement for local jurisdictions. This framing also makes it difficult to attribute violations to the correct party, muddying the distinction of where the enforceability of a jurisdiction for a violation of this requirement ends and the point at which that responsibility transfers to a recycling service provider or an intermediate supply chain entity. Jurisdictions need clear guidance on what's expected for compliance and how compliance will be determined.

Recommendation: Delete ~~"and transfers it to responsible end markets directly or to intermediate supply chain entities."~~

Response to O-100-9

CalRecycle rejects this comment for the reasons provided in response to comment I-59-7.

Comment O-100-10

Article 13: Enforcement Oversight by the Department

The draft regulations must recognize that SB 54's Enforcement Authority is limited to producers and the PRO and respect that local jurisdictions and recycling service providers are instead subject to existing enforcement regimes under AB 939. Great lengths are taken in statute to outline the potential enforcement actions that can be imposed against producers or the PRO, yet there is not a single instance in statute that refers to enforcement upon local jurisdictions or recycling service providers. Neither Public Resources Code Sections 42080 nor 42081 contemplate penalties against local governments or recycling service providers.

Local jurisdictions are subject to AB 939's diversion requirements and must develop source reduction and recycling elements outlining how they will achieve the state's solid waste and recycling requirements. Under the AB 939 framework, CalRecycle is required to regularly review jurisdictions and determine whether they have made a good faith effort to implement their source reduction and recycling element, with penalties of up to $10,000/day for noncompliance. Therefore, a local jurisdiction's failure to comply with SB 54 should be considered a violation of their existing requirements to implement diversion programs through AB 939 and subject them to these penalties exclusively.

Reporting and compliance review for SB 54 should be incorporated into existing Electronic Annual Report (EAR) system run by CalRecycle, as currently utilized for other laws that govern local jurisdiction diversion requirements such as SB 1383, AB 341, and AB 1826 compliance. This existing system can be updated to require local jurisdictions to self-report SB 54 compliance by certifying whether they include the required recyclable or compostable covered materials in their programs.

We appreciate the CalRecycle team's openness to feedback and continued dialogue to ensure the final regulations will provide a foundation for successful implementation of the law.

If you have any questions, please contact my office, 925-960-4010.

Response to O-100-10

Comment rejected for the same reasons explained in response to comment I-59-8.

O-101: California Product Stewardship Council (Bani Dhaliwal)

Comment O-101-1

The California Product Stewardship Council (CPSC) appreciates the opportunity to provide comments on the proposed permanent regulations implementing Senate Bill 54 (Allen, 2022), as noticed by CalRecycle in its August 22, 2025, Notice of Proposed Action (Title 14, Division 7). These proposed regulations represent the critical next step in implementing Senate Bill 54 (Allen, 2022), California's landmark packaging Extended Producer Responsibility Bill.

CPSC strongly supports and endorses the adoption of permanent regulations to allow the program to begin without setbacks. From our perspective, it's more important and impactful for the program to stay on track for adoption of the final regulations before December 31, 2025 than to give way to programmatic requests that are likely to require new legislation to achieve.

While the draft regulations reflect a smaller program scope than originally intended, moving forward as is essential to establish producer responsibility, reduce plastic pollution, and build the foundation for future program updates. Timely adoption will provide CalRecycle, producers, and stakeholders with the certainty needed to make decisions in 2026 and 2027 while the Plan is under development.

If there are still opportunities to make edits to the regulations, CPSC provides the following targeted recommendations with the acknowledgement that to incorporate and accomplish these aspects may require future legislation, if not included in the final Plan.

Response to O-101-1

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process. To the extent other portions of the submission do suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-101-2

1. Section 18980.1.1 Producer Identification

We support CalRecycle's refinements clarifying brand owners, licensees, or distributors as responsible producers. However, CalRecycle must ensure clarity in brand/franchise arrangements so that the responsibility lies with producers that control packaging design, not small retailers or franchisees. Transparent documentation of producer designation is essential.

Response to O-101-2

Comment rejected. No change is appropriate to address the commenter's concerns because, as explained in responses to comments O-96-4 and O-82-15, the proposed regulations establish how the statute applies to the franchisor/franchisee relationship relates to identifying the producer. Because a lawful franchisor necessarily will be "in the state," as that concept is interpreted in section 18980.1.1(a), the proposed regulations ensure that the franchisor, not small retailers or franchisees, will be an in-state brand or trademark owner for purposes of Public Resources Code section 42041(w)(1) and (2), which designate the brand or trademark owner as the producer.

Comment O-101-3

2. Section 18980.2.2 Exclusion of Certain Types Of Packaging: De Minimis Exemption

The exemption for producers under $1 million in annual sales remains unchanged. While this reduces burden on microbusinesses, it risks excluding significant volumes from oversight. We recommend adding a tonnage threshold and requiring minimal data reporting from exempt producers to maintain program integrity.

Response to O-101-3

Comment rejected. This comment appears mislabeled as one directed at section 18980.2.2, which does not concern the "exemption for producers under $1 million in annual sales." That exemption cannot be modified because it is established by statute, which does not authorize CalRecycle to establish other thresholds, such as one based on tonnages.

Comment O-101-4

3. Section 18980.2 Categorically Excluded Products

The regulations clarify exclusions for medical producers, hazardous materials, and food-related packaging. CPSC recommends clearer language on CalRecycle's decision-

making process if the Federal Guidelines misalign with the program's goals for reuse and source reduction. We caution against overly broad exemptions and urge CalRecycle to require public disclosure of exemption claims. We understand pre-emption might prevent CalRecycle from making product design requirements for packaging regulated by other agencies.

Response to O-101-4

Comment partially rejected and partially accepted. The commenter notes that the regulations "clarify exclusions for medical producers, hazardous materials, and food-related packaging," but only discusses the situation where "Federal Guidelines misalign with the program's goals for reuse and source reduction." CalRecycle therefore understands this comment's recommendation only to concern the exclusion for food-related packaging, as provided in section 18980.2(a)(2). No change is necessary to address federal guidelines that "misalign with the program's goals for reuse and source reduction." The commenter does not explain what it would mean for federal guidelines to "misalign" with reuse and source reduction, but CalRecycle interprets that not to refer to circumstances where it would be impossible to comply with both California and federal laws or regulations. Mere misalignment or mismatch between state and federal law does not justify excusing any covered material from obligations under the statute, and packaging that is "reusable" under the standards provided in the regulations is not covered material and would not be subject to any other requirements of the Act. Moreover, a direct conflict regarding source reduction is not possible because source reduction concerns the generation of waste from plastic covered material overall, not federal requirements imposed on particular packaging materials. Even more, the exclusion described in section 18980.2(a)(2) cannot possibly interfere with meeting the statute's source reduction requirements because applying the exclusion can only decrease the amount of packaging considered "covered material" included in the 2023 baseline; it cannot render compliance with the Act and federal law impossible.

Regarding the commenter's general caution against "overly broad exemptions," no specific response is needed to such a general, overarching concern; it does not direct an objection at any particular regulatory provision or recommend a change to any provision. However, if the commenter intended to refer to the scope of section 18980.2(a)(2), CalRecycle partially accepts this comment. The revisions to the regulations preserve the intended scope of 18980.2(a)(2), and that scope is properly tailored to the mandate in Public Resources Code section 42060(b): It applies where compliance with the Act and federal law is impossible. On that basis, CalRecycle rejects the commenter's objection to the scope itself. However, as CalRecycle has explained in response to comments raising concern over that scope (e.g., O-13-3 through O-13-6, I-19-1, I-59-2, O-93-9, O-75-2, and B-47-3), CalRecycle accepts this comment to the extent it alleges that section 18980.2(a)(2) was unclear in scope or effect, was insufficiently clear with regard to what renders it "not reasonably possible" to resolve conflicts with federal laws,

or would have been overbroad in effect due to the potential for the exclusion to be applied despite the conflicts being avoidable. See, in particular, CalRecycle's response to comment I-19-1, explaining the revisions responsive to this and similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

Regarding "public disclosure of exemption claims," no change is necessary because, subject to protections for trade secrets, records submitted to CalRecycle are subject to disclosure upon request, and 18980.2(a)(2) already does require CalRecycle to publish information about the notices it receives claiming that the exclusion applies.

Comment O-101-5

4. Section 18980.3.4 Independent Third-Party Validation for Postconsumer Recycled Content

The removal of specific 30/40/65% recycled content mandates in the proposed regulations weakens market uncertainty and cripples California's progress toward a circular economy. CPSC urges CalRecycle to reinstate minimum recycled content requirements by material type to create stable market demand and reduce dependence on virgin plastics.

We also recommend aligning these requirements with SB 343 (Allen, 2021) – Accurate Recycling Labels. By pairing SB 54's recycled content mandates with SB 343's labeling standards, CalRecycle can close the loop, ensuring that materials labeled as recyclable are technically recyclable, and have consistent mandate demand in manufacturing markets.

Response to O-101-5

Comment rejected. CalRecycle cannot discern what the commenter describes as the "removal of specific 30/40/65% recycled content mandates" and "SB 54's recycled content mandates." The statute does not contain any recycled content mandates, nor does it confer authority for CalRecycle to impose any.

Comment O-101-6

5. Section 18980.9 Source Reduction Baseline Report

While the 25% source reduction requirements by 2032 remain, interim milestones have been excluded from the regulations. We recommend restoring 10% by 2027 and 20% by 2030 benchmarks to ensure steady progress and accountability rather than backloading reductions.

Response to O-101-6

CalRecycle rejects this comment as section 42057(a)(1) of the PRC requires producers, individually or through a producer responsibility organization (PRO),

to achieve an aggregate 25 percent reduction by weight and number of plastic covered material by January 1, 2032, relative to the 2023 baseline. However, the statute does not establish any requirement for regulatory interim dates or milestones prior to 2032, and as such, at this time CalRecycle does not have express authority to establish such new percentage targets through regulation. Instead, the Department will be able to monitor progress through annual reporting. Further, the proposed regulations also already provide continuous accountability through the required annual reports, including in section 18980.9.1 of the proposed regulations. As such, the requested specific additional dates are both unnecessary for the reasons stated above, and would be inconsistent with statutory authority, resulting in the comment being rejected.

Comment O-101-7

6. Section 18980.6.7 Eco-Modulated Fee and Fee Schedule

The proposed regulations omit eco-modulated fees. We recommend adopting differential producer fees that reward recyclability, durability, and safer chemistry while penalizing problematic materials. Fee schedules should also reflect higher collection costs in rural and disadvantaged communities to ensure equitable service.

Response to O-101-7

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42051.1, 42053, and 42060, and no change is necessary to the implementation of the Act. To the extent this comment recommends adopting differential producer fees that reward recyclability, durability, and safer chemistry while penalizing problematic materials, and that reflect collection costs, such considerations are already included in the eco-modulated fees required under PRC sections 42053(c)-(e) and sections 18980.6.7(b) and (f) of the proposed regulations. To the extent this comment may be concerned with the timeline for eco-modulated fees, see the response to comment B-6-6.

Comment O-101-8

7. Section 18980.8 Producer Responsibility Plan: Chemical Recycling

Both Mechanical and Chemical processing have human and environmental impacts and CPSC believes the program should be technology agnostic and performance based for each facility processing materials from the program. Of course, there are some technology exclusions with waste-to-energy and incineration counting towards recycling. The responsibility is on the PRO to develop and monitor compliance mechanisms for the processors to ensure they are all: 1) not generating hazardous waste; 2) minimizing GHG impact; and 3) moving materials to responsible end-markets. If the PRO cannot prove those three things to CalRecycle in their annual reports, then the processed materials count as disposal, not recycling.

Research has shown chemical processing technologies are unproven to deliver cost-effective or environmentally sound circularity at scale, so the PRO is not making

decisions in a vacuum with the support of the scientific community. A recent comparative study by Uekert et al. (2023) found:
• Mechanical recycling remains the most cost-effective and environmentally beneficial option, though limited in quality and circularity.
• PET glycolysis shows the best balance of cost and environmental performance among chemical processes.
• Other methods like enzymatic hydrolysis, pyrolysis, and gasification remain too resource and energy intensive or costly to be viable.

CPSC emphasizes that under California law, “recycling” does not include fuel production or combustion, and processes must meet stringent requirements to qualify as “recycling,” including responsible end-markets, residual thresholds, GHG performance, and limited hazardous waste generation. Simply stockpiling outputs such as flake or intermediates cannot count as “recycling.”
To safeguard California’s climate and health goals, CPSC recommends that CalRecycle:

• Explicitly exclude fuel production and energy recovery from qualifying as recycling.
• Require continuous improvement in yields, solvent reduction, and energy efficiency, with emphasis on expanding viable closed-loop solutions for polyolefins and food service ware plastics, where recycling options remain most limited.
• Ensure all chemical processes meet California’s recycling standard and prove they achieve responsible end-markets and human health protections prior to receiving credit under SB 54 (Allen, 2022).

Response to O-101-8

Comment rejected. No regulation is needed concerning fuel production and energy recovery because statute (Public Resources Code section 42041(aa)(2)(C) and (D)) already disqualify them from being considered recycling. Regarding "continuous improvements in yields, solvent reduction, and energy efficiency," CalRecycle declines to make the requested change because the statute does not confer authority on CalRecycle to set such prescriptive standards and impose them on recyclers. Regarding the final recommendation (concerning chemical processes and responsible end markets), article 4 of the proposed regulations address responsible end market requirements, which apply to all recycling technologies (chemical or otherwise).

Comment O-101-9

8. Integration with Other EPR Programs
SB 54 will pave the way for future EPR programs, including the various programs that would be created by bills sponsored by CPSC including SB 707 (Newman): Responsible Textile Recovery Act of 2024. CPSC will continue to stay engaged in the conversation through participation in the SB 54 Advisory Board, involvement in establishment of the regulations, and through discussions in our CPSC Policy & Education Advisory Committee (PEAC).

Thank you for your work on this historic piece of legislation that will address plastic pollution, improve our materials management system, and protect our environment.

Response to O-101-9

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process. To the extent other portions of the submission do suggest changes or raise objections, CalRecycle has responded to those portions separately.

O-102: Environment and Enterprise Strategies (Holly Kaufman)

Comment O-102-1

I am writing regarding the permanent SB-54 regulations released on August 22, 2025. SB 54 was passed in order to improve the management of certain plastic wastes and reduce costs doing so, while satisfying the economic needs to the greatest extent possible of all the stakeholders involved in the system. Unfortunately, as currently drafted, the revised regulations fall short in achieving the goals of the carefully negotiated legislation.

It is critical that the regulations implement the law as it was intended, both to maintain support from industries who actively worked for passage of SB 54 rather than the competing ballot measure, and because California's implementation of SB-54 is being closely watched by other states and policymakers who are looking at implementing similar legislation. I urge CalRecycle and the Governor's office to align the regulations with SB 54's legislative intent to create a fair, effective, and transparent producer responsibility framework that promotes affordability for consumers, prevents loopholes, and builds consumer trust.

My main concerns are that some provisions go beyond statutory authority, including, critically, both enforcement against local governments and the exclusion application process. Likewise, sufficient clarity does not exist in order for producers, local governments, and other impacted entities to understand their obligations and therefore will not be able to create a working system. In addition, the reuse and refill deadlines are unrealistic given the lack of early staffing and preparation by the Producer Responsibility Organization (PRO).

To reiterate, for SB 54 to be a success, the regulations must reflect the law's intent to protect the environment while creating economic benefit. The law must be implemented as negotiated and passed. Otherwise, the regulations undermine the years of negotiations and ultimate agreement that led to passage of the law. Californians want the environmental and economic benefits that

the law will provide if implemented as intended. Californians also do not want to create unfair markets that would risk litigation, jeopardize California's leadership and, putting packaging extended producer responsibility (EPR) programs at risk across the country . Thank you for the opportunity to comment and for your continued efforts to develop fair and sound regulations.

Response to O-102-1

Comment rejected. No substantive response is required because the comment raises general concerns without stating any specific recommendations for revisions to the proposed regulations.

O-103: Kate Bell Strategies (Kate Bell)

Comment O-103-1

I. Ability for entities to reach agreement on who will report to CAA with respect to a given item.

Recommendation: Model language like Minnesota's EPR statute to help ease the burden on industry and allow businesses to comply with this law effectively.

- In defining producers, Minnesota's statute, Minn. Stat. § 115A.1441, Subd. 26(a)(6), states that "[a] person is the producer of a covered material sold, offered for sale, or distributed in or into this state, as defined [in the preceding clauses], except: (i) where another person has mutually signed an agreement with a producer . . . that contractually assigns responsibility to the person as the producer, and the person has joined a registered producer responsibility organization as the responsible producer for that covered material under this act. In the event that another person is assigned responsibility as the producer under this subdivision, the producer [under the preceding clauses] must provide written certification of that contractual agreement to the producer responsibility organization[.]"

- This language allows for an entity identified as a producer to contractually assign that responsibility to any willing party, so long as that party (1) joins a registered PRO and (2) provides written certification of the contractual agreement to the PRO.

- Not only will this allow businesses to comply with SB54 in a way that fits their individual business models, but it will cut down significantly on administrative burden to both CalRecycle and CAA in having to field questions and give guidance on every possible producer obligation scenario that might arise.

Additional Context:

- We have encountered multiple instances where reasonable minds may differ as to whom the Obligated Producer should be under the law. *(Is the item "branded?" What if it is co-branded? Is the party a "licensee" of the brand?)* At some point the discussion must end to meet deadlines, and the parties necessarily come to a contractual agreement to settle the debate.

- As written, the draft SB54 regulations appear to allow for this, but as written, the reader must first cross-reference at least two statutes and sift through extremely long hierarchies for determining the producer of both food service ware and packaging.

- With so much to parse through, the process of identifying who is or may be the obligated producer in California is rife with opportunity for multiple (and conflicting) interpretations.

- Even though the law provides for a scenario where there are "multiple brands or trademarks that may be designated [as the producer]", proposed 14 CCR 18980.1.1(e)(5) states "**the owners of brands or trademarks may agree among themselves to designate one of the brands or trademarks [as the producer], provided that the owner or a licensee of that brand or trademark satisfies the criteria to be the producer under this subdivision**."

- Even assuming all parties can agree on reaching this point in the "decision tree", it appears that the terms "owners of brands or trademarks" and "owner or a licensee of that brand or trademark" are interchangeable, which muddies the waters on who may enter into such an agreement.

- **We do not believe California intends to prohibit contractual agreements on the topic – especially since the ability to enter into such an agreement clearly exists in some form as written.**

- **As it stands, however, such agreements appear to be technically allowed, but the waters are so muddied that it will be nearly impossible for parties to**

come to any agreement – and certainly not without long and protracted negotiations.

Response to O-103-1

CalRecycle rejects this comment for the reasons stated in response to comment I-61-2.

Comment O-103-2

II. Narrowing scope of Covered Materials to only those that enter the residential waste stream.

Recommendation: All packaging & food serviceware that is destined for the residential (including single- family and multi-family) sector should be included in EPR programs. Packaging and food serviceware disposed of at restaurant should NOT be in scope (aka dine-in deduction).

- Colorado EPR law has language for this: "Packaging material" covered under the law explicitly does NOT include packaging materials used solely in business-to-business transactions where a covered material is not intended to be distributed to the end consumer.

- To further this point, AB 827 requires restaurants/QSRs to provide front of house collection for compost, recycling & landfill.

- The industry manages and pays for back of house packaging recovery, so commercial/B to B should be out of scope.

Response to O-103-2

Comment rejected. The commenter requests that only items "destined for the residential . . . sector" be included in "EPR programs." That request concerns the scope of statute, not the proposed regulations, which cannot alter the scope of statute. To the extent the commenter intended to argue that the statute itself does not encompass items "disposed of at restaurant [sic]," that interpretation is unfounded, and the only support offered is that the restaurant "industry manages and pays for back of house packaging recovery." That assertion, as well as the fact that restaurants are subject to other laws requiring them to collect certain waste separately, has no apparent relevance to statutory interpretation here.

See, also, CalRecycle's response to comment O-38-1 regarding the application of statute to commercial (or "B2B") packaging.

Comment O-103-3

III. Request extension of upcoming reporting and fee deadlines based on timing of final regulations and presumably guidance/education coming subsequent to same

Response to O-103-3

Comment rejected. With regard to extending upcoming reporting deadlines, the date of July 1, 2026 is necessary to ensure the statutory requirements are sufficiently met, including section 42051(b) of the PRC. Section 42051(b) requires that upon approval of a plan or commencing January 1, 2026, whichever is sooner, a producer shall not sell, offer for sale, import, or distribute covered materials in the state unless that producer is covered by a PRO plan or is approved by CalRecycle as an Independent Producer. Therefore, by no later than January 1, 2026, producers should be complying with the Act and regulations. Thus, requiring reports to be submitted to CalRecycle on or before July 1, 2026 gives the Department six months after the latest possible statutory date. This provides a balance by allowing adequate time for all reporting entities to gather the necessary information for the report, while also ensuring CalRecycle receives the information as expeditiously as possible to make any necessary updates to the source reduction baseline. As this regulation is necessary for implementation of the act and aligns with statutory requirements while striking a balance between both adequate time for the reporting entities and adequate time for the Department, no change is required as it would undermine the above.

With regard to extending upcoming fee deadlines, the proposed regulations are consistent with the requirements of the Act, including in PRC sections 42053, 42060, and 42064, and no change is necessary to the implementation of the Act. PRC section 42053(b) provides that the PRO must charge its producers fees during the first two years of operation and during the preparation of the PRO plan, and PRC section 42064(e)(1) provides that producers' annual environmental mitigation surcharge payments must commence in the 2027 calendar year. The proposed regulations providing for the payment of producers' fees, including section 18980.6.7, are consistent with these statutory requirements and timelines. Therefore, no change to the proposed regulations is necessary.

O-104: The Recycling Partnership (Dylan de Thomas)

Comment O-104-1

The Recycling Partnership Represents the Recycling System

The Recycling Partnership's mission is to build a better recycling system – one that delivers the economic and environmental benefits our communities and the hundreds of thousands of people who work throughout the recycling industry deserve.

With a major focus on advancing EPR and related policies, The Recycling Partnership helped lead negotiations leading to enactment of SB 54 in 2022 and we have been actively engaged ever since. We are dedicated to maximizing the expansive circular economy benefits of this novel statute and establishing it as a successful model to help drive continued progress in extended producer responsibility (EPR) nationwide.

Thank you to CalRecycle for your continuing efforts to craft workable SB 54 regulations that balance diverse stakeholder concerns.

We are not aware of a more challenging, complex or consequential state rulemaking process than the one CalRecycle is leading for SB 54. Your dedication to listening to and respecting all viewpoints while seeking objectively valid interpretations of statutory intent is impressive. Many of our top rulemaking concerns and suggestions have been addressed, sometimes in unexpected ways that bridge stakeholder perspectives.

At this critical juncture, with the future success of SB 54 hanging in the balance, we have grouped our comments in this formal rulemaking 45-day comment period into two priorities as described below.

Response to O-104-1

Comment rejected. No response is necessary to this comment because it contains introductory or summary remarks only and does not set forth requested changes to the proposed regulations or objections concerning the rulemaking process.

Comment O-104-2

Priority 1: To help SB 54 implementation proceed to on-time PRO plan approval and EPR program launch, we support CalRecycle's goal to adopt final regulations by January 1, 2026.

We do not take this position lightly.

We understand that to achieve this goal, CalRecycle must avoid substantive changes that would trigger an additional 15-day public comment period and associated process steps. And yet, as our comments below make clear, we have significant concerns over certain aspects of the current draft regulations.

The SB 54 statutory timeline and sequencing requirements for implementing the new EPR system, attaining mandated performance targets, and executing producer packaging changes are already exceedingly challenging, if not demonstrably impossible in many cases, to satisfy within the statutory deadlines based on logistical and practical considerations alone. Prolonged needs assessment delays and abandonment of the first formal rulemaking have further exasperated the PRO's time crunch to integrate needs assessment findings, final rulemaking standards and initial producer reporting into a

compliant program plan and fee schedule that will rapidly advance effective compliance strategies.
In this context, we conclude that adopting regulations as soon as possible is essential. **However, due to our continuing concerns and the need for more clarity on certain key issues, we urge CalRecycle to publish additional, plain-language guidance documents and announce plans for an additional rulemaking at the earliest possible time.** The remainder of this submission identifies our priority regulatory concerns and recommendations, including suggested topics ripe for CalRecycle guidance.

Response to O-104-2

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process. To the extent this comment recommends adopting the proposed regulations as soon as possible, CalRecycle is currently following the rulemaking process to adopt the proposed regulations, including by complying with all necessary timeframes and opportunities for public participation. To the extent this comment recommends publishing additional guidance documents and announcing plans for an additional rulemaking, these recommendations are not within the scope of the proposed regulations and do not relate to the present rulemaking process.

Comment O-104-3

Priority 2: If CalRecycle does make any substantive changes to the draft regulations as a result of this 45-day
public comment period, the following are our top priority concerns and recommendations.
Our understanding is that changes that are not substantial would not trigger an additional public comment period, and changes that may be substantial but are closely related to existing draft text may trigger an additional 15-day (as opposed to 45-day) comment period. As such, the following recommendations focus on changes we believe may be non-substantive or at least closely related to existing text.

Response to O-104-3

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process. To the extent other portions of the submission do suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-104-4

Concern 1: As currently written, the newly added categorical exclusion for federal regulation conflicts in Section 18980.2(a)(2) could potentially be highly disruptive to SB 54 implementation.
We appreciate CalRecycle's efforts to refine and narrow the scope of this newly added provision so that it applies to only a small number of products with clear conflicts. And

we acknowledge that some stakeholders may overstate their certainty that the provision will gut the impact of SB 54. But **it does appear plausible that this provision could potentially result in an categorical exclusion submissions to CalRecycle**. Certainly, a wide range of products are subject to regulation under the Food Safety Modernization Act (FSMA). And our understanding is that the Hazard Analysis and Critical Control Points (HACCP) documents prepared by companies to comply with FSMA and other federal regulations (which identify risks and mitigation strategies including packaging specifications) are not generally subject to review and approval by federal regulators but are rather controlled by the companies themselves. Some experts in this field predict companies could shift to tailoring their HACCPs specifically to meet SB 54 exclusion requirements. We are concerned that the process defined in draft regulations makes categorical exclusions 1) too easy to obtain; and 2) too burdensome and time-consuming for CalRecycle to limit through meaningful oversight reviews and determinations. Exclusion claims are apparently effective upon submission, pending CalRecycle resource intensive review, research and consultation with state and federal agencies, and information requests with a 60-day turn around all needed to finally reach potential rejection and an additional 180-day waiting period before the items are considered covered materials under SB 54. Given other SB 54 timing and resource demands, it seems reasonable to doubt CalRecycle's ability to execute a rapid and robust review of many submissions and, even if that is possible, the process could still result in prolonged uncertainty in PRO planning and fee setting that could take years to resolve. We believe that not only is the categorical exclusion not authorized under SB 54, but it is also not needed given the current provisions in 18980.2.4 allowing for limited exemptions based on specific health and safety or unique compliance challenges. These provisions provide a robust process that ensures all producers and targeted materials comply to the maximum extent possible. Conversely, the draft regulations appear to be based on a hypothetical need to change packaging that will depend on the types of PRO recycling system improvement strategies employed and their outcomes that cannot be known at the outset of the program.

Recommendations to Address Concern 1 Related to Categorical Exclusions for Federal Regulatory Conflicts Regulations Section and Topic
18980.2(a)(2) Categorical Exclusion for Identified Federal Regulatory Conflicts
And 18980.2.4 Exemptions for Certain Covered Materials due to Unique Compliance Challenges or Health and Safety Concerns

Recommendations
<u>Comment 1:</u> Ideally 18980.2(a)(2) should be deleted entirely, leaving producers the opportunity to petition the PRO to pursue an exemption under 18980.2.4 due to unique compliance challenges, for health and safety reasons, or because it is unsafe to recycle certain covered materials. This is how this issue was handled in the prior formal rulemaking. The process for evaluating limited exemptions under Section 18980.2.4 appears ideally suited since it already covers packaging health and safety or SB 54 unique compliance concerns. Most importantly, Section 18980.2.4, unlike 18980.2(a)(2) ensures that producers and covered materials will comply to the maximum extent possible, since it states, "*The exemption does not affect the status of*

the single-use packaging or single-use plastic food service ware as covered material and does not otherwise change the obligations of producers with respect to the covered material, such as reporting and payment of PRO fees."

Comment 2: If CalRecycle does not delete and retains the current approach in 18980.2(a)(2), then we recommend: a. Exclusions should last only 2-3 years and then require resubmittal and updating. Recycling systems may be improved to the point that the excluded packaging can satisfy both SB 54 and federal requirements. b. Only SB 54 producers should be allowed to submit exclusions, not all "entities" as in draft regulations. c. CalRecycle should be required (or at least authorized) to make a rapid review and ruling on submissions based on completeness and adequacy that could lead to immediate rejection of the claimed exclusion. d. There should be an annual deadline for submissions to take effect in the following plan implementation year. For the initial plan year, the deadline should be within 30 days of regulations being adopted. e. Although food safety packaging design is outside of our organization's core expertise, CalRecycle should seek to identify a more objectively measurable standard beyond "not reasonably possible to use other packaging." Following are example edits that would execute the above recommendations

18980.2(a) The following are not covered material:

…(2) In accordance with paragraphs (1) and (2) of subdivision (b) and with subdivision (d) of section 42060 of the Public Resources Code, packaging or packaging components used by a food or agricultural commodity (without regard to its origin) if it is not reasonably possible to use other packaging or packaging components to comply with regulations, rules, or guidelines issued by the United States Department of Agriculture or the United States Food and Drug Administration. A determination of exclusion pursuant to this paragraph may consider standards to prevent microbial contamination or to maintain the safety or structural integrity of packaging under the Food, Drug, and Cosmetic Act; the FDA Food Safety Modernization Act; the Poultry Products Inspection Act; the Federal Meat Inspection Act; the Egg Products Inspection Act; or other applicable food or agricultural regulations, rules, or guidelines.

(A) ~~Any entity~~ A producer that has determined that packaging is not covered material pursuant to paragraph (2) of subdivision (a) shall notify the Department and the PRO and provide both a specification for the packaging or packaging component and the associated product(s) along with a summary of the basis for its determination. The term "producer" includes a person that would be a producer pursuant to subdivision (w) of section 42041 of packaging and food service ware items if they were not categorically excluded. The basis shall identify the specific provision of this Chapter that causes a conflict, cite the conflicting federal regulations, rules, or guidelines, and explain why no reasonably possible alternative packaging or packaging component is available. The Department shall maintain on its website a publicly available electronic database of each such determination that includes the entity name, the specification for the packaging and the associated product(s), and the status of any review by the Department of such determination. For the exclusion to be effective in the initial PRO plan implementation year, notification documentation must be received by CalRecycle and the PRO within 30 days of the effective date of this chapter. In future years, notifications received by March 1 of each calendar year are eligible to take effect in the next implementation plan implementation calendar year.

(B) Within one year of receiving a submission pursuant to paragraph (A), CalRecycle shall review and issue a determination either concurring with or rejecting any claimed exclusion. A determination shall remain effective for three years from the day CalRecycle receives the submission, and updated documentation must be submitted prior to the expiration providing a basis for continued exclusion. If CalRecycle determines that a submission pursuant to paragraph (A) is incomplete or insufficient and informs the producer within 60 days of receiving it, then the identified packaging or packaging components shall immediately be considered covered material. At any time, the Department may request from an entity additional information supporting that entity's determination, which must be provided within 60 days. If such information is not provided, or if the Department believes the information provided is incomplete or insufficient as a basis for the determination, it shall notify the entity, which shall respond within 60 days. Following review of the information provided by the entity, and any further consultation with the entity and any state or federal government agencies (including the California Department of Food and Agriculture and the California Department of Public Health) that the Department deems advisable, the Department shall determine whether the packaging or packaging component qualifies for the exclusion. If the Department determines that the packaging or packaging component does not qualify for the exclusion, then it shall be considered covered material 180 days following the Department's decision.

Comment 3: As a variation of Comment 1, CalRecycle could delete the current provision in 18980.2(a)(2) and also add language to Section 18980.2.4 to explicitly allow exemption requests for identified federal regulatory conflicts. To provide flexibility where disagreements with the PRO arise, producers could be allowed to directly submit such requests to CalRecycle if the PRO declines to do so. Example suggested edits:

Add to 18980.2.4(c)(4)(F): …*An application may request an exemption pursuant to paragraphs (3) or (4) of subdivision (a) of section 42060 of the Public Resources Code due to a conflict between SB 54 regulations and specified federal regulations pursuant to paragraph (1) and (2) of subdivision (b) or subdivision (d) of section 42060 of the Public Resources Code.*

Section 18980.2.4(a) *Except as provided under paragraph 1 below, only a PRO or an Independent Producer may submit a request for an exemption pursuant to paragraph (3) of subdivision (a) of section 42060 or paragraph (4) of subdivision (a) of section 42060 of the Public Resources Code. The effect of such an exemption is that exempted covered material may be sold, offered for sale, imported, or distributed regardless of whether the covered material complies with section 42050 or subdivision (i) of section 42057 of the Public Resources Code. The exemption does not affect the status of the single-use packaging or single-use plastic food service ware as covered material and does not otherwise change the obligations of producers with respect to the covered material, such as reporting and payment of PRO fees.*

(1) A producer may independently submit a request for an exemption pursuant to this subdivision if they determine there is a conflict with a specified federal regulation as described under paragraphs (1) and (2) of subdivision (b) and with subdivision (d) of section 42060 of the Public Resources Code and if the PRO does not inform the

producer of its intent to submit the application within 60 days of receiving a petition from the producer providing sufficient rationale to justify the exemption.

Response to O-104-4

Comment partially rejected and partially accepted. For the reasons provided in response to comments I-59-2, I-19-1, and O-93-9, CalRecycle rejects the suggestion to remove 18980.2(a)(2) in its entirety and the suggestion to rely on the exemptions described in section 18980.2.4 instead. Regarding the proposed changes to subparagraph (A), CalRecycle declines to make those changes for the reasons stated in its response to comment O-96-5, which suggested substantially similar revisions.

Regarding the suggested additions imposing a time limitation on exclusions pursuant to 18980.2(a)(2), CalRecycle rejects the comment for the reasons provided in response to comment I-59-2. Moreover, the proposed effective period of three years would unnecessarily impede CalRecycle's ability to identify unmeritorious exclusion claims and deem them no longer effective within a shorter timeframe.

Regarding the suggestion to require CalRecycle's concurrence or rejection of a claimed exclusion within one year, CalRecycle rejects that suggestion because it could not be implemented fairly and would contradict the other procedures established in subparagraph (B) (subparagraph (E) in the updated proposed regulations), which the commenter does not propose changing. The process the commenter outlines would require CalRecycle's "determination" to be retroactive to the submission date. That would result in up to one year during which the affected business would be unable to assess its compliance status. And, if CalRecycle initiates the process for obtaining additional information, that process might not conclude within the one-year period the commenter proposes for CalRecycle's ultimate determination. The commenter does not explain how CalRecycle would resolve that inconsistency. Instead, the proposed regulation maximizes CalRecycle's ability to determine how to most efficiently administer the Act: CalRecycle will review each submission, ensure it contains the required elements, and determine on a case-by-case basis whether and when to require additional information justifying the exclusion. The benefit of an initial one-year period would often be illusory because the process for requiring additional justification could be concluded within one year of the submission. Regarding the suggestion that "only SB 54 producers should be allowed to submit exclusions," the commenter addresses a merely semantic issue: If packaging is not considered "covered material," there is no "producer" of it. So, any entity making a submission pursuant to section 18980.2(a)(2) would be effectively claiming not to be a producer. The suggested change would only render the proposed regulation less clear.

The commenter also suggests that exemptions pursuant to section 18980.2.4 should be used in lieu of the exclusion described in 18980.2(a)(2). CalRecycle rejects that suggestion for the reasons provided in response to comment I-59-2.

Although CalRecycle declines to make the specific changes the commenter recommends, CalRecycle accepts the comment to the extent it raises concerns over the scope and effect of 18980.2(a)(2) and has revised it accordingly. The changes address the request for a "more objectively measurable standard" by adding criteria for evaluating whether it is "not reasonably possible" to use other packaging. The changes also add procedures, including an initial review and potential immediate rejection by CalRecycle, for ensuring that deficient submissions do not result in unjustified exclusions being considered valid. More generally, CalRecycle accepts this comment to the extent it alleges that section 18980.2(a)(2) was unclear in scope or effect, was insufficiently clear with regard to what renders it "not reasonably possible" to resolve conflicts with federal laws, or would have been overbroad in effect due to the potential for the exclusion to be applied despite the conflicts being avoidable. See CalRecycle's response to comment I-19-1, explaining the revisions responsive to this and similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

Comment O-104-5

Concern 2: A viable pathway to be designated recyclable via alternative collection programs alone or in combination with local jurisdiction programs is needed. Current regulations are unclear on this and some related recyclability designation issues.

SB 54 states:
PRC 42051.1(k) Consistent with subdivision (l), as part of the plan, ***the PRO or a participant producer may rely on a range of means to collect and recycle or compost various categories of covered materials*** *that are not collected and recycled or composted through a curbside collection program or other local collection program, including, but not limited to, dropoff recycling services and retailer takeback.*

However, regulations do not appear to offer a viable compliance pathway for being designated recyclable based on alternative collection programs alone or in combination with limited curbside collection. This is because we believe the 75 percent recovery rate required by PRC 42355.51(d)(5)(B), an SB 343 recyclable criterion focused on progress in non-curbside collection programs, is objectively infeasible to achieve solely through alternative collection. And draft regulations appear to exclude local jurisdiction programs from contributing towards a separate recyclable criterion in PRC 42355.51(d)(4), even though that provision does not specify any particular type of program. This criterion also includes an unusually defined 75 percent recycling rate that needs clarification in regulations. This, alongside one final SB 343 pathway allowing temporary recyclable designations conditioned on compliance with SB 54 and taking steps to secure a

determination by the CalRecycle director that such designation will not increase curbside contamination or deceive consumers regarding recyclability.

We believe that optimizing recycling systems for difficult-to-recycle covered materials like film and flexible packaging requires a dynamic, flexible approach involving shifts to refillable, reusable or more readily recyclable designs (such as mono-PE resins) where feasible, in addition to experimentation with innovative alternative collection systems and variations on established local collection programs. Some potential model programs, for example, may leverage existing local infrastructure and contracts while keeping problematic materials out of existing MRF flows. Clarification of when such programs are considered local versus alternative is needed. The ultimate goal is to demonstrate models that are
feasible, sufficiently cost effective and that can be broadly embraced by local jurisdictions and recycling service providers.

Regulations Section and Topic
18980.3(e) Need to clarify that PRO funding can be used to satisfy the sufficient commercial value standard in PRC 42355.519d)(5)

Recommendations
The following new sub-paragraph is needed to clarify how the PRO can support achieving recyclability criteria under the SB 54 EPR program:

18980.3(e) For purposes of paragraph (5) of subdivision (d) of section 42355.51 of the Public Resources Code:

…(5) The requirement that "the material has sufficient commercial value to be marketed for recycling and be transported at the end of its useful life to a transfer, processing, or recycling facility to be sorted and aggregated into defined streams by material type and form" may be satisfied by actions, investments or funding provided by the PRO as part of an approved PRO Plan.

18980.3(f) Standards for Evaluating Recyclability Pursuant to PRC 42355.51(d)(4)

Comment 1: The following provision within SB 343 defines a pathway for specified covered materials to be designated recyclable under SB 54 pursuant to PRC 42061(c):

PRC 42355.51(d)(4) Notwithstanding paragraphs (2) and (3), a product or packaging is recyclable in the state if the product or packaging has a demonstrated recycling rate of at least 75 percent, meaning that not less than 75 percent of the product or packaging sorted and aggregated in the state is reprocessed into new products or packaging.

In the draft regulations under 18980.3(f), the following standard pertains to this provision:

18980.3(f)(1) …The "product or packaging in the program" encompasses all the covered material items sold or distributed in the state that are eligible for recovery by the program.

This standard also applies to the separate recyclable criterion under PRC 42355.51(d)(5), which makes sense to us since that criterion applies specifically to *products and packaging not collected pursuant to a curbside collection program*.

However, this standard requires clarification regarding its applicability to PRC 42355.51(d)(4) since this
criterion does not reference any type of specific program. This is important because we interpret this statutoryprovision to allow for being designated recyclable based on improvements in a combination of alternative and curbside collection infrastructure.

We recommend that CalRecycle revise draft regulations to clarify this through the following edits or similar: *189890.3(f)(1) Participant producers shall demonstrate to their PRO how the covered materials meet the requirements of paragraphs (4) or (5) of subdivision (d) of section 42355.51 of the Public Resources Code. The "product or packaging in the program" encompasses all the covered material items sold or distributed in the state that are eligible for recovery by the program. For the purposes of applying this requirement to paragraph (5) of subdivision (d) of section 42355.51 of the Public Resources Code, "program" means any type of collection and recycling program, including alternative collection and local jurisdiction collection.*

Comment 2: Draft regulations clarify how the PRO is to evaluate the recovery rate standard in PRC 42355.51(d)(5). But regulations do not address how to evaluate the very unusual definition of recycling rate within PRC 42355.51(d)(4). As written in statute it could be interpreted to mean, effectively, a post-MRF yield rate without a specified minimum level of recovery. The following addition to draft regulations could clarify this and impose a higher bar consistent with SB 54 statutory requirements:

18980.3(g) For the purposes of evaluating whether covered materials satisfy paragraph (4) of subdivision (d) of section 42355.51 of the Public Resources Code and are therefore recyclable: the weight of the "product or packaging sorted and aggregated in the state" must equal at least the amount needed to satisfy the currently applicable recycling rate pursuant to PRC 42050(c) as determined by the PRO in an approved annual report, PRO Plan or amendment.

Section 18980.3. Recyclability - Need to clarify PRC 42355.51(d)(6) Recyclable Based on Compliance with a Legislated Program

Draft regulations cite the following recyclable criterion as one of three exclusions to the local jurisdiction criteria in PRC 42355.51(d)(2) and (3), that can qualify covered materials to be designated recyclable: *PRC 42355.51(d)(6) Notwithstanding paragraphs (2) and (3), a product or packaging is recyclable in the state if the product or packaging is part of, and in compliance with, a program established pursuant to state or federal law*

on or after January 1, 2022, governing the recyclability or disposal of that product or packaging if the director determines that the product or packaging will not increase contamination of curbside recycling or deceive consumers as to the recyclability of the product or packaging. For the other two exclusions discussed in the prior comments (i.e., PRC 42355.51(d((4) and (5)) the PRO is assigned responsibility to evaluate and propose designations for CalRecycle review. But draft regulations are silent on whether and how the PRO or a producer may request recyclable designation under PRC 42355.51(d)(6).

We believe this is needed and that this provision authorizes CalRecycle to provide the opportunity for producers or the PRO to pursue a strategy of being temporarily designated as recyclable based on a trend in alternative and/or local jurisdiction programs that can achieve any of the SB 343 recyclable criteria (i.e., not just the local jurisdiction criteria as the process currently described in 18980.3.1 is limited to). To do this, we recommend adding a new subdivision similar to the following:

18980.3(g) A PRO or an independent producer may submit a request to CalRecycle requesting a recyclable designation pursuant to PRC 42355.51(d)(6). The request must include:
(1) A justification for the designation that demonstrates that collection, sortation and availability of responsible end markets for the identified covered materials are advancing with a reasonable likelihood of satisfying any of the recyclable criteria pursuant to PRC 42355.51 within a time period specified within the request.
(2) A description of specific investments and actions in an approved PRO Plan or pending Plan amendment that the PRO and member producers will take to ensure that designating the materials as recyclable will not increase contamination of curbside recycling or deceive consumers as to the recyclability of the product or packaging. Such steps may include, but are not limited to:
(i) A description of standards for any recyclable marketing claims that will be used on the targeted covered materials, and how consumers will be informed about how to recycle them in their community.
(ii) Investments and improvements at specific recycling system facilities and programs that will mitigate contamination and/or be used to demonstrate successful models.

Section 18980.3. Recyclability - Need to clarify definition of local jurisdiction program

We request that CalRecycle add the following subdivision or similar to clarify when a PRO-supported collection and recycling program can “count” towards satisfying the recyclable criteria in PRC 42355.51(d)(2):

18980.3(h) For the purpose of evaluating whether a covered material category satisfies the recyclable criteria in PRC 42355.51(d)(2), any type of collection or recycling service that is contracted by a local government is applicable. This includes, but is not limited to:
(i) Collection programs operated under a license or non-exclusive or non-franchise contract with a local jurisdiction.

(ii) Subject to satisfying the restrictions on local interference pursuant to PRC 42051.1(c)(3), a contract between the PRO and a local jurisdiction or their contracted recycling service provider that includes terms, compensation, specific service roles or operational activities related to the collection program, in support of satisfying SB 54 requirements.

Response to O-104-5

Comment rejected. Regarding the proposed change to 18980.3(e), no change is necessary because the proposed regulations impose no limitation on what actions the PRO may take to support achievement of the recyclability requirements, nor is there any reason to impose limitations. The addition would suggest that the PRO is subject to limitation; it is not clear whether the commenter intended for its proposal to create such an implied limitation. Moreover, to the extent the commenter intended its proposal to be an interpretation of the statutory text cited (from Public Resources Code section 42355.51(d)(5)), that interpretation is unnecessary because the statutory text is plain on its face; it clearly means that being "marketed for recycling and transported" for sorting and aggregation is sufficient.

Regarding the proposed change to 18980.3(f)(1), no change is necessary because the regulation is clear Public Resources Code section 42355.51(d)(5) unambiguously establishes that the commenter's interpretation is wrong. That provision is directed solely at recovery by a "non-curbside collection program." The proposed regulations make clear that CalRecycle interprets that term to refer to any program not operated by a local jurisdiction or a recycling service provider operating under contract with one.

Regarding the first proposed change referred to as "18980.3(g)," no change is required concerning "recycling rate." PRC section 42355.51(d)(4) requires calculating a percentage that it refers to as "recycling rate," and that percentage is fundamentally different on its face than the percentage referred to in SB 54 by the same term. In each context, the specific label ("recycling rate") used is not the predominant factor in statutory interpretation; rather, the language in the statues themselves establish the label's meaning in each context, and section 42355.51(d)(4) contains its own, express definition for the label. Accordingly, for purposes of PRC section 42355.51(d)(4), "recycling rate" has a fundamentally different meaning than it does in PRC section 42041(ab). Moreover, CalRecycle rejects the assertion that multiple readings of the former provision are possible. Rather, section 42355.51(d)(4) uses plain, unambiguous language that is not subject to multiple interpretations: The relevant percentage is of the total amount of a product or packaging actually sorted and aggregated in the state. Accordingly, no clarifying regulation is necessary.

Regarding the second proposed change referred to as "18980.3(g)," no change is appropriate. First, the commenter states that the proposed regulations refer to Public Resources Code section 42355.51(d)(6). There is no such reference and, in any event, the proposed regulatory text, on its face, has no relevance to that statutory provision, which provides that a separate program under federal or state law may be the basis for compliance with the labeling restrictions of

42355.51. The commenter does not explain how the proposed text would be an application of 42355.51(d)(6), nor can that provision possibly refer to compliance with the current statute's restrictions because such an interpretation would be circular: Section 42061(a)(3)(B) itself refers to a "program described in [42355.51(d)(6)]," so the Legislature could not have intended the current statute itself to be such a program.

Second, to the extent the commenter intended a "recyclable designation pursuant to Public Resources Code 42355.51(d)(6)" to be a finding that covered material can be labeled "recyclable," such a finding is plainly beyond CalRecycle's authority to begin with. The only authority granted to CalRecycle with respect to labeling restrictions is pursuant to the "trending" provision in 42061(a)(3)(B), which only concerns trends toward compliance with 42355.51(d)(2), not (d)(6). Under that provision, a "trending" determination would constitute a determination that covered material could be labeled "recyclable." But statute also provides that that determination would become irrelevant when 42355.51(d)(6) could provide justification for a recyclability designation. Morely, no other provision of the statute purports to give CalRecycle authority to make assessments of whether labeling would be deceptive, and CalRecycle has no enforcement authority with respect to labeling deceptiveness under 42355.51, whether pursuant to 42355.51(d)(6) or otherwise.

Lastly, the commenter's proposal rests on an unexplained statutory interpretation that is unsupportable. The commenter proposes that recyclability can be achieved based on a "reasonable likelihood of satisfying" statutory requirements for that status. There is no statutory authority for that approach, and the commenter cites none, and it would render the "trending" provision of Public Resources Code section 42061(a)(3)(B) superfluous. Statutory interpretations that would assert authority not provided by the statute or that render portions of statute superfluous are inappropriate. Moreover, the statute and the proposed regulations (Public Resources Code section 42060(a)(3) and section 18980.2.4(c) of the proposed regulations) already provide for a time-limited exemption for covered materials that face challenges for immediate compliance but have demonstrable phase-in pathway: Public Resources Code section 42060.

Regarding the final proposal to add 18980.3(h), no change is appropriate because Public Resources Code section 42355.51(d)(2) is plain on its face: It concerns "recycling programs for jurisdictions" and "recycling programs statewide." Moreover, application of that provision is governed by the reports that CalRecycle publishes pursuant to 42355.51(d)(1), which are not subject to formal rulemaking requirements. Accordingly, the application of 42355.51(d)(2) in those publications control in the context of recyclability determinations under section 42050(b).

Comment O-104-6

Concern 3: Current draft regulations in Section 18980.4 establish an effective zero tolerance policy on responsible end market verification that may unnecessarily cause further delays and compromise progress.

This may be obviated by the third-party certification protocol that Circular Action Alliance is developing in response to Oregon's responsible end markets (REMs) requirements, if approved by Oregon's Department of Environmental Quality as a part of the PRO's current program plan amendment and adjusted to meet SB 54's own mandates. Looking at SB 54, statute requires that, *"To be considered recycled, covered material shall be sent to a responsible end market (PRC 42041(aa)(3))."* The concept of REMs validated by the PRO to meet required standards is an important new innovation in EPR policy that addresses concerns over transparency, actual recycling yields and health and safety related issues. However, experience implementing REM requirements under the Oregon EPR law shows that validation may be quite challenging in some cases, especially regarding the overseas export markets that California has long relied upon for many recycled commodities. We are concerned that SB 54 draft regulations provide no leeway at all for even minor, temporary discrepancies in validating REMs, and that even temporary market disruptions could result in loss of REM status and/or a proliferation of two-year local exemptions from the requirement to include designated CMCs in local programs. Following are our recommendations to address these concerns.

Recommendations to Address Concern #3 Related to Responsible End Markets

Regulations Section and Topic

18980.4.2(d) End Market Compliance Audits and Verification – Conditional Approvals

Recommendations

There may be occasional gaps in REM verification documentation, especially for the initial verification process in which facilities operators must accept and integrate the new requirements into their operations. These issues could potentially lead to not counting materials as recycled and/or the proliferation of local jurisdictions receiving two-year extensions under the new explicit exemption provision in 18980.11(b), even if the discrepancies are minor or are resolved within a much shorter time frame. To provide a degree of flexibility and avoid unnecessary disruptions in SB 54 implementation and continuity in covered materials collected by local jurisdictions, we recommend that language similar to the following paragraph be added to draft regulations:

18980.4.2(f) Notwithstanding the verification standards in subdivision (c) and the disqualification of responsible end markets for any discrepancy as described in subdivision (e), the PRO or an Independent Producer may submit a request to CalRecycle to conditionally approve facilities that may have minor deviations, discrepancies or technical violations from the required verification standards or facility permit conditions that do not result in, or are not reasonably likely to lead to, actual environmental harm or harm to public health. Such requests must be submitted simultaneously to CalRecycle and to the Advisory Board for review and possible comment. CalRecycle shall determine within 60 days whether to conditionally waive certain verification standards and thereby allow the facility to be considered a responsible end market under this Chapter for a specified period of time to be determined by CalRecycle. Such a determination may be made retroactively to cover any period specified in the request if justified.

Note that in the above recommended text, we have adapted the conditional flexibility language currently applied to non-mechanical recycling technologies under 18980.4.1(d)(1)(B). We believe standards for mechanical recycling technologies serving as a REM should not be more stringent than for new, nonmechanical technologies.

18980.11(b) Local Jurisdiction Exemptions Due to the Absence of a REM

In addition to occasional gaps or delays in REM verification, there may be occasional disruptions to market demand, quality standards and/or pricing due to the inherent volatility of commodity markets. Local jurisdictions and recycling service providers may seek an exemption to collect certain designated covered materials by asserting that they amount to the absence of a responsible end market pursuant to 18980.11(b). While this may be merited in some cases, we are concerned that as currently written this subdivision grants an automatic two-year exemption, even if the disruption is temporary and of a very limited duration, and even if the PRO is able to mitigate the short-term disruption, for example, through added price support, a request for a conditional waiver as we recommend allowing in the prior comment, or temporary warehousing until demand improves.

We recommend revisions such as the following to address this concern:

18980.11(b) Covered material is considered included in a local jurisdiction or recycling service provider's collection and recycling program if the local jurisdiction or recycling service provider collects the covered material and transfers it to responsible end markets directly or to intermediate supply chain entities. The local jurisdiction or recycling service provider shall not be required to establish the availability of a responsible end market to ultimately recycle the covered material. However, the absence of responsible end markets ~~shall~~ may be deemed a local condition, circumstance, or challenge rendering inclusion of the covered material in the program impracticable for purposes of subdivision (b) of section 42060.5 of the Public Resources Code and paragraph (4) of subdivision (c) of section 18980.11.1 of this chapter. Notwithstanding subdivision (b) of Section 18980.11.1, an exemption to the requirement for local programs to include designated covered material due to the absence of a responsible end market may be granted for a period of less than two years if CalRecycle determines, with input from the Advisory Board, that the absence is due to temporary market or other disruptions that may be resolved in a shorter timeframe. In considering the length of any such exemption, CalRecycle shall identify the shortest duration for the exemption practical given the conditions and expected resolution and may extend the extension if the disruptions causing the absence are not addressed when expected.

18980.4.3(a)(3) REM Standards Related to Further Processing of Residuals

We are concerned that some market facilities, even if they satisfy most or all of the REM standards, may view the rigorous verification process as too burdensome to merit participating in. While we support the overall framework and intent of the standards, we recommend the following revisions that would provide flexibility to the REM operator in determining when it is feasible to send residual covered materials to another processor or recycler:

18980.4(a)(3) The entity shall minimize the discharge of emissions, effluents, and materials produced by the entity, including feedstocks and residuals, and shall handle incompatible materials in the following manner:

(A) For incompatible materials that the entity determines can be further processed and recycled, the entity sends materials to entities that are authorized to further process and recycle the material. (B) For incompatible materials that the entity determines cannot be

further processed and recycled, the entity disposes of the material in a way that minimizes significant effects on the environment and risks to public health and safety.

Response to O-104-6

CalRecycle rejects this comment. The proposed regulations are consistent with the relevant statutory requirements, including in PRC sections 42041(ad), 42051.1, and 42060, and the recommended change is not necessary to the implementation or enforcement of the Act.

To the extent this comment recommends including section 18980.4.2(f) of the proposed regulations to allow for conditional approvals of responsible end markets that do not satisfy all of the requirements of section 18980.4(a), no change is necessary or appropriate. PRC section 42041(aa) provides that, to constitute recycling under the Act, covered material must be sent to a responsible end market. PRC section 42041(ad) defines a responsible end market as a materials market in which the recycling of materials is conducted in a way that benefits the environment and minimizes risks to public health and worker health and safety. PRC section 42041(ad) further authorizes CalRecycle to adopt regulations to identify responsible end markets and to establish criteria regarding benefits to the environment and minimizing risks to public health and worker health and safety. Section 18980.4(a) of the proposed regulations implements these statutory provisions by setting forth the criteria that must be satisfied for an end market to be considered a responsible end market under the Act. Section 18980.4(a)—and the uniform application of its criteria to facilities seeking to be considered responsible end markets—is necessary to provide regulated parties with clear guidance and to ensure consistency and certainty in the implementation and enforcement of the Act. If CalRecycle determines that an end market does not meet all of the criteria established in section 18980.4(a), then that end market necessarily cannot be considered a responsible end market under PRC section 42041(ad). If that end market is not a responsible end market, then covered materials sent to it necessarily cannot be considered recycled under PRC section 42041(aa)(3). The Act thus does not leave discretion for CalRecycle to conditionally approve end markets that do not satisfy the criteria to be considered responsible, and the assertion of this authority in section 18980.4.2(f) of the proposed regulations would only create additional and unnecessary confusion. No change is necessary.

To the extent this comment recommends revising section 18980.11(b) of the proposed regulations, no change is necessary. PRC section 42060.5(b) requires CalRecycle to grant an extension of, or exemption from, the collection requirement of PRC section 42060.5(a) upon a written showing that compliance is not practicable because of specific local conditions, circumstances, or challenges. Therefore, CalRecycle has no discretion to deny such extension or exemption upon a written showing of an absence of responsible end markets, and the proposed revision from "shall" to "may" is not appropriate or necessary. Additionally, the proposed language allowing CalRecycle to grant an extension

or exemption for less than two years is not necessary because section 18980.11.1(g) already requires CalRecycle to repeal any extension or exemption upon a determination that the conditions, circumstances, or challenges no longer render compliance impracticable as described in the application. Therefore, once a responsible end market becomes established, the extension or exemption will be subject to repeal and no language allowing for a shorter timeframe is necessary.

Finally, to the extent this comment recommends revising the language of proposed section 18980.4(a)(3), no change is necessary. The current language strikes an appropriate balance between advancing the goals of the Act and preserving adequate flexibility for responsible end markets to dispose of incompatible materials that cannot be further processed and recycled. See the response to comment O-55-4.

Comment O-104-7

Concern 4: Further clarification of the requirement for local programs to include recyclable or compostable CMCs is needed.

We have concerns or are unclear about some issues related to the local program requirement to include designated CMCs, as described below.

Recommendations to Address Concern 4 Related to Local Program Requirements

Regulations Section and Topic

18980.11(c) Deadline for Local Programs to Add Newly

Comments and Recommendations

We support the current language in this subdivision requiring local programs to add a CMC newly added to the
SB 54 recyclable list pursuant to PRC 42060.5(a) within one year of CalRecycle publishing the list change, even
if the effective date is later than the published date.

Designated Recyclable or Compostable CMCs

However, we recommend that CalRecycle not designate CMCs as recyclable with a future effective date. If a
CMC or other grouping of covered materials has met the criteria for designation, then the designation should
be immediate.

18980.11 Local Requirement to Include Covered Materials Designated as Recyclable or Compostable on the CMC List
Pursuant to PRC 42061(c) and (d)

Comment 1: Regulations should be more specific about when a local program must include a designated CMC
specifically in a curbside collection program (i.e., that picks up materials from residences and commercial
businesses) versus drop-off or other types of collection programs. Specifically, this should be required if the
currently approved PRO Plan demonstrates that any of the criteria under PRC 42051.1(l) are satisfied, including

the first criterion under paragraph *(A), The category of covered materials can be made suitable for curbside collection and can be effectively sorted by the facilities receiving the curbside collected material for recycling or composting.* We suggest the following edits:

18980.11(b) Covered material is considered included in a local jurisdiction or recycling service provider's collection and recycling program if the local jurisdiction or recycling service provider collects the covered material and transfers it to responsible end markets directly or to intermediate supply chain entities. The local program must include the CMC specifically in an existing curbside program that picks up materials from residences and commercial businesses if the currently approved PRO Plan has demonstrated that the covered material meets any of the criteria pursuant to PRC 42051.1(l). Notwithstanding this, pursuant to PRC 42060.5(a) this provision does not require mandatory route collection service where it does not already exist. The local jurisdiction or recycling service provider shall not be required to establish the availability of a responsible end market to ultimately recycle the covered material. However, the absence of responsible end markets shall be deemed a local condition, circumstance, or challenge rendering inclusion of the covered material in the program impracticable for purposes of subdivision (b) of section 42060.5 of the Public Resources Code and paragraph (4) of subdivision (c) of section 18980.11.1 of this chapter.

Comment 2: We support the second part of subdivision 18980.11(b) above that states local programs are not required to establish the availability of a REM. However, we are concerned that even relatively minor, shortterm disruptions in either demand by a given REM or in the validation status of a given REM could result in two-year exemptions from the mandate to include materials in local jurisdiction collection lists. This could unnecessarily delay producer efforts to achieve SB 54 requirements and add to consumer confusion by triggering changes in acceptance lists. This may be especially true upon program launch in early 2027 when the PRO may still be working to validate new REM markets. We offer a recommended approach to remedy this via revisions to 18980.11(b) under Concern 3 above.

Response to O-104-7

Comment rejected. Regarding the suggestion that CalRecycle not designate CMCs as recyclable with a future effective date, CalRecycle declines to make any revisions to the current language. The proposed regulations are consistent with the requirements set forth in the Act, including those in sections 42060 and 42061 of the Public Resources Code, and the recommended change is not necessary for implementation or enforcement of the Act. Section 42061(e) requires CalRecycle to determine a process for updating the CMC list annually (until January 1, 2032) by either adding or removing covered material categories based on whether they meet all the criteria in either section 42061(c) or (d). Therefore, so long as the lists are updated annually, the Act provides CalRecycle with the necessary discretion to determine the appropriate process for making such updates, including the possibility of publishing an update before it becomes effective. Moreover, publishing a new CMC list with a future effective date may be necessary for purely administrative reasons because CalRecycle may not be able to update internal processes and external resources as soon as it determines how to update the CMC list. That outcome would impose an artificial constraint, the only effect of which would be to prevent the public from learning about crucial changes in their obligations as early as possible.

Regarding comment 1, CalRecycle declines to make the proposed change because it would merely recapitulate the statutory provision at issue (Public Resources Code section 42051.1(l)). Moreover, Public Resources Code section 42060.5(a) already establishes that local jurisdictions' and recycling service providers' obligation is to include "all covered material contained on the [CMC list] pursuant to [Public Resources Code section 42061(c) and (d)." That text provides a clear resolution to the issue raised in this comment: Compliance with the statutory obligation requires collection and recycling programs that divert all discarded covered material from disposal.
Regarding comment 2, no change is appropriate because the proposed regulations already prevent exemptions under Public Resources Code section 42060.5(b) from persisting based on ephemeral impracticability: Under section 18980.11.1(g), CalRecycle must deem an exemption no longer in effect when it determines that the impracticability underlying approval of the exemption no longer applies. Moreover, the application process required under section 18980.11.1 may require up to 90 days before an application is submitted, rendering applications based on short-term conditions unlikely.

Comment O-104-8

Concern 5: Revisions to certain other exclusions and exemptions are needed to clarify timing, avoid unintended consequences and minimize disruption to PRO plan implementation.

We appreciate CalRecycle’s clarification in past revisions to the exclusions and extensions in Article 2. Beyond our comments on the federal exclusion in 18980.2(a)(2) described above under Concern 1, we offer the following recommendations on some remaining related concerns.

Recommendations to Address Concern 5 Related to Select Exclusions and Exemptions

Regulations Section and Topic

Section 18980.2.1 Exclusion of Reusable and Refillable Packaging and Food Service Ware

Comments and Recommendations

Comment 1: To facilitate CalRecycle validation of assertions related to reuse and refill, we recommend that CalRecycle replace the previously deleted provision requiring producers to maintain documentation of reusable and refillable packaging design and performance. At minimum, this requirement should apply to packaging shifts made since the effective date of the law, January 1, 2023, and that the producer or the PRO seek to count towards the industry-wide source reduction rate targets in PRC 42050(b).

18980.2.1(b)(2) Producers, as defined for purposes of this subdivision, or a PRO acting on producers' behalf, shall maintain records sufficient to demonstrate that packaging or food service ware claimed to be reusable or refillable satisfies the applicable requirements pursuant to this subdivision and subdivision (af) of section 42041 of the Public Resources Code. Producers and the PRO shall provide such records to the Department upon request.

(A) The demand for such evidence need not be limited with respect to locations or regions where the Department has alleged packaging or food service ware that is not reusable or refillable has been sold, offered for sale, or distributed.

(B) All packaging or food service ware that records provided to the Department fail to demonstrate to be reusable or refillable shall be deemed covered material.

Comment 2: While we support and appreciate the exclusion of reusable and refillable packaging from certain requirements to incentivize participation in reuse/refill systems, we recommend including requirements to maximize the recyclability at end-of-life. Otherwise, this exclusion may inadvertently lead to increased use of non-recyclable plastic. One approach is to add the following provision:

18980.2.1(a)(3)(C) For any single use packaging or plastic food service ware that is shifted to reusable or recyclable formats after January 1, 2023 to count towards the source reduction goals pursuant to PRC 42050(a) and 42057, the producer or the PRO must include in its plan pursuant to PRC 42051.1 development

of adequate infrastructure to ensure consumers may recycle the reusable or refillable packaging at the end
of its useful life. Pursuant to PRC 42041(ai) the Plan must demonstrate that the reusable or refillable
packaging or food service ware is at least as recyclable as the single use counterparts it replaced.

Response to O-104-8

CalRecycle rejects this comment. With respect to the change labeled "Comment 1," that proposed change is unnecessary because, as a practical and legal matter, persons that CalRecycle alleges to be "producers" because their items allegedly do not satisfy the criteria in Public Resources Code section 42041(af) must be able to rebut those allegations with evidence. Regarding the change labeled "Comment 2," which proposes a recyclability requirement for reusability. Such a proposal would be a new, independent criteria for reusability not found in 42041(af). The statute does not authorize CalRecycle to impose additional criteria. The proposed additional criterion would also contradict the obvious difference between how the statute treats reusable items and how it treats "covered material": Statute expressly subjects the latter, and not the former, to a recyclability (or compostability) requirement. To interpret the statute as impliedly authorizing a requirement for certain items while expressly creating that same requirement for other items would offend basic principles of statutory interpretation.

Comment O-104-9

Regulations Section and Topic

18980.2.2(b) De Minimis Exemptions

Comments and Recommendations

Comment 1: We generally support this provision as written, especially allowing the PRO to submit de minimis proposals for CalRecycle consideration ahead of the PRO Plan. However, we recommend CalRecycle add an additional criterion under (b)(2) similar to the following, to guard against a situation where multiple de minimis exemptions leads to increased contamination in recycling and/or composting streams without prior system improvements to accommodate such materials.

18980.2.2(b)(2)(G) The cumulative effect of all approved de minimis exemptions will not lead to significant increased contamination of recycled materials of organic materials or impact the ability of covered materials to satisfy responsible end market quality standards.

Comment 2: CalRecycle staff have stated that the de minimis exemption does not apply to plastic food service ware because it appears in the definition of packaging under PRC 42041(s) even though food service ware is explicitly mentioned. Based on the statutory reference to food service ware we would support extending the de minimis exemption to food service ware. However, at minimum regulations should clarify this through a revision such as the following:

18980.2.2(b)(2) A component or group of components is of de minimis weight or volume if it satisfies the following requirements:
…(G) It is not plastic food service ware pursuant to PRC 42041(a)(8).

Comment 3: Since most food service ware has some amount of plastic or polymer, however small, and since it is not eligible for a de minimis exemption, it appears that most all food service ware will now be deemed plastic food service ware and therefore be covered material subject to SB 54 requirements. We request that CalRecycle clarify this either in regulations or a separate written guidance document.

Response to O-104-9

CalRecycle rejects this comment. With respect to the proposed change labeled "Comment 1," that proposed change is unnecessary because the proposed regulations already inherently account for the outcome sought (preventing determinations that components have de minimis weight or volume from contaminating the waste stream and or affect the ability of end markets to be responsible end markets). The proposed regulation does not limit the evaluation of items to a single instantiation of the components. If the components at issue, when considered de minimis, have the negative cumulative effect described by the commenter, they will likely fail, at a minimum, the criteria of 18980.2.2(b)(2)(B) and (C).
Regarding the proposed change labeled "Comment 2," that change is unnecessary because 18980.2.2(b) expressly states that it only concerns packaging.
Regarding the proposed change labeled "Comment 3," no change is appropriate because the definition of "plastic" already makes clear that food service ware that contains any amount of plastic is "plastic food service ware." Moreover, no regulation is necessary for CalRecycle to publish an explanation that the statute and regulations require that conclusion.

Comment O-104-10

Regulations Section and Topic
Section 18980.2.3. Exemptions for Specific Material with Demonstrated Recycling Rates

Comments and Recommendations
To minimize disruption, timing requirements should be placed on the submission of applications for this exemption, similar to our suggestions for the federal conflict exclusion under 18980.2(a)(2) above. This could be done through the following edits:
18980.2.3(b) The person seeking the exemption shall electronically submit an application to the Department and to the PRO, which may provide comments for CalRecycle's consideration. For the exemption to be effective in the initial PRO plan implementation year, the application must be submitted within 30 days of the effective date of this chapter and be approved by CalRecycle within 60 days. In future years, notifications received by March 1 of each calendar year, if approved by CalRecycle by May 1, are eligible to take effect in the next calendar plan implementation year. The

Department shall grant the exemption if the application establishes that the packaging or food service ware items satisfy each criterion in subparagraph (H) of paragraph (2) of subdivision (e) of section 42041 of the Public Resources Code. The application shall include, but not necessarily be limited to the following:

Response to O-104-10

CalRecycle rejects this comment. The statute unambiguously excludes items from the definition of "covered material" if they satisfy the criteria set forth, and those criteria are tied to specific years, with no implication that the exclusion can be delayed. The commenter's proposed time limitations are also arbitrary, and the commenter provides no justification for why they should be imposed. Lastly, nothing in the proposed regulations prevents CalRecycle from soliciting comments from the PRO on an application.

Comment O-104-11

Regulations Section and Topic

18980.2.4 Exemptions for Certain Covered Materials due to Unique Compliance Challenges, Health and Safety or Unsafe to Recycle Concerns

Comments and Recommendations

We support the current drafting of Section 2.4 that defines an evaluation process designed to maximize progress to the extent possible by all producers and covered materials under SB 54 while allowing CalRecycle to balance this goal with other pertinent considerations. However, we think guidance documents are needed as soon as possible to clarify expectations for the timing, process, and how CalRecycle will conduct authorized investigations, enforcement and consideration of unique challenge exemptions under 18980.2.4, especially after evaluation of the initial recycling rate target in 2028.

Response to O-104-11

Comment rejected. The commenter does not propose revisions to the regulations. Rather, the commenter endorses the proposed regulation but requests separate "guidance documents" concerning CalRecycle's investigations, enforcement, and consideration of exemptions. Accordingly, no response is required.

Comment O-104-12

Concern 6: CalRecycle should anticipate broad non-attainment of initial SB 54 performance targets and take actions to accelerate momentum towards goals and beneficial outcomes.

We believe it is objectively inevitable that most, if not all, CMCs will not attain the initial recycling rate targets, if not the final 65 percent rate. And there is at best high uncertainty over whether the PRO will achieve the initial source reduction targets over the first three years of program implementation, if not the final 2032 target. We conclude this based on the following considerations, among others:

• **Timing:** Since the 2028 recycling rate mandate will be evaluated based on 2027 data, there is no time for PRO system improvements to increase recycling rates. Even if the PRO were able to aggressively advance system improvements ahead of plan approval, the unavoidably lengthy process of securing approvals and permits, specifying and procuring equipment, and implementing improvements still could not be completed within 2027, much less early enough to benefit the initial recycling rate mandate evaluation. This is equally true of the enhanced education activities needed to boost generator participation. Similarly, the initial source reduction target must be achieved by January 2027, the same deadline as for PRO Plan approval. While member producers have undertaken and are engaged in a range of source reduction activities, the PRO will barely have time to assemble the first Source Reduction Plan, drawing from producer reporting, needs assessments, and final regulations that will become available shortly before the June 15 submittal deadline, let alone help to stand up new reuse/refill systems or rally producers to execute design changes as part of updated packaging strategies.
• **Measurement standards:** Even using historic recycling rate measurements based on tons shipped from a MRF, many covered material categories (CMCs) have current recycling rates well below 30%. But since the draft regulations (in Section 18980.3.2(b)) require measuring the amount of covered material recycled as the weight *sold or transferred by a responsible end market as feedstock that meets the quality standards necessary to be used in lieu of virgin material for the creation of new or reconstituted products* (i.e., adjusting downward for post-MRF yield losses), measured recycling rates for SB 54 compliance purposes will actually be much lower than historically reported rates. Inflexible responsible end market verification standards may also contribute to slower than desired progress especially if it leads to short-term disruptions result in two-year exemptions from local collection requirements. Source reduction goal attainment is made more difficult by statutory provisions that can provide credit to producers for progress prior to 2023, but don't allow it to count towards the PRO's industry-wide target as well as by the removal of a PRO adjustment factor to account for changes in demographics as was part of prior draft regulations.
• **Lack of clear market signals to producers.** On the one hand, SB 54 clearly states in PRC 42050 that *producers of covered material sold, offered for sale, imported, or distributed in the state shall achieve all of the following* [recyclability, source reduction and recycling rate mandated targets]. Many stakeholders hoped the aggressive SB 54 deadlines would catalyze substantial early investment and packaging shifts, and to varying degrees, it has. On the other hand, SB 54 also includes the prospect of exemptions (or effectively under draft regulations, extensions) due to unique compliance challenges (under PRC 42060(a)(3)). Draft regulations clarifying this provision (in 18980.2.4) appear to anticipate a decision-making process that balances the pros and cons of continuing to use or phase out certain types of packaging and plastic food service ware. Moreover, the complexity of many SB 54 provisions adds to regulatory uncertainty, especially related to the interplay between SB 54 with SB 343 recyclability standards and AB 1201 compostable labeling standards. Another example of a difficult to discern requirement intended to drive producer action is. We are also keen to understand which past source reduction activities will "count" for producers and/or for PRO industry-wide targets. In

short, many producers may be reticent to make additional major investments in new packaging strategies without greater certainty that they are unambiguously required. While mandatory and potentially subject to fines, bans or other measures for non-attainment, the SB 54 targets are certainly “stretch” goals in the sense that they go well beyond other state EPR program goals and that achieving them would require unprecedented, rapid progress and
innovations at a level never before seen. We are concerned that broad non-attainment of targets could spawn a negative public narrative that in the worst case could compromise California legislators’ commitment to the law and its potential to spur EPR policies in other states.
Following are recommendations that address these broad concerns as well as some more specific related recommendations aimed at maximizing SB 54 beneficial outcomes from efforts to satisfy the performance targets.

Response to O-104-12

Comment rejected. No response to this portion of the commenter's submission is necessary because it states concerns that are prefatory to the proposals offered in the subsequent portions of the commenter's submission. It does not contain those proposals themselves, so no further response is required. To the extent the subsequent portions propose changes or raise objections requiring responses, CalRecycle has responded to those portions accordingly.

Comment O-104-13

Regulations Section and Topic
Need for Additional Plain Language Guidance Documents to reduce uncertainty about regulatory processes and outcomes

Recommendations
The following two topics directly related to compliance with mandated targets appear ripe for guidance documents and CalRecycle sponsored public informal discussions:
• **How will enforcement of interim recycling rate mandates play out.** CalRecycle should describe a timeline of activities and milestones expected to occur after each recycling rate mandate date. A key theme should be the long-term trajectory of SB 54 towards aggressive goals, progress made, and specific strategies now in place, with acknowledgement of the time needed to reach them in practice. To help producers and all stakeholders prepare, the guidance should also describe how the following activities may be sequenced in time, and how they may affect one another as well as producer and covered material compliance outcomes.
- Evaluation of recycling rate mandates and compliance. This includes completing and publishing a required study pursuant to 42061(b) presumably with a public comment period.
- Some covered material exclusion determinations related to federal conflicts may still be pending and be under consideration by CalRecycle. Even if disqualified by CalRecycle, the materials may not yet be considered covered materials due to the 180-day waiting period currently in draft regulations pursuant to 18980.2(a)(2).

- For the initial recycling rate mandate (and possibly subsequent ones), the PRO may be engaged in a study to evaluate whether a REM can be developed for CMCs without a currently identified REM pursuant to 18980.4.3. Also, the PRO may require time beyond program start up to complete the REM verification process. In some cases, covered materials may be shipped to non-verified markets out of necessity.
- Enforcement related to covered material categories not satisfying mandated recycling rates. This may include audits and investigations, notices of violation, consideration of and approval of compliance action plans and potentially two (up to three) year extensions to satisfy requirements, and potentially temporary CalRecycle adjustments to the applicable mandated recycling rate.
- The PRO may submit requests for exemptions due to unique compliance challenges or health and safety related issues under PRC 42060(a)(3) and the CalRecycle review process may overlap with audits and investigations or enforcement actions related to non-attainment of mandated recycling rate targets. It is unclear when CalRecycle anticipates such exemption requests being submitted and how they dovetail with these other enforcement related processes. Producers may also continue to sell covered materials not meeting the recycling rate mandate if they satisfy the equivalent rate provision that requires clarification under PRC 42083, which requires clarification in regulations.
- PRO plan revisions may be necessary in light of lessons learned through implementation to date.
- **Bottom line:** When and under what circumstances might producers learn that currently used covered materials will be banned or that significant monetary penalties or other regulatory consequences may be imposed?

• De-mystifying SB 343 labeling standards and the SB 54 recyclable or compostable mandate. This issue continues to cause confusion among some producers and should be a priority for clear, plain language guidance documents. Issues to cover include:
- The producer obligation to ensure their covered materials meet all recyclable and compostable criteria, including the “product specific” criteria not evaluated by CalRecycle’s category level analysis.
- Clarifying compliance with the recyclable or compostable mandate via alternative vs. local jurisdiction collection programs.
- Timing of requirements and enforcement process related to use of chasing arrows and other recyclable marketing claims under SB 343, including the 18-month delay in SB 343 restrictions becoming effective after CalRecycle’s first April 2025 finalized material characterization study.
- Whether and when CalRecycle may begin to consider market related criteria when updating the SB 54 CMC recyclable list. This includes the SB 343 Basel agreement references in PRC 42355.51(d)(2)(B)(i), the requirement for routine use as feedstock in production of products or packaging in PRC 42355.51(d)(1) and the SB 54 requirement that, to be considered recycled, covered material must be sent to a responsible end market per PRC 42041(aa)(3).

Response to O-104-13

Comment rejected. The commenter does not propose changes to the proposed regulations. Rather, the commenter requests that CalRecycle publish "clear, plain language guidance documents" addressing various topics. Accordingly, no response is required here.

Comment O-104-14

Regulations Section and Topic

18980.4.3 Focus market development investments and PCR sourcing on North America

Recommendations

We concur with concerns of the Association of Plastic Recyclers (APR) that SB 54 incentives and requirements should focus on strengthening North American recycling infrastructure, and we endorse their proposed revisions below to address these concerns.

Comment 1: Apply the source reduction credit pursuant to PRC 42057(a)(2)(B)(i) to recycled content only from North American sources to support the region's recycling programs and responsible end markets. Otherwise, companies would be rewarded for buying recycled content from overseas markets, which are undermining the viability of U.S. and North American recycling operations. Because the recycled content credit is an optional program, not a mandate, it is our understanding that the state has legal authority to allow only North American sources without infringing upon global trade protections. Additionally, while third party certification does not currently report on the use of North American sources, it can be leveraged to do so given the SB 54 program goals and lead time. This can be done through revisions similar to the following:

18980.3.4(b) The Department shall approve an alternative compliance formula as part of a PRO's plan only if the plan establishes the following:

(6) How the formula will grant source reduction credit only for usage of postconsumer recycled content processed at North American reclamation facilities and generated from plastics collected from North American sources.

Comment 2: Direct PRO investments only in domestic or North American operations. Section 18980.4.3 details requirements for the PRO to support the development, expansion, and continued operations of responsible end markets. Consistent with PRC 42051.1(c)(5), that requires the PRO to describe *how the plan will enhance or expand viable responsible end markets in California including manufacturing*, we support the following three APR-recommended revisions:

18980.4.1(a) A PRO or Independent Producer shall include in its plan the method by which it will identify responsible end markets. At minimum, the plan shall:

…(4) Describe how the PRO will give preference to end markets in North America.

18980.4.3(a) … Each plan must establish, at a minimum, how the PRO or Independent Producer will do the following:

(1) Provide financial support to end markets as necessary to develop responsible end markets and ensure that they continue to satisfy the standards specified in section 18980.4. The plan must specify, at a minimum, how the PRO or Independent Producer will identify where financial support is needed and decide whether to provide it.

(A): Financial support shall only be given to U.S. and North American end markets.

18980.6.7(e)(1) (C) A PRO shall set base fee rates for covered material categories to account for investments or other expenditures necessary to develop North American-based responsible end markets for such covered material categories, implement source reduction measures for such covered material categories, or shift to reuse and refill systems.

Response to O-104-14

Comment rejected. See the response to comment O-39-1. CalRecycle regulations cannot lawfully disfavor interstate or international commerce.

Comment O-104-15

Regulations Section and Topic
18980.1(a)(4)(B) Definition of detachable component.

Recommendations
Draft regulations and the current CMC list and guidance document place detachable packaging components in their own covered material category, separate from the base packaging itself. This is problematic in some cases because it can:
• Conflict with design standards and best practices,
• Lower recycling rates,
• Distort the producer fees,
• Create more consumer confusion, and
• Promote poor design choices.

We agree with APR's recognition that one of the goals of SB 54 is to reduce plastic waste from small components, and therefore there is a need to quantify the number and types of plastic components. However, we also agree with APR that the goal to count all components should not undermine recycling efforts, and we believe there is a way for the state to set the definitions to both quantify the number of components and ensure components are effectively recyclable and recycled.

We therefore join APR in requesting that CalRecycle amend the definition of detachable component to recognize that some plastic components are best recycled as part of the base packaging and should be categorized as part of the base packaging.

Response to O-104-15

CalRecycle rejects this comment for the reasons provided in responses to comments O-39-5 and O-41-3.

Comment O-104-16

Regulations Section and Topic
Section 18980.3.2 Methodology for Recycling Rate Determination
Recommendations
Following is a restatement for the record of our past comments aimed at ensuring calculation of recycling rates drives maximum yield rates across the supply chain, is

transparent and accurate, and also in-line with the expectations of negotiators as they determined the percentage recycling rate targets in PRC 42050(c). Comment 1: We support requiring the PRO to set minimum yield rates that must be achieved by responsible end markets, but we recommend for the purpose of evaluating satisfaction of the mandated recycling rates in PRC 42050(c), the weight recycled should be based on shipments from MRFs, per the suggested revisions below. This is needed to render the final 65 percent target reasonably attainable.

18980.3.2(b)(2)(A) For end markets specified in paragraphs (1) through (5) of subdivision (b) of section 18980.4, the weight recycled shall be calculated at the point that the material is sold or transferred by a recycling processor to a responsible end market ~~as recycled content feedstock~~ that meets the quality standards of the responsible end market. ~~necessary to be used in lieu of virgin material for the creation of new or reconstituted products.~~ The weight recycled shall be adjusted as necessary to exclude the proportion of the recycled content feedstock derived from materials other than covered material.

Comment 2: Ideally recycling rates should be evaluated during the same year as the target. That is, the 30 percent by January 1, 2028 target would be evaluated based on data gathered during 2028. This will allow the PRO to have one additional year to improve systems prior to being evaluated. While we do not expect this to be sufficient to greatly alter progress towards the goals due to the significant lead times needed to identify, approve, invest and implement improvements, it will at least provide the PRO with a single program year to demonstrate as much progress as possible ahead of the first goal, and facilitate somewhat goal attainment in future years. Following is one revision that could achieve this:

18980.3.2(b)(1) Recycling rate shall be calculated as the weight of covered material that is recycled divided by the sum of the total weight of covered material disposed of, as described in paragraph (3), and the weight of covered material recycled, as described in paragraph (2). The recycling rate as of a particular date shall be calculated using data from the current calendar year in which that date occurs. ~~over the latest twelve- month period before such date for which sufficient data to make the calculation exists.~~

Response to O-104-16

Comment rejected. Regarding the first proposal, as the commenter impliedly acknowledges, the proposed change would distort the calculation of recycling rates to make it easier to achieve the rates required under Public Resources Code section 42050(c). The proposed change would result in all material accepted by a responsible end market being considered "recycled." That would be inappropriate because the amount of material accepted can include contamination and incompatible materials, pursuant to the end market's specifications. There is no justification for considering those materials recycled for purposes of calculating recycling rates; the commenter's stated purpose of rendering compliance more "attainable" is not a legitimate justification.

Regarding the second proposal. The proposed change ignores the plain text of statute, which requires recycling rate of 30 percent to be achieved "on and after January 1, 2028." The commenter's request would effectively change that to "by any time in 2028." CalRecycle does not have authority to shift statutory targets.

Moreover, the text that the commenter suggests deleting provides clarity as to how recycling rates must be calculated (using data spanning 12 months). That deletion would render ambiguous the application of a major statutory requirement.

Comment O-104-17

Regulations Section and Topic
PRC 42083 - Need to clarify statutory provision allowing use of covered materials not achieving mandated recycling rates.

Recommendations
The following SB 54 provision potentially allows a producer to continue using covered material even if it has not satisfied the current mandated recycling rate targets:

PRC 42083 A producer may offer for sale, sell, distribute, or import covered material in a covered material category that does not meet the recycling rates established pursuant to subdivision (c) of Section 42050 if the producer demonstrates to the department that the producer has achieved the applicable rate for an amount equal to the producer's market share of that covered material category in the state.

This provision is unclear and is not addressed in current draft regulations. Additional clarity is needed for the PRO and producers to understand what specific steps are needed to qualify for continued covered material use, and what the process is to demonstrate that the standards are satisfied. Most importantly, what does "achieved the applicable rate for an amount equal to the producer's market share of that covered material" mean? Is this referring to a producer's use of PCR content in its manufacturing in general or in the covered material used in California specifically? Or is this a reference to what may be, effectively, a sort of tradeable credit system in which one producer funds or arranges for the recycling of their own and/or other producers' covered materials and such efforts recycle at least an amount of material equivalent to the current percentage mandated recycling rate multiplied by the producer's market share of tons in that CMC?

Response to O-104-17

Comment rejected. The commenter erroneously asserts that the proposed regulations do not address Public Resources Code section 42083. Although section 18980.13(h)(3) does not expressly reference 42083, it is based on that statutory provision and provides clarity as to how producers may avail themselves of it. No further detail is necessary because it is sufficiently clear from statute that producers must make a particularized showing of the recycling rate for specific to the covered material for which they are the producer.

Comment O-104-18

Regulations Section and Topic
Section 18980.9. Source Reduction Baseline Report and Need for a Source Reduction Adjustment Factor

Recommendations
We recommend that CalRecycle replace the provision previously established as 18980.8.3 that would require the PRO to propose a source reduction adjustment factor accounting for future changes in demographics. We understand the motivation for striking this section, which will effectively focus SB 54 on achieving more robust plastics source reduction outcomes than would occur if the PRO adjusts the baseline for population growth and other factors. However, we note that under PRC 42057(h), statute already requires CalRecycle in 2030 and every five years thereafter to evaluate the need for additional source reduction and to impose new source reduction requirements on the PRO and producers if the number of plastic components or the overall weight of plastic covered material has increased. We believe that retaining the source reduction adjustment factor is a fair approach that allows businesses to grow while still providing CalRecycle with mechanisms to ensure long-term progress in plastics source reduction.

Response to O-104-18

CalRecycle rejects this comment as the source reduction factor proposed on the comment would essentially definitively modify the statutory baseline by allowing growth-based recalibration of the 2023 baseline, potentially reducing the overall quantity of reduction required to meet the 25 percent target. Such an adjustment would be inconsistent with the plain statutory language in section 42057, which defines the baseline year and reduction metric without reference to population or demand elasticity, and more specifically section 42057(a)(1) which establishes a quantitative, reduction requirement in which producers must achieve a 25 percent reduction by weight and number of plastic covered material. Section 42057 of the PRC does not authorize the Department or PRO to issue the suggested definitive factor as suggested which could effectively reduce the overall quantity of reduction required by statute as requested by the commenter. Further, as the commenter references PRC § 42057(h) of the PRC, this provision provides the Department with authority to evaluate and, if necessary, increase source-reduction requirements, thus strengthening them, and not to offsetting or discounting the statutory threshold requirements. Thus, the comment would undermine and contradict statute, and the Department's authority in section 42057(h) of the PRC already ensures CalRecycle can account for systemic trends which could include population growth and economic growth. Therefore, the comment is rejected. See also response to comment O-89-2 and O-48-5.

Comment O-104-19

Regulations Section and Topic
Need for a clear regulatory pathway to evaluate compostable plastics for designation under SB 54.
Recommendations
At a high level, The Recycling Partnership supports the need for establishing clear requirements that do not eliminate the possibility for compostable plastics or other innovative new materials and packaging formats to qualify for compostable or recyclable

designations under SB 54. We are supportive of policies that would allow the PRO to work with the compost industry, local jurisdictions and recycling service providers to experiment with models that may allow compostable plastics to be integrated into existing local programs and/or collected and processed through separate, parallel systems.

Response to O-104-19

Comment rejected. No response is required because, as the commenter acknowledges, this comment only states the commenter's concerns "[a]t a high level" and identifies "policies" that it supports, without setting forth any identifiable recommendations for revising the proposed regulations. To the extent other portions of the commenter's submission contain proposed changes or states objections requiring responses, CalRecycle has provided responses to those other portions.

Comment O-105-1

Further Considerations for SB-54 Revisions and Updates to Covered Material Categories Regarding Paper Cups

In Response to California's SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act Permanent Regulations

Introduction

This letter is a response to the release of California's SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act Permanent Regulations. In the most recent Update to Covered Material Categories (CMCs), *Released September 2, 2025, and complementary Covered Material Categories Reporting Guidance Documents*, we see that polycoated paperboard/paper hot cups, which are plastic-coated on one side, have been classified into **25_PF10P (Paperboard All Forms W/ plastic component)**. According to the Covered Material Category (CMC) List and recycling and composting determinations, released on January 1, 2025, the 25_PF10P category was deemed as "recyclable". We agree with this recommended designation of 25_PF10P for polycoated paperboard/paper hot cups, which have paper fiber as the dominant material and are lightly plastic-coated on one side. Below we share additional information on the recyclability of paper hot cups and progress being made across the United States today. It is our belief that these fiber cups are readily recyclable and should be included in recycling systems across California.

Who We Are

The Center for the Circular Economy ('the Center') is the innovation arm of Closed Loop Partners, a leading circular economy-focused investment firm in the U.S. The Center executes research and analytics, unites organizations to tackle complex material challenges and implements systemic change that advances the circular economy. The

Center's expertise spans circularity across the full lifecycle of materials, connecting upstream innovation to downstream recovery infrastructure and end markets.

The NextGen Consortium is a multi-year consortium that addresses single-use foodservice packaging waste by advancing the design, commercialization and recovery of food service packaging alternatives. Starbucks and McDonald's are the founding partners of the Consortium, with The Coca-Cola Company and PepsiCo as sector lead partners. Yum! Brands, Wendy's, Delta Air Lines, Toast, Keurig Dr Pepper and Avery Dennison are supporting partners.

The NextGen Consortium takes a multi-pronged approach to addressing foodservice packaging waste through three key workstreams:
1. Fiber Cups: Strengthening recycling infrastructure to recover and recycle more fiber cups after use while also exploring material science innovations that enhance the recyclability, recoverability and/or compostability of paper cup materials.
2. **Polypropylene (PP) Cups**: Expanding national access to recycling for PP cups to increase the availability of rPP in the market.
3**. Reuse Systems**: Advancing reusable packaging systems that keep cups in service for multiple uses. The NextGen Consortium is launching its largest yet multi-retailer activation in 2026 in Southern California. This initiative builds upon the success of the Petaluma Reusable Cup Project launched in 2024. In 2026, reusable cups will be offered by major brands, supported by regional reverse logistics infrastructure and a citywide consumer campaign. The project is designed to address the two key barriers for reuse to scale: cost and consumer adoption.

As described below, there has been growing momentum over the last several years to increase the recycling of and improve outcomes for polycoated paper packaging, including cups nationwide.

About Polycoated Paper Cup Recycling

The typical paper beverage cup (i.e., to-go coffee cup or soda cup/beverage vessel) is roughly composed of 95 percent paper while the remainder of the cup is made up of a thin conventional plastic coatingi. The paper in most cups is made from longstrand, cellulose fibers that are valuable in the recycling system as they enhance the strength and quality of new products made of recycled paperii. The plastic liner coating is typically a thin polyethylene (PE) barrier – on the inside for hot cups and on both sides for cold cups. While the PE-liner has historically been cited as an impediment to widespread recyclability of paper cups, it is increasingly not a challenge and can be separated from the fiber by paper mills in their pulping process. More than 35 mills in North America accept and process fiber cups when sorted into Residential Mixed Paper (RMP) or Cartons bales at the MRF (Materials Recovery Facility)iii.

To learn more about paper cups and the value they can add to the recycling system when captured, please review NextGen's latest report on paper cup recycling: Closing the Loop on Cups: Collective Action to Advance the Recovery of Paper Cups in the

U.S.iv This report demonstrates how the recovery of paper cups increases when each stakeholder in the value chain plays a role, including:
• **Mills** to conduct recycling tests on paper cups to determine how much of the fiber can be captured.
• **MRFs** to conduct material flow studies to determine where best to site interventions (equipment) for cup sortation.
• **Communities** engage with MRFs and mills to evaluate feasibility of adding cups to accepted recyclables lists and share guidance with residents.
• **Consumers** to bring their own reusable cups when they can and to check local recyclability options and guidance when using paper cups
• **Brands** to source recycled paper content when procuring their cups and other packaging, among other activitiesv.

Paper Cup Recycling Progress to Date

Since NextGen's inception in 2018, we have been collaborating with other stakeholders to increase the number of cities, material recovery facilities (MRFs), and paper mills that accept, sort and process paper cups into specific paper grade bales. Through these efforts, we have actively engaged with dozens of subject matter experts and stakeholders across the recycling value chain (MRFs, mills, recycling labs, consumers, communities, etc.) and can offer the following perspectives on cup recycling efforts and opportunities:
• **The paper in fiber cups is high quality, strong and desirable.** From our work with paper mills, and the paper industry's public statements, we know that the fiber in cups is high quality and can help offset declining feedstock volumes of other paper types such as newsprint, magazines, high-grade office paper and paper catalogsvi.
• **A growing number of paper mills can successfully recycle paper cups.** According to the Foodservice Packaging Institute (FPI), as of June 2025, there are more than 35 mills that accept cups in bales of mixed paper or aseptic and gable top cartons in North Americavii. The mills that accept cups in mixed paper represent more than 75% of domestic mixed paper demandviii. These mills can separate the polyethylene liner in the pulping process so that the valuable fiber can be captured at high rates and reprocessed. Several large mill companies such as Sonoco and Georgia Pacific have conducted cup trials in recent years to demonstrate their ability to effectively recycle the cups. o As of summer 2025, companies including Georgia Pacific and Graphic Packaging have made announcements of new mills that are able to accept polycoated paper cups. ixx
• **Paper cup recycling and repulping tests demonstrate a high fiber yield**. NextGen's work confirms these findings, supported by results from its test at Western Michigan University's paper pilot plant, where a standard polycoated paper cup passed the recycling and repulpability test, demonstrating a **fiber yield of 89 percent** (well above the 80 percent benchmark needed to pass that portion of the test)xi. *A copy of the full repulpability/recyclability study is available upon request.*
• **Cups can be effectively sorted by MRFs**. NextGen has collaborated with FPI and RRS, and partnered with several large and mid-sized MRFs across the United States (most of which are the main processor for their municipality, including top ten cities by population in the US) to conduct flow studies to better understand how cups flow

through a MRF environment. Based on this work, we know that cups can be diverted to mixed paper or polycoated paper bales through technology (e.g. optical sorters, robotic sorters, etc.) or manual sorting effortsxii.
o In Dallas, Texas, NextGen, the Foodservice Packaging Institute, and the Carton Council collaborated on a grant to install robotic equipment at the local MRF (FCC Environmental Services) to create a cup and carton bale with an end market customer purchasing the balesxiii. As a result, Dallas promotes the recycling of paper cups to its residents.
o In 2025, at TFC Recycling in Virginia, NextGen collaborated with Foodservice Packaging Institute to support a MRF equipment grant that would help effectively sort and capture cups at TFC Recycling to bales designated for recycling.
o In 2025 in Austin, NextGen collaborated with the Foodservice Packaging Institute and Carton Council on a grant to install robotic equipment at the local MRF to create a cup and carton bale with an end market customer purchasing the bales. As a result of these engagements, Austin, Texas promotes the recycling of paper cups, among other items such as beverage cartons and coated paper products to its residents.xiv
o As of June 2025, the Recycled Materials Association (ReMA) has officially updated the ReMA ISRI specifications "to include the board-approved addition of 'Paper cups' to the allowable paper commodities in the Inbound Residential Single Stream and the Inbound Residential Dual Stream specifications". REMA is a global recycling industry organization, and their specifications help set standards for recycled materials and guide material buyers and sellers.xv This formal, industry-wide recognition is a critical milestone for paper cup recycling and enables future recycling opportunities. xvi
• **A growing number of US cities and counties have added cups to their lists of acceptable recycling items.** Several major US cities including San Francisco, Seattle, New York City, Denver, Atlanta, Chicago, Detroit, Louisville, Portland, ME, and Washington, DC, among several others, can effectively recycle cups and accept cups in their residential recycling streamxvii. The list of cities will continue to grow as they see more MRFs and mills accepting, collecting and effectively reprocessing cups. Some notable examples of wider cup recycling adoption follow:
o In February 2022, Rumpke, one of the nation's largest privately-owned recycling firms, announced it would begin accepting fiber cups at its MRFs, as well as in its curbside and drop box programs across Indiana, Kentucky, and Ohioxviii.
o According to The Recycling Partnership's Community Recycling Program Acceptance Data database, ~15% of communities in the U.S. accept paper cups in recycling programs as of June 2025. This access rate has gone up several percentage points in the last few years.xix
• **Paper cups are being more widely accepted in regions with EPR regulations in place, including Ontario, Canada**. In September 2025, it was announced that hot and cold paper cups would be recyclable province-wide (starting in 2026) following a successful pilot in Toronto. xx The pilot demonstrated an increase in the collection of plastic-lined paperboard (polycoated paperboard) and that this material was being successfully "sent to end markets where they are recycled and repurposed into new paper products".xxi This example illustrates a terrific proof point for State and/or Province wide acceptance of a format such as paper cups, after sufficient testing.

Response to O-105-1

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process. To the extent other portions of the submission do suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-105-2

Recommendations

The Center is actively working across multiple channels to divert cups from landfill and keep their valuable materials in circulation. Our extensive research over the past six years shows that there is no single solution to fully address cup waste challenges, especially as alternatives require additional testing and scaling to ensure they're properly recovered and don't end up in a landfill. To successfully achieve reduced cup waste and fiber cup recovery at scale, we recommend:

• Realistic requirements for recyclability and compostability or clarity on the onramp and resources to increase fiber cup recycling infrastructure in California before compliance begins.

• Clear pathways for recyclability determination in the Covered Materials Categories (CMC) list when innovations are developed that eliminate nonrecyclable components of a packaging item.

• Design for recycling guidance to ensure greater uniformity and marketability of captured materials and avoid excess contamination/look-a-likes that might depreciate value.

• Exclusion of the requirement that packaging needs to meet the USDA's National Organics Program definition for an organic input to be deemed compostable in SB-54.

When single-use packaging, including polycoated paper cups and compostable packaging, are captured for recovery, California will reduce the number of these items going to landfill. To accomplish this, these packaging types need to be accepted in the statewide recycling system. Below we've highlighted a few areas of the current draft that could be modified for clarity.

- **The process of changing a packaging item's determination on the Covered Material List (CMC) to recyclable or compostable is unclear**: In Section 18980.3, a covered material item's evaluation of recyclability is determined as well by its compliance with SB-343. This statute requires packaging to have statewide recycling access of 60%. Currently fiber cups do not meet these requirements with statewide access currently falling under a 20% acceptance rate in California. It is our understanding that failure to meet certain access thresholds will hinder an item's determination as recyclable in SB-343 and impact CMC designation. It's unclear how to build access and recovery rates, and capitalize on momentum for certain items, such as paper cups, if they currently fall below required thresholds for labeling as recyclable or use of the "chasing arrows". Further, this might impact a wider array of covered material category

items that, in the absence of labeling, are unable to market recyclability guidance to customers and subsequently build capture and recycling rates required by the state.

- **Lack of clear guidance on consumer communication around package recyclability**: Section 18980.3.1 **Recyclability of Certain Material Categories** suggests information needed to move a material on the CMC and use the claim of being “recyclable”, but does not clearly articulate how a package can utilize clear, simple and easily recognizable communication to consumers that the package is indeed recyclable. Without consistent and repetitive communication, consumers and the whole recovery supply chain will not be able to substantially increase capture of recyclable items. The regulations should clarify how to increase capture using simple tools like chasing arrows, which are a longtime communication symbol for recycling.
- **Lack of clear process for onboarding new innovations**: Section 18980.3.1 explains how a producer can advocate for a covered material to be recognized as recyclable by providing evidence of increased collection and sorting efforts in the state. However, it does not describe how packaging (or modification to a packaging format) currently not on the CMC list has a pathway to recyclability. If an innovation is developed, such as a paper cup with an alternative liner with minimal plastic or bio-based component (several of which are in development), it would be difficult to show an increase in collection within the state’s program when they are not currently accepted. This can potentially limit coating/barrier technologies coming to market that could make cups (and other paper-based packaging) a more valuable commodity to MRFs and paper mills that seek fiber feedstocks. Generally, it would be helpful to provide clear onramps for packaging innovation that can help remove elements of a package that deemed it non-recyclable, to one that should be acceptable in the system.

Response to O-105-2

Comment rejected. The commenter identifies three areas "that could be modified for clarity." First, the commenter alleges that the "process" for packaging that is currently not recyclable or compostable achieving recyclability or compostability is unclear. The problems the commenter identifies, however, are not lack of clarity in the proposed regulations. Rather, the commenter asserts that it is unclear how packaging can comply with the aggressive thresholds set in statute, not any compliance requirement that the proposed regulations can affect or further clarify. In other words, the commenter's concern is with how the PRO plan and producers' actions pursuant to it will result in compliance. The proposed regulations cannot relax the compliance standards, but they do set forth how CalRecycle will implement the statutory exemptions, which provide opportunity for relief in the event that statutory standards cannot be met (see section 18980.2.4). Moreover, the commenter does not propose any change to the regulatory text for CalRecycle to consider. Accordingly, no change in response to this comment is necessary.

Second, the commenter states that there is a "[l]ack of clear guidance on

consumer communication around package recyclability." The commenter's concern appears to be over how producers can communicate how to recycle materials without violating the restrictions of Public Resources Code section 42355.51(a) or (b). CalRecycle, however, does not have authority to enforce deceptive labeling laws, and how a product is labeled is irrelevant to CalRecycle determinations of compliance with the current statute. Therefore, any guidance it could state in its proposed regulations would not have the force of law with respect to such enforcement, with the notable exception that Public Resources Code section 42061(a)(3)(B) does give authoritative effect to CalRecycle's "trending" determinations for labeling purposes. To the extent the commenter proposes that CalRecycle establish an exemption from the labeling restrictions of 42355.51(a) and (b), no change is appropriate because CalRecycle has no authority to establish that exemption. CalRecycle notes, however, that it may be possible for CalRecycle to collaborate with government entities with enforcement authority under 42355.51 to publish informal guidance, such as "frequently asked questions," concerning their enforcement authority, and such publications may satisfy the commenter's implied request for "clear guidance."

Lastly, the commenter asserts that there is a "[l]ack of [a] clear process for onboarding new innovations." The commenter requests "clear onramps for packaging innovation." However, CalRecycle cannot create new onramps or exemptions other than those authorized under statute. Fortunately, no new onramps or exemptions are needed to accommodate the commenter's concerns. Where the "trending" onramp under Public Resources Code section 42061(a)(3)(B) is unavailable, exemptions pursuant to section 42060(a)(3) (addressed in section 18980.2.4 of the proposed regulations) establishes the appropriate on-ramp through "phase-in" plans. In other words, when new innovations foreseeably will result in compliance but cannot possibly currently comply due to the newness of the material, an exemption with a phase-in plan provides the onramp requested.

The first portion of this comment also briefly states recommendations specifically aimed at "achiev[ing] reduced cup waste and fiber cup recovery at scale." Those recommendations largely overlap with the comments addressed above. To the extent they do not, CalRecycle responds as follows:

• Regarding "[r]ealistic requirements of recyclability and compostability." CalRecycle cannot accommodate that request because those requirements are established in statute. While CalRecycle can (and does, in section 18980.2.4) implement a process for granting exemptions described in statute, CalRecycle cannot change the requirements themselves.

• Regarding "clarity on the onramp and resources to increase fiber cup recycling infrastructure in California before compliance begins," the responses above address "onramps," and how industry can improve current infrastructure is beyond CalRecycle's purview. CalRecycle's mandate is to implement and enforce the statute, not to dictate how industry addresses infrastructure needed "before compliance begins."

• Regarding "[d]esign for recycling guidance to ensure greater uniformity and marketability of captured materials and avoid excess contamination/look-a-likes

[sic] that might depreciate value," dictating how industry addresses such challenges is beyond CalRecycle's statutory authority. Rather, statute contemplates producer responsibility plans and their implementation to address such infrastructure needs.
• Regarding the "USDA's National Organics Program definition for an organic input," the commenter appears to propose that CalRecycle declare the requirement stated in Public Resources Code section 42357(g)(1)(B) inapplicable to whether covered material is "eligible to be labeled 'compostable.'" Statute unambiguously incorporates that requirement along with the rest of section 42357, so CalRecycle cannot lawfully make the requested change.

Comment O-105-3

Conclusion

The Center for the Circular Economy recommends that single-lined, polycoated paper cups retain a recyclability designation and stay in circulation to prevent unnecessary landfilling. As illustrated above, there has been tremendous progress and recognition on polycoated paper cup recycling nation-wide and a clear opportunity for the material in California, although more access and acceptance needs to be built locally. Furthermore, while we are working diligently on reusable solutions, and new material innovation, we recognize that there is no single solution to address food-services packaging waste, and a concerted effort to build recycling infrastructure to capture these valuable materials is critical while alternative models, such as reuse systems, are developed and scaled.

We would be happy to discuss with CalRecycle any additional research needed and answer any questions you might have about our work advancing the circularity of this widespread packaging category. Thank you for this opportunity to share our research.

Response to O-105-3

Comment rejected. The comment concerns recyclability designations on the Covered Material List that CalRecycle published, not the proposed regulations. Accordingly, no substantive response is required here.

O-106: AMERIPEN (Gregory Melkonian)

Comment O-106-1

Good morning.· My name is Gregory Melkonian, and I'm an analyst with Serlin Haley. But I am here on behalf of our client, AMERIPEN.

AMERIPEN, or the American Institute for Packaging and the Environment, represents the entire packaging value chain from material producers to brand owners to recycling partners.· AMERIPEN represents all material types as well, including paper, metal, glass, and plastic.

To begin, we want to express gratitude towards CalRecycle staff and Director Heller for the thoughtful work and many hours involved in this year's rulemaking. While we may not agree with some of the outcomes in the proposed rules, we know the Department listened to and considered input from the public to try to craft better policy.

In particular, I'd like to call attention to several areas in the rules that have improved since last year.· First, we are grateful for the clear direction for identifying covered materials, more details regarding the exemption request processes, and a better outline of producer hierarchies.· These elements will make it easier for producers to participate in and comply with SB 54.

Next, we recommend CalRecycle -- sorry.· We commend CalRecycle for removing many complicated provisions for reuse and refill.· As mentioned before, there may be more work to be done in this area going forward.· But it's important for there to be flexibility now in order to foster innovation and help provide scale in this fledgling sector.

Third, the rules that clarify eligible cost and reimbursement methods are well-crafted.· They will help ensure the program expenses are appropriately contained and funded.

Response to O-106-1

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process. To the extent other portions of the submission do suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-106-2

That being said, it wouldn't be a comment opportunity without pointing to some areas of disagreement.· AMERIPEN would like to call attention to the following issues that remain and are likely to hinder the goals and implementation of SB 54.

As one example, changes made to the proposed rules this year limit the department's obligation to update the covered material categories list when new information becomes known.· It is critical that the list adapts with growing investment and efforts to boost recycling, especially in the early years of the program. AMERIPEN requests that CalRecycle recommit to making more responsive updates to the list.

Response to O-106-2

Comment rejected. This comment appears to be directed at section 18980.2.5(a) and (b), but those provisions only implement the unavoidable logical conclusion that, when CalRecycle reviews the covered material categories list but finds that there is no new information or changed circumstances meriting a change, there is no "update" to make. These provisions do not "limit the department's obligation to update the covered material categories list." There is no obligation to make changes to the list at any one time; rather, Public Resources Code section

42061(e) and (f) requires CalRecycle to establish a process for updating the list. It defies logic to say that any such process must, every time CalRecycle reviews the list, a change must be made.

Comment O-106-3

Second, AMERIPEN reiterates that the design of the trending on-ramp connected to SB 343 is arbitrarily limited.· As it stands, this is counterproductive because it will actually hinder efforts to make certain materials more recyclable.

Response to O-106-3

Comment rejected. No substantive response is required because the comment raises vague concerns that the trending on-ramp is "arbitrarily limited" without stating any specific recommendation or explanation of its objections to the proposed regulations.

Comment O-106-4

And finally, this year's version of the rule text omitted the provision that would have allowed for adjustments to the source reduction baseline based on factors outside producers' control, such as population growth.· We believe the Department has regulatory authority to implement such adjustments, and we ask it to reexamine this area to avoid unwarranted market impacts.

Response to O-106-4

CalRecycle rejects this response for the reasons stated in comment responses O-89-2 and O-48-5, and O-104-18.

Comment O-106-5

In closing, AMERIPEN appreciates CalRecycle's deliberate work developing these rules, but urges the Department to consider the remaining areas of concern as the program rolls out.· Our written comments speak to the full scope of issues, and we are always happy to discuss them further with the Department.· Thank you.

Response to O-106-5

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process. To the extent other portions of the submission do suggest changes or raise objections, CalRecycle has responded to those portions separately.

O-107: Association of Plastic Recyclers (Allison Kustic)

Comment O-107-1

Good morning.· I'm Allison Kustic with the Association of Plastic Recyclers.· I'd like to raise two main points that we think need to be addressed in the regulations.

First is that the regulations should build a system that supports North American recycling infrastructure.· SB 54 is meant to build a transparent and robust recycling system for California, and this must include investing in recycling infrastructure in California and throughout North America rather than that outside of North America.

SB 54 is about collecting recyclable materials.· But if there are no markets to sell that recycled plastic back into, the system will break down and California won't have a circular economy.

California plastic reclaimers are really struggling to stay in business as companies buy recycled plastic from overseas instead of buying locally.· We've seen this really close at home.· Just last month, we saw the closure of rPlanet Earth, the Southern California PET reclaimer, in part because they couldn't compete with the extremely low price of imports.

This is a huge loss in recycling capacity within the state and for all of North America.· We think that we really can't wait to address this issue.· And to that end, we've provided details in written comments for how the regulation language can be changed to better support North American recyclers.

Response to O-107-1

Comment rejected. CalRecycle regulations cannot lawfully disfavor interstate or international commerce.

Comment O-107-2

Specifically we'd like to see that the source reduction credit for the use of recycled content be granted only for the use of recycled content produced from North American sources and processed here as well. And we'd like to see investments made only to domestic or North American recyclers.

Response to O-107-2

Comment rejected. CalRecycle regulations cannot lawfully impose different restrictions or confer different benefits based on whether business is conducted with foreign versus domestic partners.

Comment O-107-3

The second issue I'd like to raise is the definitions of plastic components.· We ask that not all plastic components be treated the same when it comes to recycling.· The

definition should differentiate between components that are and are not recycled with the container.

We really want to build a system where it's easy to recycle the entire container as one unit and people don't have to take off caps, sprayers, labels, and all of those kinds of things.· And so the component definition should reflect that the package is where this is the case.· Where it can go and be recycled with the base product.

So we need to make sure that products are designed to be recycled.· And to do that, there should be differentiation in the definition of how components are put into covered material categories.· Thank you.

Response to O-107-3

Comment rejected. The proposed regulations do not include a definition of "plastic components." Statute defines that phrase and the definition of "plastic" in plain terms (Public Resources Code section 42041(t) and (u)). To the extent the commenter intended to request that the proposed regulations should define detachable components with respect to how consumers are instructed to recycle them or with respect characteristics that cannot be ascertained before they are discarded, CalRecycle rejects that proposal for the reasons provided in response to comments O-39-5 and O-41-3.

O-108: Black Women for Wellness (Dr Zoe Cunliffe)

Comment O-108-1

Okay.· Good morning, all.

My name is Dr. Zoe Cunliffe, and I am the environmental justice program manager at a nonprofit called Black Women for Wellness and a member of the California statewide EJCAP coalition.· As Tevin named, that's the Environmental Justice Communities Against Plastic.

My comment will really be building on what some allies and colleagues have mentioned.· But I really want to bring, like, the EJ perspective on why it is that, like, these particular limitations of the regulations are so important in my comment.

So, Black Women for Wellness, BWW for short, is a reproductive justice and human rights organization based in South LA where an EJ team works to build healthier communities by addressing issues caused and perpetuated by environmental racism.

One of our major campaign areas is tackling the life cycle of plastic, which has a significant negative impact on health.· And especially reproductive health, given the high incidence of endocrine-disrupting chemicals in plastics and processes related to plastic, something that Black families and Black women in particular are overexposed to.

BWW has been conducting robust community engagement on plastics and the SB 54 process, specifically over the past two or more years, including a firm banking effort that reached over 11,000 people and culminating in a community report that we released earlier this year.

I'm raising this because, really, this community engagement is what informs and is behind my public comment today and this response to the regulations.· So I want to touch on three of the significant limitations with the draft regulations and why these things really need to be addressed in order to meet EJ needs.

Response to O-108-1

CalRecycle rejects the comment. No substantive response is required because the comment raises general concerns without stating any specific recommendation or explanation of its objections to the proposed regulations. To the extent that this portion is preface for subsequent portions that are specific, CalRecycle has responded to those comments separately.

Comment O-108-2

So first, as already raised by others, I think a significant limitation with the regulations as they currently stand are the way that the exclusions to covered materials are currently described.· Right?· So the draft allows for these exemptions if producers claim that it is not reasonably possible to use packaging that also complies with USDA or FDA rules or regulations.

This language is far too subjective.· And as has been mentioned, potentially allows producers to exclude these large swathes of food packaging and other kinds of packaging from the regulations and dodge accountability this way.

This is worrying for all sorts of reasons. But especially because low-income BIPOC communities across California typically face a particularly high burden when it comes to highly-processed and overly packaged foods.

For example, one in four Black people across the country face food insecurity.· And the foods most available to these folks are awash in single-use plastic.· So these are the reasons that it's really important that all relevant plastic food packaging is subject to these regulations and that these kinds of exemptions aren't made possible.

Response to O-108-2

Comment accepted. CalRecycle has revised section 18980.2(a)(2) to address the commenter's concern. See CalRecycle's response to comment I-19-1, explaining the revisions responsive to this and similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further

explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

Comment O-108-3

So the second limitation I want to touch on then is something that Nick brought up.· That this is the -- the standards currently proposed for reuse and refill are not sufficiently strict, because there is no quantifiable definition given of the kind of reusable, refillable language in the regulations.· Without this kind of definition, the regulations leave open the
possibility of producers bringing in false solutions and reuse systems that are not worthy of the name.

As the communities that EJCAP represents can attest, when strict definitions and accountability measures are absent, producers and polluters can and will shirk their responsibilities.· And this must be avoided, otherwise it's BIPOC and low-income communities that suffer the most.

It's really important for SB 54 to pave the way towards genuine reuse and refill infrastructure and systems.· And for these systems to operate in all communities, especially EJ communities where the need for alternatives is most keenly felt and has been called for repeatedly.

Response to O-108-3

CalRecycle rejects this comment because it does not describe or specifically propose what it means by "a quantifiable definition" to add to the proposed regulations. CalRecycle also rejects this comment for the reasons provided in response to comment B-6-2 and because the statute contains straightforward standards for what constitutes "reusable" or "refillable" packaging. Section 18980.2.1 of the proposed regulations interpret those provisions to the extent necessary for regulated entities to comply with the law and for CalRecycle to enforce it. CalRecycle's responses to comments I-30-2, B-38-3, O-75-3, and O-48-4 provide additional bases for CalRecycle's decision not to revise section 18980.2.1.

Comment O-108-4

Third and finally, and again, this has come up already.· But a really big problem with the regulations as they currently stand is that they permit chemical recycling.· Right?· So-called advanced recycling, advanced manufacturing.· Whatever it is, it's just some form of incineration by another name.

So the technologies involved in chemical recycling are toxic to air, water, and soil.· And always end up polluting and damaging the health, particularly of communities of color.· Right?· So the pollutants released by chemical recycling and these processes are linked to all sorts of health harms including cancer, reproductive harms, respiratory illness, and so on.

The whole point of SB 54 is to reduce plastic production and protect public health, especially the health of EJ communities.· Right?· This is why the Plastic Pollution Mitigation Fund is supposed to generate these funds that go specifically to mitigate harms to these communities.

We can't end up in a situation where these PPMF funds that are much needed, right, a much-needed aid to addressing long-standing environmental racism across California, they can't just end up being a Band-Aid to fix problems like chemical recycling that SB 54 itself ends up making worse.

So in general, thank you for your time today. And I just really want to urge CalRecycle in finalizing and implementing and moving forwards with the SB 54 process to really center environmental justice communities and organizations.· Because it's really these communities that are the most harmed by the toxic life cycle of plastic.· Thanks.

Response to O-108-4

Comment rejected. To the extent the comment implies that "chemical recycling" be banned outright in the regulations, a complete ban on any technology could have been accomplished through straightforward, specific language in the Act that required prohibition based solely on the type of technology at issue. Instead, the Legislature chose to word statute in a way that requires consideration of hazardous waste generation, not merely consideration of the type of technology. CalRecycle also rejects this comment for the reasons stated in response to comment O-62-1.

O-109: Californians Against Waste (Nick Pappas)

Comment O-109-1

We had submitted comments repeatedly.· Maybe a dozen times at this point.· We've testified at every single workshop.· Probably every single advisory committee meeting.· So at this point it feels kind of redundant to repeat the same points.

We do have a very detailed comment letter coming later today.· I just want to highlight the three -- what I think of as the three biggest flaws in the current proposed regulations.· And again, I feel like I'm a broken record.· But I guess that's sort of part of the process.

Now, on the chemical recycling, I think you've stretched really far from the statutory limits on what is allowed here.· You know, take the hazardous waste section specifically.· That one seems to be the most egregious.

The statute says that you're supposed to not allow facilities that generate significant quantities of hazardous waste.· And I don't think you have followed any one of the words in that statement, because it's about generation.· And I don't think you even looked at generation.· You looked at disposal.

Significant quantities has been defined as being in compliance with a permit, which doesn't say anything about whether or not it's a significant amount. And quantity is quantity, not the quality of the hazardous waste.

And finally, the definition of hazardous waste.· You all are relying on the federal definition, when it's pretty clear that California law is governed by a different definition of hazardous waste.

Response to O-109-1

CalRecycle rejects this comment for the reasons stated in response to comment O-62-1.

Comment O-109-2

On the exclusions.· The current exclusions, while the most recent draft does get a little bit better, it does still create really broad loopholes that will be abused without a doubt.· You know, look at the -- well, first of all, I mean, the legislature laid out specific exclusions.· And that should be the range of exclusions that are in the regulations.

The fact they go beyond that is inappropriate, period.· And anything beyond that should be considered under the unique challenges exemption, which is intentionally not a permanent exclusion.

And then, you know, you look at some of the federal language.· And I keep going back to the fact that it lists compliance with legislation, regulations, or guidelines.· Right?

And "guideline" is an ill-defined term that could mean a single email issued from the Trump administration saying that whole categories of packaging should be in plastic.· A guideline doesn't have any kind of Administrative Procedure Act.· Doesn't have any kind of regulatory process.· It is not a defined legal term.

And again, after these regulations are adopted, the regulated community that wants to be exempt just has to ask FDA or USDA to put out a statement about how important it is for plastic to protect food safety, or whatever they're arguing for.

Response to O-109-2

Comment partially rejected and partially accepted. Regarding the assertion that exclusions in the regulations are overbroad, no substantive response is required because the commenter does not identify the particular exclusions alleged to be broad. To the extent the commenter intended to refer to the exclusion in 18980.2(a)(2) for packaging for food and agricultural products that presents conflicts with federal laws, however, CalRecycle accepts this comment for the reasons provided in response to comment I-19-1, explaining the revisions responsive to this and similar comments. CalRecycle declines the commenter's recommendation to remove the term "guidelines" because the statute itself uses

that term. See, also, CalRecycle's response to comment I-59-2. CalRecycle partially accepts the comment, however, to the extent that "guidelines" might have been interpreted to refer to non-mandatory legal provisions. Because the statute uses that term as an example of "a federal law or regulation," it cannot be interpreted to encompass non-mandatory suggestions by federal government entities, and it is axiomatic that a mere suggestion presents no compliance obstacle or direct legal conflict; one cannot violate a mere suggestion. Accordingly, the regulation has been revised to clarify that merely voluntary guidelines cannot, by themselves, create a direct legal conflict with federal law. To the extent this comment was intended to recommend deletion 18980.2(a)(2) and reliance on exemptions under 18980.2.4 in its stead, CalRecycle rejects that suggestion for the reasons provided in response to comment I-59-2. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

Comment O-109-3

The last thing I want to highlight, which hasn't really gotten as much attention but I think is another major pitfall, is the fake reuse.· I think the original regulations probably were a little bit too prescriptive when it came to reuse.· But the current regulations really open the door for rebranding disposables as reusables and not changing the status quo.· And that's not what the public wanted.

You know, we did repeated polling when we looked at the ballot measure a few years ago with overwhelming support from the public for really wanting to see systemic change from the current packaging to less packaging and to more recyclable and compostable alternatives.· And allowing people to more or less rebrand disposable packaging as reusable totally defies that entire purpose.

We have, again, like I said, a lot more comments.· And I know you've heard all these comments before.· I'm not sure if there's going to be any changes taken based on them, because so far they've clearly not been accepted.· But appreciate your time anyway.· Thank you.

Response to O-109-3

Comment rejected. No substantive response is required because the comment raises general concerns without stating any specific recommendation or explanation of its objections to the proposed regulations.

O-110: CALPIRG (Emerson Damiano)

Comment O-110-1

Hello.· My name is Emerson Damiano, and I am a zero waste associate at CALPIRG in Los Angeles.

I have always been passionate about reducing plastic pollution, because it is an incredibly disastrous problem that causes a multitude of health effects and environmental crises, as previously touched on.

Microplastics have been found in the deepest depths of the ocean where humans have little to no access, proving the extent of our impact on our surrounding environments.· In fact, the equivalent of one dump truck of plastic goes into the ocean every 45 seconds.

SB 54 was a groundbreaking legislation regarding plastic pollution regulation in the United States.· However, this legislation is at risk of being weakened.

Response to O-110-1

Comment rejected. No substantive response is necessary because the commenter provides no identifiable suggestions as to how the "legislation is at risk of being weakened". The regulations do not alter SB 54; rather, they interpret and implement the statute as written.

Comment O-110-2

Current regulations do not at all protect against harmful chemical recycling, as my colleague touched on, which is quite literally just a new term for incineration.· Chemical recycling creates toxic pollutants that harm our environment and threaten public health and does not reduce demand for new plastic to be created.

Additionally, these regulations unlawfully exclude new, broad categories of products such as food and agricultural products or over-the-counter drugs, which leaves more plastic to pollute the environment.

Therefore, CalRecycle should strengthen these regulations so that only real recycling technologies are allowed in our state, not chemical recycling. CalRecycle should also not allow for broad exclusions of packaging for the aforementioned products, but instead institute an exemption process.

Thank you so much.

Response to O-110-2

CalRecycle partially accepts and partially rejects this comment. Regarding chemical recycling, CalRecycle rejects this comment for the reasons provided in response to comment O-62-1. See, also, CalRecycle's response to comment I-6-

1 regarding incineration. Regarding over-the-counter drugs, CalRecycle rejects this comment for the reasons provided in response to comment O-49-1. Regarding the suggestion that an exemption process should apply, CalRecycle rejects that suggestion for the reasons provided in response to comment I-59-2. To the extent the commenter intended to suggest removal of section 18980.2(a)(2), regarding food and agricultural packaging, CalRecycle rejects that suggestion for the reasons stated in response to comment I-19-1 and I-59-2. CalRecycle accepts this comment with regard to food and agricultural packaging, however, to the extent it alleges that section 18980.2(a)(2) was unclear in scope or effect, was insufficiently clear with regard to what renders it "not reasonably possible" to resolve conflicts with federal laws, or would have been overbroad in effect due to the potential for the exclusion to be applied despite the conflicts being avoidable. See CalRecycle's response to comment I-19-1, explaining the revisions responsive to this and similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

O-111: CALPIRG (Fiona Hines)

Comment O-111-1

Hello.· I'm Fiona Hines.· I'm with California Public Interest Research Group education fund, also known as CALPIRG education fund.· We're a public interest advocacy group that works on a number of issues that mainly are trying to solve problems that affect Californians' health, safety, and well-being.

And when this bill first passed, we delivered thousands of petitions in support from Californians, and we had done so again.· This latest draft regulation we delivered over 4,000 petitions asking for them to be tightened and strengthened. ·

Like I said, we've had thousands of conversations with Californians both at their door, on college campuses, and around community events.· We've heard time and time again is that Californians want real solutions to wasteful and polluting packaging.· They understand that their decisions alone will not solve the issue.· That we need systemic change from industry and government working together, which I understand this bill is trying to do -- this law is trying to do.

So ensuring that this law is implemented with strong regulations is the best way we can do this the quickest way possible.· And so I agree with what my colleagues had said previously that there was a couple things we're specifically concerned about today.

One is the weakened protections against chemical recycling, also known as advanced recycling. The language of SB 54 was clear that recycling technologies that were prohibited, if they provide -- if they create more hazardous waste than mechanical

recycling.· And the new regulations make this prohibition more vague, and also moot without a permit.

And so this is not how we should be protecting our communities from harmful technologies.· And we would say that plastics-to-fuel facilities aren't solving the problem.

They're not reducing the demand for virgin plastics, and there's also the concern that some of them are creating new harmful waste.· And even those that in theory might be able to convert plastic waste into new plastics do pose major threats that we think are of concern, including releasing carcinogenic chemicals into the air.

So we would urge you all at CalRecycle to strength the regulation so that only real and safe technologies are allowed in our state and not ones that we -- could be allowed with both those changes I made to this law.

And we think that failing to do so risks the health of Californians and threatens to undermine the key intent of this law, which is to greatly reduce the amount of plastic waste we're producing and discarding into our environment and protect our communities from the environmental and health impacts of plastic production disposal.

Response to O-111-1

Comment rejected. With regard to chemical recycling, the comment expresses general concern but does not suggest specific changes to the proposed regulations. SB 54 does not expressly forbid chemical recycling, so the regulations cannot lawfully do so, either. A complete ban on any technology could have been accomplished through straightforward, specific language that required prohibition based solely on the type of technology at issue. Instead, the Legislature chose to word statute in a way that requires consideration of hazardous waste generation, not merely consideration of the type of technology. Thus, no further changes are necessary to the implementation or enforcement of the Act.

Comment O-111-2

And like our colleagues before us said, we're also concerned that the new FDA USDA exclusions risk creating major unintended loopholes that would deal a massive blow to the intent of this law, which is to unnecessarily limit -- and also unnecessarily limit the amount of waste that this law could prevent.

We don't think that entire categories of food or agricultural or over-the-counter drugs should be excluded carte blanche.· And producers seeking exclusion should have to provide detailed verification subject to public notice and public comment.· And any exclusions granted should be time-bound.

Without these changes, I personally really fear that the plastic waste this law was passed to prevent will continue to fill our landfills and litter our communities.· And I don't want that to happen, as I think none of you want that to happen either.

And so I urge CalRecycle to heed the suggestions and strengthen these regulations so that California can truly be a leader in protecting our communities from toxic pollutants and waste.· Thanks so much.

Response to O-111-2

CalRecycle partially rejects and partially accepts this comment. Regarding over-the-counter drugs, CalRecycle rejects this comment for the reasons stated in response to comment O-49-1. Regarding food and agricultural packaging, the commenter incorrectly asserts that they are all categorically excluded; to the contrary, the proposed regulations only exclude packaging for which there is an intractable conflict with federal law. The commenter is also incorrect that the proposed regulation (section 18980.2(a)(2)) creates any "carte blanche" exclusion. Entities seeking to avail themselves of the exclusion are required to explain the basis for their claim that it applies. CalRecycle also rejects the suggestion that the exclusion should be subject to "public notice and public comment." Even if the types of packaging that are excluded are few, the number of specific examples of each type is likely to be large, and imposing a public notice and comment requirement would be impracticable.

CalRecycle accepts this comment with regard to food and agricultural packaging, however, to the extent it alleges that section 18980.2(a)(2) was unclear in scope or effect, was insufficiently clear regarding what renders it "not reasonably possible" to resolve conflicts with federal laws, or would have been overbroad in effect due to the potential for the exclusion to be applied despite the conflicts being avoidable. See CalRecycle's response to comment I-19-1, explaining the revisions responsive to this and similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

O-112: Circular Action Alliance (Roxanne Spiekerman)

Comment O-112-1

Thank you very much. My name is Roxanne Spiekerman, and I'm the director of plastics for Circular Action Alliance. I'm here speaking as proxy for Emily Coven, a California executive director. I'd like to thank the Department for the opportunity to submit written comments that will be written -- submitted by later this evening on the regulations, as well as the opportunity to speak here today.

CAA is honored to have been selected in January 2024 as a Producer Responsibility Organization for the Plastic Pollution Prevention and Packaging Producer Responsibility Act.

As a nonprofit, producer-led organization, CAA is committed to helping producers comply with EPR laws, delivering harmonized, best-in-class compliance services, and to working with governments, businesses, and communities to reduce waste and recycle more.

Since being selected as a PRO under SB 54, CAA has been fortunate to have many opportunities to engage with interest-holders across the spectrum, including producers, trade associations, local governments, haulers, processors and markets, and numerous nongovernmental and community-based organizations.

One overreaching theme has emerged from those conversations. There is alignment. A shared goal of making this law work. Where we regularly find differences, and sometimes vehement ones, is not the what but the how. Well, we certainly will hear today about many of those differences of opinion.

CAA would like to assure CalRecycle and all the interested parties present that regardless of where the regulations land, we are deeply committed to implementing SB 54 effectively and ensuring the program's success.

That said, success will become exponentially more difficult if the regulations are not finalized by the end of the year. So we encourage everyone here to work together to resolve our differences, giving producers jurisdiction and service providers the certainty and clarity we all need to launch this program on time for 2027.

The written comments that CAA is submitting today focus on necessary changes to implement the regulations as efficiently and effectively as possible. As we all know, the ambitious target set by SB 54 will require a great deal of time and effort, as well as financial investment.

Our written comments highlight challenges with timing and sequencing that could hinder not only CAA's efforts, but also those of everyone working towards our shared goal of reducing plastic waste and building a more circular economy. We see several opportunities for SB 54 with all parties which ultimately will result in a program that is more cost-effective and more impactful.

Thank you, again, for the opportunity. CAA looks forward to working with the Department as well as everyone participating today both in person and virtually to ensure a successful implementation that will establish California as the world's leader in packaging extended producer responsibility.

Thanks again.

Response to O-112-1

Comment rejected. No substantive response is required for this comment because the comment raises general concerns without stating any specific recommendation or explanation of its objections to the proposed regulations. The commenter indicates that these remarks are preface for their written comments; if the commenter did provide this follow-up, the substance of that written comment is addressed in the response to that written comment.

O-113: City of Los Angeles (Christine Batikian)

Comment O-113-1

First, local jurisdictions must have a voice in alternative collection systems operating within our boundaries.· Without our consultation and consent, these systems could duplicate services, confuse residents, and shift costs back to ratepayers contrary to the intent of SB 54.

Response to O-113-1

Comment rejected. No substantive response is required because the comment merely raises a concern about local jurisdiction participation without stating any specific recommendation for revising the proposed regulations.

Comment O-113-2

Second, we urge CalRecycle to remove the categorical exclusion in section 18980.2(a)2.· Packaging that may face federal compliance issues should go through the existing time-limited exemption process, not receive a permanent carve-out.

Response to O-113-2

Comment partially rejected and partially accepted. CalRecycle declines to remove section 18980.2(a)(2) for the reasons provided in response to comments I-19-1 and I-59-2. CalRecycle accepts this comment, however, to the extent it alleges that section 18980.2(a)(2) was unclear in scope or effect, was insufficiently clear with regard to what renders it "not reasonably possible" to resolve conflicts with federal laws, or would have been overbroad in effect due to the potential for the exclusion to be applied despite the conflicts being avoidable. See CalRecycle's response to comment I-19-1, explaining the revisions responsive to this and similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

Comment O-113-3

Third, the increased cost criteria for covered cost must be clarified.· Jurisdictions that have already invested in SB 54 align systems should not be penalized simply because those costs are not new.

Response to O-113-3

Comment rejected. No substantive response is required because the comment merely raises a concern about cost criteria without stating any specific recommendation for revising the proposed regulations.

Comment O-113-4

Fourth, we urge CalRecycle to require PROs to consult with local jurisdictions before cost-covering recycling service providers to prevent duplicate of payments and protect our ratepayers.

Response to O-113-4

CalRecycle rejects this comment as it is outside of our current statutory authority, and within our authority, the commenter's concerns are already addressed within the existing framework of the proposed regulations. Section 18980.8(g) already requires advance notice to, and discussion with, local jurisdictions regarding the payment of covered costs for recycling service providers. Therefore, no change is necessary to the implementation or enforcement of the Act. Additionally, CalRecycle does not have the authority to dictate how local jurisdictions allocate SB 54 funds or structure their ratepayer calculations, or any authority over ratepayer assessments. CalRecycle cannot lawfully depart from the statutory provisions in Public Resources Code section 42051.1(g) that require payment of costs to local jurisdictions and recycling service providers incurred due to requirements of the Act. The proposed regulation at section 18980.8 is consistent with the statutory text and legislative intent to pay these costs to local jurisdictions and recycling service providers. See also responses to comments O-33-2 and I-51-1.

Comment O-113-5

And finally, we ask that local jurisdictions not be subjected to the same penalty structure as producers.· SB 54 was designed to hold producers accountable, not to impose $50,000 per day fines on public agencies acting in good faith.

Response to O-113-5

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements set forth in the Act, including in sections 42060, 42060.5, and 42081 of the Public Resources Code, and the recommended change is not necessary to the implementation or enforcement of the Act. Section 42081(a)(1) provides that CalRecycle may issue a notice of violation to, and impose an administrative civil penalty not to exceed fifty thousand dollars ($50,000) per day

per violation on, any entity not in compliance with the Act or any of the regulations adopted to implement the Act. Section 18980.13.2(a) of the proposed regulations implements this statutory provision by specifying that any entity, including a local jurisdiction, not in compliance with the Act is subject to penalties pursuant to section 42081(a). However, section 18980.13.2(c) further clarifies that penalty determinations will be made by the CalRecycle director or the director's designee based on evidence presented in hearings conducted pursuant to section 18980.13.4 addressing, at a minimum, the factual factors identified in section 42081(c). Therefore, while section 18980.13.2(a) preserves flexibility for CalRecycle to assess penalties of up to $50,000 per day per violation against a noncompliant local jurisdiction consistent with statutory authority, that is a maximum amount and CalRecycle will always make its penalty determinations based on the factual factors and evidence identified in section 18980.13.2(c). The penalties assessed against a noncompliant local jurisdiction will necessarily often be far less than the maximum amount of $50,000 per day per violation that is allowed under section 42081(a)(1). No further changes to the proposed regulations are necessary to the implementation or enforcement of the Act.

O-114: Coalition for Protein Packaging (Teri Grill)

Comment O-114-1

I'm Teri Grill, and I'm representing the Coalition for Protein Packaging.

So on behalf of the coalition, I want to commend CalRecycle for its balanced and thoughtful approach in these draft regulations.· By recognizing the unique challenges of protein packaging, you've shown a commitment to ensuring public health and food safety as nonnegotiable priorities.

We especially appreciate that CalRecycle has prioritized food security.· Protein is a foundational part of the California diet.· And by aligning packaging rules with federal standards, you're helping to ensure that fresh protein remains available, affordable, and safe.

Your reliance on federal law and agencies like the USDA and FDA is a strength.· It demonstrates humility and foresight in acknowledging the agencies' expertise limitations in these very specialized areas of packaging.· In doing so, CalRecycle has created a stable, less litigious framework that consumers and producers alike can trust.

Looking ahead, we encourage CalRecycle and the PRO to recognize industry associations as eligible applicants for market-based exclusions and exemptions. This would simplify compliance, reduce redundancy, and ensure the policies are applied consistently across the protein sector.

Finally, we want to thank CalRecycle for its collaborative approach throughout the process.· This willingness to work with stakeholders builds trust, and it sets a strong foundation for successful implementation of SB 54.

Response to O-114-1

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

O-115: Monterey Bay Aquarium (Amy Wolfrum)

Comment O-115-1

My name is Amy Wolfrum.· I am Monterey Bay Aquarium's director of California policy.

The proposed regulations undermine the laws, source reduction, producer responsibility, and pollution prevention strategies by authorizing illegal categorical exclusions for over-the-counter drugs, food and agricultural packaging, and secondary packaging associated with the excluded and exempted products.

Today I want to specifically address the proposed regulations exclusion of packaging associated with over-the-counter drugs.· The statutory language and legislative history of SB 54 are clear.· Only drugs that require a prescription are categorically excluded from 54's requirements.

CalRecycle understood this, and that's why the regulations that were previously proposed did not exclude them based on the plain language in the statute, the legislative history, the primary author's statements and clear intent, and previous versions of implementing regulations.· Packaging for over-the-counter drugs are within the scope of the law.· CalRecycle's attempt to now exclude over-the-counter drug packaging through regulation is contrary to the law.

We will be submitting comments later today with more detail to support our urging that the regulations be amended to restore the inclusion of over-the-counter medication.· Thank you

Response to O-115-1

Comment partially rejected and partially accepted. With respect to over-the-counter drugs, CalRecycle rejects this comment for the reasons provided in response to comment O-49-1. Regarding the assertion that the proposed regulations contain "illegal categorical exclusions" for food and agricultural packaging, CalRecycle rejects that assertion for the reasons provided in response to comments I-59-2 and I-19-1.Regarding secondary packaging, CalRecycle rejects the commenter's assertion for the reasons stated in response to comment O-13-3 and because, with respect to packaging excluded pursuant to Public Resources Code section 42041(e)(2)(A), that provision is clear that it

applies to packaging used with the products, and Public Resources Code section 42041(s)(2) and (3) expressly provides that "packaging" includes secondary and tertiary packaging.

CalRecycle accepts this comment with regard to food and agricultural packaging, however, to the extent it alleges that section 18980.2(a)(2) was unclear in scope or effect, was insufficiently clear with regard to what renders it "not reasonably possible" to resolve conflicts with federal laws, or would have been overbroad in effect due to the potential for the exclusion to be applied despite the conflicts being avoidable. See CalRecycle's response to comment I-19-1, explaining the revisions responsive to this and similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

O-116: Monterey Bay Aquarium, Oceana, and Ocean Conservancy (Jennifer Fearing)

Comment O-116-1

Thank you very much.

My name is Jennifer Fearing.· I'm here today on behalf of Monterey Bay Aquarium, Oceana, and Ocean Conservancy.

And while we will be providing comprehensive comments throughout today and in writing, I just want to focus on one aspect of our concerns with the regulations as proposed.· And I also want to just state up front how important it is to our organizations that 54 work to achieve its ambitious goals.

But the piece I'd like to focus on is the categorical exclusions section that is new to this version of the proposed formal regs.· That's section 18980.2.· We believe that to be unnecessary, unlawful, and undermining of SB 54's overall objectives.· And it could threaten to tank the entire program for a number of reasons.

The first is its permanence.· The fact that it's a categorical exclusion means it will be considered once and done, and that will thwart innovation.· And also, like, that's not something SB 54 ever envisioned was to permanently eliminate any packaging or food ware item through -- from the program.

The determination -- the way the regs are written, the determination of exclusion is being made by the producer and then puts the onus on CalRecycle to evaluate or disapprove.· There are at least eight problems with this.

First, the volume is likely to be very high, because this is not about covered material.· This is about a specific component.· There are many components. I don't know why producers won't be motivated, given the bar and the fact that they get to claim -- make -- claim their own determination of exclusion.· Very concerned about the volume of applications to CalRecycle here being very high.

That begs the question of who will pay for CalRecycle's evaluation of every one of these determinations?· And our read is since they are out of the program by the entity's own determination, it seems unlikely that the PRO will pay for that evaluation.· And that leaves it on taxpayers, which seems highly incongruent with the objectives of this law.

Thirdly, the timeline that's laid out in the regulations.· Any entity that claims the exclusion probably has up to the better part of a year to being out of the program, even if on its face it's an item that does not -- that there is clearly a compliant material for that component.

Again, that will -- that has a reinforcing impact on the volume, because there is sort of a no downside to a producer deciding to make that determination and enter that process.· Seems to be a very inefficient use of CalRecycle staff time to be reviewing what could be a voluminous amount of applications.

Fifth, the uncertainty.· This seems this will create enough uncertainty to make the PRO plan very difficult, if not impossible, to develop accurately.

Sixth, the low bar included in the regulations of inclusion of federal guidelines.· I mean, it seems obvious that it would be very easy for the Feds to change guidelines, especially with producers lobbying them to do so.· Which again, seems like a circular opportunity here to see a lot of components and packaging removed from this program permanently.

And lastly, and I raised this at the last SB 54 advisory board meeting, there is a stark incongruity here that CalRecycle sees the need to explicitly create this problematic exclusion process to address -- what's said is address 54's direction to avoid conflicts with federal law while waving a hand at the repeated calls to explicitly ensure that the regs and any infrastructure to implement the law don't negatively impact disadvantaged communities.

There's nothing explicit in the regs that do that.· Meanwhile, we now have this explicit provision aimed at addressing a similar type of direction in the law at the request of producers.

So for these reasons, we would strongly urge CalRecycle to strike section 18980.2 entirely. Thank you.

Response to O-116-1

Comment partially rejected and partially rejected. The commenter proposes that CalRecycle remove section 18980.2 entirely. CalRecycle rejects that suggestion for the reasons provided in response to comments I-19-1 and I-59-2. Even if the objections raised in this comment were meritorious, they would not counsel removal of that entire section; the comment only specifically addresses section 18980.2(a)(2), not the rest of that section. Regarding disadvantaged communities, CalRecycle declines to make changes because Article 4 of the regulations already incorporates robust protections against end markets that harm the environment, which ensures that disadvantaged communities are not negatively impacted. Moreover, to obtain an exemption for covered material under section 18980.2.4, applicants must address impacts on disadvantaged communities. Also, as specified in section 18980.8(c)(7), producer responsibility plans must assess such impacts. Lastly, various statutory provisions impose requirements for producer responsibility plans and implementation related to protecting disadvantaged communities, and the regulations establish that a producer responsibility plan will not be approved unless all such requirements are met. See, e.g., section 18980.8(a) and 18980.6.2(a).

CalRecycle accepts this comment, however, to the extent it alleges that section 18980.2(a)(2) was unclear in scope or effect, was insufficiently clear with regard to what renders it "not reasonably possible" to resolve conflicts with federal laws, or would have been overbroad in effect due to the potential for the exclusion to be applied despite the conflicts being avoidable. The revisions significantly ameliorate or eliminate the commenter's concern over durability of exclusion claims, the potential for abuse and high volumes of submissions, uncertainty, and the regulation's reference to "guidelines." See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

O-117: Natural Resources Defense Council (Renee Sharp)

Comment O-117-1

Hi.· I'm Renee Sharp, a senior scientist with the Natural Resources Defense Council.

I already see we'll be submitting detailed comments later today that cover many issues that we see with the prepared regulations, including the fact that the definition of categorically-excluded materials is overly broad and narrows state law impermissibly.

The definition of disposal and permissibly narrows the application of key definitions in the statute.· CalRecycle must provide additional guidance on how the PRO is to implement the few provisions of SB 54 that relate to toxic chemicals to give meaning to

the statute's requirements.· And recycled content and recycling rate accounting requirements should be made clear and prevent greenwashing.

Response to O-117-1

CalRecycle rejects this comment for the reasons provided in response to comments O-62-1, O-62-2, O-62-4, O-62-5, and O-62-6.

Comment O-117-2

Given our limited time here, I want to underscore one specific issue.· Which is that the proposed language addressing chemical recycling is inconsistent with the law and undermines the statute's legislative intent.

There are many issues with the proposed language as it relates to chemical recycling, including defining significant amounts of hazardous waste based on the concept of risk and waste management conflicts with the intent and statutory language of SB 54.· The exemption for compliance with permits further exacerbates these conflicts with the law.

Using the federal definition of hazardous waste rather than the California definition does not comport with the law.· The definition of recycling for technology as other than mechanical recycling relies inappropriately on a nonbinding ISO standard. Infrequent reporting of facility-level information could allow skirting of thresholds for significant amounts of hazardous waste.

And CalRecycle should include a definition of recycling in the regulations that categorically exclude specified chemical recycling technologies and reflect SB 54 language and legislative history.

So we'll provide, of course, much more detail in our comments that we'll be submitting very shortly. So just wanted to say thank you for your careful consideration of our comments, and we hope to see changes in the proposed regulations as they become finalized.· Thank you.

Response to O-117-2

CalRecycle rejects this comment for the reasons stated in response to comment O-62-1.

O-118: Olli Salumeria (Sarah)

Comment O-118-1

Hi. Good morning. My name is Sarah, and I work with Olli Salumeria.· We make salami. We are USDA-regulated. And we would like to know what are steps we can take in order to gain an exemption? I'm aware that in the August 2025 proposed regulatory texts, there were provisions for facilities regulated by, you know, the Federal Meat Inspection Act, USDA. So just curious to hear what you guys have to say about that.

Response to O-118-1

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

O-119: Physicians for Social Responsibility (Tevin Hamilton)

Comment O-119-1

Hello.· My name is Tevin from Physicians for Social Responsibility, Los Angeles.· And I'm also here with EJCAP, Environmental Justice Communities Against Plastics.

First off, I kind of want to uplift the comments that Nick made earlier about the chemical recycling ramifications.· As an environmental justice -- we're a coalition of environmental justice communities that represent the California communities who are most impacted by the life cycle of plastic.· Our coalition includes Just Transition Alliance, Pacoima Beautiful, PSR-LA, Black Women for Wellness, and I'm missing -- I'm blanking on the last one.· But -- oh, Valley Improvement Projects.· Thank you.

So the chemical recycling ramifications impact our communities a lot more than the other ones do. We're the ones who pay the brunt of the front line of what the impact of the life cycle really does.

For example, the incinerators that used to be in Pacoima, the incinerator that used to be in Long Beach, the incinerator that used to be in Modesto, it really impacts our communities.· And though those facilities have closed down thus far, they still have long-lasting impacts on our community.

We also want to express our deep concerns that we've been engaging in this process for several months. This is my first time making comments here in person, but I have said several things over the course of months in the public comments written as the coalition.

We have made comments on the SB 54 advisory board about how these regulations are written really could give us harm.· Would cause us long-term harms over the entire duration of SB 54.· And everything it's trying to do is in direct violation of the statute, and we do not agree with what's going on with the regulations.

So the section that I'm really most interested in is the responsible end market section.· And we're really concerned about how the producers are basically able to regulate themselves.

And what I mean by that is about what is, like, substantial compliance between our permits and their laws.· Allowing their producers to really determine for themselves what can be an acceptable form of recycling gives them free range to potentially put in harmful impacts that will impact our communities.

So the pyrolysis plant that was potentially going to happen from Resynergi is an example of some of the risks that could happen.· Yes, that project has transitioned and shifted to somewhere else.· But those are the type of projects and type of technologies we don't want to risk coming back into California, especially in our communities.

When these facilities are going to be pumping -- deciding for locations, they're going to put them in the communities that could fight back and have the least amount of resources to really put up a fight against those type of billion-dollar corporations.

So we really urge CalRecycle to really tighten up the regulations in an effort to really make sure that these chemical recycling technologies are banned explicitly.· Because if you don't, you're really putting the communities that are most impacted in harm more than they already have been historically.

It's kind of ironic that this law generates funds to, kind of, reduce the harms and impacts and mitigate some of the harms of plastic.· But it's also still feeding into that system, so it's a never-ending loop.· So there's no point in just, kind of, putting money into a system that you're also putting money into worsening going forward.· So thank you for your time.

Hello.· Can I be heard?· Hello. My name is Tevin, again, from Physicians for Social Responsibility, Los Angeles.· And also with Environmental Justice Communities Against Plastics, or EJCAP.

I just kind of want to point out the trend that several people today, either in the room or online, brought up the technology sections and the chemical recycling ramifications.· I just urge you all to really hear these pleas.

Because these communities, a lot of people really care about this issue.· And you're sending a clear message that you don't care about our concerns, our EJ communities, if you allow the regulations to go as they are written now.

So I just really want to urge you to really put in the effort and ask you to work in good faith with EJ communities and all the concerns that are uplifted from the people in this room and online about how these harm our communities and how this can cause long-lasting impacts across California.· Thank you.

Response to O-119-1

CalRecycle rejects this comment's suggestion that "chemical recycling technologies" be banned outright in the proposed regulations. A complete ban on any technology could have been accomplished through straightforward language establishing a prohibition based solely on the type of technology. Instead, the Legislature chose to word statute in a way that requires consideration of hazardous waste generation, not mere consideration of the type of technology. Additionally, PRC section 42041(aa)(2)(B) expressly excludes incineration from

the definition of "recycling," and nothing in the proposed regulations contradicts that exclusion.

CalRecycle also rejects this comment for the reasons stated in response to comment O-62-1.

O-120: Surfrider Foundation (Miho Ligare)

Comment O-120-1

Good morning.· My name is Miho Ligare.· I am Surfrider Foundation's senior manager for plastic pollution initiative.

I'm also the ocean advocacy representative on the advisory board, and I'm honored to be serving in this capacity.· And just to be clear, these comments on behalf of the Surfrider Foundation do not reflect the views of the advisory board.

First off, a huge thank you to CalRecycle staff for your commitment and hard work in developing the regulations.· We'll also be submitting a more detailed letter, but our main comments for today are dealing with articles 2 and 4, refill and reuse systems, mitigation funds, and implementation and enforcement of the State-led expanded polystyrene food ware prohibition.· Many of my comments are comments made already by the Environmental Justice Communities Against Plastics, Californians Against Waste, CALPIRG, and others.

Response to O-120-1

No response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations, does not raise an objection concerning the rulemaking process, or refers to suggested changes or objections set forth in greater detail in other portions of the submission. To the extent other portions of the submission suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-120-2

Starting with article 2, we are also concerned about the potential loophole through the exclusions.· As it's currently written, it is too broad and will make this law ineffective.

With such a wide swath of categorically excluded materials, it seems like the PRO is set up to fail as it will be underfunded and there will be an unfair burden on those participating in the PRO.· This also means that it will be harder to meet source reduction targets, as there are fewer producers.

And finally, it will also have a ripple effect on refill and reuse and creating an equitable system, as there will be fewer incentives and funding from the PRO to transition from disposable packaging to refill.

Response to O-120-2

Comment accepted. CalRecycle interprets this comment to generally object to the scope and effect of section 18980.2(a)(2). CalRecycle has revised that regulation to clarify its scope or effect, made clearer what renders it "not reasonably possible" to resolve conflicts with federal laws, and more clearly limit its scope to minimize the potential for the exclusion to be applied despite the conflicts being avoidable. See CalRecycle's response to comment I-19-1, explaining the revisions responsive to this and similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

Comment O-120-3

In regarding article 4, I am deeply concerned about chemical recycling and want to reinforce the current regulation as clearly and critically at odds with the SB 54 statute.

The focus of management of waste through permits and the production of significant quantity of hazardous waste as to the generation of waste, which is in statute, is a significant shift away and opens the door for chemical recycling and is very problematic. SB 54 language refers to the amount of hazardous waste, not the risk associated with it.· And these are clearly different standards.

So we'd like to see the alignment with the statute and regulations in the form of a categorical prohibition of chemical recycling technologies as envisioned in SB 54's requirement that California, or CalRecycle, excludes plastic recycling technologies that produce significant amounts of hazardous waste.

And if the State is seeking to reduce cost in this program, chemical recycling is not the answer.· The estimated minimum sales price for chemical recycling is 70 to 80 times as expensive as mechanical recycling.

Response to O-120-3

CalRecycle rejects this comment's suggestion that "chemical recycling technologies" be banned outright in the proposed regulations. A complete ban on any technology could have been accomplished through straightforward language establishing a prohibition based solely on the type of technology. Instead, the Legislature chose to word statute in a way that requires consideration of hazardous waste generation, not mere consideration of the type of technology.

CalRecycle also rejects this comment for the reasons stated in response to comment O-62-1.

Comment O-120-4

And moving on to refill and reuse.· We also heard from over 50 California-based ocean-friendly restaurants who are also part of a national Surfrider program of over 600 ocean-friendly restaurants that without adequate standards for reusable and refillable packaging, it will make it harder for businesses to implement reuse and refill systems in an affordable and effective manner.· Broad exclusions for more types of products will stifle innovation and cause confusion for business owners without lowering the price of sustainable alternatives.

Response to O-120-4

Comment rejected. Regarding adequate standards for reusable and refillable packaging and the implication that product exclusions should be narrowed, the commenter does not describe changes sought with enough specificity for CalRecycle to evaluate whether changes to this provision are appropriate. No changes to the proposed regulations are necessary to the implementation or enforcement of the Act.

Comment O-120-5

And regarding concerns about the mitigation funds, there's concerns around the process and how to ensure that the funding will go to the communities most burdened by plastic pollution.

Although the mitigation funds will be allocated through the legislative budget process and aren't addressed in these regulations, I think it's still critical to ensure that environmental justice and tribal representation is adequately made throughout the SB 54 implementation process.· And there's clear processes established and understanding of how the mitigation funds will be allocated.

So we encourage CalRecycle to hold public workshops throughout the state on this topic and dedicate a web page to helping the public and communities understand the mitigation fund, timeline, and process to access funding.

Response to O-120-5

CalRecycle rejects this comment. See the response to comment O-45-2.

Comment O-120-6

And then, finally, we appreciate CalRecycle's work to create a web page along with FAQs and sending out notices with additional information regarding expanded polystyrene food ware to producers.· However, we'd like to see CalRecycle provide more enforcement beyond education and assistance.

We'd also like to see more transparency regarding how and who CalRecycle is reaching out to in providing compliance for support.· For example, what's happening with the CalRecycle's online notification portal?· We'd like to see a little bit more information about that.

And then finally, producers who were unable to demonstrate to the Department that the polystyrene recycling rate was unable to be met on January 1st, 2025, should not have the opportunity to come back in the future attempting to show that they met the target recycling rate, even though the target is shifting.

There is concern that this will increase focus on the false recycling or advanced recycling of expanded polystyrene at the cost of our communities and the environment.

And so thank you so much for your time, and I look forward to the continued engagement.

Response to O-120-6

CalRecycle rejects this comment. The portion of the comment regarding general information, transparency, FAQs, notices which are being provided, and the commenter's request to see more enforcement beyond education and assistance does not necessitate a response as it is outside the scope of regulations, and further, the comment does not propose any specific regulatory language to achieve their concerns. Further, regarding enforcement, there is nothing in the regulations indicating that CalRecycle will not investigate potential violations, issues notices of violation, or in general exercise the Department's statutory enforcement authority, and as such, no changes or additions to the regulations are necessary. Finally, the portion of the comment regarding producer demonstration requirements is already addressed in section 42057(i) of the PRC with sufficient specificity, including the statutorily required demonstration dates and percentages, such that the regulations do not require any additional clarifications, nor does the Department have the authority to change said statutory requirements.

O-121: West Contra Costa Integrated Waste Management Authority (RecycleMore) (Cliff Feldman)

Comment O-121-1

Good morning.· Cliff Feldman, executive director of the West Contra Costa Integrated Waste Management Authority, AKA, RecycleMore.· And I just have a couple of questions, but a few comments regarding the current regulations leading up to those questions.

It is clear that in chapter 3, article 1, the fundamental role of local jurisdictions, also construed as ratepayers, is crystal clear and being the backbone behind this entire system.· It is also clear that the intent is to shift the cost burden of implementing the regulations from the producers away from the local jurisdictions, which would normally take place.

So questions that I have are pertaining to what controls are in place to ensure those fundamental premises are kept intact?· That the producers are held accountable for the costs, and not the local jurisdictions?

Well, we applaud the advanced notice to local jurisdictions by the PRO before funds are distributed. And we certainly applaud transparency.· Neither advanced notice nor transparency will be adequate.· In fact, those are abundantly inadequate to ensure that the integrity of the making the fundamental intent of the law is maintained.· And that fundamental intent includes keeping local jurisdictions financially whole.

Where this regulation falls woefully short is that it does not prescribe that it will be illegal by service providers and recipients of PRO funds to also seek reimbursement from local jurisdictions for those costs.· In addition, if any operational savings or process improvements are accrued via the funds paid by the PRO, how will the local jurisdictions be kept whole for those expenses as well?

So in essence, the questions are pretty simple.· Where in these current regulations is it expressly illegal that service providers or recipients of the PRO cannot also seek reimbursement of costs paid by the PRO from the local jurisdictions?

And secondarily, where in these current regulations is it expressly illegal that the recipients of the PRO funds cannot benefit further and not pass along those savings via reduction of cost of operations or increased commodity revenue or a host of other process improvements in order to ensure the fundamental intent of the law in keeping the ratepayers financially whole is maintained?

Those are my simple questions, and I look forward to the Agency's responses.· Thank you very much.

Response to O-121-1

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment I-51-1.

O-122: 350 Bay Area Action (Judy Sorre)

Comment O-122-1

Hi.· My name is Judy Sorre, and I'm a volunteer and a legislative advocate with 350 Bay Area Action.

We're concerned about several revisions to the latest draft regulations, especially weakening protection against the chemical recycling, sometimes called advanced recycling.

In the language of SB 54, recycling does not include combustion, incineration, or fuel production, and it says it should minimize environmental and public impacts.· Chemical

recycling essentially is incineration and fuel production, and it does have environmental impacts.

In addition to the CO2 emissions and pollution produced by the making of many plastic products, this so-called recycling just adds more emissions.· Toxins, such as dioxins and heavy metals which are carcinogens and neurotoxins, are often admitted during the process.

Chemical recycling is also very energy-intensive.· It's primary product is, from 86 to 99 percent, will be burned.· And the secondary product polymers, about 1 to 14 percent will be down-cycled into another plastic product.

Pyrolysis and gasification can produce from 55 to over 200 percent more greenhouse gases than mechanical recycling.· Economically, plastic production by chemical recycling is between one to ten times more expensive than plastic -- making plastic from virgin materials.

Few chemical plants are operational in the US, and they are heavily subsidized.· Two plants have multi-million dollar lawsuits against them.· Oregon's plant, Agilyx, received over 577,000 in tax credits, but it closed within 16 months.

In Rohnert Park, Resynergi is trying to open a -- it's actually a microwave technology for incineration of plastics.· They've come upon a lot of community action against them, and it appears that they may be pulling out of California.· They have had too many hurdles to jump over with public backlash, regulatory hurdles, difficulty permitting, and they need more environmental incentives.

So this advanced or chemical recycling is not advanced.· It is not a solution, and we should avoid it. We need to enforce the intent of SB 54 to reduce the amount of plastic we are producing, find safe ways to recycle it and discard it, and protect our environment, health, and future.· Thank you.

Response to O-122-1

Comment rejected. With regard to chemical recycling, SB 54 does not expressly forbid chemical recycling, so the regulations cannot lawfully do so, either. A complete ban on any technology could have been accomplished through straightforward, specific language that required prohibition based solely on the type of technology at issue. Instead, the Legislature chose to word statute in a way that requires consideration of hazardous waste generation, not merely consideration of the type of technology. Regarding combustion, incineration, and fuel production, PRC section 42041(aa)(2)(B) expressly excludes those from the definition of "recycling," and nothing in the regulations contradicts that exclusion. Thus, no further changes are necessary to the implementation or enforcement of the Act.

O-123: Alliance with Family Farmers (Jennifer Fearing)

Comment O-123-1

Great.· Thank you for allowing me to comment again.· I have another client with a different perspective I wanted to share.

Jennifer Fearing on behalf of Community Alliance with Family Farmers.· We are an organization that represents over 8,000 California smallest and most vulnerable family farmers, and have worked for over 47 years to preserve family-scale agriculture and promote environmental sustainability, work closely with growers throughout the state to build healthy soils, and expand markets for high-quality compost.

While CAFF broadly supports California's world-leading effort to curb the growth of single-use packaging and plastic food ware framework, we believe that SB 54's extended producer responsibility framework has the promise to reducing costs to residents and businesses, negative impacts on public health, and environmental degradation.· SB 54 can and should incentivize packaging and food ware producers to source-produce materials and to shift to materials that are reusable, recyclable, or compostable.

As 54 continues to be implemented, CAFF wants to urge CalRecycle to support the need for California's compost to remain a strong, responsible end market by keeping it free of packaging and food ware that does not break down, leaches toxic chemicals or additives, or breaks down into microplastics.· A strong body of science validates concerns that farmers and composters have about the adverse impacts that such waste will have on compost integrity and consumer confidence in compost created in California.

It's important to note that California's agriculture industry purchases well over two thirds of all compost sold in California, making it the single largest and most promising end market for the material. Use by growers conventional and organic alike hinges on product quality.· And we cannot risk introducing contaminants that jeopardize crop safety, farm certifications, or brand reputation.

I could go on.· I just want CAFF to be on the record here.· And then we will be in writing as well that compostable plastics in our farmers' consideration do not offer any nutrient value.· They often contain toxic additives, and they frequently fail to fully degrade, leaving behind microplastics that harm soil health and plant growth.

So we urge -- we align our comments with Neil Edgar's of the California Compost Coalition as their -- as a primary customer of that.· And the end of that, kind of, circular chain, please protect this responsible end market by retaining the way the regs currently treat compostable products.· And don't expand them to inflict compostable plastics into this end market, causing all kinds of problems.

Thank you.

Response to O-123-1

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

O-124: American Forest and Paper Association (Terry Weber)

Comment O-124-1

All right.· Terry Weber, American Forest and Paper Association.· We are the national trade association for America's paper mills and, importantly, the paper-based packaging manufacturers.

We represent about 90 -- 70 million tons of production capacity.· Also importantly, we recycle about 46 million tons of paper every year at our mills.· So we'll be submitting detailed written comments covering all of our issues.· But just a couple I'd like to highlight in verbal comments.

You know, it's been said, but it – the exemptions that are written into the legislation were really important from the perspective of our industry. And it's important that CalRecycle honor the legislative language through the regulation.· And we feel like the draft regulations are still falling short in a couple of areas.

Response to O-124-1

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process. To the extent other portions of the submission do suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-124-2

One exemption that's really important to our industry is the exemption for source-separated material that can demonstrate a recycling rate of at least 65 percent until 2030.· And then it goes to 70 percent.

Right now as the regulations are drafted, it reads as though individual producers would need to document that their specific box, for example, flows through the collection system and it is recovered at a rate of 65 to 70 percent.

Practically in the real world, that is not going to be possible.· It's not a question that's going
to be knowable.· Our industry has a lot of experience in these statistics.

We'd prefer to see an approach that's based on covered material category.· We can substantiate that the
recycling rate for boxes that flow through commercial collection source-separated by store typically have a recycling rate of about 95 percent.· So well in excess of the thresholds met in the -- met in the -- stated in the legislation.· We need the regulations to reflect a process that allows us to access the off-ramp as was negotiated in the legislature.

Response to O-124-2

Comment rejected. The statutory provision at issue, Public Resources Code section 42041(e)(2)(H), unambiguously requires demonstration that the material to be excluded from the definition of "covered material" fulfills certain criteria (stated in clause (i) of that provision). The Legislature unambiguously drafted this exclusion to concern "covered material" (i.e., material to be excluded from the definition of that term) for which a person is the producer, not a "covered material category." Accordingly, to the extent the commenter's proposal of an express "covered material category" approach would mean entire categories would be excluded from the definition of "covered material, that approach would not be lawful. Also, to the extent the commenter's reference to what was "negotiated" was intended to argue that stakeholder discussions with legislators are relevant, that position is legally wrong. It is axiomatic that the text of a statute controls its meaning; and, even if wording of statute is ambiguous and requires interpretation, the context established elsewhere in the statute and, if necessary, legislative history may be relevant, but legislative history encompasses debate within the legislature and evaluations of the bill by the legislature, not informal discussions with stakeholders. Lastly, the commenter's concern is overstated because the proposed regulation does not expressly require reliance on the statistics the commenter claims will not be available. Any statistics that can establish satisfaction of the statutory requirements, as interpreted via regulation, are sufficient. So, if the commenter is correct that statistics can "substantiate" a recycling rate for a particular "boxes," that substantiation would be considered for purposes of the exclusions under 42041(e)(2)(H).

Comment O-124-3

·And then the second piece that's really important to our membership that Dawn just mentioned is the exemption around de minimis.· So right now, what we're being told and was, you know, in the draft guidance that CalRecycle issued in late August around plastic source reduction is that we need to report the adhesive content of our boxes.

And there's -- it's not really clear in the regulatory package, you know, the legislation by CalRecycle with the authority to decide what constitutes de minimis.· It's not clear how that process is going to work.· And what our members are being told by Circular Action Alliance right now is that they have to report all that data, CAA will apply for an exemption, and then CalRecycle will decide whether the de minimis qualification is met.

Well, that's an enormous amount of regulatory and reporting cost for our membership to undertake for -- to report data that will ultimately, from a regulatory standpoint, be meaningless.

So we feel very strongly that in order to be consistent with the governor's intent as he stated in pulling back and rewriting these regulations, that CalRecycle needs to take a look at that de minimis exemption and offer some guidance, and clear guidance, about what is going to qualify as de minimis.

And that needs to be done ahead of time so that we don't have to go through this tremendous data-gathering exercise to report data that's ultimately, from a regulatory standpoint, going to be meaningless.

Response to O-124-3

CalRecycle rejects this comment for the reasons provided in response to comments I-62-27 and O-65-9.

O-125: Biodegradable Products Institute (Alex Truelove)

Comment O-125-1

Thank you, everybody.· This is Alex Truelove with the Biodegradable Products Institute, or BPI.

I wanted to focus our comments today on the responsible end market language as proposed by CalRecycle.· We are concerned that the individual compostable items are specified to have different end market requirements, even though they're composted together typically along with all the organic waste that
they help divert.

We're also concerned that the compost facilities as the end markets in this situation are not required to provide the conditions necessary to responsibly process those covered compostable products into a -- well, excuse me -- the stable and mature finished product.· In other words, the responsible end market language for compostables as written doesn't seem to require anything of the end market itself.

I'll start with the term "biologically decompose."· This continues to be applied in a way that is unclear, unsupported, and undefined despite our request to remove this term.· The ASTM standard that support compostable products, D6400, D6868, already required by California law provide clearly defined and scientific criteria for both disintegration and biodegradation, which are defined terms.

The latter references, of course, conversion to CO2 that can only be measured in a lab.· So we're here, again, with this term "biologically decompose" that feels unnecessary and problematic.

In the same section, the regs also do not require certain paper and fiber-based items to fully break down, even if they contain persistent polymeric additives.· Which brings up another important point.

Response to O-125-1

CalRecycle rejects this comment. See the response to comment O-83-5.

Comment O-125-2

The term "polymer" needs defining.· It's listed in the definitions, but not actually defined alongside the term "plastic."· Plastic and polymers are different.· They're related.· And this is needed to clarify existing labeling law coming from AB 1201.· But it's also needed to close a dangerous loophole that I fear is being exploited in this very section of the regs.

Response to O-125-2

CalRecycle rejects this comment for the reasons provided in response to comment B-14-2.

Comment O-125-3

To back up for a second, to put this as plainly as I can and in response to some of the comments I heard earlier, the suggestion that a product being made primarily of paper or fiber or being made primarily of plastic determining its compostability is just a scientifically-bankrupt position.· It's not supported by science.· It's not supported by law.

There are compostable paper and fiber-based items, there are non-compostable paper and fiber-based items.· There are compostable plastic items, there are non-compostable plastic items.· And of course there are products made from all different kinds of material combinations.

What is clear is that truly compostable products in California, regardless of material this is true across the country, are held to the same standard. Including for toxicity, which I think was referenced earlier as well.· Same laboratory methods, same pile conditions, and they've been verified over and over and over again.

I fear that CalRecycle is confusing market preferences, which, of course, are real.· And they're an important consideration for composters as a substitute for science.· I'll say that again.· CalRecycle should not confuse market preferences as a substitute for science.· But unfortunately, that appears to be where we are.· This is in the same world where we're seeing food waste being collected in conventional plastic polyethylene bags as allowed by California law.· Tell me how that makes sense?

Response to O-125-3

Comment rejected. This portion of the commenter's submission states general objections but does not set forth a discernible recommendation for changes to the proposed regulations (it is not even clear what regulatory provisions are even

at issue), so no response is required. To the extent any response is required, CalRecylce notes that the statute incorporates the provisions from Public Resources Code sections 42355 through 42358.5 for the criteria for what is eligible to be labeled "compostable." The commenter is therefore incorrect to say that the law does not consider whether material is paper or fiber, as opposed to plastic, relevant; section 42356.1(d) creates an exemption based on that distinction. To the extent the commenter's general suggestion that all products be "held to the same standard" ignores that distinction, CalRecycle rejects the suggestion on that basis. CalRecycle also rejects the commenter's suggestion because it appears to be based in part on how responsible end markets are identified under section 18980.4 of the proposed regulations, not the proposed regulations' treatment of the criteria for being eligible to be labeled "compostable." The latter relates to compliance with Public Resources Code section 42050(b), whereas the former concerns whether processing at the end market can be considered "recycling" and is irrelevant to the standards that apply for being eligible for being labeled "compostable."

Comment O-125-4

Speaking of science, to ensure that compostable products are given the opportunity to break down and that they go to a responsible end market, we need to ensure that facilities are capable of responsibly processing those products of all material types.

We recommend that CalRecycle consider the recently published field testing methods, ASTM D8618 or 8619, which offer methods for evaluating compost operation and applying operating parameters like minimum residence time, curing time, pot and moisture content.

We think it's more than reasonable that composters who wish to participate, of course, and receive funding through EPR should, according to this method, submit a test report and prove that their finished compost is stable, mature, and ensure that they're capable of responsibly processing compostable products.

Response to O-125-4

Comment rejected. The commenter suggests that CalRecycle "consider" certain recent publications, without submitting the publications themselves and without advocating for any particular outcome to CalRecycle's consideration of them. Accordingly, CalRecycle cannot respond specifically to that recommendation. Regarding the more general suggestion that composters should be required to submit test reports regarding the quality of their finished compost, no revision is appropriate because the proposed regulations already expressly require covered material included in composting operations to fully biologically decompose, and the recycled organic product must meet marketplace standards, which is the threshold established in Public Resources Code section 42041(aa)(1) for what can be considered "recycling."

Comment O-125-5

So in summary, we should hold both compostable products and composters to the highest standards. Compostable products are already required to be tested and certified.· And we have this broad sweep of labeling requirements that are enshrined in California law.

So let's meet in the middle here.· Let's avoid frameworks that betray the statute, and let's not assume that performance is based on material origin.· And instead, follow the science and the law.· Look forward to submitting written comments, and thanks for the time.

> **Response to O-125-5**
>
> Comment rejected. The comment only makes vague suggestions but does not suggest specific changes to the proposed regulations or raise objections related to the rulemaking process. To the extent other portions of the submission do suggest changes or raise objections, CalRecycle has responded to those portions separately.

O-126: California Compost Coalition (Neil Edgar)

Comment O-126-1

Good morning.· Neil Edgar on behalf of the California Compost Coalition.· My comments reflect those of my composter members.· They're not on behalf of the SB 54 advisory board.

Despite assertions from producers, CCC has no desire to limit or ban compostable packaging.· In fact, California compost manufacturers are receiving and processing hundreds of tons of food, soil, paper, and f iber every day.

Bioplastic materials, however, are not functional in collection and composting systems at the scale of services being delivered by commercial operators in California.· California composters have decades of experience in working with the jurisdictions they serve trying to make compostable plastics work and have learned many costly lessons about how they don't.

We fully understand the difference in manufacturers have sunk -- the difference between the investment manufacturers have sunk into making functional packaging for delivering food to consumers safely.· And what is functional at the end of life in composting facilities that are relied upon to manage that waste?

My members operate composting facilities that have invested millions of dollars in environmental compliance measures and must meet the demands of their primary agricultural markets to manufacture the highest value compost products they can in order to meet very ambitious revenue targets.· Food service ware and packaging

marketed as compostable presents significant challenges to compost manufacturers that impair its ability to function as a circular solution.

There are contamination impacts.· Removing contamination from compost during the manufacturing process is job number one for composters.· Quite simply, we need to keep plastics out of compost.· Plastic contamination, including from bioplastics which meet lab biodegradation standards in ASTM D6400 represent the largest threat and processing cost to compost production.

As SB 1383 collection programs have increased in number and volume, the costs of removing increasing plastics contamination has risen significantly.· ASTN marketing standards require materials that 90 percent disintegrate maybe for days and 90 percent biodegrade within 180 days.· Those standards do not reflect the production cycles for commercial composters who must move a finished product to market within 90 days.· Any partially degraded visible plastic is very difficult to remove and will devalue the compost.

We have a lack of proper labeling and enforcement.· California has adopted labeling standards for compostable products under AB 1201.· Existing statutory requirements found mainly in Public Resources Code 42357(g) are not being enforced.· A large proportion of these products sold in California are not clearly labeled, causing confusion for consumers and adding cost unnecessarily as they are typically disposed of following costly removal.

Consumer confusion is leading to higher costs and contamination.· Compostable plastics are often confused with conventional disposables, which they are often designed to mimic, leading to contamination in both the compost and recycling streams, increasing processing costs for ratepayers and customers, and reducing the marketability of material due to the physical contamination resulting from the acceptance of packaging at large with food materials.

While fiber and paper compostable products come with their own potential contamination challenges, composters have not found nearly the level of impact on product quality that comes with plastics.

It also creates a permission structure for increasing contamination.· Despite signage and other education, many users lost in the confusion of multiple products, resin types, and conflicting messages carelessly throw all food-associated packaging into their green bin, leading to the need for mechanical separation which wastes additional food and increases cost for processing.

Compostable plastics are not allowed in certified organic agriculture and are not desired by farmers.· California farmers buy over 60 percent of our compost and want product that is allowable for use in certified organic agriculture as a means of assuring quality.· Under the National Organic Program rules, plastic is considered a synthetic product, which is not allowed even if it's compostable.

Toxicity and microplastic concerns are emerging.· Some compostable products still contain harmful chemicals like PFOS, which do not break down during composting and can contaminate soil and water. Other polymers and chemical constituents are also concerning.

While the science and understanding of microplastics is emerging, there is evidence that in the absence of specific composting conditions, moisture content, adequate temperature, et cetera, some of these compostable plastics generate microplastics like their conventional plastics they mimic, causing all of the same environmental damage to soil and impairment of plant function.

We will be submitting comments to largely support the existing language under section 18980.3, the eligibility to be labeled compostable, and 18980.4, which defined responsible end markets for compostables.

Lastly, we'll be asking for a reinstatement of a definition of desirable organic waste, which is referenced in these sections.

Thank you for the opportunity to comment.

Response to O-126-1

Comment rejected. No substantive response to this comment is required because it does not directly address the proposed regulations or suggest changes to them. The comment refers to a suggestion that the commenter intended to (and presumably did) submit regarding "desirable organic waste," but this comment itself does not put forth that recommendation. To the extent the commenter separately submitted comments suggesting any changes to the proposed regulations, CalRecycle has responded to them separately.

O-127: California Restaurant Association (Matt Sutton)

Comment O-127-1

There's been no shortage of news coverage over the last few years in the state newspapers and national newspapers about the challenges that the restaurant community faces, particularly the affordability crisis that restaurant operators everywhere in the state continue to face.

So restaurants are the end users of many of these products that we're talking about today and have talked about for years in this context.· So we know that by its very nature, an extended producer responsibility program is going to send some costs downstream to us.

That's acceptable.· It's normal.· We want to be incredibly delicate with that.· We're real about those coming down to us as end users.· But we just can't stress enough the need

and the fragility of the restaurant community right now and the need for that to be done delicately.

So our comments today will be submitted. They're going to offer more context and clarity on a number of fronts.· I'll keep it brief here, because I know what stands between you and lunch is probably me.

So at this time we're focusing on some suggested clarity around the issue of, quote, unquote, obligated producer.

We've become aware of a number of scenarios where the process of identifying who is or who may be obligated producer is rife with opportunity for multiple and conflicting interpretations.· So we have some suggestions to clarify that.

And we believe by doing that, it will significantly cut down on the administrative load that you all face, or CalRecycle faces, and certainly that the CAA will face.· Also, we think it will reduce confusion and questions coming in to you from our members about a wide variety of scenarios.

Response to O-127-1

Comment rejected. This comment expresses concern over the clarity of the provisions of the proposed regulations concerning producer identification. However, this comment only previews the commenter's more detailed, separate submission of comments on that topic; this comment itself does not discuss the regulations in detail or propose any clarifications or other changes to the proposed regulations, so no response is required here.

Comment O-127-2

Lastly, we're offering some suggestions so as not to exacerbate the current dilemma we already face with the organic and compostable packaging limitations so that compostable packaging and packaging in food service ware can remain a meaningful compliance pathway for restaurants and for all.

Response to O-127-2

Comment rejected. No substantive response is required for this comment because the comment raises general concerns without stating any specific recommendation or explanation of its objections to the proposed regulations. The commenter indicates here that it will be providing more specific comments elsewhere; if the commenter did provide this follow-up, the substance of that comment is addressed in the response to that comment.

O-128: CALPIRG (Emma Moorhead)

Comment O-128-1

I don't want a future where myself and my kids are constantly exposed to microplastics.· And the beautiful, natural environment that we're really lucky to experience in California is filled with plastic trash everywhere.· So there are two specific problems that we urge CalRecycle to resolve before finalizing the proposed regulations.

Similarly as colleagues of mine have spoken on before, first we urge CalRecycle to not weaken the protections against chemical recycling, which is a false solution to our plastic pollution crisis.· The process is polluting and energy-intensive and does nothing to stop the production of new single-use plastics.

Response to O-128-1

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process. CalRecycle further rejects this comment to the extent it may be recommending that "chemical recycling" be banned outright in the regulations. A complete ban on any technology could have been accomplished through straightforward language establishing a prohibition based solely on the type of technology. Instead, the Legislature chose to word statute in a way that requires consideration of hazardous waste generation, not mere consideration of the type of technology.

Comment O-128-2

And second, we urge CalRecycle to remove the new FDA USDA exclusions.· Without these changes, I really do worry that this law will not do what it was intended to do and what those thousands of students worked really hard to pass.· We want to significantly limit plastic pollution and set the stage for a cleaner and healthier California.

So thank you so much, and thanks for the opportunity to comment.

Response to O-128-2

Comment partially rejected and partially accepted. CalRecycle interprets this comment to request removal of section 18980(a)(2). CalRecycle rejects that request for the reasons provided in response to comment I-19-1 and I-59-2. CalRecycle accepts this comment, however, to the extent it alleges that section 18980.2(a)(2) was unclear in scope or effect, was insufficiently clear with regard to what renders it "not reasonably possible" to resolve conflicts with federal laws, or would have been overbroad in effect due to the potential for the exclusion to be applied despite the conflicts being avoidable. See CalRecycle's response to comment I-19-1, explaining the revisions responsive to this and similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes).

That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

O-129: CALPIRG (Felix Bolton)

Comment O-129-1

Hello.· I am Felix Bolton.· I'm a student at UC Santa Cruz, and I live -- I am from Santa Monica and I'm representing CALPIRG, the student activist group at -- across the UCs.

I am here because the equivalent of a dump truck of plastic goes into the ocean every 45 seconds. The US plastics industry was responsible for at least 232 million tons of CO2 emissions, gas emissions, in 2020, equivalent to an average emissions of 116 average-sized coal-fire power plants.

The current regulations do not protect against harmful chemical recycling, which is mostly just a new term for incineration.· Chemical recycling creates toxic pollutants that harm our environment and threaten public health and doesn't reduce demand for new plastic to be created.

Response to O-129-1

CalRecycle partially accepts and partially rejects this comment and comments O-129-2 and O-129-3 as a group, as described in response to comment O-110-2, which is substantively the same as the group of comments.

Comment O-129-2

Also, the current regulations unlawfully exclude new broad categories of products, food and agriculture products, over-the-counter drugs, for example, which will result in more plastic being sent to landfills or left to pollute our environment.

Response to O-129-2

CalRecycle partially accepts and partially rejects this comment and comments O-129-1 and O-129-3 as a group, as described in response to comment O-110-2, which is substantively the same as the group of comments.

Comment O-129-3

CalRecycle should strengthen the regulations so that only real recycling technologies are allowed in our state, not chemical recycling.· CalRecycle should not allow for broad exclusions of packaging for over-the-counter drugs and food and agricultural products, but instead institute an exemption process.

Response to O-129-3

CalRecycle partially accepts and partially rejects this comment and comments O-129-1 and O-129-2 as a group, as described in response to comment O-110-2, which is substantively the same as the group of comments.

O-130: CALPIRG (Quinn)

Comment O-130-1

Hello.· My name is Quinn, and I'm with CALPIRG.

I grew up in Norway, and there's a lot of agriculture and nature there.· Growing up, I kind of came to understand the importance of our environment.

And when it comes to our legislation, we need to take into mind how, like, the final decision will impact our environment.· And burning plastics will add tons of toxicity to the air, which will not only harm the wildlife but also hurt us in the long term.· So I think it's really important to remember this when making a decision.

Response to O-130-1

CalRecycle rejects this comment. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process. To the extent this comment may be suggesting that the proposed regulations allow for the incineration of plastic, PRC section 42041(aa)(2)(B) expressly excludes incineration from the definition of "recycling," and nothing in the regulations contradicts that exclusion. To the extent this comment may be recommending that "chemical recycling" be banned outright in the regulations, see the response to comment O-128-1.

O-131: CALPIRG (Ty)

Comment O-131-1

So my name is Ty.· I live in Santa Cruz, and I'm with CALPIRG.

And I am here to -- I care about reducing plastic in our environment.· Because there's an equivalent of a dump truck of plastic that goes into the ocean every 45 seconds.· And the plastics industry is responsible for billions of tons of CO2 and gas emissions.· And it's equivalent to, like, hundreds of coal-fired power plants.

And current regulations do not protect against chemical recycling, which is mostly just a new term for incineration and creates toxic pollutants that harm our environment and threaten public health.

Response to O-131-1

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process. To the extent this comment might suggest that "chemical recycling" be banned outright in the regulations, a complete ban on any technology could have been accomplished through straightforward language establishing a prohibition based solely on the type of technology. Instead, the Legislature chose to word statute in a way that requires consideration of hazardous waste generation, not mere consideration of the type of technology. Additionally, PRC section 42041(aa)(2)(B) expressly excludes incineration from the definition of "recycling," and nothing in the regulations contradicts that exclusion. No change is necessary to the implementation of the Act.

Comment O-131-2

And a new plastic ban needs to be created. The current regulations unlawfully exclude new broad categories of products like agricultural products and over-the-counter drugs, which will result in more plastic being sent to landfills and polluting our environment.· Thank you.

Response to O-131-2

CalRecycle partially rejects and partially accepts this comment. With respect to over-the-counter drugs, CalRecycle rejects this comment for the reasons provided in response to comment O-49-1. Regarding the suggestion that a new plastic ban needs to be created, that recommendation is not relevant to the proposed regulations, and the Act does not authorize CalRecycle to create a "plastic ban." Regarding exclusion of agricultural packaging, CalRecycle rejects the assertion that the regulations "unlawfully exclude" it for the reasons set forth in response to comment I-19-1. However, CalRecycle accepts this comment to the extent it asserts that section 18980.2(a)(2) (implementing the exclusion) was unclear or could result in exclusion of packaging that does not actually conflict with federal law or for which alternatives are available. See CalRecycle's response to comment I-19-1, explaining the revisions responsive to this and similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

O-132: Central Contra Costa Solid Waste Authority (David Krueger)

Comment O-132-1

Thank you.· I'm David Krueger, executive director of the Central Contra Costa Solid Waste Authority.

And the communities that we serve very much support the intent of SB 54, particularly the intent to shift the costs of recycling from the local governments and ratepayers to the producers.· And also, the intent stated in SB 54 that there won't be any new costs on local governments, because it wouldn't be recovered from the PRO.

However, I think the regulations as written are lacking some important language to make that happen. We're submitting four comments, but I'm going to highlight this one section here.

Some of what's lacking is a requirement that service providers actually participate in the EPR program.· That might sound odd, but it's actually already happened in other California programs.· We've seen it with the mattress recycling PR program where some service providers had refused to participate because it would prohibit them from charging the public.

We've also seen recently with CAA and CalRecycle trying to survey service providers to get the baseline data needed for this process, and many of them have opted not to comply.· So I think there is a need for the regulations to require the service providers to seek the funding.

The concern is that if the service providers have new costs necessary to meet SB 54 and they perceive it's going to be easier for them to get that funding from the ratepayers from the local jurisdictions as opposed to from the PRO, that that's where they'll go first.· So I think there needs to be a regulation to make sure they participate.

Response to O-132-1

Comment rejected. The commenter's recommendation is, in effect, that the proposed regulations impose requirements directly on service providers to participate in the PRO's program. Nothing in statute, however, confers authority on CalRecycle over recycling service providers other than with respect to their obligations under Public Resources Code section 42060.5(a) (the requirement to include certain covered materials in their collection and recycling programs).

Comment O-132-2

And when they do participate, as mentioned by other folks, we need to look out for the possibility of double-dipping.· Of a service provider recovering costs from the PRO and then recovering those same costs from the jurisdictions and the ratepayers.· That needs to be prohibited in law and regulation.

And you can't really rely on local jurisdictions and franchise agreements to enforce that. Doing so would put an unnecessary burden on local jurisdictions, especially the smaller ones that don't have lots of staff and so forth, and that is this type of thing.· And might also require a mass -- you know, a minimum of franchise agreements throughout the state, which is not really a productive use of time.

So most of the current franchise agreements didn't really anticipate SB 54 and EPR.· And instead of having everyone have to rewrite their franchise agreements, it would be more efficient for the State simply to enforce these requirements to prevent the double-dipping.

Response to O-132-2

CalRecycle rejects this comment for the reasons stated in response to comment I-51-1.

Comment O-132-3

In addition to double-dipping, we want to make sure that when service providers get funding from the PRO that actually reduces their operating costs, that their customers benefit from that as well.· That that savings is shared with the ratepayers with the local jurisdictions.
Anyway, thank you for listening to these comments.· I appreciate your time.· And thanks again. Bye.

Response to O-132-3

CalRecycle rejects this comment for the reasons stated in response to comment I-51-1.

O-133: Environment California (Caleb Weiss)

Comment O-133-1

Great.· Yeah, hi.· My name is Caleb Weiss, and I'm a campaign associate for Environment California based in Oakland.

I've cared deeply about the environment since I was a kid growing up in the woods of northern Vermont. However, I never imagined that we would reach a point when protecting our environment would be so intertwined with protecting ourselves.

The statistics about microplastics' impact on health are downright scary.· And when coupled with the terrifying amount of plastic waste that we currently produce, 2,000 truck loads per day, provide more than enough reason to significantly limit our plastic consumption as SB 54 sets out to do.

Therefore, I would like to state my strong opposition to recent provisions which both allow chemical recycling under certain circumstances and implement broad exclusions of packaging for over-the-counter drugs, food, and agricultural products.

Both of these practices would significantly threaten the efficacy of SB 54.·

Response to O-133-1

CalRecycle partially rejects and partially accepts this comment and comments O-133-2 and O-133-3 as a group for the reasons stated in response to comment I-44-1, which this commenter also submitted and encompasses the concerns and recommendations set forth in the group of comments.

Comment O-133-2

Chemical recycling creates toxic pollutants that harm our environment and threaten public harm, and it does not reduce our demand for new plastic to be created, which seems kind of crazy for a recycling policy.

Response to O-133-2

CalRecycle partially rejects and partially accepts this comment and comments O-133-1 and O-133-3 as a group for the reasons stated in response to comment I-44-1, which this commenter also submitted and encompasses the concerns and recommendations set forth in the group of comments.

Comment O-133-3

Meanwhile, broad exclusions for over-the-counter drugs, food, and agricultural products will result in more plastic being sent to landfills or left to pollute our environment.· I urge you, therefore, to strengthen SB 54 regulations so that only real recycling technologies are allowed in our state.

Furthermore, I ask that you ensure that packaging for over-the-counter drugs and food and agricultural commodities are fully covered by the regulations.· Thank you.

Response to O-133-3

CalRecycle partially rejects and partially accepts this comment and comments O-133-1 and O-133-2 as a group for the reasons stated in response to comment I-44-1, which this commenter also submitted and encompasses the concerns and recommendations set forth in the group of comments.

O-134: Environment California (Layla Sharp)

Comment O-134-1

Good morning.· My name is Layla Sharp.· I work with Environment California as a clean air and water intern.

On behalf of Environment California, I urge CalRecycle to strengthen the regulations under SB 54 so that only real recycling technologies are allowed in our state.

This is our opportunity to make California a national leader in real solutions to plastic pollution by not allowing loopholes and false solutions to undermine the intent of SB 54.·

Allowing chemical recycling is worse than creating new plastic in many ways.· It is similar to plastic incineration that releases toxic chemicals in our air and water.

These facilities are often built in low-income neighborhoods and communities of color, adding to the environmental injustices that these residents face every day.· I grew up in southeastern parts of San Diego where pollution became normalized, and communities like mine were often overlooked when it came to environmental protections.

During heatwaves and wildfires, the air would hang low and thick with smoke.· And by the age of 16, I would have migraines at least twice a week during wildfire season.· My family accepted it as it was normal, and no one and no community should have to accept this in their home.

Far too long, families like mine have lived with the consequences of weak environmental policies. Policies like SB 54 are supposed to protect them from these kinds of harms, not make it worse.

I ask CalRecycle to keep SB 54 strong and to not improve anything that fails to represent the best intent of California residents.· Ban chemical recycling and hold producers accountable to ensure the final regulations truly reduce plastic as a source and not shift the burden onto communities already breathing air pollution.

Now we have the chance to protect public health, clean air, and environmental justice across California.· Please do not let weak regulations take that away.· Thank you for your time.

Response to O-134-1

CalRecycle rejects this comment's suggestion that "chemical recycling" be banned outright in the regulations. A complete ban on any technology could have been accomplished through straightforward, specific language that required prohibition based solely on the type of technology at issue. Instead, the Legislature chose to word statute in a way that requires consideration of hazardous waste generation, not merely consideration of the type of technology.

O-135: City of San Jose (Reit Voorhees)

Comment O-135-1

Thank you.· Good afternoon. My name is Reit Voorhees, and I'm speaking on behalf of the Environmental Services Department for the City of San Jose.

As the third most populous city in California, we are highly supportive of SB 54, the goals of reducing plastic pollution, shifting the packaging responsibility to producers, and lessening the financial burden on most local jurisdictions, waste collection, and processing of covered materials.· We are -- we have submitted extensive comments

already, but I do want to highlight a few concerns that we have about the written regulations.

Response to O-135-1

Comment rejected. No response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations, does not raise an objection concerning the rulemaking process, or refers to suggested changes or objections set forth in greater detail in other portions of the submission. To the extent other portions of the submission suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-135-2

We strongly believe that section 18980.2, meaning section (a)2, which significantly expands the number of products that would be category 3 excluded, must be deleted.· If it's not removed, it would directly conflict with statute and result in the failure of the State to implement SB 54 as retired by statute.

Instead of just expanding the proposed regulations, this continues to allow producers to apply for the unique challenges exemptions outlined in section 18980.2.4.· Relying on exemptions instead of broadly applicable exclusions would require these producers to remain part of the SB 54 system and create a safe pathway for producers to onboard materials as it becomes feasible to do so.

The (inaudible) that CalRecycle published in June 2025 estimates that the total benefits of SB 54 are over $53 billion.· However, this estimate assumes that SB 54 is implemented as intended by the State of California.· If a large percentage of the products that are currently required to be covered by statute pursue categorical exclusions under the proposed regulations, these benefits, public health, reduced environmental impacts, and savings for taxpayers would not be realized.

Additionally, SB 54's intent to reduce the f inancial burden on ratepayers would also be unmet as many types of packaging intended to be covered under SB 54 would be categorically excluded from all current (inaudible) requirements to meet SB 54's recycling rates and recyclability mandates.

Response to O-135-2

CalRecycle partially rejects and partially accepts this comment. For the reasons set forth in response to comments I-19-1, I-59-2, and O-93-9, CalRecycle rejects the suggestion to remove section 18980.2(a)(2) and instead rely on exemptions described in section 18980.2.4. However, CalRecycle accepts this comment to the extent it alleges that section 18980.2(a)(2) was unclear in scope or effect, was insufficiently clear with regard to what renders it "not reasonably possible" to resolve conflicts with federal laws, or would have been overbroad in effect due to the potential for the exclusion to be applied despite the conflicts being avoidable. See CalRecycle's response to comment I-19-1, explaining the revisions

responsive to this and similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

Comment O-135-3

I wanted to echo some of the concerns that are already been mentioned about enforcement on local jurisdictions.· The $50,000 per day fine for noncompliance, we believe there's discrepancy between SB 54's intention as an EPR law and the enforcement on local jurisdictions for those requirements.

Response to O-135-3

CalRecycle rejects this comment for the reasons stated in response to comment O-15-7.

Comment O-135-4

And we also wanted to highlight that SB 54 requires the PRO to reimburse local jurisdictions and service providers for cost incurred to implement SB 54. And that includes the cost of consumer education, collection, processing, storage, and transportation of covered materials.

However, under the current regulations, the cost for that same type that are already being incurred by jurisdiction, it only allows us to cover the amount of increase that's caused by the requirements of SB 54. Separating both costs that are due to the existence of SB 54 would prove extremely difficult and incredibly burdensome for jurisdictions.· This language in the regulation should therefore be (inaudible) be left.

And I will thank you for the time and consideration.· We look forward to working with CalRecycle as they continue to draft these regulations. Thank you.

Response to O-135-4

CalRecycle rejects this comment for the reasons stated in response to comment O-13-14.

O-136: Global Alliance for Incinerator Alternatives (Sirine Rached)

Comment O-136-1

Thank you.· Hello.· Sirine Rached here, speaking for the Global Alliance for Incinerator Alternatives.· We're a global network of over 1,000 grassroots groups in over 90 countries working for a shift towards a just zero-waste world.

Thank you for this opportunity.· We've been engaging in this process, and apologies for any repetition in our comments.· But unfortunately, our main concerns with the regulations have not been heard so far.

I will make some -- I will highlight some points that we are making in further detail in our written comments which we will be submitting in a few hours.· And before I begin, I just want to echo concerns raised by colleagues of the environmental justice communities against plastics like Californians Against Waste, by the NRDC, and the Surfrider Foundation among others.

So the first point I want to make, we've heard that chemical recycling is incineration by another name. I would go further and say pyrolysis is actually incineration under the Clean Air Act, and it fits with California's definition of incineration.

And pyrolysis being the main chemical recycling technology currently deployed, that means that so-called chemical recycling, in between quotation marks, is actually not recycling at all.· It is disposal, and it should not be a technology that sees any growth as a result of these regulations.

The second point I'm going to make is that a prohibition or a moratorium on plastic waste pyrolysis, gasification, solvolysis, depolymerization, and solvent-based purification -- these are a family of technologies that are commonly marketed as so-called chemical recycling -- would best uphold the statute, and I'll explain why.

The third point I'll be making is that these technologies actually have unacceptable climate and toxic impacts, which are inconsistent with the statutory definition of a responsible end market.· So another reason not to authorize them.

And finally, I will make the point that the regulations responsible end market criteria ignore the statutory emphasis not only on preventing harm, but on environmental benefits.· And on preventing the generation of hazardous waste, not simply managing whatever hazardous waste has been generated in compliance with permits.· Furthermore, it fails environmental justice by failing to give any protections against cumulative impacts.

So coming back to the point that pyrolysis is incineration in federal law and in California law.· This clarity in the law comes in contrast with the claims that we are hearing from sections of the industry that present these technologies as recycling.

Terms you may have heard include "advanced recycling" or "chemical recycling."· And as you may be aware, California's attorney general has filed a lawsuit alleging, with ample evidence, that these technologies are not recycling at all.· And they are described by the attorney general as deceptive business practices.

And this is why these regulations, in our view, are absolutely essential in providing the clarity and reinforcing the law and in providing clarity in the face of these claims that

threaten genuine mechanical recycling with technologies that actually don't result in a significant amount of plastic waste coming back into new products.

So pyrolysis and associated processes actually burn off most of the plastic waste.· They also produce a low-yield and highly contaminated oil, pyrolysis oil, that needs dilution with large amounts of virgin petroleum naphtha to become usable.· Okay?

This means that in the best care scenario, only 2 percent of the plastic waste that we are feeding into this pyrolysis process, so-called chemical recycling, will make the round trip into a steam cracker and effectively be recycled.

So really, we really insist on the importance of having a prohibition, or at least a moratorium, on this family of technologies, pyrolysis, gasification, solvolysis and the others in order to uphold the statute.

Furthermore, let me jump to the -- now some evidence on these costs.· Why am I saying that the climate and toxic costs are not compatible with the statute?

The statute does say -- again, it doesn't only say minimize the harm.· It says we need -- responsible end market means a material market that is conducted in a way that benefits the environment and minimizes risk to public health and worker health and safety.· However, this evidence that we are presenting in detail in our letter negates that.

So, first of all, life cycle assessments when probably conducted actually show that chemical recycling has a significant toxic footprint from the use of solvents.· And this toxic footprint, which is often not considered in the literature, is actually also responsible for a large amount of the carbon footprint from these technologies.

The hazardous waste issue that relates to chemical recycling is not only at the facility itself, but across all the lines, transportation lines, where this waste must be transported until final disposal at a hazardous waste facility, as our colleagues at the NRDC have shown in a very good investigation.

And as some of you may recall who like to read ProPublica, this investigative outlet showed that the EPA estimated a 100 percent cancer risk from lifetime exposure to pollution from a boat-fuel component that is made through the pyrolysis of plastic waste.· They also showed at a separate facility that the EPA estimated a one-in-four cancer risk for people exposed to pollution from this facility over a lifetime.

And, of course, that is relevant because lifetime exposure is what happens when you live next to a facility.· It is constant, daily exposure that accumulates to this unacceptable cancer risk.· We don't see how this is consistent with statute at all.

On the greenhouse gas, as I mentioned earlier, part of this footprint is due to the solvent use. Chemical recycling is a major emitter of carbon, and has been found to produce

carbon emissions an order of magnitude more than mechanical recycling, and more emissions per ton than primary plastic.

So chemical recycling of plastic produces more carbon per ton than making new virgin plastic.· Again, we don't see how embracing chemical recycling in the regulation makes any sense, given California's climate commitments.

Finally, I'll just conclude here to say that we really are concerned that the regulation does not provide any protection for environmental justice, despite the requirements and statute.

And specifically, it brings no safeguards against cumulative impacts when several end markets or several recycling facilities might be located in the same community.· And the only mention is significant compliance or rough compliance with the permit.· This doesn't address the harm from the accumulation of polluting facilities in one location.

And finally, one point that is really dear to GAIA's heart given our work on environmental justice on a global scale, California exports a lot of its plastic waste beyond its borders, including to Mexico and Asia. And the language in the regulation provides no -- no protection for countries where environmental regulations are insufficient.· And compliance with permit does not constitute a safeguard for human health and the environment.

So thank you for your patience, and we will be providing further detail in our written comments.

Response to O-136-1

CalRecycle rejects this comment's suggestion that "chemical recycling" be banned outright in the regulations. A complete ban on any technology could have been accomplished through straightforward, specific language that required prohibition based solely on the type of technology at issue. Instead, the Legislature chose to word statute in a way that requires consideration of hazardous waste generation, not merely consideration of the type of technology.

O-137: McHugh Koepke Padron (Dawn Koepke)

Comment O-137-1

Okay. Good afternoon, or good morning, I guess, still.

Dawn Koepke with McHugh Koepke Padron providing comments on behalf of two clients, if I may. First, the California Manufacturers and Technology Association. Appreciate the opportunity to provide these comments on this updated proposed permanent regulation. A few things, all of which will be included as part of our robust comments to be submitted later today. And I'll just touch on a couple of high points.

With regard to section 18980.1(a)8. This is related to the definition of food service ware. CMTA and its members continue to have concerns about the definition and the lack of clarity. That it suggests in terms of who is considered the producer for that food service as it relates to reference to good versus food packaging, food service, and specifically concerns about ambiguity when it comes to the manufacturer of that actual packaging versus who puts it into commerce by use and providing it to consumers. So continue to have concerns about that.

Response to O-137-1

CalRecycle rejects this comment for the reasons provided in response to comments O-76-2 and O-76-6, which were submitted on behalf of the same entity on whose behalf this comment was submitted and address the same issues. See, also, CalRecycle's response to comment O-55-1.

Comment O-137-2

[This comment code not used.]

Response to O-137-2

[Intentionally left blank.]

Comment O-137-3

With regard to the definition of plastic in 18980.1(a)15.· CMTA also just notes and has concerns that certainly the regulatory definition of plastic is incredibly broad.· And in that regard includes everything from your traditional plastics to even coatings and adhesives that provides potentially significant compliance challenges, particularly for fiber-based materials.

That broad scope could complicate producers' ability to accurately identify, separate, and report plastic content.· And so a lot of concerns about that. CMTA has continued to recommend the use of the de minimis reference within the statute to set a threshold for considering that.

Sorry.· It's, like, so low. Okay.· Thank you.· Sorry about that.

Response to O-137-3

CalRecycle rejects this comment for the reasons provided in response to comments O-55-1 and O-82-7.

Comment O-137-4

So in terms of the de minimis reference within the statute, CMTA continues to believe it would be important for added clarity and to avoid ambiguity to further clarify and refine what de minimis means in the context of the regulations for plastics as specifically recommending setting a threshold.

Further, in section 18980.2.2(b), defines criteria to meet that de minimis standard.· However, this section requires added clarity on how it applies to adhesives and coatings on packaging that are primarily composed of recycled materials.

Response to O-137-4

Comment rejected. CalRecycle rejects this comment for the reasons provided in response to comments B-30-2 and O-82-7.

Comment O-137-5

A couple of additional points regarding detachable components.· We continue to have a bit of concern.· And it seems as though, based on the detachable components, components within the regulation, that there could be a lack of alignment with the Association of Plastic Recyclers' design guides, which recommend leaving plastic caps on bottles and containers
when recycling.

Response to O-137-5

CalRecycle rejects this comment for the reasons provided in responses to comment O-39-5 and O-41-3.

Comment O-137-6

Further, kind of, similar situation, we note that the department as well as the – Sorry.· Should I just continue? I feel like it's even cutting in and out on my end, too.

So we would note that the department as well as the beverage industry have been working on a campaign
focused on keeping caps on when returning beverage containers for recycling. · And we think that the detachable components language within the regs needs to align with that for the broader universe of packaging as well.

Response to O-137-6

Comment rejected. This comment does not provide a discernible proposal of a change to the regulations for CalRecycle to consider. To the extent the commenter intended to suggest that components should not be considered "detachable" when the instructions on packaging requests that the components be discarded attached to others component, CalRecycle rejects that proposal for the reasons stated in response to comment O-39-5 and O-41-3.

Comment O-137-7

We strongly support the inclusion -- or, exclusion for over-the-counter drugs and urge CalRecycle to maintain this important exclusion in the final approved regulation.· As we've previously discussed, these medical products, which were exempted in statute and included as part of FDA's review and requirements. And we think that it is important that that exclusion be maintained in the final regs.

Response to O-137-7

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-137-8

With regard to reusable and refillable, CMTA strongly supports maintaining the change in that section to avoid applying uniform requirements to the design and labeling of reusable and refillable packing regardless of the significant differences in packaging, recognizing that there are changes and differences that should provide for flexibility.

Response to O-137-8

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process.

Comment O-137-9

In terms of the exemption duration, we strongly support maintaining the change and exemption from one year to two years, which provides longer period for certainty for producers who may be granted exemptions.

Response to O-137-9

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process.

Comment O-137-10

On the post-consumer content credit, although SB 54 requires CalRecycle to determine a 2023 baseline for purpose of measuring overall source reduction, it should be clear that nothing in Senate Bill 54 itself requires CalRecycle to adopt a 2023 baseline for purpose of determining this credit.· I really believe greater flexibility would be helpful and important.

Response to O-137-10

CalRecycle rejects this comment for the reasons provided in response to comment B-11-7.

Comment O-137-11

On the malice fee section, as CMTA also urges the Department to add language recognizing that under the office of -- environmental health hazard assessment and Proposition 65, there are thresholds set for various chemicals under Prop 65.· And the malice fee should be accordingly and aligned with those level settings and address that issue as part of malice fee determinations.

Response to O-137-11

CalRecycle rejects this comment. See the response to comment B-11-9.

Comment O-137-12

And then finally, on behalf of the California Council for Environmental and Economic Balance, CCEEB urges the department to provide added clarity and guidance on business-to-business related packaging for producers.

They continue -- many producers who may not be consumer-facing producers for the purposes of SB 54 but who may, indeed, have obligations for compliance are largely focused on business-to-business transactions and packaging within their business-to-business, still are continuing to struggle with a lack of clarity as it relates to the producer definition, that hierarchy, what have you.

Response to O-137-12

Comment rejected. As written, the proposed regulations provide ample clarity concerning when businesses that are not "consumer-facing" (a term CalRecycle understands to refer to the users that acquire products at the end of the supply chain) may be producers. As explained in greater detail in response to comment O-38-1, the statute does not distinguish between sales to businesses and sales to individual consumers. To the extent the commenter intended to request that CalRecycle publish additional resources, such as a "frequently asked questions" document, to assist businesses in understanding their obligations, no change to the proposed regulations is necessary because a regulation is not required for CalRecycle to create such resources.

Comment O-137-13

And so we really urge the Department to continue to work on providing added clarity through additional guidance, frequently asked questions, FAQs, and to ensure all entities that have compliance requirements, even if they're not consumer-facing packaging, are clear and understand what that entails.

Response to O-137-13

CalRecycle rejects this comment for the reasons provided in response to comment O-137-12.

Comment O-137-14

On the issue of alternative collection, CCEEB urges the Department to further revise the definition of alternative collection.· Continue to have concerns that as it relates to that, that it could have an impact and undermine franchise agreements that were not part of any kind of agreement under SB 54.· The intention was always
to uphold franchise agreements and the important contracts related to those.

Response to O-137-14

CalRecycle rejects this comment for the reasons provided in response to comments B-40-2, B-42-1, and O-42-7.

Comment O-137-15

In terms of responsible in-markets and responsible in-markets for plastics, CCEEB supports the revisions made to the regulation related to whether material recovery facilities creating flake or pellet are considered end markets.· So really just want to ensure added clarity.

While we appreciate some of that language was adjusted, we do believe that there continues to be a little bit of ambiguity as it relates to having removed flake, but continuing to maintain pellets, pellet manufacturing, or processing in that scope.

Response to O-137-15

CalRecycle rejects this comment. See the response to comment O-57-3.

Comment O-137-16

And then finally, with regard to exemptions and extensions for local jurisdictions and recycling service providers, the regulations state that the local jurisdictions and recycling service providers' obligation to collect material on the CMC list do not take affect while CalRecycle is deciding on an application or an extension or exception.

To align this with the eyesore sections on the topic, the final statement of reason should clarify that a request to the Department pursuant to those sections is a notification of the intent to file an application. That application would meet the criteria under 18980.11.1 and be considered by CalRecycle for approval or denial.

This clarification would ensure that the consultation process with the PRO as required serves its intended purpose and local jurisdictions and recycling service providers are not subject to penalties during that consultation process, which the PRO has discretion to extend.

With that, I appreciate your time.· And thank you for your consideration

Response to O-137-16

CalRecycle rejects this comment for the same reasons stated in response to comments O-57-5 and B-42-3.

O-138: Monterey Bay Aquarium (Karla Garibay Garcia)

Comment O-138-1

My name is Karla Garibay Garcia. I'm with the Monterey Bay Aquarium.

I'd like to first echo the comments from others related to the environmental justice concerns with hazardous waste generation technologies.· But my comments today are focused on SB 54's goal to reduce plastic production at the source.

Response to O-138-1

CalRecycle rejects this comment. To the extent this comment raises environmental justice concerns with hazardous waste generation technologies, see the response to comment O-62-1. To the extent this comment alludes to source reduction goals under the Act, no response to this portion of the commenter's submission is necessary because the issues raised in it have been addressed in response to other portions of the submission discussing the same issues.

Comment O-138-2

Monterey Bay Aquarium and our colleagues at Oceana and Ocean Conservancy appreciate that the proposed regulations maintain the integrity of the source reduction mandate.· The removal of the source reduction adjustment language from prior versions of the regulations is critical to effectuate the intent of the law.

The requirement to source-reduce plastic-covered material by no less than 25 percent by January 1st, 2032, was fundamental to our organization's support of SB 54.· And it was carefully negotiated as part of withdrawing the ballot initiative.

Neither the Department nor the PRO have the statutory authority to adjust the amount of plastic-covered material that is required to be reduced relative to the baseline.

So with this in mind, we urge CalRecycle to ensure that the final regulations do not include a source reduction adjustment factor, as any effort to change the source reduction mandate in the regulation would be unlawful and ultimately undermine the clear intent of SB 54.· Thank you.

Response to O-138-2

CalRecycle rejects this comment as there is no substantive response required because the comment raises general concerns without stating any specific recommendations or objections to the proposed regulations.

O-139: National Stewardship Action Council (Heidi Sanborn)

Comment O-139-1

Good morning.· My name is Heidi Sanborn.· I'm the director of the National Stewardship Action Council, and we advocate for a responsible circular economy.

And I am, along with others in this room including Dr. Brandon, were in -- worked very hard in negotiating SB 54 to be something we could all be proud of.· And I want to reiterate -- there's so many comments that were made today that I don't want to restate.

So I'll just say the comments that she just made about the chemical recycling are very clear in the law that we're not following it in this version of the regs.

Response to O-139-1

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process. To the extent the comment might imply that "chemical recycling" should be banned outright in the regulations, a complete ban on any technology could have been accomplished through straightforward, specific language in the Act that required prohibition based solely on the type of technology at issue. Instead, the Legislature chose to word statute in a way that requires consideration of hazardous waste generation, not merely consideration of the type of technology. CalRecycle also rejects this comment for the reasons stated in response to comment O-62-1.

Comment O-139-2

The comments about the cost to local governments and the cost shift to the producers, we should not have $50,000 fines for local governments.· They've carried the weight all these years, and it's time for the producers to have responsibility.· And that's the way this law was written.

Response to O-139-2

CalRecycle rejects this comment for the reasons stated in response to comment O-15-7.

Comment O-139-3

And I can just say that, you know, my biggest concern about this version of the regulations is that they really don't follow the law.· And if there's one thing that this agency is responsible for, it's following the law.· And the regs should align clearly with the statute.

It doesn't even include discussion about another PRO.· That's in the law.· They're not in there. How can another PRO compete with the existing PRO?· To keep cost down and create competition, which is part of our mantra in this economy.

Response to O-139-3

Comment rejected. Contrary to the commenter's assertion, an additional PRO is addressed in regulations, such as section 18980.1 subd. (c). With regard to the general assertion that the regulations do not follow the law, no substantive response is required because the comment raises general concerns without

stating any specific recommendation or explanation of its objections to the proposed regulations.

Comment O-139-4

Exclusions, that is a whole nother level of not following the law.· You know, we have a member of our working group on SB 54 named Gary Cohen.· He's out of Tennessee and working on packaging there.· He came out of the packaging industry and had 40 years of experience and has submitted a comment that he shared with me.

And that basically he's consulted with other food safety experts who are also 40-year experts in the field, and he has submitted their comments as well.· But I just want to reiterate and uplift one of his comments.

That based on his experience with FSMA, the Food Safety Modernization Act and the HACCP protocols, I believe the draft language could potentially exempt 70 percent of food packaging found in a typical supermarket.

That was not the intent of the law, I can assure you, from the people who were negotiating it. And they're very concerned with how this is going to affect other states and their state, even in Tennessee, rolling out what they're hoping to pass.

And his request was that before finalizing article 2, please pause and consult with qualified food safety experts to ensure that the draft exemptions do not unintentionally undermine the very goals and financial stability of SB 54.· This is like Groundhog Day.· I, and many others, have made many of these comments multiple times before.· But this is like driving a truck through the regulations.

It is going to result, in my prediction, of a lot of litigation on both sides.· The businesses, when they get the bill for actually having to comply with this that are left paying, are going to revolt, in my opinion.· Because why would they want to carry the weight for the 70 percent that are going to ask for an exclusion, permanently exempted from having to do anything?· That's just shameful, quite frankly.· And I'm very disappointed that this is where we are.

While I appreciate the opportunity to comment again, stakeholders are quickly losing faith that thoughtfully-negotiated bills in California can be implemented as they were written.· And I really hope this goes better in the next draft, because I am concerned about what that means for not only California, but for the nation.· Thank you.

Response to O-139-4

CalRecycle partially rejects and partially accepts this comment. To the extent the commenter alleges section 18980.2(a)(2) is unlawful and would permanently exempt packaging and therefore must be deleted, CalRecycle rejects the comment for the reasons provided in response to comments I-19-1, I-59-2, and O-93-9. Moreover, CalRecycle rejects that suggestion because the commenter proposes no alternative approach to account for direct conflicts with federal laws

and regulations, as mandated by Public Resources Code section 42060(b). To the extent this comment incorporates the objections and suggestions made in comments I-33-1 through I-33-3 (the comments to which this comment refers and purports to "uplift), CalRecycle rejects it for the same reasons stated in response to those comments. As explained in those responses, the exclusion at issue is tailored to address unavoidable conflicts with federal laws and regulations; the commenter offers no explanation for the implied assertion that 70 percent of packaging in a typical supermarket might face such unavoidable conflicts. To the extent the commenter's assertions and suggestions are based on the intent of "the people who were negotiating" the Act, CalRecycle interprets that as a reference to people other than legislators and therefore rejects the comment. Discussions occurring outside the Legislature are not legislative history, and therefore are irrelevant to CalRecycle's execution of its statutory obligations, which must be based on the statutory text, relying on legislative history when necessary to interpret it.

However, CalRecycle accepts this comment to the extent the commenter alleges that section 18980.2(a)(2) was unclear in scope or effect, was insufficiently clear with regard to what renders it "not reasonably possible" to resolve conflicts with federal laws, or would have been overbroad in effect due to the potential for the exclusion to be applied despite the conflicts being avoidable. See CalRecycle's response to comment I-19-1, explaining the revisions responsive to this and similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

O-140: Ocean Conservancy (Dr. Anya Brandon)

Comment O-140-1

Hi, there.· Dr. Anja Brandon, director of plastics policy at Ocean Conservancy.

I'm going to focus my comments today on article 4.1 on nonmechanical recycling technologies.· As you've heard from us previously and other groups today, these regulations go beyond what is authorized in the statute by allowing technologies that generate a significant amount of hazardous waste to count as recycling.

And by failing to encourage recycling technologies that minimize the generation of hazardous waste, the generation of greenhouse gases, environmental impacts, environmental justice impacts, and public health impacts per the specific and detailed requirements outlined in section 42041(AA)5.

These regulations propose an unlawful shift from a criteria based on production to the disposition and management of hazardous waste.· Moreover, this criteria is rendered essentially moot by allowing for hazardous waste managed under a permit to not count.

These proposed regulations continue to fail to encourage recycling technology that minimize impacts to people and the planet.· And the ISO standard cited does not speak to these issues.

It's worth noting that the permitting requirements are -- that permitting requirements are not uniform across the country, let alone the world.· Which is why the drafters of SB 54 intentionally drafted language to develop criteria based on production which would create a more level playing field.

As written, these proposed regulations, in effect, give preferential treatment to areas with the least stringent permitting requirements, which directly goes against the Department's statutory requirement in section 42060(d) to ensure that the regulations avoid or minimize disproportionate impacts to disadvantaged or low-income communities or rural areas, which too often are communities that live in or around areas with weak permitting requirements.

Rather than encouraging innovation and system change, these proposed regulations seem to be aimed at
maintaining the status quo.· We encourage CalRecycle to outline a clear and uniform criteria based on the production of hazardous waste, the actual amount of hazardous waste generated, as called for in the law.

We have additional comments on this section, including concerns over the definition of hazardous waste used, as well as a lack of transparency and data on these facilities being shared with the Department and with the public.· We will follow up with more details and encourage you to revisit this section.· Thank you.

Response to O-140-1

CalRecycle rejects this comment for the reasons stated in response to comment O-62-1.

O-141: The Recycling Partnership (Dylan de Thomas)

Comment O-141-1

Thank you so much.· My name is Dylan de Thomas.· I lead state policy work for The Recycling Partnership.· I wanted to start -- and I'm going to do a little weird stance here so I can get down here.

I wanted to thank CalRecycle staff for the incredible amount of hard work and challenging circumstances of trying to get this regulatory package over the line.· And I'm going to share a few comments here, but really we'll have a full robust letter as we typically do later on today.· Like many of the other speakers, I also wanted to echo a fair amount of what some of the other speakers had said.

But wanted to lead with just to -- we want to make sure that we see the impacts of this law being implemented.· And we feel we are aligned with CalRecycle as well as the designated producer responsibility organization that for the implementation to stay on time, we support the goal of adopting the final regulations by Jan 1, 2026.

We don't take this lightly.· We know that there are some real changes that need to happen to the regulations to be able to make the law work into the future.

But we still believe that the regulation, the regulatory package currently before us, should be finalized.· And then immediately following finalization, announce plans for additional rulemaking at the earliest possible time for -- after that regulation adoption occurs.

Response to O-141-1

Comment rejected. No substantive response is required because the comment generally encourages finalization without stating any specific recommendation on content of the proposed regulations.

Comment O-141-2

Okay.· But recognizing that changes may be necessary, we have -- and there would be another 45-day public comment period.· We wanted to highlight some of the top priority concerns that if changes are to be made, that these are the changes that should be focused on.

The first and foremost, echoing a lot of the earlier comments that happens -- that others have said is about the categorical exclusion for packaging that conflicts with federal regulation.· It's going to be highly disruptive to the SB 54 implementation piece.

Our initial suggestion is that the provision, the new provision that was in the most recent regulatory package just be deleted entirely.· There would still be an option to request for a more limited exemption due to unique compliance challenges and/or health and safety concerns.

We feel that this is sufficient to be able to address some of the concerns from other folks in industry that have highlighted for packaging that is necessary to be able to deliver their products to marketplace.· There already is a process in place, and we think that that is robust and necessary.

If you do keep the current approach, then we would suggest a few changes.· Primarily that the exclusions would be limited to two to three years and then require resubmission.· That we require CalRecycle to make rapid rulings and have those rejections be effective immediately so the producer responsibility organization can properly plan and make sure that they're able to reach the robust rates and dates in statute.

We believe there should be an annual deadline for submissions that take effect in the following year and initially 30 days after the regulations are adopted to only allow SB 54 producers to file for exclusions. And also to identify a more objective and measurable standard than, quote, not reasonably possible to use other packaging.

So that way producers are able to identify what packaging they can use and cannot use, and it's not as vague.· It's not -- we also feel, and this is something that we've said a number of times in earlier comments, is that there needs to be greater clarity and a viable pathway for recyclable designations via alternative collection either alone or in combination with local jurisdictional programs as in 18980.3.

We really think that, especially as we were looking at packaging that, you know, if there is good redesign and there's a good focus, especially for challenging packaging to recycle like film and flexibles, that there's going to be innovative collection modalities that are going to have to be implemented.

And we believe that there should be an optimal mix of local and alternative collection, still making sure, of course, materials are going to responsible end markets as defined.· And we think that there needs to be some additional clarity delivered via the next regulatory package.

And one of those suggestions that we're making is that for a local program recyclable pathway, that a local program could include any program included in our PRO contract with a local jurisdiction and their service provider or recycler.

Response to O-141-2

Comment partially rejected and partially accepted. For the reasons provided in response to comments I-19-1, I-59-2, and I-93-9, CalRecycle rejects the suggestion to removed 18980.2(a)(2) in its entirety and instead rely on the exemptions described in section 18980.2.4 (for unique challenges and health and safety exemptions). Regarding annual deadlines and the 30-day period after adoption of regulations with respect to exclusion under the 18980.2(a)(2), a pathway for "recyclable designations," and a "mix of local and alternative collection," CalRecycle rejects those suggestions for the reasons provided in responses to comments O-104-4 and O-104-5, in which this commenter provides greater detail concerning those suggestions. CalRecycle rejects the final suggestion concerning "a local program recyclable pathway" because it is vague; CalRecycle cannot discern what the commenter suggests. However, CalRecycle interprets this comment to be an overview of the comments that the commenter submitted in writing, which are comments O-104-1 through O-104-19; to the extent those comments address the suggestion alluded to in this comment, CalRecycle's responses to those comments apply to this one.

CalRecycle accepts this comment, however, to the extent it alleges that section 18980.2(a)(2) was unclear in scope or effect, was insufficiently clear with regard to what renders it "not reasonably possible" to resolve conflicts with federal laws,

or would have been overbroad in effect due to the potential for the exclusion to be applied despite the conflicts being avoidable. See CalRecycle's response to comment I-19-1, explaining the revisions responsive to this and similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

Comment O-141-3

Additionally, there's some regulatory language that could be clarified around a -- another designation for recyclability, which would be allowing for the PRO to request CalRecycle designations if there's a reasonable likelihood to satisfy any of the other three SB 343 recyclability criteria within a particular time period, as well as an application process to the director to make sure that if packaging is collected, that it would not reasonably confuse consumers as well as increase contamination in the recycling system.

Response to O-141-3

Comment rejected. No regulation is required for CalRecycle to consider requests from the PRO regarding certain covered materials. Regarding a designation of material as having a "reasonable likelihood to [sic] satisfy any of the other three SB 343 recycling criteria within a particular time period," CalRecycle cannot discern what purpose such a designation could have under the statute, so no change to the proposed regulations is appropriate. Regarding CalRecycle determinations of whether packaging "would not reasonably confuse consumers as well as increase contamination in the recycling system," CalRecycle understands that to be a reference to Public Resources Code section 42355.51(d)(6), which provides that packaging can be deemed "recyclable in the state" if it is part of another program governing recyclability. CalRecycle declines to formalize a process for such determinations because they will only be possible once CalRecycle identifies such a program. More broadly, until such a program exists, CalRecycle cannot create regulations relevant to evaluation of packaging under 42355.51(d)(6) because there are no particular types of packaging and associated issues at which the regulations could be directed.

Comment O-141-4

I also wanted to suggest under the responsible end markets program to look to Oregon, as it is working to finalize its program plan amendment.· And the approach that CAA has put forward before the EQ and its advisory council, the Recycling Advisory Council, which I happen to sit on, although I'm not speaking for that advisory council now, they are currently looking at a third-party designated responsible end market verification process that will have far-reaching effects, as well as impacting California's approach on responsible end markets.

And would encourage CalRecycle in looking at the regulations around responsible end markets to coordinate with Oregon's EQ as well as CAA as they are working to finalize what that third-party verification program looks like -- protocol, rather.

Response to O-141-4

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including PRC sections 42041(aa), 42041(ad), 42051.1, and 42060, and no change is necessary to the implementation of the Act. Consistent with the discretion afforded to the PRO under PRC section 42051.1(c), section 18980.4.1 of the proposed regulations requires a PRO to include in its plan the method by which it will identify responsible end markets. The plan is then subject to review and approval by CalRecycle. Moreover, section 18980.4.2 of the proposed regulations provides that responsible end markets will then be subject to annual compliance audits by an independent third-party and annual verification by the PRO. Therefore, the proposed regulations already strike an appropriate balance between reserving distinct roles for the PRO, CalRecycle, and an independent third-party in identifying and verifying responsible end markets in a manner consistent with the overall structure and intent of the Act. However, consistent with its obligation under PRC section 42060(c), CalRecycle will continue considering the approaches taken by other states with EPR programs for packaging, including Oregon.

Comment O-141-5

And then, lastly, we wanted to suggest to help the universe of producers that are going to be impacted by this program as well as other interested parties that all stakeholders need to prepare for SB 54 implementation.· That CalRecycle prepares additional guidance documents as well as holding informal discussions very quickly on how enforcement of interim recycling rate mandates and related activities will play out, as well as demystifying the 343 labeling standards or the 54 recyclable or compostable mandate.· Just guidance documents, informal meetings.· That's something we've called for for many months now, and hope that CalRecycle is able to do that.

Response to O-141-5

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-141-6

And then lastly, we just wanted to say that we understand it's very complicated.· But the negotiated SB 54 law that's in statute did allow for compostable packaging.· And I believe that there should be a pathway, a clear regulatory pathway to be able to evaluate compostables for designation of compostability under 54.

And with that, the rest will be in our letter. Thank you.

Response to O-141-6

Comment rejected. This comment makes general assertions but does not suggest any change to the proposed regulations. To the extent the commenter's suggestion is that the proposed regulations should "allow for compostable packaging," no change is appropriate because the proposed regulations do not prohibit compostable packaging. To the contrary, the proposed regulations directly address the various statutory provisions concerning how packaging can be eligible for being labeled "compostable."

O-142: Valley Improvement Projects (Tom Helme)

Comment O-142-1

Hello again.· Tom Helm.· I'm the cofounder of Valley Improvement Projects, an environmental justice organization.· I'm also the environmental justice representative on the advisory board, but my comments here today are representing Valley Improvement Projects and other environmental justice organizations that I work with.

From an environment justice perspective, we know that the State of California actually recommended that if you want a site-polluting industry like trash incinerators, that you should look to low-income, low-education rural communities.· That even the SOREL report mentions Catholic communities.

A couple years after that report was written, West Stanislaus County, which is about 80 percent Latino area, got one of the, at the time, three trash incinerators in the state of California.· At the time, the city of Modesto and Stanislaus County had one of the earliest volunteer weekly curbside recycling programs in the state.

But after you bring in a facility that makes its money off of burning trash, including plastics, that recycling program was slowly phased out.· This is what happens when you commodify the use of waste to create energy or fuels, basically commodifying the waste.· Then you have an incentive to produce more, and not less. And that is a large concern of what we see in these regulations.

SB 54 itself says that environmental justice communities, disadvantaged communities, communities of color in California are shouldering the burden of plastic pollution in the state and the health effects that come along with it.

So a weak set of regulations, or dragging on the regulatory process, only hurts those environmental justice communities, which is why this is -- I'm taking this last chance on this final day of the regulation comment period to, again, say many of the same comments I've made before, which I know we were asked to not be repetitive.· But it's kind of the only thing I have at this point.· Because all the other comments and from other environmental justice groups have basically been ignored, if not made worse by the newer version of the regulations.

Another major problem that environmental justice has had with similar regulations as these is too much control over the industry itself being regulated, which we see with the PRO and the numerous responsibilities and powers that they have in these regulations and over this process.

Response to O-142-1

Comment rejected. No substantive response is required because the comment raises general concerns without stating any specific recommendation or explanation of its objections to the proposed regulations.

Comment O-142-2

We now see another issue, which is the turning over of some of these rules and definitions to the federal government.· Giving exclusions to too broad of a range of products that, as mentioned earlier, under this current administration could simply be made an exclusion to this process with a memo from the FDA or the USDA. And I think we're all aware that the federal government right now is moving towards deregulating and lessening regulations, despite the cost to human health.

Response to O-142-2

Comment accepted. CalRecycle interprets this comment to be directed at the possibility that a publication other than a mandatory regulation or guideline, such as a "memo," could expand the scope of the exclusions available under 18980.2(a)(2). CalRecycle has revised 18980.2(a)(2) to eliminate that possibility. In particular, 18980.2(a)(2) now clarifies that it concerns only regulations, rules, or guidelines that are mandatory. See, also, CalRecycle's response to comment I-19-1, explaining the revisions responsive to this and similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

Comment O-142-3

We also believe that the reusable and refillable language is too vague.· That we could end up with sort of like with the plastic bag ban which gave us thicker, single-use plastic bags.· I don't want to be drinking out of a slightly thicker plastic cup that is still being mass-produced, because it's able to count as reusable and refillable.· And I think as we saw with the plastic bag ban, the industries that are creating these products will gladly take advantage of vague language and regulations.

Response to O-142-3

CalRecycle rejects this comment for the reasons provided in responses to comments B-6-2, I-30-2, B-38-3, O-75-3, and O-48-4.

Comment O-142-4

The responsibility end market section has, of course, been the biggest cause of concern, as I mentioned with the incinerator in our county taking away the incentive to reduce waste.· I feel that that's where we could be headed if these regulations allow for chemical recycling, which use the plastic waste to create fuel.· And that becomes a profit motive.· And that becomes an industry that is going to be promoted, which I think is the exact opposite of what was meant with SB 54.

The original language in the regulations was better.· It set up a rigorous process for comparing these technologies to mechanical recycling and making sure that they're not producing more pollution.· And that language was taken out when we were told the language had to change to reduce cost on consumers.

Through conversations with CalRecycle staff, it was mentioned to me that the language that was changed was reflective on new data.· And that that is what led to showing that the costs were actually lower on consumers.· And if that's the case, I don't know why that section on chemical recycling technologies was changed at all.· That didn't have anything to do with, you know, changing baseline data.· It seems purely an influence from industries that want to utilize this technology.

What also got worse was instead of taking into account whether or not significant hazardous waste was being created is now just if a facility is in substantial compliance with a permit creating hazardous waste, which is overseen by the Department of Toxic Substances Control for the most part which has numerous hazardous waste facilities in the state that have literally been operating for decades without a permit. And this is how we want to oversee these industries that are going to be producing more hazardous waste, most likely in environmental justice communities and communities of color, as what happened with incinerators.

Valley Improvement Projects is a founding member of the California Environmental Justice Coalition, which has been around for over ten years now, and has almost 90 groups in the coalition.· And it was formed by literally dozens of environmental justice organizations that had major issues with the Department of Substances Control, mainly due to their cleanup and management and regulation of hazardous waste facilities. So this is just opening up a whole new door to allow hazardous waste into environmental justice communities while we have this lax regulatory system on them.

For some reason, I'm not sure why, the State is relying on the federal definition of hazardous waste. I thought California came up with their own laws to be more protective than the federal government.

And in fact, we've been making the same exact argument to DTSC lately, who basically tried to switch that out and say, "Well, maybe the federal definition of hazardous waste isn't so bad.· In fact, we want to allow some hazardous waste that wouldn't be allowed under California's law, but that is allowed under federal law to go into local municipal landfills."

That was part of their hazardous waste management plan was to let non-recurrent contaminated soils go to municipal landfills.· Guess where those municipal landfills are for the most part?· Just like incinerators, next to communities of color and environmental justice communities.

You also have this reliance on the ISO standard, which is very far away from addressing environmental justice impacts, hazardous waste impacts, greenhouse gases, and other environmental pollution and contamination.

Again, to sound like a broken record and bring it back to chemical recycling, there is too big of a loophole for an industry that was -- that was said by the author of SB 54, Senator Allen, that pyrolysis facilities, gasification, solvolysis, these other types of incinerators and chemical recycling, were never the intent to be allowed under SB 54 and to be on the same playing field with other types of recycling.· But yet these regulations open up those loopholes to happen.

And we've said from the very beginning that it should just be banned, just like Senator Allen had said. That those types of technologies should not be allowed under this.· We got the first set of regulations, like I said, were stronger.· And we kept advocating for a ban. And after all of those public comments, the regulations just got weaker, and we feel opened that door even wider for these technologies to come in.

It was mentioned earlier before, and I've mentioned it many times before.· You don't have to take my word for it or the environmental justice community. You can look at the law suits of our own attorney general in the state who is suing because of what he refers to as the new wave of a scam of making the public think that we can go ahead and keep producing these single-use plastic products and many other plastic products because they will be recycled now chemically.

And so it lets the industry off the hook for having to reduce of production of plastics, and that's what we want to see in strong regulations.· No chemical recycling, nontoxic reuse and refill, source reductions, a true polluter-pays program where we're not going to allow the producers to get out of paying for certain aspects that are outlined in SB 54.

And starting with environmental justice communities for these programs, for these cleanups, to undo the decades of harm that commodifying waste and allowing polluting technologies and hazardous waste in environmental justice communities.· Thank you.

Response to O-142-4

CalRecycle rejects this comment's suggestion that "chemical recycling" be banned outright in the proposed regulations. A complete ban on any technology could have been accomplished through straightforward language establishing a prohibition based solely on the type of technology. Instead, the Legislature chose to word statute in a way that requires consideration of hazardous waste generation, not mere consideration of the type of technology. The commenter's

concerns over incineration and fuel production are unfounded, also, because Public Resources Code section 42041(aa)(2) expressly forbids such processes from being considered "recycling."

CalRecycle also rejects this comment for the reasons stated in response to comment O-62-1.

SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act Regulations: 15-Day Comment Matrix

I-1: Tamara Kennick

Comment I-1-1

SB54 law on recycling. I am the neice of Carlton E Fairfax who worked recycling and granddaughter of Sylvia Dawson who recycled regularly from here estate and daughter of Gardena homeowner who recycles regularly.
I want to report the urgent need in Sierra Leone Africa for recycling and waste need. I watched a documentary film on the subject. They have sn emergency there.

Response to I-1-1

Comment rejected. No response to this comment is necessary because it is not related to the revisions made to the proposed regulations.

I-2: Louise Gray

Comment I-2-1

Research has proven microplastics are in our brains and increasing so we absolutely must stop these dangerous poisons!!
Link here is one of many giving scientific proof plastic is deadly.

https://hscnews.unm.edu/news/hsc-newsroom-post-microplastics-human-brains

Response to I-2-1

Comment rejected. No response to this comment is necessary because it is not related to the revisions made to the proposed regulations.

I-3: Cindy Douglas

Comment I-3-1

We are a small organic farm who must package our crops as our customers wish (not as we see fit). Our customers are large grocery store chains that have international supply chains. Many of them wish to deliver more groceries to folks directly (this means individual packaging). Also, many of them require single use plastic as mitigation from "dirt" in the fields (no scientific justifications for many uses of plastic but still we are not able to pass our inspections if we are not using single use plastic products). How can we survive and reduce single use plastics? Provide alternatives and incentives to the retailers of the food products and encourage scientifically sound and statistically meaningful practices to reduce food pathogen/diseases.

Response to I-3-1

Comment rejected. No response to this comment is necessary because it is not related to the revisions made to the proposed regulations.

I-4: Leslie Kruger

Comment I-4-1

I represent a food manufacturing facility serving the State of California.

While I recognize SB 54 and EPR legislation as efforts toward environmental reform, the regulations as currently written will materially impair our ability to operate efficiently while maintaining compliance with USDA and FDA food safety requirements.

There are no commercially viable alternatives to plastic-based flexible packaging for our products. We cannot transition to paper, glass, or other materials without compromising product safety, integrity, and regulatory compliance. Although recyclable or "recycle-ready" resins are under development, there is currently no established recycling stream in the United States for packaging that has been in direct contact with food products. In addition, many of these emerging materials have not been validated for performance in high-abuse supply chains.

Materials such as nylon and polyester are critical to protecting our perishable products. Nylon provides puncture resistance necessary to withstand distribution and handling. Without it, spoilage and failure rates increase significantly (estimated 15–20%). Polyester substrates are essential to maintaining line speeds and operational efficiency. Removing them would reduce production efficiency by approximately 20–25%, increasing run time, emissions, rework, and spoilage.

The most sustainable packaging solution for perishable goods is one that protects and extends shelf life. This approach aligns with USDA and FDA requirements and helps reduce food waste. In the United States, over one-third of food is wasted. Compromising packaging performance will increase spoilage and overall carbon emissions across the supply chain.

Additionally, these materials allow optimization of product fill. In some cases, up to 40% more product per case with less packaging weight. This equals 40 % less packaging waste in our system.

As written, SB 54 may create conflicts with federal food safety regulations. We respectfully request that exemptions be granted where compliance with recyclability mandates would undermine food safety and increase waste."

Response to I-4-1

Comment rejected. The comment does not concern the revisions made to the proposed regulations, so no response is required. To the extent the commenter intended the comment to relate to revisions to section 18980.2(a)(2), the comment is rejected because 18980.2(a)(2) does what the commenter claims the regulations fail to do: It ensures that businesses can "maintain[] compliance with USDA and FDA food safety requirements" by excluding packaging from regulation under the Act when the packaging cannot comply with both the Act and those requirements. Section 18980.2(a)(2) solves, rather than creates, "conflicts with federal food safety regulations" because it excludes packaging from the Act when there are such conflicts. To the extent that the commenter's request for "exemptions . . . where compliance . . . would undermine food safety and increase waste" was directed at 18980.2(a)(2) is a suggestion that such risks should be sufficient under section 18980.2(a)(2) to exclude packaging from the definition of "covered material," without any direct conflict with federal laws and regulations (i.e., "mandatory" provisions), CalRecycle rejects that suggestion for the reasons set forth in response to comment B-3-1 .

I-5: Chad Amaral

Comment I-5-1

To CalRecycle:
I am submitting comments on the Jan. 29, 2026, final draft "SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act" regulation on behalf of D'Arrigo Bros. Co. of California, a 102 year old grower/packer/shipper of fresh produce operating in California. Our company, whose mission is to develop strategies that enable us to provide fresh fruits and vegetables to inspire a healthy lifestyle is at the core of what we do daily. Being a family owned company, our vision is to implement solutions and sustainable practices to enhance the communities we serve. This topic is at the core of what we are driven to achieve. We are relentless in providing a sustainable path in all we do, that is why we are so concerned about the revisions to the SB 54 regulation.
The revised language in Section 18980.2 (Categorically Excluded Materials) is deeply concerning. The addition of the word "mandatory" and the narrow definition of what is "reasonably possible" effectively eliminates the categorical exclusion pathway for fresh produce packaging.
Federal food safety packaging statutes, regulations and FDA guidance represent the current, widely accepted compliance pathway for the fresh produce industry. Packaging decisions are driven by food safety requirements, including FSMA and FDA food-contact standards, which are designed to prevent contamination and protect public health. These federal requirements have long served as the appropriate benchmark for determining whether packaging is safe and legally compliant.
In addition to food safety, fresh produce packaging serves many other critical functions for fresh produce, including optimizing the supply chain to prevent food waste and greenhouse gas emissions, and ensuring the delivery of quality fruits and vegetables to

Californians. Packaging is necessary to maintain the integrity throughout harvesting, cooling, transportation and retail handling. Fresh produce packaging is highly technical and carefully engineered to:

• Protect fragile produce from physical damage during transit and handling
• Optimize transportation efficiency which reduces energy demands on the supply chain
• Maintain airflow, moisture control and structural stability
• Preserve shelf life and product quality

Fresh produce packaging is also designed to keep produce alive longer by managing respiration and moisture. These functions:

• Reduce spoilage and contamination across the supply chain
• Reduce food waste, which directly reduces greenhouse gas emissions associated with wasted food production, transportation and disposal

Packaging changes that conflict with established federal food safety guidance or compromise package integrity or shelf life will increase food waste and associated GHG emissions, undermining California's environmental and climate objectives.

As drafted, the regulation requires producers to prove that:

• No alternative packaging complies with FSMA, FDA food-contact requirements and California law. The fresh produce industry is constantly evaluating alternatives to further enhance food quality and safety. Most alternatives do not provide the same functionality as the industry gold standard, leading to increased risk of food waste, contamination, and costs to consumers.
• Conflicts cannot be resolved through liners, coatings or closures. Removing access to tools that can support the transition to alternatives packaging will stifle advancements and packaging technology advancements.
• A full package redesign would still fail food safety or legal requirements. Food safety is a critical priority for the fresh produce industry.

This standard is unworkable and does not reflect real-world food safety, operational and supply-chain constraints. In many cases, alternative materials either do not exist or would increase contamination risk, compromise package integrity, shorten shelf life or increase food waste.
Without a viable categorical exclusion, SB 54 would impose:

• Unrealistic recycling and recyclability mandates
• Permanent caps on single-use plastic packaging with no accommodation for business growth
• Significant EPR fees and exposure to civil penalties of up to $50,000 per day, per SKU

I respectfully urge CalRecycle to revise the final regulation to restore a clear, workable categorical exclusion that recognizes federal food safety packaging guidance as the

accepted compliance pathway and the essential role of packaging in food safety, package integrity, waste reduction and greenhouse gas mitigation.
Thank you for considering these comments.
Sincerely,
Chad Amaral
VP of Sales, Marketing and Business Development
D'Arrigo Bros. Co., of California
Salinas, Ca

Response to I-5-1

Comment rejected. CalRecycle rejects this comment for the for the reasons set forth in response to comment B-3-1 .

I-6: Ben Adam

Comment I-6-1

To CalRecycle:

I am submitting comments on the Jan. 29, 2026, final draft "SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act" regulation on behalf of my company, a grower and packer of fresh produce operating in California.

The revised language in Section 18980.2 (Categorically Excluded Materials) is deeply concerning. The addition of the word "mandatory" and the narrow definition of what is "reasonably possible" effectively eliminates the categorical exclusion pathway for fresh produce packaging.

Federal food safety packaging statutes, regulations and FDA guidance represent the current, widely accepted compliance pathway for the fresh produce industry. Packaging decisions are driven by food safety requirements, including FSMA and FDA food-contact standards, which are designed to prevent contamination and protect public health. These federal requirements have long served as the appropriate benchmark for determining whether packaging is safe and legally compliant.

In addition to food safety, fresh produce packaging serves many other critical functions for fresh produce, including optimizing the supply chain to prevent food waste and greenhouse gas emissions, and ensuring the delivery of quality fruits and vegetables to Californians. Packaging is necessary to maintain the integrity throughout harvesting,

cooling, transportation and retail handling. Fresh produce packaging is highly technical and carefully engineered to:
Protect fragile produce from physical damage during transit and handling
Optimize transportation efficiency which reduces energy demands on the supply chain
Maintain airflow, moisture control and structural stability
Preserve shelf life and product quality
Fresh produce packaging is also designed to keep produce alive longer by managing respiration and moisture. These functions:
Reduce spoilage and contamination across the supply chain
Reduce food waste, which directly reduces greenhouse gas emissions associated with wasted food production, transportation and disposal
Packaging changes that conflict with established federal food safety guidance or compromise package integrity or shelf life will increase food waste and associated GHG emissions, undermining California's environmental and climate objectives.
As drafted, the regulation requires producers to prove that:
No alternative packaging complies with FSMA, FDA food-contact requirements and California law. The fresh produce industry is constantly evaluating alternatives to further enhance food quality and safety. Most alternatives do not provide the same functionality as the industry gold standard, leading to increased risk of food waste, contamination, and costs to consumers.
Conflicts cannot be resolved through liners, coatings or closures. Removing access to tools that can support the transition to alternatives packaging will stifle advancements and packaging technology advancements.
A full package redesign would still fail food safety or legal requirements. Food safety is a critical priority for the fresh produce industry.
This standard is unworkable and does not reflect real-world food safety, operational and supply-chain constraints. In many cases, alternative materials either do not exist or would increase contamination risk, compromise package integrity, shorten shelf life or increase food waste.
Without a viable categorical exclusion, SB 54 would impose:
Unrealistic recycling and recyclability mandates
Permanent caps on single-use plastic packaging with no accommodation for business growth
Significant EPR fees and exposure to civil penalties of up to $50,000 per day, per SKU

Thank you for considering these comments.
I respectfully urge CalRecycle to revise the final regulation to restore a clear, workable categorical exclusion that recognizes federal food safety packaging guidance as the accepted compliance pathway and the essential role of packaging in food safety, package integrity, waste reduction and greenhouse gas mitigation.
Sincerely,
Ben Adam
Farm Manager
Freshway Farms, LLC
Santa Maria, CA

Response to I-6-1

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment B-3-1.

I-7: Gerald Donohue

Comment I-7-1

We need to abide by the deadlines previously established. Given timeframes, alternatives to many consumer related plastic products can be found

Response to I-7-1

Comment rejected. No response to this comment is necessary because it is not related to the revisions made to the proposed regulations.

I-8: Marion Garza

Comment I-8-1

Please do not weaken SB 54 to reign in plastic waste. Our planet and health need to end this scourge. Thank you.

Response to I-8-1

Comment rejected. No response to this comment is necessary because it is does not concern the revisions made to the proposed regulations.

I-9: Christina Harvey

Comment I-9-1

I am submitting comments on the January 29, 2026, final draft regulations for the SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act.
The revised language in Section 18980.2 (Categorically Excluded Materials) is deeply concerning. The addition of the word "mandatory" and the significantly narrowed definition of what is "reasonably possible" effectively eliminates the categorical exclusion pathway for fresh produce packaging.
Conflict With Federal Food Safety Requirements
Fresh produce packaging is governed first and foremost by federal food safety laws and regulations, including the Food Safety Modernization Act (FSMA) and FDA food-contact requirements. These statutes and regulations represent the nationally accepted, science-based standard for protecting public health. Packaging decisions in our industry are driven by contamination prevention, shelf-life preservation, and compliance with mandatory federal requirements.

As drafted, the regulation no longer reasonably accommodates these federal mandates. Instead, it requires producers to prove that no conceivable alternative packaging design could ever comply, even after coatings, liners, closures, or full redesigns. This standard is not achievable in real-world food safety, operational, or supply-chain conditions.

Essential Role of Fresh Produce Packaging

In addition to food safety, fresh produce packaging performs critical and highly technical functions across harvesting, cooling, transportation, storage, and retail handling. Packaging is carefully engineered to:

•Protect fragile produce from physical damage
•Maintain airflow, moisture control, and structural integrity
•Preserve shelf life and product quality
•Optimize transportation efficiency and reduce energy use

Fresh produce packaging also helps keep produce alive longer by managing respiration and moisture. These functions directly:

•Reduce spoilage and contamination
•Reduce food waste
•Reduce greenhouse gas emissions associated with wasted production, transportation, and disposal

Packaging changes that compromise integrity or shelf life will increase food waste and GHG emissions, directly undermining California's environmental and climate objectives.

Unworkable Exclusion Standard

Under the revised regulation, producers must now prove that:

•No alternative packaging complies with FSMA, FDA food-contact rules, and California law
•Conflicts cannot be resolved through liners, coatings, or closures
•Even a full package redesign would still fail food safety or legal requirements

This standard is impractical and legally risky. Many alternative materials either do not exist at commercial scale or would increase contamination risk, shorten shelf life, compromise package performance, or significantly increase costs for consumers.

Consequences of Eliminating Categorical Exclusions

Without a viable categorical exclusion pathway, SB 54 would impose:

•Unrealistic recyclability and recycling-rate mandates
•Permanent caps on single-use plastic packaging with no accommodation for business growth
•Significant and open-ended EPR fees
•Exposure to civil penalties of up to $50,000 per day, per SKU
•Risk of packaging bans for ongoing noncompliance

These impacts are unprecedented for the fresh produce industry and threaten the viability of safe, affordable food distribution in California.

Request for Revision

I respectfully urge CalRecycle to revise the final regulations to restore a clear, workable categorical exclusion that:

•Recognizes federal food safety packaging requirements as the appropriate compliance benchmark

•Acknowledges the essential role of packaging in food safety, shelf life, waste reduction, and greenhouse gas mitigation
•Provides a realistic, legally defensible pathway for compliance for fresh produce packaging
Thank you for the opportunity to submit comments during this critical 15-day period.

Response to I-9-1

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment B-3-1.

I-10: che miller

Comment I-10-1

Food packaging is the biggest problem with the over abundance of plastics.
Stop messing around and remove the language that allows broad exemptions for food and over-the-counter medication in SB 54's regulations.

Response to I-10-1

Comment rejected. Regarding "language that allows broad exemptions for food," CalRecycle rejects this comment for the reasons stated in responses to comments I-19-1, I-59-2, and O-93-9 (each submitted in response to 45-Day Changes). Those responses explain the effects of the revisions to section 18980.2(a)(2) and the reasons for not removing it. Regarding over-the-counter medication, no response is required because provisions relevant to over-the-counter medication packaging have not been revised in the 15-Day Changes.

I-11: John Schoenfeld

Comment I-11-1

I am writing to urge CalRecycle to remove the broad exemptions for food and over the counter medications of SB 54. We are a state that needs to lead the reduction of plastic use and address this critical problem, change the habits of consumers and initiate change.

Response to I-11-1

Comment rejected. Regarding proposed removal of "broad exemptions for food," CalRecycle rejects this comment for the reasons stated in responses to comments I-19-1, I-59-2, and O-93-9 (each submitted in response to 45-Day Changes). Those responses explain the effects of the revisions to section 18980.2(a)(2) and the reasons for not removing it. Regarding over-the-counter

medication, no response is required because provisions relevant to over-the-counter medication packaging have not been revised in the 15-Day Changes.

I-12: Jennifer Robles

Comment I-12-1

Remove the language that allows broad exemptions for food and over-the-counter medication. I am ready and willing to pay more upfront to make a purchase and less in the future to remediate the damage caused by plastic pollution.

Response to I-12-1

Comment rejected. Regarding proposed removal of "broad exemptions for food," CalRecycle rejects this comment for the reasons stated in responses to comments I-19-1, I-59-2, and O-93-9 (each submitted in response to 45-Day Changes). Those responses explain the effects of the revisions to section 18980.2(a)(2) and the reasons for not removing it. Regarding over-the-counter medication, no response is required because provisions relevant to over-the-counter medication packaging have not been revised in the 15-Day Changes.

I-13: Kevin Castello

Comment I-13-1

Dear Sirs
Plastic packaging in the produce industry is crucial to the food safety, shelf life and product damage. If you don't have a bag on a one head Lettuce or Cauliflower, you expose the product to damage during transit. If you don't cover the product, you have a safety issue with people handling at the store level. If you don't have a plastic package, your shelf life on the product with last days and not weeks. 100% recycled or compostable is not feasible or realistic, 30% Post Consumer plastic is realistic and is being done now by some major Plastic Packaging Companies. 1/mm bags of 3 Heart Romaine with 30% PCR takes 5,000LBS. of virgin resin out of the landfill. Please re-think this decision. Thank you

Response to I-13-1

Comment rejected. The revisions to 18980.2(a)(2) do not change the protections in the proposed regulations against food safety risk, shelf-life, and product damage. As with the 45-Day Changes, the 15-Day Changes account for those concerns. Under section 18980.2(a)(2), packaging is not considered "covered material" if it would not be possible to comply with the Act and federal laws and regulations addressing such issues. To the extent those concerns arise despite there not being such a conflict, the exclusions described in section 18980.2.4 (for "unique challenges" and health and safety risks) address the commenter's

concern that it is not feasible to satisfy the Act's requirements concerning recyclability and compostability (Public Resources Code section 42050).

I-14: Sheng Su

Comment I-14-1
Comment on 15-Day Modifications to Proposed Permanent Regulations (SB 54)

Submitted by:
Sustain You (Independent systems-oriented technology and resource conversion company)

Opening Statement Sustain You respectfully submits the following comment in response to the 15-day modifications to the proposed permanent regulations under the Plastic Pollution Prevention and Packaging Producer Responsibility Act (SB 54).

This comment is limited to the revised language circulated during the 15-day notice period and focuses specifically on long-term implementation stability, system adaptability, and potential structural risks that may arise from the current regulatory framing.

1. Observations on Implicit Assumptions in the Revised Language
Several of the revised provisions appear to rely on an implicit assumption that SB 54 compliance capacity will be achieved primarily through the incremental expansion of currently articulated recycling and processing pathways.

While such an assumption may support administrative clarity in the near term, it also risks embedding a static view of solution space into permanent regulations intended to remain effective over multiple decades.

Response to I-14-1

Comment rejected. Although the commenter asserts that the comment is "limited to the revised language circulated during the 15-day notice period," it does not address the revised language or issues discernibly related to it. Instead, it offers abstract, vaguely stated issues, without explanation of how they are relevant to the revisions. None of the revisions relate to the alleged "assumption that SB 54 compliance capacity will be achieved primarily through the incremental expansion of currently articulated recycling and processing pathways." The commenter does not explain any such link—the comment does not even identify any regulatory text at issue—or show how the 45-Day Changes have been changed in a way that creates, lessens, or exacerbates the concerns stated. Lastly, the commenter does not offer any suggested changes to the revised language, so CalRecyle cannot discern what changes, such as reverting back to the 45-Day Changes, would resolve the commenter's criticism.

Comment I-14-2

2. Risk of Structural Lock-In

By reinforcing category-specific definitions and compliance pathways, the revised language may unintentionally introduce structural lock-in, whereby future solutions are evaluated based on alignment with existing classifications rather than on achieved outcomes.

In other resource recovery and industrial system contexts, non-incremental, system-level approaches have emerged that consolidate reduction, mitigation, and processing outcomes within a single operational framework. These approaches often do not align neatly with legacy categories, despite demonstrating strong performance characteristics and deployment advantages.

Response to I-14-2

Comment rejected. CalRecycle rejects this comment for the same reasons stated in response to comment I-14-1. This comment does not concern the revisions to the 45-Day Changes. Those revisions do not concern "category specific definitions and compliance pathways," and the commenter offers no explanation to the contrary or point to any of regulatory text supposedly at issue.

Comment I-14-3

3. Implications for SB 54 Long-Term Objectives

If permanent regulations implicitly prioritize currently defined pathways over outcome-based evaluation, the State may encounter a situation in which technically viable and cost-effective solutions are excluded not due to performance limitations, but due to classification mismatch.

Over time, this dynamic could constrain California’s ability to meet SB 54 objectives efficiently, particularly under conditions of regional variability, infrastructure limitations, or cost pressure.

Response to I-14-3

Comment rejected. CalRecycle rejects this comment for the same reasons stated in response to comment I-14-1. This comment does not concern the revisions to the 45-Day Changes. The commenter offers the vague, abstract claim that the regulations might "implicitly prioritize currently defined pathways over outcome-based evaluation" and risk excluding "solutions" due to "classification mismatch." CalRecycle cannot discern how these vague statements relate to the revisions embodied in the 15-DayChanges, much less to any other particular regulatory provision.

Comment I-14-4

4. Principle-Level Consideration

From a long-term policy implementation perspective, preserving regulatory flexibility for outcome-oriented, system-level approaches—including those that may not conform to existing categorical structures—will be important to ensuring SB 54 remains resilient and effective as technological capabilities evolve.

This comment does not advocate for any specific technology or pathway, but rather encourages careful consideration of how permanent regulatory structures may shape, or unintentionally limit, future compliance options.

Closing
Thank you for the opportunity to comment on the revised regulatory language.

Respectfully submitted,
Sustain You

Response to I-14-4

Comment rejected. CalRecycle rejects this comment for the same reasons stated in response to comment I-14-1. This comment does not concern the revisions to the 45-Day Changes. Instead, with no reference to the proposed regulations, it offers vague, broad statements about abstract regulatory concepts and "encourages careful consideration of how permanent regulatory structures my shape, or unintentionally limit, future compliance options." CalRecycle cannot discern how this comment relates to any specific regulatory provision.

I-15: Hillary Boylan

Comment I-15-1

Subject (optional): Comments on SB 54 Final Draft Regulations – 15-Day Comment Period
To CalRecycle:
I am submitting comments on the Jan. 29, 2026, final draft "SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act" regulation on behalf of my company, a [grower/packer/shipper/distributor] of fresh produce operating in California. The revised language in Section 18980.2 (Categorically Excluded Materials) is deeply concerning. The addition of the word "mandatory" and the narrow definition of what is "reasonably possible" effectively eliminates the categorical exclusion pathway for fresh produce packaging.
Federal food safety packaging statutes, regulations and FDA guidance represent the current, widely accepted compliance pathway for the fresh produce industry. Packaging decisions are driven by food safety requirements, including FSMA and FDA food-contact standards, which are designed to prevent contamination and protect public health. These federal requirements have long served as the appropriate benchmark for determining whether packaging is safe and legally compliant.

In addition to food safety, fresh produce packaging serves many other critical functions for fresh produce, including optimizing the supply chain to prevent food waste and greenhouse gas emissions, and ensuring the delivery of quality fruits and vegetables to Californians. Packaging is necessary to maintain the integrity throughout harvesting, cooling, transportation and retail handling. Fresh produce packaging is highly technical and carefully engineered to:

• Protect fragile produce from physical damage during transit and handling
• Optimize transportation efficiency which reduces energy demands on the supply chain
• Maintain airflow, moisture control and structural stability
• Preserve shelf life and product quality

Fresh produce packaging is also designed to keep produce alive longer by managing respiration and moisture. These functions:

• Reduce spoilage and contamination across the supply chain
• Reduce food waste, which directly reduces greenhouse gas emissions associated with wasted food production, transportation and disposal

Packaging changes that conflict with established federal food safety guidance or compromise package integrity or shelf life will increase food waste and associated GHG emissions, undermining California's environmental and climate objectives.

As drafted, the regulation requires producers to prove that:

• No alternative packaging complies with FSMA, FDA food-contact requirements and California law. The fresh produce industry is constantly evaluating alternatives to further enhance food quality and safety. Most alternatives do not provide the same functionality as the industry gold standard, leading to increased risk of food waste, contamination, and costs to consumers.
• Conflicts cannot be resolved through liners, coatings or closures. Removing access to tools that can support the transition to alternatives packaging will stifle advancements and packaging technology advancements.
• A full package redesign would still fail food safety or legal requirements. Food safety is a critical priority for the fresh produce industry.

This standard is unworkable and does not reflect real-world food safety, operational and supply-chain constraints. In many cases, alternative materials either do not exist or would increase contamination risk, compromise package integrity, shorten shelf life or increase food waste.

Without a viable categorical exclusion, SB 54 would impose:

• Unrealistic recycling and recyclability mandates
• Permanent caps on single-use plastic packaging with no accommodation for business growth
• Significant EPR fees and exposure to civil penalties of up to $50,000 per day, per SKU

I respectfully urge CalRecycle to revise the final regulation to restore a clear, workable categorical exclusion that recognizes federal food safety packaging guidance as the accepted compliance pathway and the essential role of packaging in food safety, package integrity, waste reduction and greenhouse gas mitigation.

Thank you for considering these comments.

Sincerely,
Hillary Boylan

Response to I-15-1

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment B-3-1.

I-16: Cindy Cheng

Comment I-16-1

February 10th, 2026
Subject: SB 54 Plastic Pollution prevention and Packaging Producer Responsibility Act Permanent Regulations

Dear CalRecycle Regulatory Staff,

I'm a Food Safety and Quality Assurance Manager writing on behalf of Atkins Sheep Ranch, Inc, a small USDA meat processing facility in Fremont, CA. We appreciate CalRecycle's efforts to reduce plastic pollution and improve environmental sustainability as that also aligns with our company values and commitment to leaving nature better. We are also equally committed to producing safe foods with the highest quality possible, a key part of which is food packaging. The regulations as currently written would impair our ability to maintain compliance with various USDA and FDA food safety requirements to ensure that the packaging is safe for direct food contact and does not result in any contamination of the food products. Due to the sensitive, perishable nature of our products, we cannot transition to paper, glass, or similar non-plastic materials without compromising product quality and safety, as well as jeopardize the already short shelf life. At present there is no commercial availability of recycled materials that would be compliant with both SB 54 and FDA/USDA food safety regulations, and the existing recycling infrastructure has not yet allowed for the scale of supply necessary to reliably and consistently support current supply chain needs.

We respectfully request that the regulations be amended to allow exemptions in situations such as ours to ensure that we can continue to maintain compliance with USDA and FDA food safety regulations and requirements.

Thank you,
Cindy Cheng
Food Safety and Quality Assurance Manager
Atkins Sheep Ranch, Inc.
40880 Encyclopedia Circle
Fremont, CA 94538
Office (510) 996-7295

Response to I-16-1

Comment rejected. The commenter's assertion that the proposed regulations interfere with "compliance with various USDA and FDA food safety requirements" is nonsensical. Section 18980.2(a)(2) does the opposite: It ensures that the proposed regulations do not prevent such compliance by excluding packaging from the Act entirely when, as the commenter asserts, it is not possible to "transition" to packaging that complies with the Act. Moreover, the commenter's assertion that there "is no commercial availability of recycled materials that would be compliant" with the Act and federal regulations is nonsensical because the Act does not require use of recycled materials. To the extent the commenter asserts that the scope of the exclusion should be expanded to cover all risks to product quality, safety, and shelf-life regardless of whether there is a conflict with requirements under federal laws and regulations, CalRecycle rejects that assertion for the reasons stated in response to comment B-3-1.

I-17: Clayton Gillum

Comment I-17-1

I represent Certified Meat Products, a food manufacturing facility that serves the State of California.

While we acknowledge that SB 54 and EPR legislation are intended to advance environmental sustainability, the regulations as currently drafted would significantly hinder our ability to operate efficiently while remaining compliant with USDA and FDA food safety requirements.

Our facility has actively tested recyclable and sustainable packaging materials in full-scale production environments. These trials resulted in increased material failure, higher scrap rates, and unplanned line stoppages. The operational inefficiencies created additional downtime, increased energy use, and higher overall emissions, ultimately generating more waste rather than less. These outcomes demonstrate that, under current conditions, such materials are not suitable for mass production of perishable food products.

At present, there are no commercially viable alternatives to plastic-based flexible packaging for our products. Transitioning to paper, glass, or other materials would compromise product safety, quality, and regulatory compliance. Although recyclable or recycle-ready resins are in development, there is currently no established recycling infrastructure in the United States for packaging that has been in direct contact with perishable food. Additionally, many of these emerging materials have not yet been validated for use in high-abuse supply chains.

Materials such as nylon and polyester are essential to the protection of our perishable products. Nylon provides the puncture resistance necessary to withstand handling and distribution; without it, spoilage and failure rates increase substantially—by an estimated 15–20%. Polyester substrates are critical to maintaining production line speeds and operational efficiency. Eliminating them would reduce efficiency by approximately 20–25%, resulting in increased run times, emissions, rework, and product loss.

For perishable foods, the most sustainable packaging solution is one that effectively protects the product and extends shelf life. This approach aligns with USDA and FDA mandates and plays a key role in reducing food waste. In the United States, more than one-third of all food is wasted, and diminished packaging performance would further increase spoilage and associated carbon emissions throughout the supply chain.

As written, SB 54 risks creating conflicts with federal food safety regulations. We respectfully request that exemptions be provided in cases where compliance with recyclability requirements would compromise food safety and lead to increased waste.

Response to I-17-1

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment I-4-1, which is substantively the same as this comment.

I-18: Vincent Caboara

Comment I-18-1

Subject: Comment on SB 54 Revised Regulations – Agricultural Commodity Packaging

Agricultural Commodity Packaging, Material Exclusions
Section 18980.2 (Categorically Excluded Materials)

To the CalRecycle Rulemaking Team,

The agricultural sector faces a significant challenge in balancing mandatory federal food safety requirements with California's aggressive circularity goals. I have developed a process (Patent Pending, Priority Date 12/17, Potential Standard), which offers a practical solution for producers. By utilizing off-the-shelf modular components for the on-site conversion of agricultural waste, this standard enables the immediate production of compliant, carbon-negative packaging while generating renewable energy—directly supporting the mandates of SB 54 without compromising food safety protocols.

Respectfully,

Vincent Pietro Caboara
ACS (Arboreum Commercial Solutions, LLC) arboreum.net

12/17/25 Filed Potential Standard:
SB 54 Compliance & Alignment Matrix

To: CalRecycle – Office of Public Affairs / SB 54 Rulemaking Team
From: Arboreum Commercial Solutions, LLC (ACS)
Date: February 11, 2026
Subject: Technical Submission regarding 15-Day Changes (Agricultural Commodity Packaging)

I. Executive Summary

The **12/17 Standard** is a proprietary, carbon-negative industrial process (Patent Pending, Priority Date 12/17/2025). The standard utilizes modular, off-the-shelf conversion units to transform agricultural waste into high-strength, biochar-infused pulp on-site, effectively eliminating the need for virgin timber and high-carbon synthetic feedstocks.

II. SB 54 Mandate Alignment Matrix

SB 54 Requirement
100% Recyclable/Compostable (by 2032)

Current Industry Baseline
Failure due to multi-material coatings and virgin fiber saturation.

12/17 Standard Solution
Homogeneous, biochar-infused organic pulp with zero synthetic binders.

Compliance Status
Exceeds

SB 54 Requirement
25% Source Reduction (by 2032)

Current Industry Baseline
Reliant on global logistics and virgin timber extraction.

12/17 Standard Solution
Modular, on-site conversion eliminates supply chain bulk and waste.

Compliance Status
Exceeds

SB 54 Requirement
Carbon Neutrality / SB 308

Current Industry Baseline
Net-Positive (High emissions from pulping and transport).

12/17 Standard Solution
Net-Negative (Direct sequestration of carbon into the packaging matrix).

Compliance Status
Verified

SB 54 Requirement
PRO Participation

Current Industry Baseline
High administrative fees due to non-compliant material use.

12/17 Standard Solution
Minimum fee tier due to inherently circular, non-toxic material profile.

Compliance Status
Optimized

III. Technical Performance Metrics
● Feedstock: 100% Agricultural Waste (Hemp, Rice Straw, Corn Stover, etc.).
● Energy Profile: Energy-independent via closed-loop thermal conversion. Excess thermal energy supports on-site pulping operations.
● Carbon Sequestration: Direct integration of biochar provides a permanent carbon sink within the finished packaging product.
● Scalability: Modular "Off-the-Shelf" (OTS) deployment allows for rapid regional integration in rural agricultural hubs (Pillar 4 Alignment).

IV. Formal Notice of Alternative Availability
This submission serves as formal evidence on the public record that a viable, scalable alternative to legacy high-carbon packaging exists. For the purposes of SB 54 rulemaking, the **12/17 Standard** demonstrates that categorical exclusions for agricultural commodities are no longer necessary for technical or economic reasons.

Response to I-18-1

Comment rejected. No response to this comment is necessary because it does not concern the revisions made to the proposed regulations.

I-19: Francis Pacheco

Comment I-19-1

Dear Director:

As a member of the food and agriculture community, I write to convey concerns regarding CalRecycle's SB 54 rulemaking, the Plastic Pollution Prevention and Packaging Producer Responsibility Act. The current regulation contains extraordinary compliance issues that fly in the face of affordability, and I respectfully ask that the final regulation restore a workable categorical exclusion for food and agriculture, as included in the prior draft.

The regulation poses significant risks and challenges for food and agriculture in California. The proposed changes to section 18980.2(a)(2) (Categorically Excluded Material) will significantly impact food and agriculture's ability to conduct business in the state and provide safe and affordable food. Further, the inclusion of the word "mandatory" in this section, and the proposed requirement to prove no other packaging alternative is "reasonably possible," each create conditions that would make certain food and ag exclusions - meant to protect human health and prevent environmental safety issues - impossible to obtain. Additionally, SB 54's statutory language requires that the regulation not conflict with "guidelines" relating to food safety requirements outlined by the FDA and USDA, not mandatory laws.

Food and ag products require extensive R&D to create packaging materials that adhere to specific food safety guidance and prevent the spread of pests and diseases. For these reasons, I encourage you to reinstate a workable categorical exclusion acknowledging such guidance as a mechanism for food and ag to comply with the statute.

Sincerely,

Francis Pacheco

I-22: Bill Mattos

Comment I-22-1

Dear Director:

As a member of the food and agriculture community, I write to convey concerns regarding CalRecycle's SB 54 rulemaking, the Plastic Pollution Prevention and Packaging Producer Responsibility Act. The current regulation contains extraordinary compliance issues that fly in the face of affordability, and I respectfully ask that the final regulation restore a workable categorical exclusion for food and agriculture, as included in the prior draft.

The regulation poses significant risks and challenges for food and agriculture in California. The proposed changes to section 18980.2(a)(2) (Categorically Excluded Material) will significantly impact food and agriculture's ability to conduct business in the state and provide safe and affordable food. Further, the inclusion of the word "mandatory" in this section, and the proposed requirement to prove no other packaging alternative is "reasonably possible," each create conditions that would make certain food and ag exclusions - meant to protect human health and prevent environmental safety issues - impossible to obtain. Additionally, SB 54's statutory language requires that the regulation not conflict with "guidelines" relating to food safety requirements outlined by the FDA and USDA, not mandatory laws.

Food and ag products require extensive R&D to create packaging materials that adhere to specific food safety guidance and prevent the spread of pests and diseases. For these reasons, I encourage you to reinstate a workable categorical exclusion acknowledging such guidance as a mechanism for food and ag to comply with the statute.

Sincerely,

Bill Mattos

RE: SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act Permanent Regulations Comments

DATE: February 13, 2026

Dear CalRecycle SB 54 Regulatory Team,

The Carton Council of North America is composed of four leading carton manufacturers – Elopak, Novolex Pactiv, SIG, and Tetra Pak. Formed in 2009, the Carton Council works to deliver long-term collaborative solutions to divert valuable cartons from the landfill.

We appreciate the opportunity to provide comments on CalRecycle's draft regulations for SB 54 and offer the following comments for consideration.

Section 18980.2.5 Covered Material Category List Updates

18980.2.5(b) For purposes of subdivision (a), updates are necessary if new information or changed circumstances renders the list out of date, incomplete, or otherwise inaccurate with respect to how it relates to waste generation and the handling and end-of-life management of covered material.

Comment:

In the discussion document for the SB 54 Informal Public Workshop on the SB 54 "Permanent Regulations" (May 27, 2025) CalRecycle noted that it "deleted language in subdivision (b) of section 18980.2.5 that required updates to the Covered Material Categories List in response to new information or changed circumstances." It seems that CalRecycle only intends to update the CMC list if information has changed, but no more frequently than once per year.

Subdivision (e) of section 42061 of the Public Resources Code states "As part of the process, the Department shall update the list at least [emphasis added] annually until January 1, 2032." We believe that CalRecycle has an obligation to consider additional data as they become available and publish changes to the list throughout the calendar year to be true to the spirit of the law and to avoid potential negative impacts in these early phases of implementation. Local government service provider contracts (for recycling collection list purposes) need to be informed by any CMC "recyclable" changes well before contracts are renewed. An annual update is simply not adequate,

as it is not reflective of dynamic circumstances of recyclable determinations. If the list is not current and accurate it will lead to consumer confusion as materials are dropped from collection programs, only to potentially be added back in. This will create consumer distrust of the program and will be burdensome to municipalities. It will also be a burden to businesses and stifle innovation as producers that are committed to using recyclable packaging make unnecessary and costly packaging changes.

We recommend explicitly adding language requiring the CMC list to be updated more frequently than annually if information has changed that would change the recyclable or compostable status of a CMC, but we also understand CalRecycle's desire to limit administrative burdens. Therefore, we propose the following language:

18980.2.5(b) For purposes of subdivision (a), updates are necessary if new information or changed circumstances renders the list out of date, incomplete, or otherwise inaccurate with respect to how it relates to waste generation and the handling and end-of-life management of covered material. At a minimum, the Department shall update the list twice annually if new information and changed circumstances support changing the recyclable or compostable status of a CMC.

Section 18980.2.6 Covered Material Category List Recommendations

18980.2.6(a) A PRO, participant producer, or Independent Producer may recommend changes to the CMC list, subject to the same time constraints applicable to information submissions under subdivision (f) of section 18980.2.5.

Comment:

The Carton Council speaks on behalf of four leading carton manufacturers and the obligated producers that carton manufacturers furnish with carton packaging material. This section precludes carton packaging producers, and their trade association, the Carton Council, from recommending changes to the CMC list. We ask that CalRecycle make the list of who can recommend changes to the CMC list more inclusive, to include packaging manufacturers and their trade associations, at a minimum.

We do not understand CalRecycle's methodology regarding how it characterizes material types and forms (MT&F) for cartons – specifically that CalRecycle has divided cartons into two separate CMC and MT&F categories – despite at least 10 requests to CalRecycle by the Carton Council to combine them. The Carton Council asks that CalRecycle explain why it divides aseptic cartons (Category ID PF15P) and gable-top cartons (Category ID PF5P) into two categories when they should be combined into a single CMC. Gable-top and aseptic cartons are widely recognized and managed within the recycling industry under a single material category (including in the EPR systems in Maine, Oregon, and Colorado). Circular Action Alliance supports combining the two carton CMCs into one in all of its state programs, including in California. Aseptic and gable-top cartons are **baled, marketed, and sold together** at Material Recovery Facilities (MRFs) across the country, including within California. The industry does not

differentiate between gable-top and aseptic cartons when preparing bales for end markets. In fact, ReMA's ISRI specifications for the Grade 52 bale includes both gable-top and aseptic 1.2. The U.S. EPA, in its waste characterization studies, also keeps aseptic and gable-top cartons together. Consumers often have difficulty discerning the two types of cartons. CalRecycle's SB 343 MCS Report issued in April 2025 found that the difference in acceptance in recycling programs between the two types of cartons is negligible and programs that stated in the past that they manage them differently in all likelihood no longer do (i.e., any implication that they are collected, sorted, or marketed separately from each other is based on outdated information). Furthermore, the MCS Report found that large volume transfer and processing facilities (LVTPFs) sort both types of cartons at the same percentage for recycling and into the same output stream. Maintaining this artificial and unnecessary distinction between the two types of cartons increases the cost to California consumers, the PRO, and CalRecycle by requiring additional composition study sorting, additional data collection, calculation of two instead of one recycling rates, and separate cost allocation to each carton type. We once again request that CalRecycle combine aseptic and gable-top CMCs together into one category.

Section 18980.3.1 Recyclability of Certain Covered Material Categories Identified by the Department

18980.3.1(b) To be considered recyclable under this section, a covered material category must first be preliminarily identified by the Department when the Department publishes a material characterization study update or additional information pursuant to clause (ii) or (iii) of subparagraph (B) of paragraph (1) of subdivision (d) of section 42355.51 of the Public Resources Code. The Department may preliminarily identify a covered material category only if it preliminarily concludes that the following conditions are met:...

(c) If the Department preliminarily identifies a covered material category pursuant to subdivision (b), it shall publish the basis for its determination on its website and ~~. The Department shall provide an opportunity for public engagement and~~ allow 30 days for public review and submission of comments and ~~comment and submission of~~ relevant information and evidence.

Comment:

The Carton Council appreciates the improvement in the clarity of this rule section by the addition in this draft of a specified 30-day period for public comments. However, this section still lacks clarity. The Carton Council requests the following edits to this paragraph:

To be considered recyclable under this section, a covered material category must first be preliminarily identified by the Department within 60 days of when the Department publishes a material characterization study update or additional information pursuant to clause (ii) or (iii) of subparagraph (B) of paragraph (1) of subdivision (d) of section 42355.51 of the Public Resources Code. The Department ~~may~~ must preliminarily identify a covered material category only if it preliminarily concludes that the following conditions are met:

These changes are needed to ensure the Department responds promptly to new information, as significant programmatic confusion and relapse can occur if there are delays in identifying CMCs that are trending toward meeting the requirements of section 42355.51 of the Public Resources Code – particularly those that have historically been included in many municipal recycling programs throughout California. The "trending toward" designation should mitigate disruption to recycling programs and therefore is a time-sensitive component of the program. The Carton Council urges the Department to develop the trending toward criteria as soon as possible to avoid disruption of recycling programs in the state.

Section 18980.4 Responsible End Market Criteria

18980.4(a)(3) The entity shall minimize the discharge of emissions, effluents, and materials produced by the entity, including feedstocks and residuals, and shall handle incompatible materials in the following manner:
(A) For incompatible materials that can be further processed and recycled, the entity sends materials to entities that are authorized to further process and recycle the material.
(B) For incompatible materials that cannot be further processed and recycled, the entity disposes of the material in a way that minimizes significant effects on the environment and risks to public health and safety.

Comments:

The phrase "can be further processed and recycled" is very broad and the word "can" is subject to interpretation. The Carton Council is concerned that end markets may choose not to source materials from California due to regulatory ambiguity and uncertainty over whether they will be determined to not be a responsible end market if they do not recycle incompatible material that they currently receive and dispose of because they cannot recover and sell it for recycling cost-effectively. CalRecycle's explanatory language states that the subsection is necessary to effectuate the intent of section 42041 of the PRC to prevent responsible end markets from being able to dispose of materials that are capable of being further processed and recycled [to maximize environmental benefits]. This begs the question as to whether CalRecycle expects such activities to take place for minimal amounts of incompatible material, and at all costs. This regulatory uncertainty and financial risk could prevent end markets from sourcing material from California. Furthermore, forcing end markets to recycle incompatible material that is not able to be recycled cost-effectively in order to qualify as a

responsible end market will increase the program costs due to these regulations, as markets will have to reduce bale purchase prices to comply with these regulations, resulting in higher net costs to California recycling facilities, and ultimately higher costs to California consumers. The Carton Council requests the following edits to this paragraph:

(A) For incompatible materials that the end market determines can be further processed and recycled cost-effectively, the entity sends materials to entities that are authorized to further process and recycle the material.

Alternatively, CalRecycle can address regulatory risk and uncertainty by adding a specific dollar-per-ton cost limit for what is practicable for responsible end markets with respect to incompatible materials, such as what Oregon has done in its responsible end market regulations.

Section 18980.6.7 Eco-modulated Fee and Fee Schedule

18980.6.7(j) Pursuant to paragraph (7) of subdivision (e) of section 42053 of the Public Resources Code, a PRO shall provide a credit for producers who use plastic covered material derived from renewable materials.
(1) "Renewable materials," for the purposes of paragraph (7) of subdivision (e) of section 42053 of the Public Resources Code, means materials that are ***wholly*** *[emphasis added] derived from natural resources that are not of mineral or fossil fuel origin, without resulting in the net depletion of any of the resources. Examples of potentially renewable material include those derived from wood, mycelium, algae, or plants such as cotton, corn, sugar cane, or wheat.*

Comments:

We request that the word "wholly" be deleted from the draft rules. A declared intent of SB 54 is to reduce plastic use in packaging in the absolute, and any packaging that reduces the use of fossil-based plastic, including shifts to formats made from renewable materials, should be incentivized, even if some non-renewable material remains. Such innovation should be encouraged rather than discouraged.

Thank you for the opportunity to provide these comments on behalf of the Carton Council and its members.

Sincerely,
Jordan Fengel,
Executive Director, Carton Council

Response to I-33-1

Comments rejected. No response is necessary because this comment does not concern the actual revisions made to the 45-Day Changes.

I-34: Gerald Donohue Gerald Donohue

Comment I-34-1

SB 54 was a landmark piece of legislation. Changes for packaging meat or some health-related issues deserve a look but to grant numerous exemptions to grocery and other retail entities is an unworthy backtrack. SB 54 was a breath of fresh air. Have courage support the original premises of the bill. We are talking about generations to come in supporting this legislation. We can adapt to change. Thank you for listening!

> **Response to I-34-1**
>
> Comment rejected. No substantive response is necessary because the comment does not recommend a change to any proposed regulations or raise an objection related to the rulemaking process, nor does the comment concern specific revisions embodied in the current 15-day changes. To the extent this comment can be interpreted as a general objection to inclusion of section 18980.2(a)(2), CalRecycle also rejects this comment for the reasons stated in responses to comments I-19-1, I-59-2, and O-93-9 (each submitted in response to 45-Day Changes) regarding the effects of the revisions to section 18980.2(a)(2) and the reasons for not removing it.

I-35: Larry Bradley

Comment I-35-1

Dear Director:

As a member of the food and agriculture community, I write to convey concerns regarding CalRecycle's SB 54 rulemaking, the Plastic Pollution Prevention and Packaging Producer Responsibility Act. The current regulation contains extraordinary compliance issues that fly in the face of affordability, and I respectfully ask that the final regulation restore a workable categorical exclusion for food and agriculture, as included in the prior draft.

The regulation poses significant risks and challenges for food and agriculture in California. The proposed changes to section 18980.2(a)(2) (Categorically Excluded Material) will significantly impact food and agriculture's ability to conduct business in the state and provide safe and affordable food. Further, the inclusion of the word "mandatory" in this section, and the proposed requirement to prove no other packaging alternative is "reasonably possible," each create conditions that would make certain food and ag exclusions - meant to protect human health and prevent environmental safety issues - impossible to obtain. Additionally, SB 54's statutory language requires that the regulation not conflict with "guidelines" relating to food safety requirements outlined by the FDA and USDA, not mandatory laws.

Food and ag products require extensive R&D to create packaging materials that adhere to specific food safety guidance and prevent the spread of pests and diseases. For these reasons, I encourage you to reinstate a workable categorical exclusion acknowledging such guidance as a mechanism for food and ag to comply with the statute.

Sincerely,

Larry Bradley
9992 Jones Ave
Durham, CA 95938-9718

Response to I-35-1

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment B-3-1, which raises the same objections this comment raises.

I-36: Anonymous

Comment I-36-1

To CalRecycle:

I am submitting comments on the Jan. 29, 2026, final draft "SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act" regulation on behalf of my company, a [grower/packer/shipper/distributor] of fresh produce operating in California.

The revised language in Section 18980.2 (Categorically Excluded Materials) is deeply concerning. The addition of the word "mandatory" and the narrow definition of what is "reasonably possible" effectively eliminates the categorical exclusion pathway for fresh produce packaging.

Federal food safety packaging statutes, regulations and FDA guidance represent the current, widely accepted compliance pathway for the fresh produce industry. Packaging decisions are driven by food safety requirements, including FSMA and FDA food-contact standards, which are designed to prevent contamination and protect public health. These federal requirements have long served as the appropriate benchmark for determining whether packaging is safe and legally compliant.

In addition to food safety, fresh produce packaging serves many other critical functions for fresh produce, including optimizing the supply chain to prevent food waste and greenhouse gas emissions, and ensuring the delivery of quality fruits and vegetables to Californians. Packaging is necessary to maintain the integrity throughout harvesting,

cooling, transportation and retail handling. Fresh produce packaging is highly technical and carefully engineered to:

Protect fragile produce from physical damage during transit and handling
Optimize transportation efficiency which reduces energy demands on the supply chain
Maintain airflow, moisture control and structural stability
Preserve shelf life and product quality
Fresh produce packaging is also designed to keep produce alive longer by managing respiration and moisture. These functions:

Reduce spoilage and contamination across the supply chain
Reduce food waste, which directly reduces greenhouse gas emissions associated with wasted food production, transportation and disposal
Packaging changes that conflict with established federal food safety guidance or compromise package integrity or shelf life will increase food waste and associated GHG emissions, undermining California's environmental and climate objectives.

As drafted, the regulation requires producers to prove that:

No alternative packaging complies with FSMA, FDA food-contact requirements and California law. The fresh produce industry is constantly evaluating alternatives to further enhance food quality and safety. Most alternatives do not provide the same functionality as the industry gold standard, leading to increased risk of food waste, contamination, and costs to consumers.
Conflicts cannot be resolved through liners, coatings or closures. Removing access to tools that can support the transition to alternatives packaging will stifle advancements and packaging technology advancements.
A full package redesign would still fail food safety or legal requirements. Food safety is a critical priority for the fresh produce industry.
This standard is unworkable and does not reflect real-world food safety, operational and supply-chain constraints. In many cases, alternative materials either do not exist or would increase contamination risk, compromise package integrity, shorten shelf life or increase food waste.

Without a viable categorical exclusion, SB 54 would impose:

Unrealistic recycling and recyclability mandates
Permanent caps on single-use plastic packaging with no accommodation for business growth
Significant EPR fees and exposure to civil penalties of up to $50,000 per day, per SKU
I respectfully urge CalRecycle to revise the final regulation to restore a clear, workable categorical exclusion that recognizes federal food safety packaging guidance as the accepted compliance pathway and the essential role of packaging in food safety, package integrity, waste reduction and greenhouse gas mitigation.

Thank you for considering these comments.

Sincerely,
Joseph Henry

Response to I-39-1

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment B-3-1, which is substantively the same as this comment. The comment is also rejected regarding the commenter's objection to the

"CalRecycle labeling EPS as not recyclable." No substantive response to that objection is necessary because it does not concern the proposed regulations, which do not address that issue directly. Even if that objection could be construed to concern the proposed regulations, no response would be necessary because it does not concern the revisions made to the 45-Day Changes.

I-40: Sydney Vandemeulebroecke

Comment I-40-1

2/13/2026

RE: California SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act

Permanent Regulations; 15-day Public Comment Period

The Plant Based Products Council (PBPC) appreciates this opportunity to provide comments in response to the California Department of Resources Recycling and Recovery's (CalRecycle) 15-day public comment period regarding the latest changes to the proposed rulemaking for Senate Bill 54 (SB 54) Plastic Pollution Prevention and Packaging Producer Responsibility Act regulations.

PBPC represents businesses large and small that are committed to advancing a more circular bioeconomy through greater adoption of plant-based materials supported by appropriate end-of-life infrastructure. We aspire to deliver a future based on renewable goods that improve global resource efficiency and address challenges while providing environmental benefits.

Plant-based products, including biobased plastics, are made from renewable sources like corn, hemp, soy, and sugarcane, and can serve as alternatives to traditional fossil-fuel-derived materials. Many of these products are compostable or recyclable, enabling them to contribute to soil health through composting, support carbon sequestration, reduce methane emissions from landfills, or be integrated into existing recycling systems. As interest grows among consumers, brands, and retailers for environmentally beneficial packaging, plant-based products, either compostable or recyclable, are increasingly positioned to play an important role in reducing waste and promoting resource recovery.

We appreciate that CalRecycle continues to take industry feedback and has incorporated previous recommendations that support the environmental goals of SB 54. As the rulemaking moves towards finalization, PBPC continues to have concerns with the proposal. Thank you for your responsiveness to these priorities as we work together to foster an improved packaging ecosystem in California.

Response to I-40-1

Comment rejected. No response to this comment is necessary because it does not concern the revisions made to the proposed regulations.

Comment I-40-2

Treatment of "excluded material"

We appreciate and support the requirement that an entity must "demonstrate that it is not reasonably possible to use any alternative packaging or packaging components" to qualify for a categorical exclusion. This requirement ensures producers consider compostable or recyclable alternatives before seeking exclusions, helping to advance the use of more sustainable packaging solutions.

"The notice shall identify the specific provisions of this Act and the mandatory federal regulations, rules, or guidelines that are in conflict, specifically describe all packaging and packaging components to be excluded and the associated products, and demonstrate that it is not reasonably possible to use any alternative packaging or packaging component that would avoid the conflict."

Response to I-40-2

Comment rejected. No substantive response is necessary because the comment does not recommend a change to the proposed regulations or raise an objection related to the rulemaking process.

Comment I-40-3

The exemption of certain fiber-based products from third-party certification

We reaffirm that all products should meet the same burden of proof testing for recyclability or composability, regardless of material composition. This ensures fairness and consistency across the industry. Further, we are concerned that CalRecycle's broad testing requirement, without a specified independent standard for assessing the absence of plastics or polymers in fiber products, may lead to inconsistent methods of testing and disclosure. Without clear guidelines and independent verification, companies may use varying approaches, which could impact the integrity of the process.

Concerns with definitions

Renewable materials

We remain deeply concerned that CalRecycle has overlooked the fact that many plastic products derived from renewable materials, such as "wood, mycelium, algae, or plants like cotton, corn, sugar cane, or wheat," may contain trace amounts of materials from other sources. The requirement for products to be "wholly derived from natural resources" still unfairly disadvantages producers who are striving to create sustainable products made using renewable materials.

This approach not only penalizes companies working to reduce their environmental footprint but could also hinder efforts to develop and scale up sustainable solutions. By imposing stringent requirements, CalRecycle risks stifling innovation and limiting the production of materials that reduce reliance on fossil fuels and minimize waste. Using a fee structure to encourage the use of a portion of renewable materials rather than requiring purity will help drive the transition to a circular economy. The adoption of incentives and other policy tools could also drive growth and adoption of plant-based options.

“(j) Pursuant to paragraph (7) of subdivision (e) of section 42053 of the Public Resources Code, a PRO shall provide a credit for producers who use plastic covered material derived from renewable materials. (1) “Renewable materials,” for the purposes of paragraph (7) of subdivision (e) of section 42053 of the Public Resources Code, means materials that are wholly derived from natural resources that are not of mineral or fossil fuel origin, without resulting in the net depletion of any of the resources. Examples of potentially renewable material include those derived from wood, mycelium, algae, or plants such as cotton, corn, sugar cane, or wheat.”

Food service ware

We are still concerned that the definition of 'food service ware' excludes it from being classified as packaging. This creates unnecessary complexity and draws arbitrary distinctions that complicate producer responsibility assignments. *“(8) “Food service ware” means the goods identified in subparagraphs (A) and (B). Plastic single-use food service ware is covered material and shall not be considered “packaging” for purposes of this chapter.”*

At the same time, we support the inclusion of language within the definition of ‘food service ware’ covering items “designed specifically for use in conjunction with food service ware items,” as this appropriately captures food-associated products such as cup sleeves alongside cups and facilitates their co-disposal.

Plastics and polymers

It is imperative that CalRecycle distinguish between “plastics” and “polymers” for the purposes of this regulation. Section 18980.3.3(c)(4)(A)(i) states that any product exempted from the compostable labeling requirements must:

“(i) demonstrate that the manufacture of the items does not incorporate plastics or polymers, as defined in paragraph (16) of subdivision (a) of section 18980.1, into the item through an intentional process or combination of processes, such as lamination, extrusion, and mixing.”

However, polymers are not necessarily synonymous with plastics. Polymers are present in many common products, from soaps to lubricants, that cannot be made into plastics. To ensure accurate application of the regulation and the proper identification of persistent, non-compostable polymers used in covered material items, we respectfully request that CalRecycleadopt a separate and precise definition of “polymers.” Using the recognized definition of “polymer” from ASTM D883 would align with both the intent and language of existing statute, including the references to ASTM D6400 and D6868 in defining “compostable.”

Realistic criteria for responsible composting end markets

We remain concerned about the requirements for full biological decomposition for compostable materials. CalRecycle requires entities seeking approval to ensure that compostable covered material will fully biologically decompose. While we agree that composting entities should meet a standard, it is essential that this standard be clear and enforceable. We recommend replacement language to clarify that entities should demonstrate the ability to fully process compostable covered products, provide evidence of disintegration within their process, and confirm that the final compost is stable and mature. This section should also reflect AB 1201’s requirements for material neutrality; products of all material types must adhere to the same disintegration and biodegradation standards (ASTM D6400 and D6868) under equivalent facility

conditions. These revisions are crucial to supporting responsible and sustainable end markets for compostable products in California. We appreciate your continued attention to this matter.

(B) Covered material partially or wholly comprising plastic and intentionally included in the process used to generate a recycled organic product must fully biologically decompose, and the recycled organic product must meet standards necessary to be sold into the marketplace. Full biological decomposition of compostable plastic refers to the complete biodegradation and disintegration of the material under controlled composting conditions, resulting in its conversion to carbon dioxide, water, biomass, and inorganic compounds, with no visible, distinguishable, or toxic residues remaining after the composting cycle. The entity must neither dispose of undecomposed material intentionally included in the process nor send it to another entity that subsequently disposes of it, and the entity must ensure that it fully biologically decomposes, through additional processes conducted either by the entity or by subsequent entities to which the material is transferred. Covered material inadvertently included in the process that remain undecomposed shall be considered incompatible materials and are subject to paragraph (3) of subdivision (a).

Concerns regarding De Minimis Composting Exceptions

We are concerned about the allowance of contamination in compostable streams through the inclusion of *de minimis* non-compostable components. Even small amounts of non-compostable materials within covered products can persist as contaminants in composting systems. We strongly urge the removal of “composting” and “compostable” from the *de minimis* allowance to protect the integrity of compost.

***

It is important for the SB 54 regulations to recognize the growing nature of the plant-based products industry and foster, rather than discourage their use. By minimizing barriers and establishing clear, achievable criteria for both compostable and recyclable products, the market for plant-based solutions can expand.

Thank you for your continued consideration of these comments. Please contact me at james@pbpc.com with any questions.

Sincerely,
James Glueck Jr.
Executive Director

Response to I-40-3

Comment rejected. No response to this comment is necessary because it does not concern the revisions made to the proposed regulations.

I-41: Mark Leonard

Comment I-41-1

Dear Director:

As a member of the food and agriculture community, I write to convey concerns regarding CalRecycle's SB 54 rulemaking, the Plastic Pollution Prevention and Packaging Producer Responsibility Act. The current regulation contains extraordinary compliance issues that fly in the face of affordability, and I respectfully ask that the final regulation restore a workable categorical exclusion for food and agriculture, as included in the prior draft.

The regulation poses significant risks and challenges for food and agriculture in California. The proposed changes to section 18980.2(a)(2) (Categorically Excluded Material) will significantly impact food and agriculture's ability to conduct business in the state and provide safe and affordable food. Further, the inclusion of the word "mandatory" in this section, and the proposed requirement to prove no other packaging alternative is "reasonably possible," each create conditions that would make certain food and ag exclusions - meant to protect human health and prevent environmental safety issues - impossible to obtain. Additionally, SB 54's statutory language requires that the regulation not conflict with "guidelines" relating to food safety requirements outlined by the FDA and USDA, not mandatory laws.

Food and ag products require extensive R&D to create packaging materials that adhere to specific food safety guidance and prevent the spread of pests and diseases. For these reasons, I encourage you to reinstate a workable categorical exclusion acknowledging such guidance as a mechanism for food and ag to comply with the statute.

Sincerely,

Mark Leonard
901 N. Walton Ave

The current regulation contains extraordinary compliance issues that fly in the face of affordability, and I respectfully ask that the final regulation restore a workable categorical exclusion for food and agriculture, as included in the prior draft.

The regulation poses significant risks and challenges for food and agriculture in California. The proposed changes to section 18980.2(a)(2) (Categorically Excluded Material) will significantly impact food and agriculture's ability to conduct business in the state and provide safe and affordable food. Further, the inclusion of the word "mandatory" in this section, and the proposed requirement to prove no other packaging alternative is "reasonably possible," each create conditions that would make certain food and ag exclusions - meant to protect human health and prevent environmental safety issues - impossible to obtain. Additionally, SB 54's statutory language requires that the regulation not conflict with "guidelines" relating to food safety requirements outlined by the FDA and USDA, not mandatory laws.

Food and ag products require extensive R&D to create packaging materials that adhere to specific food safety guidance and prevent the spread of pests and diseases. For these reasons, I encourage you to reinstate a workable categorical exclusion acknowledging such guidance as a mechanism for food and ag to comply with the statute.

Sincerely,

Andrew Kamper

Comment I-54-1

February 13, 2026
Zoe Heller
Executive Director
California Department of Resources Recycling and Recovery (CalRecycle)
PO Box 4025
Sacramento, CA 95712-4025
Re: SB 54 Plastic Pollution Prevention & Packaging Producer Responsibility Act Regulations 15-Day Comment Period

Dear Director Heller,

On behalf of the Consumer Healthcare Products Association (CHPA)1, thank you for the opportunity to provide comments on CalRecycle's proposed regulations implementing the Plastic Pollution Prevention and Packaging Producer Responsibility Act (SB 54). We appreciate the significant effort that has gone into developing this updated draft and, in particular, we strongly support the Department's recognition of the importance of exempting certain over-the-counter (OTC) drug products. That said, we respectfully urge the Department to expand this exemption to apply broadly to all OTC drugs, without exception, to ensure consistency and alignment with SB 54.

Strong Support for Medical Products Exclusions

CHPA strongly supports the inclusion of paragraph (6) within Section 18980.2(a), which excludes packaging for medical products, including nonprescription drugs. This exclusion, consistent with SB 54's enacted language, is critical because drug packaging must comply with stringent federal requirements for product integrity, tamper evidence, child resistance, and sterility that may be incompatible with source reduction or recycled content mandates.

Without this exemption, manufacturers may be forced to limit product lines or eliminate smaller, more affordable package sizes—disproportionately harming nearly 29% of Californians in lower-income households who rely on these formats to manage costs. Maintaining this exemption ensures continued consumer access to affordable medications and oral care products without compromising federal compliance or product safety.

Legal Foundation for a Comprehensive Drug Exemption

While we appreciate the current exemption for OTC drug products, we urge CalRecycle to extend it to cover all nonprescription drugs without product limitations or restrictive criteria.

All OTC drugs are subject to the same federal regulatory framework, labeling requirements, and packaging integrity standards, leaving no meaningful policy or public health basis for differentiating among them for EPR packaging obligations. SB 54 explicitly exempts "medical products" by referencing Title 21 of the United States Code, Sections 321(g) and 321(h), under which all nonprescription drugs unequivocally qualify as medical products per the Federal Food, Drug, and Cosmetic Act—with no distinction drawn between different types. The draft regulations' attempt to carve out only certain nonprescription drugs based on secondary classifications, such as SPF content, is inconsistent with the statute's plain language and regulatory structure.

FDA Principles of Drug Classification

The Food and Drug Administration (FDA) maintains a fundamental regulatory principle: a drug is a drug, regardless of its additional properties or classifications. Products meeting the statutory definition of a drug under 21 U.S.C. Section 321(g) retain their essential character as pharmaceutical products, even when they also qualify as cosmetics or possess other characteristics. All FDA-regulated OTC drugs—identified by their required "Drug Facts" panel—are medical products under federal law, and secondary benefits such as cosmetic, cleaning, or sunscreen properties do not alter that status.

SB 54's exclusion of nonprescription drugs rightly recognizes the unique packaging requirements necessary to maintain product integrity, safety, and efficacy across all

pharmaceutical products. OTC products—whether medications, mouthwashes, or toothpastes—must meet stringent FDA criteria for maintaining active ingredient levels and concentrations throughout their shelf life. The structural integrity required to prevent moisture and vapor transmission, essential for preserving active pharmaceutical ingredients, cannot be achieved through conventional plastic reduction methods without compromising regulatory compliance. Additionally, Consumer Product Safety Commission requirements for child-resistant closures under the Poison Prevention Packaging Act impose further constraints that make meeting reduction targets untenable for FDA-regulated OTC products. These critical public health functions should not be compromised by regulatory distinctions based on secondary product characteristics.

Concerns with the Current Scope of Implementation

CalRecycle's Initial Statement of Reasons (August 2025) suggests that nonprescription drugs also regulated as cosmetics—such as dandruff shampoo, antibacterial hand soap, and antiperspirant—would not qualify for the exemption. This interpretation raises serious concerns, as it creates inconsistent treatment among OTC drugs based on secondary characteristics, contradicting the uniform treatment these pharmaceutical products receive under federal law. It also narrows the exemption beyond what SB 54's statutory language supports and introduces regulatory uncertainty that could extend to numerous other nonprescription drug categories. A comprehensive exemption for all nonprescription drug products, regardless of their additional uses, would eliminate these ambiguities and ensure predictable compliance requirements and enforcement.

National Consistency in Packaging EPR Legislation

California’s exemption for all nonprescription drugs would align with the prevailing approach nationwide that have adopted similar laws. States with enacted EPR legislation that exempt all drugs from scope include:

- Colorado
- Oregon
- Minnesota
- Washington
- Maryland

This consistent approach across multiple states reflects widespread recognition that drug packaging serves critical health and safety functions that warrant exclusion from EPR and post-consumer recycled content requirements. California's proposed regulations align with this emerging national consensus and demonstrate sound policy coordination across state lines.

Recommended Regulatory Change

CHPA respectfully requests that CalRecycle revise the Article 2 exemption to explicitly include all nonprescription drugs, regardless of additional classifications such as cosmetics, soaps, or sunscreen products. This revision would align California's requirements with federal law and product classifications, honor SB 54's statutory language, maintain consistency with national packaging EPR requirements, and preserve the integrity of pharmaceutical packaging standards.

Conclusion

CHPA appreciates CalRecycle's recognition of the importance of excluding nonprescription drugs from SB 54's requirements. However, limiting that exclusion to

select drug categories undermines statutory clarity and consistency with federal packaging requirements. The medical products exemption should apply comprehensively to all nonprescription drugs without exception, ensuring continued access to essential healthcare products for Californians and supporting the successful implementation of SB 54. We appreciate your consideration of these comments and welcome the opportunity to provide any additional information to assist the Department through the final stage of the rulemaking process.
Respectfully,
Carlos I. Gutiérrez

Comment I-55-1

Dear Director:

As a member of the food and agriculture community, I write to convey concerns regarding CalRecycle's SB 54 rulemaking, the Plastic Pollution Prevention and Packaging Producer Responsibility Act. The current regulation contains extraordinary compliance issues that fly in the face of affordability, and I respectfully ask that the final regulation restore a workable categorical exclusion for food and agriculture, as included in the prior draft.

The regulation poses significant risks and challenges for food and agriculture in California. The proposed changes to section 18980.2(a)(2) (Categorically Excluded Material) will significantly impact food and agriculture's ability to conduct business in the state and provide safe and affordable food. Further, the inclusion of the word "mandatory" in this section, and the proposed requirement to prove no other packaging alternative is "reasonably possible," each create conditions that would make certain food and ag exclusions - meant to protect human health and prevent environmental safety issues - impossible to obtain. Additionally, SB 54's statutory language requires that the regulation not conflict with "guidelines" relating to food safety requirements outlined by the FDA and USDA, not mandatory laws.

Food and ag products require extensive R&D to create packaging materials that adhere to specific food safety guidance and prevent the spread of pests and diseases. For these reasons, I encourage you to reinstate a workable categorical exclusion acknowledging such guidance as a mechanism for food and ag to comply with the statute.

Sincerely,

Stan Chance

Further, the inclusion of the word "mandatory" in this section, and the proposed requirement to prove no other packaging alternative is "reasonably possible," each create conditions that would make certain food and ag exclusions - meant to protect human health and prevent environmental safety issues - impossible to obtain. Additionally, SB 54's statutory language requires that the regulation not conflict with "guidelines" relating to food safety requirements outlined by the FDA and USDA, not mandatory laws.

Food and ag products require extensive R&D to create packaging materials that adhere to specific food safety guidance and prevent the spread of pests and diseases. For these reasons, I encourage you to reinstate a workable categorical exclusion acknowledging such guidance as a mechanism for food and ag to comply with the statute.

Sincerely,

Alma Reyes

I-67: Allen Davis

Comment I-67-1

Dear Director:

As a member of the food and agriculture community, I write to convey concerns regarding CalRecycle's SB 54 rulemaking, the Plastic Pollution Prevention and Packaging Producer Responsibility Act. The current regulation contains extraordinary compliance issues that fly in the face of affordability, and I respectfully ask that the final regulation restore a workable categorical exclusion for food and agriculture, as included in the prior draft.

The regulation poses significant risks and challenges for food and agriculture in California. The proposed changes to section 18980.2(a)(2) (Categorically Excluded Material) will significantly impact food and agriculture's ability to conduct business in the state and provide safe and affordable food. Further, the inclusion of the word "mandatory" in this section, and the proposed requirement to prove no other packaging alternative is "reasonably possible," each create conditions that would make certain food and ag exclusions - meant to protect human health and prevent environmental safety issues - impossible to obtain. Additionally, SB 54's statutory language requires that the regulation not conflict with "guidelines" relating to food safety requirements outlined by the FDA and USDA, not mandatory laws.

Food and ag products require extensive R&D to create packaging materials that adhere to specific food safety guidance and prevent the spread of pests and diseases. For these reasons, I encourage you to reinstate a workable categorical exclusion acknowledging such guidance as a mechanism for food and ag to comply with the statute.

Sincerely,

Allen Davis

B-1: Ted Carman (Ted Carman)

Comment B-1-1

I represend a a number of perishable food manufcturers serving the State of California.

While I recognize SB 54 and EPR legislation as efforts toward environmental reform, theregulations as currently written will materially impair our ability to operate efficiently whilemaintaining compliance with USDA and FDA food safety requirements.

There are no commercially viable alternatives to plastic-based flexible packaging for our products.We cannot transition to paper, glass, or other materials without compromising product safety,integrity, and regulatory compliance. Although recyclable or "recycle-ready" resins are underdevelopment, there is currently no established recycling stream in the United States for packagingthat has been in direct contact with perishable food products. In addition, many of these emergingmaterials have not been validated for performance in high-abuse protein supply chains.

Barrier materials such as nylon and polyester are critical to protecting our products. Nylon provides puncture resistance necessary to withstand distribution and handling. Without it, spoilage and failure rates increase significantly (estimated 15–20%). Polyester substrates are essential to maintaining line speeds and operational efficiency. Removing them would reduce production efficiency by approximately 20–25%, increasing run time, emissions, rework, and spoilage.

The most sustainable packaging solution for perishable goods is one that protects and extends shelf life. This approach aligns with USDA and FDA requirements and helps reduce food waste. In the United States, over one-third of food is wasted. Compromising packaging performance will increase spoilage and overall carbon emissions across the supply chain.

> **Response to B-1-1**
>
> Comment rejected. No response to this comment is necessary because it does not concern the revisions made to the 45-Day Changes. To the extent this comment was intended to be directed to section 18980.2(a)(2) of the regulations, a response is nonetheless unnecessary because the comment does not identify how the stated concerns relate to the revisions made to that section, nor does the comment propose changes for CalRecycle to consider.

Comment B-1-2

As written, SB 54 may create conflicts with federal food safety regulations. We respectfully request that exemptions be granted where compliance with recyclability mandates would undermine food safety and increase waste."

Response to B-1-2

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment B-9-1, which raises the same issues and makes the same request as does this comment.

B-2: Bioelements (Camila Errazuriz)

Comment B-2-1

Plastic Pollution Prevention and Packaging Producer Responsibility Act (SB 54)

Referenced Sections:
Title 14, Division 7, Chapter 11.1, Sections 18980.1(a)(2), 18980.3.5, 18980.6.6;
Title 14, Division 7, Chapter 11.5, Section 18981 (15-Day Changes)

We submit the following technical comments in response to the 15-Day Changes to the proposed regulations under the Plastic Pollution Prevention and Packaging Producer Responsibility Act. These comments are intended to support regulatory clarity, scientific consistency, and effective implementation of the Act, particularly with respect to compostable covered materials.

1. Alternative Collection and Compostable Materials

Section 18980.1(a)(2) – Definition of "Alternative Collection"

We support the clarification of the definition of "alternative collection" included in the 15-Day Changes. To ensure technical completeness and regulatory consistency, we recommend that CalRecycle explicitly recognize that alternative collection systems may be used to demonstrate appropriate end-of-life management for compostable covered materials.

Compostable materials are designed to be managed within organic waste processing systems rather than traditional recycling infrastructure. As such, alternative collection should clearly encompass privately operated, sector-specific, or closed-loop composting systems, including but not limited to commercial food service operations, institutional settings, industrial composting facilities, and other non-curbside collection models.

Explicit recognition of these systems would align the regulation with real-world waste management practices and support the Act's objectives to reduce plastic pollution while enabling materials designed for organic recovery.

2. Compostability Determinations and Infrastructure Considerations

Section 18980.3.5 – Compostability Determinations

We recommend that CalRecycle clarify that determinations regarding whether a covered material is "eligible for being labeled compostable" should be based primarily on the intrinsic compostability performance of the material, as demonstrated through compliance with recognized standards (e.g., ASTM D6400 or ASTM D6868).

While access to composting infrastructure is an important implementation consideration, conditioning compostability eligibility solely on the current availability of municipal collection infrastructure may unintentionally exclude materials that are technically compostable and environmentally beneficial. Compostable materials are specifically engineered to fully biodegrade in controlled composting environments without generating persistent plastic residues.

Clarifying that compostable materials may rely on alternative collection systems, pilot programs, or phased infrastructure development would ensure that regulatory determinations remain science-based and aligned with the Act's long-term waste reduction and pollution prevention goals.

3. Evaluation of Compostable Materials Relative to Recyclable Materials

Section 18980.6.6 – Covered Material Category Determinations

We recommend that CalRecycle ensure compostable materials are evaluated using performance-based criteria comparable to those applied to recyclable materials. In particular, determinations should account for real-world performance metrics, including actual recovery rates, contamination impacts, and environmental persistence.

Certain recyclable materials may be technically recyclable but demonstrate low collection rates or contribute to contamination in practice. Compostable materials that fully biodegrade in appropriate facilities can provide measurable environmental benefits, especially in applications closely associated with food and organic waste streams.

Explicitly acknowledging these performance considerations in the interpretation of covered material categories would promote data-driven regulatory outcomes and support the pollution prevention objectives of the Act.

4. Environmental Marketing and Qualified Compostability Claims

Chapter 11.5, Section 18981 – Environmental Marketing and Labeling

We support the intent of the 15-Day Changes to prevent misleading environmental marketing claims. We recommend, however, that the regulations allow for the use of qualified compostability claims when such claims are accurate, certified, and clearly specify appropriate end-of-life pathways (e.g., "compostable in industrial composting facilities").

Allowing qualified, standards-based compostability labeling supports transparency and consumer education while ensuring that materials are directed toward appropriate collection and processing systems. This approach is consistent with established environmental labeling frameworks and avoids unintended suppression of accurate, performance-based information.

5. Regulatory Flexibility and Implementation

General Implementation Provisions Affected by the 15-Day Changes

Finally, we recommend that CalRecycle emphasize regulatory flexibility when implementing the revised provisions introduced in the 15-Day Changes, particularly where new definitions or clarifications are provided. Flexibility is essential to enable innovation in material design, collection systems, and processing infrastructure, while maintaining environmental safeguards and accountability.

Such an approach would facilitate continuous improvement and support the successful implementation of the Act over time.

Response to B-2-1

Comment rejected. Other than with respect to the portion labeled "5. Regulatory Flexibility and Implementation," no response is necessary because this comment does not concern revisions in the 15-Day Changes. Regarding that portion, CalRecycle rejects this comment because it makes only the vague recommendation that "CalRecycle emphasize regulatory flexibility when implementing [them]," which is not a recommendation that CalRecycle revise the proposed regulations. Accordingly, no change is appropriate in response to this comment. Even if this portion of the comment was intended as a recommended change, it is too broad and nonspecific for CalRecycle to discern what that recommendation is.

B-3: J. G. Boswell Company (Cameron Boswell)

Comment B-3-1

To CalRecycle:
I am submitting comments on the Jan. 29, 2026, final draft "SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act" regulation on behalf of my company, a grower, packer and shipper of fresh produce operating in California.
The revised language in Section 18980.2 (Categorically Excluded Materials) is deeply concerning. The addition of the word "mandatory" and the narrow definition of what is "reasonably possible" effectively eliminates the categorical exclusion pathway for fresh produce packaging.
Federal food safety packaging statutes, regulations and FDA guidance represent the current, widely accepted compliance pathway for the fresh produce industry. Packaging

decisions are driven by food safety requirements, including FSMA and FDA food-contact standards, which are designed to prevent contamination and protect public health. These federal requirements have long served as the appropriate benchmark for determining whether packaging is safe and legally compliant.

In addition to food safety, fresh produce packaging serves many other critical functions for fresh produce, including optimizing the supply chain to prevent food waste and greenhouse gas emissions, and ensuring the delivery of quality fruits and vegetables to Californians. Packaging is necessary to maintain the integrity throughout harvesting, cooling, transportation and retail handling. Fresh produce packaging is highly technical and carefully engineered to:

- Protect fragile produce from physical damage during transit and handling
- Optimize transportation efficiency which reduces energy demands on the supply chain
- Maintain airflow, moisture control and structural stability
- Preserve shelf life and product quality

Fresh produce packaging is also designed to keep produce alive longer by managing respiration and moisture. These functions:

- Reduce spoilage and contamination across the supply chain
- Reduce food waste, which directly reduces greenhouse gas emissions associated with wasted food production, transportation and disposal

Packaging changes that conflict with established federal food safety guidance or compromise package integrity or shelf life will increase food waste and associated GHG emissions, undermining California's environmental and climate objectives.

As drafted, the regulation requires producers to prove that:

- No alternative packaging complies with FSMA, FDA food-contact requirements and California law. The fresh produce industry is constantly evaluating alternatives to further enhance food quality and safety. Most alternatives do not provide the same functionality as the industry gold standard, leading to increased risk of food waste, contamination, and costs to consumers.
- Conflicts cannot be resolved through liners, coatings or closures. Removing access to tools that can support the transition to alternatives packaging will stifle advancements and packaging technology advancements.
- A full package redesign would still fail food safety or legal requirements. Food safety is a critical priority for the fresh produce industry.

This standard is unworkable and does not reflect real-world food safety, operational and supply-chain constraints. In many cases, alternative materials either do not exist or would increase contamination risk, compromise package integrity, shorten shelf life or increase food waste.

Without a viable categorical exclusion, SB 54 would impose:

- Unrealistic recycling and recyclability mandates
- Permanent caps on single-use plastic packaging with no accommodation for business growth
- Significant EPR fees and exposure to civil penalties of up to $50,000 per day, per SKU

I respectfully urge CalRecycle to revise the final regulation to restore a clear, workable categorical exclusion that recognizes federal food safety packaging guidance as the accepted compliance pathway and the essential role of packaging in food safety, package integrity, waste reduction and greenhouse gas mitigation.

Thank you for considering these comments.
Sincerely,
Cameron Boswell
Vice President
J. G. Boswell Company
Pasadena, California

Response to B-3-1

CalRecycle rejects this comment for the detailed reasons articulated under the subheadings below.

In summary, the revisions in section 18980.2(a)(2) clarify the standard for when the exclusion applies, ensuring clarity, uniformity, and transparency in application of the exclusion. As with the previous version of the proposed regulations, the standard is met when it is "not reasonably possible" to use packaging that complies with both the Act and federal laws. That standard tracks the Act's directive that the exclusion applies when there is a "direct conflict" with federal food safety laws. CalRecycle's obligation to implement the statutory standard was the same under the previous version's regulatory text. The clarification enables the exclusion's application by explaining how those claiming that it applies can demonstrate that it does so.

The addition of the word "mandatory" to qualify "regulations, rules, and guidelines" is necessary because only a requirement
can create a direct conflict. But that qualification does not make non-mandatory guidance inapplicable to the process. CalRecycle recognizes federal laws and regulations do not ordinarily require that food and agricultural commodity packaging be of a specific type or use specific designs, materials, or components. Instead, federal laws and regulations set mandatory performance standards. Documents that may not be described as "mandatory" themselves but are guidance, best practices, and recommendations for the specific type, design, material, or components of packaging published by government agencies, industry associations, standards development organizations, or academic institutions, are nevertheless relevant to the exclusion process. They evidence the underlying federal standards that packaging must meet and establish that the packaging for which the exclusion is sought is designed to meet those standards; they may also be informative on the availability and suitability of any alternatives.

Further, the criteria do not require notices to prove that all hypothetical packaging, packaging components, and design options are unsuitable before the notice can give effect to the exclusion. The regulatory language in subparagraph (B) does not lead to that result. Nor are the criteria divorced from the remainder of paragraph (2) or the overall standard of "not reasonably possible . . . to

comply." Moreover, the notice, while it must include the elements set out in subparagraph (B), establishes the exclusion if it is complete and CalRecycle itself is not aware of additional alternatives. Any subsequent process and determination by CalRecycle concerning further evaluation of the exclusion, as set out in subparagraph (E), involves an iterative review process that allows for submission of additional information supporting the exclusion. This process does not require entities to prove a negative.

Finally, an exclusion is not the only available path for relief from the requirements of the Act. The proposed regulations allow businesses to secure exemptions from requirements of the Act when the exclusion under section 18980.2(a)(2) does not apply but there are compelling reasons, such as health and safety concerns, not to use alternative packaging that would be allowed under federal laws. Consistent with statute, the regulations implement those exemptions in section 18980.2.4, and those exemptions can be of considerable duration. While the default duration is two years, they may be valid for five years if circumstances justify that longer duration, and exemptions to address "unique challenges" can be for any duration established by a phase-in plan established to resolve those challenges. Additionally, exemptions are renewable through a non-burdensome process.

Addition of the Word "Mandatory" Is Necessary for Consistency with the Statute, Which Concerns Direct Conflicts with Federal Laws or Regulations

The commenter's objection to the addition of the word "mandatory" effectively requests that packaging be allowed even if there is no conflict with any federal law or regulation. That outcome would contravene Public Resources Code section 42060(b)(2), which refers to "direct conflict with a federal law or regulation" and uses the terms "rules" and "guidelines" as examples of such restrictions, not an expansion of what such restrictions may be. That provision can logically only refer to mandatory provisions of federal law because a merely voluntary provision cannot constitute an obstacle to compliance with both state and federal law.

Nor does the reference to "guidelines" in Public Resources Code section 42060(b)(1) support the commenter's assertions. Even if such "guidelines" included non-mandatory ones, that provision only states that the regulations must "consider" them, not that the regulations must avoid "conflict" with them. In contrast, 42060(b)(1) also says that the regulations must "not conflict with regulations issued by the [FDA] and the [USDA]." The juxtaposition in that sentence between "guidelines," which the regulations must "consider," and "regulations," with which the regulations must not "conflict," undermines the commenter's position that the Legislature intended voluntary guidelines sufficient to render packaging outside the Act's scope. The proposed regulations satisfy the mandate that they "consider" FDA and USDA guidelines that may not be

mandatory by making clear that entities can address the concerns embodied in such guidelines through the exemptions for covered material presenting "unique challenges" (Public Resources Code section 42060(a)(3)) and for covered material that cannot comply with the Act for "health and safety reasons" (section 42060(a)(4)). Section 18980.2.4(c)(4)(A)(ii) makes clear that "unique challenges" may include, for example, technical, legal, or financial challenges, and either exemption may be justified by the necessity to avoid, for example, public health, or environmental risks and the technical or financial limitations of alternatives (see section 18980.2.4(c)(4)(A)(iii) and (iv) and (C)(iii)).

The Proposed Regulation Does Not Assume That Federal Regulations, Rules, or Guidelines Require Use of Specific Packaging

To the extent the commenter's objection to the term "mandatory" is that the term can only refer to requirements that dictate specific packaging materials or designs, the objection is unfounded. Under its plain meaning, "mandatory" is a synonym of "required," and section 18980.2(a)(2) uses the term in that sense only: It refers to any requirement that a federal regulation, rule, or guideline may impose. Referring to regulations, rules, or guidelines as "mandatory" is therefore consistent with how the commenter describes the challenges that packaging for food and agricultural products faces. As the commenter explains, such packaging is subject to "federal requirements," such as "FSMA and FDA food-contact standards" and "food safety requirements."

Nowhere does the proposed regulation imply that "mandatory" has a meaning other than "required," so there is no basis to read section 18980.2(a)(2) to mean that there must be a federal requirement dictating use of specific packaging for there to be a conflict with the Act's requirements. CalRecycle recognizes that the specific type, design, material, or components for food and agricultural commodity packaging is generally not specified in federal laws and regulations, but rather that the laws and regulations set performance standards for the packaging, such as those concerning contamination prevention and the safety of food-contact materials. Those are legal requirements encompassed within the term "mandatory regulations, rules, or guidelines."

The Term "Mandatory" Does Not Render Guidance Documents Irrelevant

To the extent the commenter's objection is that section 18980.2(a)(2) would require businesses to ignore guidance published by a federal agency because the publications themselves are not laws, the objection is unwarranted. An agency publication guiding regulated entities on how to comply with the laws and regulations enforced by the agency may be highly relevant under section 18980.2(a)(2) regardless of whether they may be considered "mandatory." For example, a guidance document may present the only known way of complying with the underlying federal requirements. Guidance documents may also present

examples of non-compliance. Such guidance would be highly relevant to claims that the packaging to be excluded complies with federal requirements and that other packaging would fail to do so.

Similarly, non-mandatory guidance—such as best practices and recommendations for the specific type, design, and material of packaging—issued by government agencies, industry associations, standards development organizations, or academic institutions may also be relevant to exclusions. Entities may rely on such guidance to illustrate the underlying federal food packaging performance standards that the packaging is designed to meet, explain how the packaging to be excluded satisfies them, and highlight how those standards conflict with requirements under the Act.

Addition of Criteria for Meeting the "Not Reasonably Possible" Standard Clarifies the Proposed Regulation

The criteria in subparagraph (B) are necessary to meet the clarity standard in the Administrative Procedure Act and its implementing regulations. By objecting to the establishment of criteria for evaluating what is "not reasonably possible," the commenter effectively suggests that there should be no such standard to begin with. The commenter is incorrect to characterize the revised regulation as "narrow[ing] the definition" of "reasonably possible" because the previous draft of the regulation provided no clear definition, standard, or test for determining whether complying with the Act and federal law is reasonably possible, and the revisions fix that oversight. CalRecycle's obligation to implement the statutory standard was the same under the previous version of the proposed regulatory text, but the text did not state the standard with the necessary clarity. Notably, the commenter does not identify what definition of "reasonably possible" the initial draft of the regulations established, nor does the commenter suggest one. The revised regulation fills that void by providing the test for applying that term, first by explaining that "reasonably possible" refers to the possibility that there is packaging that can avoid the cited conflict with federal law. The commenter objects to that formulation, but that formulation is axiomatic: If it is reasonably possible to avoid the conflict, there is no conflict, and section 42060(b) provides no basis for the packaging to be excluded from the definition of "covered material." The regulation then establishes criteria for how CalRecycle will evaluate whether an entity has shown that a conflict with federal law exists (i.e., that it is not reasonably possible to avoid it). Without such criteria, there would be no uniform and transparent rule governing the exclusion and explaining to businesses how to justify its application. This type of clarity is required by the Administrative Procedure Act and its implementing regulations.

The Revision Does Not Eliminate the Exclusion or Render it Impossible to Obtain. It Ensures That the Scope of the Exclusion Is Consistent with the Statutory Provisions Authorizing It

The commenter incorrectly asserts that the revised regulation "eliminates the categorical exclusion pathway." The criteria established in section 18980.2(a)(2)(B)(i) through (iii) are straightforward, logical requirements that packaging must meet to establish that they must be used despite not complying with the Act's strictures. If any one of those criteria is not met, it cannot be true that simultaneous compliance with the Act and federal law is beyond reach. The commenter claims, in substance, that there is no packaging that can meet the criteria. But that claim is conjecture and based in a misreading of the language of section 18980.2(a)(2), as explained throughout this response Moreover, even if the claim were true, the commenter negates its own opposition: If no packaging could meet the criteria, that would mean that there is no unavoidable conflict with federal law, and there would be no justification under Public Resources Code section 42060(b) for the exclusion to apply.

The commenter also alleges that the proposed regulation will have certain outcomes, none of which support its premise that the regulation leaves no "viable categorical exclusion." The commenter implies that the purpose of the proposed regulations is to relax the restrictions SB 54 imposes. To the contrary, the purpose of the regulations is to implement those restrictions, and the proposed regulations do so while accommodating intractable conflicts with other laws and other types of compliance challenges. The commenter also asserts that SB 54 would impose "[u]nrealistic recycling and recyclability mandates." However, if a mandate is "unrealistic," it will either be not reasonably possible to comply with, so that the exclusion applies, or present challenges that justify an exemption pursuant to Public Resources Code section 42060(a)(3) or (4). Next, the commenter asserts that SB 54 would impose "caps on single-use plastic packaging with no accommodation for business growth." The commenter fails to explain that assertion or how, even if it is correct, that it is specific to the packaging that section 18980.2(a)(2) concerns.

The commenter then asserts that SB 54 would impose "[s]ignificant EPR fees and exposure to civil penalties." That objection, however, is directed at the statute itself, not the proposed regulations. Fees and penalties are a core element of SB 54 and therefore cannot, on their own, be the rationale for it not applying to certain packaging. The commenter points to the burdens inherent in SB 54 and claims, without any basis in the law, that they should not apply. CalRecycle recognizes the potential economic burdens associated with SB 54 compliance, including those for producers of food and agricultural commodities, but must implement the law as enacted. The legislature, in enacting SB 54, imposed those burdens on all single-use packaging but provided a pathway to exclude packaging where there is a direct conflict between a federal food safety law and the Act. The Act itself directs that food packaging will otherwise be considered covered material and subject to the requirements of the Act, but with a pathway for exemptions from requirements of the Act if a unique challenge or

health and safety reason can be shown.

In addition to the reasons set forth below, see CalRecycle's response to comment I-19-1 (submitted in response to the first draft of regulations) regarding the effects of the revisions to section 18980.2(a)(2).

The Proposed Regulation Does Not Require Consideration of Merely Theoretical Alternatives and Does Not Impose an Impossible Burden of Proof

To the extent that this comment and similar comments contend that section 18980.2(a)(2) requires notices to demonstrate that there is no theoretical alternative packaging that could comply with the Act and federal requirements, that contention is unfounded. Other commenters have articulated this argument as being required to "prove a negative." But section 18980.2(a)(2) sets forth a minimally burdensome procedure and cannot reasonably be read to impose an unreasonable standard.

Nowhere does the proposed regulation consider merely theoretical alternatives or achieve an impossible showing of proving a negative. As explained in section 18980.2(a)(2)(A) and (B), notices asserting that packaging is excluded must present the basis for that assertion. To make such an assertion in good faith, an entity must have considered whether any alternative packaging or packaging components that would avoid conflict with the Act's requirements exist. The entity must also have considered whether it is aware of redesign options that would, in effect, be such an alternative.

If there are such alternatives, subparagraph (B) sets forth the conditions that the entity must consider with respect to those alternatives. In effect, the question is whether those alternatives cause any of those conditions to fail. Considered in context with the overall standard of alternatives being "not reasonable possible to use" and the conditions in clauses (i) through (iii) of subparagraph (B), the concept of there being any "alternatives" inherently means that such alternatives are known to be possible, rather than merely theoretical or speculative. If none of the known alternatives can be used successfully, then the conditions set forth in those clauses would be satisfied. Businesses regularly make choices on packaging among the alternatives available to them and are reasonably expected to have up-to-date knowledge of such alternatives.

To the extent the comment is concerns the phrase "creates no new unavoidable legal conflict with any law" in (i) or the references to "all legal conflicts" in (ii) and (iii), those concepts are clear in the context of the regulatory section and as applied. The phrases are intentionally broad to include legal conflicts beyond only those due to federal food safety standards, so that the proposed regulation does not have the effect of deeming an alternative possible despite its use being

unlawful. For example, an alternative packaging type might meet the Act's requirements and meet federal food safety requirements, but it is still not an alternative that precludes an exclusion if using the packaging would infringe on a patent. Similarly, an alternative that meets the Act's requirements and federal food safety requirements is nevertheless not an alternative that precludes an exclusion if a more stringent state law deems its material a contaminant.

The process described in subparagraph (C) makes clear that subparagraph (B) does not create an unreasonable standard mandating speculation about potential alternatives or costly research and development when no alternatives are currently known. Under that subparagraph, CalRecycle cannot reject a notice based on the failure of the business to consider merely hypothetical alternative packaging. Rather, CalRecycle can deem a notice incomplete and require resubmission of the notice if it "identifies packaging" that the notice did not address but that CalRecycle contends would avoid the legal conflict at issue. If a packaging option does not already exist, it would not be possible for CalRecycle to "identify" it.

Further, the express acknowledgment that notices may be resubmitted dispels the notion that subparagraph (B) imposes an impossible standard or, as other commenters have stated this objection, require notices to "prove a negative." The resubmission process makes clear that CalRecycle does not consider even the existence of packaging options that appear to resolve the conflict to conclusively establish those options to be "alternatives." If CalRecycle's identification of such options were sufficient to render the exclusion unavailable, there would be no purpose of allowing resubmission. Rather, resubmission pursuant to subparagraph (C) acknowledges that notices may demonstrate that those options are not existing "alternatives" that would disqualify packaging from the exclusion according to the conditions set forth in clauses (i) through (iii).

Finally, the fundamental nature of a "notice," as opposed to an "application," accommodates the commenter's concerns and establishes that there is no burden for it to "prove a negative." There is no "application" that CalRecycle must evaluate and approve before the exclusion takes effect. Rather, a complete notice triggers the exclusion. Then, the process established in subparagraph (E) means that the ultimate test of the notice's sufficiency is circumscribed by CalRecycle's requests for information, not an evaluation of whether the notice proved a negative.

The Proposed Regulation Does Not Foreclose "Compliance Pathways" such as Liners, Coatings, Closures, or Other Options to Transition Packaging

The commenter claims that notices must prove that "[c]onflicts cannot be resolved through liners, coatings, or closures." Comment O-57-1 makes a

substantially identical assertion, arguing that section 18980.2(a)(2) "no longer reasonably accommodates compliance pathways that are commonly used to safely transition packaging . . . where necessary to meet food safety and food-contact performance requirements." For three reasons, those assertions are erroneous on their face.

First, the basic assertion is unclear. Nothing in section 18980.2(a)(2) mentions "liners, coatings, or closures," and CalRecycle cannot discern the reason the commenter singles them out as alternatives that notices must expressly disprove as alternatives. Nor does the proposed regulation suggest that, when such transitional packaging elements would not resolve the conflict, packaging could not use them as incremental advancements in tandem with pursuit of the exclusion under section 18980.2(a)(2) or an exemption under 18980.2.4.

Second, the assertion's premise is illogical. Even if it were true that entities would need to prove that "liners, coatings, or closures" cannot be used to resolve the legal conflict—which could be the case if CalRecycle identifies such packaging as alternatives that a notice must address because they might resolve the conflict—that would not mean that the proposed regulation eliminates "access to tools that can support the transition to alternatives." Instead, it would mean the opposite. In that scenario, the regulation would encourage use of those tools because they would resolve the conflict.

Third, if the commenter intended to base their objection on the unstated assumption that "tools that can support the transition to alternative packaging" would not comply with the Act, that assumption would support application of the exclusion, not render it unavailable.

In sum, nothing in the exclusion process precludes compliance pathways through the use of liners, coatings, or closures, nor does the process preclude an exclusion when such packaging options cannot resolve the direct conflict.

Exemptions Described in Section 18980.2.4 Are Available for Food Packaging and Can Address Practical Challenges and Risks, Including Health and Safety Risks, Associated with Alternative Packaging

The commenter does not acknowledge that the regulations provide an alternative path for relief from certain requirements of the Act. Specifically, the exemptions addressed in section 18980.2.4 exempt packaging from recyclability/compostability and recycling rate requirements. In many cases, one of the exemptions described in section 18980.2.4 (those pursuant to Public Resources Code section 42060(a)(3) and (4)) would be appropriate to address the scenario where there is no direct conflict with mandatory provisions of federal law even though, as the commenter suggests, alternative packaging would increase the "risk of food waste, contamination, and costsSimilarly, the

commenter cites "[f]ood safety" as the reason why it should not be necessary to demonstrate that "full package redesign" could not avoid all legal conflicts. Under the criteria set forth in 18980.2.4, such limitations could be the basis for an exemption based on "unique challenges" or health and safety. Moreover, the commenter's assertion that "access to tools . . . can support the transition to alternatives" through "advancements and packaging technology advancements" effectively concedes that it will often be possible to formulate phase-in plans to justify the "unique challenges" exemption pursuant to section 18980.2.4.

To the extent that the commenter asserts that exclusions pursuant to section 18980.2(a)(2) are more appropriate than exemptions under section 18980.2.4 because exemptions are time-limited, CalRecycle rejects that assertion. First, exclusions under section 18980.2(a)(2) are also not permanent—their justifications may not remain valid and are subject to review, as described in 18980.2(a)(2)(E)—nor would it be reasonable for them to be. Second, there is no logical reason why time limitations would be inappropriate for exemptions only for food or agricultural commodity packaging. Time limitations for exemptions ensure that exemptions do not continue despite the justification for them no longer applying and preserve incentives for overcoming the obstacles justifying the exemption. The time limitations are therefore necessary to protect the Act's effectiveness, regardless of the packaging at issue. The time limitations are also reasonable and flexible. Exemptions are valid for at least two years but may be approved up to a five-year term. A "unique challenges" exemption may be valid for an even longer period because they may be accompanied by a phase-in plan established to resolve those challenges, and there is no limit on the duration of phase-in plans. Also, all exemptions are renewable. Where all the information and evidence submitted with the application remains accurate and current, a certification to that effect suffices as support for renewal of the exemption.

To the extent the commenter asserts that exemptions under section 18980.2.4 are unsuitable for food packaging because they cannot accommodate the commenter's compliance challenges, CalRecycle rejects that assertion. The exemptions require meeting a different, and arguably less rigorous, standard than "not reasonably possible." With respect to the exemption for "unique challenges," those challenges may include legal and technical challenges and need not render compliance impossible. Rather, the exemption is available when challenges render compliance "impractical." (See section 18980.2.4(f)(2)(A).) With respect to the exemption for health and safety risks, the exemption is available when the risks that would arise from compliance with the Act exceeds the risks that would arise from exempting the covered material.

Finally, to the extent the commenter suggests that the PRO, which is tasked with submission of exemption applications, is disincentivized to move them forward, those suggestions are unfounded. The exemptions do not reduce fees or shift the cost burden in a manner that disadvantages the PRO.

Public Resources Code Section 42060(b) Does Not Authorize Exclusions for Packaging Based on Concerns Other than Conflicts with Federal Requirements

CalRecycle rejects this comment to the extent it asserts that challenges and risks related to food packaging, including technical, economic, environmental, and health and safety risks, can justify exclusion pursuant to Public Resources Code section 42060(b) even when there is no direct conflict between the Act's requirements and a federal requirement. As explained above, the Legislature included express exemptions in the Act (Public Resources Code section 42060(a)(3) and (4)) to accommodate packaging that cannot satisfy the Act's requirements due to such challenges and risks. Construing section 42060(b) to allow exclusion of that packaging based on those same challenges and risks, without there being any conflict with a federal requirement, would mean section 42060(b) effectively supplants the exemptions under section 42060(a)(3) and (4). That result would severely undermine the Act because exemptions, by not changing packaging's status as "covered material," accommodate compliance obstacles while protecting two core principles of the Act. First, they preserve the intended effect of the Act's recycling rate requirements by ensuring that the rates calculated for covered materials accurately reflect the state of recycling infrastructure for single-use plastic. Second, they preserve the Act's intended effect of incentivizing development and use of recyclable, compostable, and reusable packaging.

The Statute Does Not Authorize Unconditional, Categorical Exclusion of Food and Agricultural Goods

To the extent the commenter intended to recommend that the regulation establish a "categorical exclusion" for food and agricultural goods that takes effect based solely on an entity's determination that it applies, without any action by CalRecycle, CalRecycle rejects that recommendation because it violates statutory interpretation principles. The Legislature provided express statutory exclusions from the definition of "covered material" in Public Resources Code section 42041(e)(2). The exclusions demonstrate that the Legislature intended for certain packaging to be unconditionally, categorically excluded. For example, section 42041(e)(2)(B) excludes packaging for pesticide products, and 42041(e)(2)(E) excludes beverage containers. The Legislature defined such exclusions with direct reference to entire categories of relevant goods, not with respect to extrinsic circumstances, such as practicality or legal conflicts, that must be considered and determined to be present for the exclusion to apply to the goods' packaging. In contrast, section 42060(b) does not expressly describe an exclusion for food and agricultural goods as a category. Instead, it requires that CalRecycle consider the potential for conflicts with federal requirements. The major textual differences between these statutory provisions prove that the

Legislature did not intend for them to have the same effect. Accordingly, section 42060(b) cannot be read as an unconditional, categorical exclusion. Instead, CalRecycle reasonably interprets section 42060(b) as authorizing CalRecycle to establish rules for determining when an exclusion is justified because the circumstance described in statute (a conflict with federal requirements) is present.

The Revisions Add Minor Procedural Provisions to Protect Against Inappropriate Applications of the Exclusion

Lastly, without revision, the regulation could have had results that would have drastically undermined the statute by potentially creating a loophole. In particular, the previous draft did not clearly state that CalRecycle could decline to recognize a business's determination that the exclusion applies. Commenters on the previous version pointed out that, without some mechanism for CalRecycle to do so, a business could submit a determination that is patently incorrect, submitted with no justification, or even in bad faith, and thereby inappropriately secure at least 300 days of the exclusion (60 days to respond to CalRecycle's initial request for information, 60 additional days to provide additional information if CalRecycle requests it, and 180 more days before the exclusion would be deemed not to apply. Even then, the previous draft of the regulation did not clearly state that a new determination could not be submitted to again initiate that entire process. The commenter's opposition to CalRecycle closing these loopholes effectively requests that CalRecycle adopt a rule that would allow businesses to repeatedly claim that any packaging—even packaging that is not food and agriculture packaging--is eligible for the exclusion, thereby securing a perpetual exclusion for the packaging.

To the extent the commenter asserts that the revisions impose undue procedural burdens, such assertion is unsupportable. The only significant procedural burden added by the revisions is a burden on CalRecycle, which will have the burden of determining, within 90 days, whether a submission has all required elements and whether there is specific packaging that the submission must address to be considered complete. CalRecycle acknowledges that the 90-day timeline may create a period of uncertainty for the businesses, but the time frame carefully balances the workload for CalRecycle to review the notices for completeness and any burden of the delay in obtaining certainty for the businesses. In contrast, the addition of subparagraph (B) (the criteria for whether use of alternative packaging is reasonably possible) imposes no additional burden. Instead, it only establishes a consistent framework for how submissions must establish the basis for the exclusion (a requirement that was included in the first draft of the proposed regulation) and how CalRecycle will assess that basis. The commenter's objection impliedly suggests that the regulations should not require submissions to establish that the "not reasonably possible" standard (a standard

that was also included in the first draft of the proposed regulations), has been met. That is not a reasonable suggestion.

B-4: Caruthers Raisin Packing Co., Inc. (DENNIS DEE HOUSEPIAN)

Comment B-4-1

THE BILL AS WRITTEN IS UNREALISTIC AND POORLY CONCEIVED. JUST ANOTHER "FEEL GOOD" BILL, THAT SHOWS TOTAL DISREGARD TO PACKAGING AVAILABILITY, COSTS AND MEANS TO COMPETE WITH SUPPLIERS OUTSIDE OF CALIFORNIA, BOTH DOMESTICALLY AND INTERNATIONALLY. THIS BILL WILLFULLY IGNORES THAT CUSTOMERS AND CONSUMERS ARE LOOKING TO KEEP COSTS DOWN, WHICH THIS BILL WILL ACTUALLY DRIVE COSTS HIGHER. SOMETHING THIS BILL IGNORES COMPLETELY. FORCING SUCH LEGISLATION UNTIL SUCH TIME THAT PACKAGING IS AVAILABLE AND COST EFFECTIVE TO ALLOW BUSINESS TO COMPLY, WILL ONLY SERVE TO FOR US TO MOVE OPERATIONS OUT OF THE STATE TO REMAIN COMPETITIVE.

Response to B-4-1

Comment rejected. No response to this comment is necessary because it does not concern the revisions made to the proposed regulations.

B-5: Durant Harvesting, Inc. (Laura Domingos)

Comment B-5-1

To CalRecycle:

I am submitting comments on the January 29, 2026, final draft regulations implementing the SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act on behalf of my company, a fresh produce packer operating in California.

The revised language in Section 18980.2 (Categorically Excluded Materials) is deeply concerning. The addition of the word "mandatory," coupled with the narrowed definition of what is "reasonably possible," effectively eliminates the categorical exclusion pathway for fresh produce packaging.

Federal food safety statutes, regulations, and FDA guidance represent the current and widely accepted compliance framework for the fresh produce industry. Packaging decisions are driven first and foremost by food safety requirements, including FSMA and FDA food-contact standards, which are designed to prevent contamination and protect public health. These federal requirements have long served as the appropriate benchmark for determining whether packaging is safe, functional, and legally compliant.

In addition to food safety, fresh produce packaging serves multiple critical functions throughout the supply chain, including preventing food waste and reducing greenhouse gas emissions, while ensuring the delivery of high-quality fruits and vegetables to Californians. Packaging is essential to maintaining product integrity during harvesting, cooling, transportation, and retail handling. Fresh produce packaging is highly technical and carefully engineered to:

• Protect fragile produce from physical damage during transit and handling
• Optimize transportation efficiency, reducing energy demands across the supply chain
• Maintain airflow, moisture control, and structural stability
• Preserve shelf life and product quality

Fresh produce packaging is also designed to keep produce alive longer by managing respiration and moisture. These functions:

• Reduce spoilage and contamination throughout the supply chain
• Reduce food waste, which directly lowers greenhouse gas emissions associated with food production, transportation, and disposal

Packaging changes that conflict with established federal food safety guidance or compromise package integrity or shelf life will increase food waste and associated greenhouse gas emissions, directly undermining California's environmental and climate objectives.

As drafted, the regulation requires producers to prove that:

• No alternative packaging complies with FSMA, FDA food-contact requirements, and California law. While the fresh produce industry continually evaluates alternatives to improve sustainability, most available options do not provide the same functionality as the current industry standard, increasing risks of food waste, contamination, and higher costs to consumers.
• Conflicts cannot be resolved through the use of liners, coatings, or closures. Eliminating access to these tools removes viable pathways for innovation and will hinder advancement in packaging technology.
• A full package redesign would still fail to meet food safety or legal requirements. Food safety remains the highest priority for the fresh produce industry, and packaging redesigns cannot compromise that obligation.

This standard is unworkable and does not reflect real-world food safety, operational, or supply-chain constraints. In many cases, alternative materials either do not exist or would increase contamination risk, compromise package integrity, shorten shelf life, or significantly increase food waste.

Without a viable categorical exclusion, SB 54 would impose:

• Unrealistic recycling and recyclability mandates

• Permanent caps on single-use plastic packaging with no accommodation for business growth
• Significant extended producer responsibility (EPR) fees and exposure to civil penalties of up to $50,000 per day, per SKU

I respectfully urge CalRecycle to revise the final regulation to restore a clear and workable categorical exclusion that recognizes federal food safety packaging guidance as the accepted compliance pathway and acknowledges the essential role of packaging in food safety, product integrity, waste reduction, and greenhouse gas mitigation.

Thank you for considering these comments.

Sincerely,

Laura Domingos

B-7: Destiny Farms, LLC (Laura Domingos)

Comment B-7-1

To CalRecycle:

I am submitting comments on the January 29, 2026, final draft regulations implementing the SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act on behalf of my company, a fresh produce grower operating in California.

The revised language in Section 18980.2 (Categorically Excluded Materials) is deeply concerning. The addition of the word "mandatory," coupled with the narrowed definition of what is "reasonably possible," effectively eliminates the categorical exclusion pathway for fresh produce packaging.

Federal food safety statutes, regulations, and FDA guidance represent the current and widely accepted compliance framework for the fresh produce industry. Packaging decisions are driven first and foremost by food safety requirements, including FSMA and FDA food-contact standards, which are designed to prevent contamination and protect public health. These federal requirements have long served as the appropriate benchmark for determining whether packaging is safe, functional, and legally compliant.

In addition to food safety, fresh produce packaging serves multiple critical functions throughout the supply chain, including preventing food waste and reducing greenhouse gas emissions, while ensuring the delivery of high-quality fruits and vegetables to Californians. Packaging is essential to maintaining product integrity during harvesting, cooling, transportation, and retail handling. Fresh produce packaging is highly technical and carefully engineered to:

• Protect fragile produce from physical damage during transit and handling
• Optimize transportation efficiency, reducing energy demands across the supply chain
• Maintain airflow, moisture control, and structural stability
• Preserve shelf life and product quality

Fresh produce packaging is also designed to keep produce alive longer by managing respiration and moisture. These functions:

• Reduce spoilage and contamination throughout the supply chain
• Reduce food waste, which directly lowers greenhouse gas emissions associated with food production, transportation, and disposal

Packaging changes that conflict with established federal food safety guidance or compromise package integrity or shelf life will increase food waste and associated greenhouse gas emissions, directly undermining California's environmental and climate objectives.

As drafted, the regulation requires producers to prove that:

• No alternative packaging complies with FSMA, FDA food-contact requirements, and California law. While the fresh produce industry continually evaluates alternatives to improve sustainability, most available options do not provide the same functionality as the current industry standard, increasing risks of food waste, contamination, and higher costs to consumers.
• Conflicts cannot be resolved through the use of liners, coatings, or closures. Eliminating access to these tools removes viable pathways for innovation and will hinder advancement in packaging technology.
• A full package redesign would still fail to meet food safety or legal requirements. Food safety remains the highest priority for the fresh produce industry, and packaging redesigns cannot compromise that obligation.

This standard is unworkable and does not reflect real-world food safety, operational, or supply-chain constraints. In many cases, alternative materials either do not exist or would increase contamination risk, compromise package integrity, shorten shelf life, or significantly increase food waste.

Without a viable categorical exclusion, SB 54 would impose:

• Unrealistic recycling and recyclability mandates

• Permanent caps on single-use plastic packaging with no accommodation for business growth
• Significant extended producer responsibility (EPR) fees and exposure to civil penalties of up to $50,000 per day, per SKU

I respectfully urge CalRecycle to revise the final regulation to restore a clear and workable categorical exclusion that recognizes federal food safety packaging guidance as the accepted compliance pathway and acknowledges the essential role of packaging in food safety, product integrity, waste reduction, and greenhouse gas mitigation.

Thank you for considering these comments.

Sincerely,

Laura Domingos
Office Manager
Destiny Farms, LLC
Santa Maria, CA 93456

Response to B-7-1

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment B-3-1, which is substantively the same as this comment.

B-8: Lucky Farms, Inc. (Bryan Cogley)

Comment B-8-1

February 2, 2026

To CalRecycle,

I am submitting comments on the February 2nd, 2026, final draft regulations for the SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act on behalf of Lucky Farms, Inc., a California-based grower, packer, and distributor of fresh produce.

We are concerned about the revisions to Section 18980.2 (Categorically Excluded Materials). Specifically, the addition of "mandatory" and the narrowed interpretation of what is considered "reasonably possible" effectively removes the categorical exclusion option for fresh produce packaging.

Fresh produce packaging is governed by federal food safety statutes, regulations, and FDA guidance, which represent the recognized compliance framework for our industry. Decisions about packaging are primarily driven by food safety requirements, including FSMA and FDA food-contact standards, designed to prevent contamination and protect

public health. These federal standards have long served as the baseline for determining whether packaging is safe and legally compliant.

Beyond food safety, packaging is critical to maintaining product quality, reducing food waste, and minimizing greenhouse gas emissions. Fresh produce packaging is highly engineered to:

Protect fragile products from damage during harvesting, cooling, transportation, and handling

Optimize transportation efficiency and reduce energy use

Maintain airflow, moisture control, and structural integrity

Preserve shelf life and overall product quality

Proper packaging also helps manage respiration and moisture, which reduces spoilage and contamination throughout the supply chain. Packaging changes that conflict with federal food safety guidance or compromise product integrity would increase food waste and related greenhouse gas emissions, undermining California's environmental goals.

As currently drafted, the regulation would require producers to demonstrate that:

No alternative packaging can meet FSMA, FDA food-contact requirements, and California law. Many alternatives do not match the functionality of existing solutions, creating higher risks of waste, contamination, and added costs.

Packaging conflicts cannot be addressed through liners, coatings, or closures. Limiting these tools could slow progress in alternative packaging development.

Full redesigns of packaging would still comply with food safety and legal requirements. Food safety remains the highest priority in the fresh produce industry.

This standard is unrealistic and does not reflect the realities of food safety, operational, and supply chain constraints. In many cases, alternatives either do not exist or would increase risk, compromise integrity, shorten shelf life, or generate more waste.

Without a functional categorical exclusion, SB 54 could impose:

Unachievable recycling and recyclability requirements

Permanent caps on single-use plastic packaging without considering business growth

Significant EPR fees and potential civil penalties of up to $50,000 per day per SKU

We respectfully urge CalRecycle to revise the final regulations to reinstate a clear, workable categorical exclusion that recognizes federal food safety guidance as the baseline and acknowledges the essential role packaging plays in food safety, product integrity, waste reduction, and greenhouse gas mitigation.

Thank you for considering these comments.

Sincerely,
Bryan Cogley
Operations Manager
Lucky Farms, Inc.

Response to B-8-1

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment B-3-1, which is substantively the same as this comment.

B-9: Superior Farms (Laura Cruz)

Comment B-9-1

Our protein manufacturing facility supports the environmental goals of SB 54; however, the bill's current packaging requirements create unavoidable conflicts with USDA and FDA food safety standards.

Flexible plastic packaging is the only material that safely protects perishable protein products. Alternatives such as paper or glass cannot meet required durability, barrier protection, or performance needs. Emerging "recycle-ready" materials are not yet validated for high-abuse food supply chains, nor does the U.S. have recycling streams for food-contact flexible films.

Critical materials like nylon and polyester cannot be removed without increasing spoilage and systemwide waste. Eliminating them would significantly raise package failure rates, reduce production efficiency, and ultimately increase emissions—undermining the environmental intent of SB 54.

For perishable foods, the most sustainable packaging is the one that prevents waste and maintains food safety. Without exemptions, SB 54 may unintentionally force choices that increase spoilage, emissions, and regulatory non-compliance.

We respectfully request targeted exemptions where recyclability mandates would compromise food safety or increase overall waste.

I welcome the opportunity to discuss practical solutions.

Response to B-9-1

Comment rejected. No further revisions are necessary because section 18980.2(a)(2) ensures that all packaging implicating food safety concerns will not be considered "covered material" if it is not possible to comply with the Act and federal food safety regulations. To the extent that the commenter's request is that section 18980.2(a)(2) apply when there are food safety and waste concerns despite federal regulations not preventing compliance with the Act, CalRecycle rejects that request because there would be no conflict with federal legal requirements, so the basis for the exclusion in section 18980.2(a)(2) cannot apply. See, also, CalRecycle's response to comment B-3-1, which further explains the basis of 18980.2(a)(2), its scope, and the availability of exemptions. As explained in that response, the mere theoretical possibility of alternatives that comply with federal law does not eliminate the conflict with federal law or otherwise render the exclusion established in section 18980.2(a)(2) unavailable. Moreover, the commenter requests that "exemptions be granted when "recyclability mandates would undermine food safety or increase overall waste," but section 18980.2.4 (implementing Public Resources Code section 42060(a)(3) and (4)) already establishes that exemptions from recyclability requirements are available to address "unique challenges" and health and safety concerns. Further revising section 18980.2(a)(2) to address the commenter's concern would therefore be duplicative.

B-10: Anonymous

Comment B-10-1

I represent a food manufacturing facility serving the State of California.

While I recognize SB 54 and EPR legislation as efforts toward environmental reform, the regulations as currently written will materially impair our ability to operate efficiently while maintaining compliance with USDA and FDA food safety requirements.

There are no commercially viable alternatives to plastic-based flexible packaging for our products. We cannot transition to paper, glass, or other materials without compromising product safety, integrity, and regulatory compliance. Although recyclable or "recycle-ready" resins are under development, there is currently no established recycling stream in the United States for packaging that has been in direct contact with perishable food products. In addition, many of these emerging materials have not been validated for performance in high-abuse supply chains.

Materials such as nylon and polyester are critical to protecting our perishable products. Nylon provides puncture resistance necessary to withstand distribution and handling. Without it, spoilage and failure rates increase significantly (estimated 15–20%). Polyester substrates are essential to maintaining line speeds and operational efficiency.

Removing them would reduce production efficiency by approximately 20–25%, increasing run time, emissions, rework, and spoilage.

The most sustainable packaging solution for perishable goods is one that protects and extends shelf life. This approach aligns with USDA and FDA requirements and helps reduce food waste. In the United States, over one-third of food is wasted. Compromising packaging performance will increase spoilage and overall carbon emissions across the supply chain.

As written, SB 54 may create conflicts with federal food safety regulations. We respectfully request that exemptions be granted where compliance with recyclability mandates would undermine food safety and increase waste.

Response to B-10-1

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment B-9-1, which raises the same issues and makes the same request as does this comment.

B-11: Volm Companies, Inc. (Marsha Pozza)

Comment B-11-1

Subject: Comments on SB 54 Final Draft Regulations – 15-Day Comment Period
To CalRecycle:
I am submitting comments on the final draft of the "SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act" regulation, dated January 29, 2026, on behalf of my company, which is a manufacturer of fresh produce packaging operating in California.
The updated language in Section 18980.2 (Categorically Excluded Materials) is very troubling. Including the word "mandatory" and restricting the meaning of "reasonably possible" essentially removes the categorical exclusion option for fresh produce packaging.
Federal food safety packaging statutes, regulations, and FDA guidance constitute the current, widely accepted compliance pathway for the fresh produce industry. Packaging decisions are driven by food safety requirements, including FSMA and FDA food-contact standards, which are designed to prevent contamination and protect public health. These federal requirements have long served as the appropriate benchmark for determining whether packaging is safe and legally compliant.
Beyond ensuring food safety, fresh produce packaging performs several vital roles, such as streamlining the supply chain to reduce food waste and greenhouse gas emissions, and guaranteeing that Californians receive high-quality fruits and vegetables. It is essential for preserving the produce's integrity during harvesting, cooling, transportation, and retail handling. This packaging is highly specialized and meticulously designed to:
• Protect fragile produce from physical damage during transit and handling

• Optimize transportation efficiency to reduce energy demands on the supply chain
• Maintain airflow, moisture control, and structural stability
• Preserve shelf life and product quality
Fresh produce packaging is also designed to keep produce fresh longer by managing respiration and moisture. These functions:
• Reduce spoilage and contamination across the supply chain
• Reduce food waste, which directly reduces greenhouse gas emissions from the production, transportation, and disposal of wasted food
Packaging modifications that go against established federal food safety guidelines or weaken package integrity or shelf life can lead to increased food waste and higher GHG emissions, undermining California's environmental and climate goals.
As drafted, the regulation requires producers to demonstrate that:
• No alternative packaging complies with FSMA, FDA food-contact requirements, and California law. The fresh produce industry continually evaluates alternatives to further enhance food quality and safety. Most alternatives do not match the functionality of the industry gold standard, increasing the risk of food waste and contamination and raising costs for consumers.
• Conflicts cannot be resolved through liners, coatings, or closures. Removing access to tools that support the transition to alternative packaging will stifle advancements in packaging technology.
• A full package redesign would still fail to meet food safety or legal requirements. Food safety is a critical priority for the fresh produce industry.
This standard is impractical and fails to accurately represent real-world food safety, operational limitations, and supply-chain challenges. Often, alternative materials are either unavailable or could raise contamination risks, weaken package integrity, reduce shelf life, or lead to more food waste.
Without a viable categorical exclusion, SB 54 would impose:
• Unrealistic recycling and recyclability mandates
• Permanent caps on single-use plastic packaging with no accommodations for business growth
• Significant EPR fees and exposure to civil penalties of up to $50,000 per day per SKU
I kindly encourage CalRecycle to update the final regulation to re-establish a clear and practical categorical exclusion. This should acknowledge federal food safety packaging guidance as the preferred compliance route and highlight the important role of packaging in ensuring food safety, maintaining package integrity, reducing waste, and lowering greenhouse gas emissions.
Thank you for taking these comments into consideration.
Sincerely,
Marsha Pozza
Director of Marketing & Communications
Volm Companies, Inc.

Response to B-11-1

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment B-3-1.

B-12: HMC Farms (Chelsea Ketelsen)

Comment B-12-1

To CalRecycle:
I am submitting comments on the Jan. 29, 2026, final draft "SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act" regulation on behalf of my company, HMC Farms, fresh produce operating in California.
The revised language in Section 18980.2 (Categorically Excluded Materials) is deeply concerning. The addition of the word "mandatory" and the narrow definition of what is "reasonably possible" effectively eliminates the categorical exclusion pathway for fresh produce packaging.
Federal food safety packaging statutes, regulations and FDA guidance represent the current, widely accepted compliance pathway for the fresh produce industry. Packaging decisions are driven by food safety requirements, including FSMA and FDA food-contact standards, which are designed to prevent contamination and protect public health. These federal requirements have long served as the appropriate benchmark for determining whether packaging is safe and legally compliant.
In addition to food safety, fresh produce packaging serves many other critical functions for fresh produce, including optimizing the supply chain to prevent food waste and greenhouse gas emissions, and ensuring the delivery of quality fruits and vegetables to Californians. Packaging is necessary to maintain the integrity throughout harvesting, cooling, transportation and retail handling. Fresh produce packaging is highly technical and carefully engineered to:
• Protect fragile produce from physical damage during transit and handling
• Optimize transportation efficiency which reduces energy demands on the supply chain
• Maintain airflow, moisture control and structural stability
• Preserve shelf life and product quality
Fresh produce packaging is also designed to keep produce alive longer by managing respiration and moisture. These functions:
• Reduce spoilage and contamination across the supply chain
• Reduce food waste, which directly reduces greenhouse gas emissions associated with wasted food production, transportation and disposal
Packaging changes that conflict with established federal food safety guidance or compromise package integrity or shelf life will increase food waste and associated GHG emissions, undermining California's environmental and climate objectives.
As drafted, the regulation requires producers to prove that:
• No alternative packaging complies with FSMA, FDA food-contact requirements and California law. The fresh produce industry is constantly evaluating alternatives to further enhance food quality and safety. Most alternatives do not provide the same functionality as the industry gold standard, leading to increased risk of food waste, contamination, and costs to consumers.
• Conflicts cannot be resolved through liners, coatings or closures. Removing access to tools that can support the transition to alternatives packaging will stifle advancements and packaging technology advancements.

• A full package redesign would still fail food safety or legal requirements. Food safety is a critical priority for the fresh produce industry.
This standard is unworkable and does not reflect real-world food safety, operational and supply-chain constraints. In many cases, alternative materials either do not exist or would increase contamination risk, compromise package integrity, shorten shelf life or increase food waste.
Without a viable categorical exclusion, SB 54 would impose:
• Unrealistic recycling and recyclability mandates
• Permanent caps on single-use plastic packaging with no accommodation for business growth
• Significant EPR fees and exposure to civil penalties of up to $50,000 per day, per SKU
I respectfully urge CalRecycle to revise the final regulation to restore a clear, workable categorical exclusion that recognizes federal food safety packaging guidance as the accepted compliance pathway and the essential role of packaging in food safety, package integrity, waste reduction and greenhouse gas mitigation.
Thank you for considering these comments.
Sincerely,
Chelsea Ketelsen
Director of Marketing
HMC Farms
Kingsburg, CA

Response to B-12-1

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment B-3-1, which is substantively the same as this comment.

B-13: Lakeside Organic Gardens (Juan Gonzalez)

Comment B-13-1

To CalRecycle:
I am submitting these comments regarding the January 29, 2026, final draft regulations implementing the SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act. I submit these comments on behalf of my company, Lakeside Organic Gardens, a California-based grower, packer, and shipper of fresh produce that supplies both in-state and national markets.
While I support the stated goals of reducing plastic pollution and improving recycling outcomes, the current draft regulations—particularly the revisions to Section 18980.2 governing Categorically Excluded Materials—create serious and unworkable conflicts for the fresh produce industry.
Elimination of a Workable Categorical Exclusion
The revised language in Section 18980.2 effectively eliminates the categorical exclusion pathway that previously recognized the unique food safety and operational realities of fresh produce packaging. The introduction of the word "mandatory" and the narrowed interpretation of what is "reasonably possible" impose an evidentiary burden that is

impractical, legally risky, and disconnected from how food safety compliance actually functions in real-world agricultural operations.

Fresh produce packaging is governed first and foremost by federal food safety requirements, including the Food Safety Modernization Act (FSMA), FDA food-contact regulations, and related guidance. These requirements exist to prevent contamination, protect public health, and ensure that food reaches consumers in a safe condition. Packaging choices are not discretionary—they are integral components of a validated food safety system.

Requiring producers to prove, on a package-by-package basis, that no conceivable alternative material could ever comply with these federal requirements places growers and packers in an untenable position and exposes them to unacceptable regulatory and liability risk.

Packaging Is a Food Safety and Waste-Reduction Tool

Fresh produce packaging is not simply a marketing or convenience choice. It is a technical, engineered system designed to:

• Protect fragile commodities from damage during harvest, cooling, transportation, and retail handling
• Maintain airflow, moisture balance, and structural integrity
• Manage respiration to extend shelf life
• Reduce spoilage, contamination, and product loss across the supply chain

These functions directly reduce food waste. Increased food waste results in higher greenhouse gas emissions from wasted production inputs, transportation, refrigeration, and disposal—undermining California's environmental and climate objectives. Packaging changes that compromise food safety, package integrity, or shelf life will increase waste, raise costs for consumers, and disrupt reliable access to fresh fruits and vegetables.

The Revised Standard Is Not Practically Achievable

Under the current draft, producers must demonstrate that:

• No alternative packaging complies with FSMA, FDA food-contact rules, and California law
• Conflicts cannot be resolved through liners, coatings, or closures
• Even a complete package redesign would still fail food safety or legal requirements

This standard ignores the reality that many alternative materials either do not exist at commercial scale, do not perform adequately in wet or cold-chain environments, or introduce new contamination and quality risks. Prohibiting the use of liners, coatings, or closures as compliance tools removes pathways for innovation rather than encouraging it.

Severe Economic and Operational Consequences

Absent a functional categorical exclusion, the regulations would impose:

• Unrealistic recyclability and recycling-rate mandates for food-contact packaging
• Permanent caps on plastic packaging with no accommodation for business growth, seasonality, or market demand
• Significant and open-ended EPR fees set by a Producer Responsibility Organization
• Exposure to civil penalties of up to $50,000 per day, per SKU, and potential packaging bans

For fresh produce operations operating on thin margins, these requirements represent substantial financial risk and could force packaging decisions that are inconsistent with food safety best practices.
Requested Revisions
I respectfully urge CalRecycle to revise the final regulations to:
• Restore a clear, workable categorical exclusion pathway for fresh produce packaging
• Recognize compliance with federal food safety packaging requirements as the appropriate benchmark
• Allow reasonable use of liners, coatings, and closures to resolve material conflicts
• Ensure that environmental goals are pursued without increasing food waste, safety risk, or consumer costs
A balanced approach can and should protect public health, maintain food system reliability, and advance California's environmental objectives.
Thank you for the opportunity to submit these comments and for your consideration of the unique challenges facing California's fresh produce industry.
Sincerely,

Juan Gonzalez
Chief Operating Officer
Lakeside Organic Gardens
Watsonville, CA

Tracy CA 95377
(209)221-6208
WE are a Ground Beef manufacuring plant that processes Beef trims into patties, Hot dogs, and Meat balls and package them into flexible packaging (PE bage ,or polyester/PE and nylon/PE laminated films). We purchase the plastic items from out of state suppliers. Does that make us the producer ?

Response to B-14-1

Comment rejected. No response to this comment is necessary because it does not concern the revisions made to the proposed regulations.

Comment B-14-2

Also We are a USDA/FSIS inspected plant does that make us exsempt ?

Response to B-14-2

Comment rejected. No response to this comment is necessary because it does not concern the revisions made to the proposed regulations.

Comment B-14-3

Costco also has multible plants in california, do we need to report by location or company?

Response to B-14-3

Comment rejected. No response to this comment is necessary because it does not concern the revisions made to the proposed regulations.

B-15: Bright and Green (Carly Tambling)

Comment B-15-1

I strongly support SB 54's direction. However, I would like to encourage the Department to strengthen the implementation guidance within the regulations to ensure these goals are achieved without unintended negative impacts on small businesses, local governments, and community operators. This includes standardizing data collection systems and the reporting frameworks used to measure impact, so compliance is clear, consistent, and achievable.

System change can fail not because goals are incorrect, but because pathways are unclear.

I recommend that the Department incorporate or reference practical, minimum-viable guidance that shows how entities can move from single-use systems toward reuse in a realistic, phased way. This includes:

Recognizing simple 3-sink basin washing as a minimum, accessible baseline for reuse and food service ware washing

Providing guidance or references to existing sources of reusable service ware

Identifying wash hubs, commissary kitchens, or shared washing infrastructure as viable compliance pathways

Acknowledging the role of implementation consultants and reuse service providers who support planning, logistics, education, and compliance

Offering clear "if you currently use disposables, here is how to start" pathways rather than assuming full system redesign at once

Circular economy systems work best when they are shown, not just required. For example, bring-your-own container programs alone are not sufficient when establishments have legitimate concerns about food safety and liability. Clear regulations paired with practical implementation guidance will::
Reduce compliance confusion

Accelerate reuse adoption

Ensure SB 54's goals translate into real, on-the-ground success

SB 54 will be strongest when it not only sets expectations, but also shows the way forward.
Best Regards,
Carly Tambling
Bright & Green
Arcata, California

B-16: Lucky Farms, Inc. (Bryan Cogley)

Comment B-16-1

From: Bryan Cogley
Sent: Monday, February 2, 2026 2:42 PM
To: CalRecycle Public Affairs
Subject: Comments on SB 54 Final Draft Regulations – Lucky Farms, Inc.

Caution: This email originated from outside of the organization. Do not click links or open
attachments unless you recognize the sender and know the content is safe.

February 2, 2026

To CalRecycle,

I am submitting the following summary comments on the January 29, 2026, final draft regulations for the SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act on behalf of **Lucky Farms, Inc.,** a California-based grower, packer, and distributor of fresh produce.

Lucky Farms is concerned that revisions to Section **18980.2 (Categorically Excluded Materials),** particularly the addition of the term “mandatory” and the restrictive

interpretation of what is “reasonably possible,” effectively eliminate the categorical exclusion for fresh produce packaging. As drafted, the provision does not reflect the realities of food safety, supply chain operations, or available packaging technology.

Fresh produce packaging is governed primarily by federal food safety laws and FDA guidance, including FSMA and food-contact material standards. These requirements exist to protect public health and represent the established and widely accepted compliance framework for the produce industry. Packaging decisions must prioritize contamination prevention, product integrity, and consumer safety.

In addition to food safety, produce packaging plays a critical role in maintaining quality, reducing food loss, and minimizing greenhouse gas emissions. Packaging is carefully designed to protect fragile commodities, maintain airflow and moisture balance, preserve shelf life, and optimize transportation efficiency. Packaging systems that compromise these functions will increase spoilage and food waste, directly undermining California’s environmental and climate objectives.

The current regulatory language places an unworkable burden on producers to demonstrate that no alternative packaging could meet food safety, legal, and operational requirements, even where such alternatives are not commercially viable or would increase contamination risk and food waste. This standard does not align with real-world agricultural and distribution practices.

Without a functional categorical exclusion, SB 54 risks imposing recycling mandates and
material restrictions that conflict with food safety requirements, limit operational growth, and expose produce companies to significant fees and penalties without delivering corresponding environmental benefits.

Lucky Farms respectfully urges CalRecycle to revise the final regulations to restore a clear and practical categorical exclusion that recognizes federal food safety standards as the appropriate benchmark and acknowledges the essential role of packaging in food safety, waste reduction, and greenhouse gas mitigation.

Thank you for the opportunity to provide these comments.

Best regards,

Response to B-16-1

CalRecycle rejects this comment for the reasons stated in response to comment B-3-1, which raises the same concerns and offers the same recommendation as does this comment.

B-17: LK Packaging (Doron Chertkow)

Comment B-17-1

We are ok with the most recent proposed changes to SB 54, as long as no additional ones are planned.

Response to B-17-1

Comment rejected. No response to this comment is necessary because it does not concern the revisions made to the proposed regulations.

B-18: Main Street Produce (Dan Piester)

Comment B-18-1

Subject (optional): Comments on SB 54 Final Draft Regulations – 15-Day Comment Period

To CalRecycle:

I am submitting comments on the Jan. 29, 2026, final draft "SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act" regulation on behalf of my company, a [grower/packer/shipper/distributor] of fresh produce operating in California.

The revised language in Section 18980.2 (Categorically Excluded Materials) is deeply concerning. The addition of the word "mandatory" and the narrow definition of what is "reasonably possible" effectively eliminates the categorical exclusion pathway for fresh produce packaging.

Federal food safety packaging statutes, regulations and FDA guidance represent the current, widely accepted compliance pathway for the fresh produce industry. Packaging decisions are driven by food safety requirements, including FSMA and FDA food-contact standards, which are designed to prevent contamination and protect public health. These federal requirements have long served as the appropriate benchmark for determining whether packaging is safe and legally compliant.

In addition to food safety, fresh produce packaging serves many other critical functions for fresh produce, including optimizing the supply chain to prevent food waste and greenhouse gas emissions, and ensuring the delivery of quality fruits and vegetables to Californians. Packaging is necessary to maintain the integrity throughout harvesting, cooling, transportation and retail handling. Fresh produce packaging is highly technical and carefully engineered to:
Protect fragile produce from physical damage during transit and handling
Optimize transportation efficiency which reduces energy demands on the supply chain
Maintain airflow, moisture control and structural stability
Preserve shelf life and product quality
Fresh produce packaging is also designed to keep produce alive longer by managing respiration and moisture. These functions:
Reduce spoilage and contamination across the supply chain
Reduce food waste, which directly reduces greenhouse gas emissions associated with wasted food production, transportation and disposal
Packaging changes that conflict with established federal food safety guidance or compromise package integrity or shelf life will increase food waste and associated GHG emissions, undermining California's environmental and climate objectives.
As drafted, the regulation requires producers to prove that:
No alternative packaging complies with FSMA, FDA food-contact requirements and California law. The fresh produce industry is constantly evaluating alternatives to further enhance food quality and safety. Most alternatives do not provide the same functionality as the industry gold standard, leading to increased risk of food waste, contamination, and costs to consumers.
Conflicts cannot be resolved through liners, coatings or closures. Removing access to tools that can support the transition to alternatives packaging will stifle advancements and packaging technology advancements.
A full package redesign would still fail food safety or legal requirements. Food safety is a critical priority for the fresh produce industry.
This standard is unworkable and does not reflect real-world food safety, operational and supply-chain constraints. In many cases, alternative materials either do not exist or would increase contamination risk, compromise package integrity, shorten shelf life or increase food waste.
Without a viable categorical exclusion, SB 54 would impose:
Unrealistic recycling and recyclability mandates
Permanent caps on single-use plastic packaging with no accommodation for business growth
Significant EPR fees and exposure to civil penalties of up to $50,000 per day, per SKU

Thank you for considering these comments.
I respectfully urge CalRecycle to revise the final regulation to restore a clear, workable categorical exclusion that recognizes federal food safety packaging guidance as the accepted compliance pathway and the essential role of packaging in food safety, package integrity, waste reduction and greenhouse gas mitigation.
Sincerely,
Dan Piester

General Manager
Main Street Produce LLC

Response to B-18-1

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment B-3-1, which is substantively the same as this comment.

B-19: Anthony Vineyards, Inc (Domenick Bianco)

Comment B-19-1

Please see our letter of strong opposition to the current language in Section 18980.2

Response to B-19-1

No response to this portion of the commenter's submission is necessary because it is an introduction to later, more detailed portions of the submission and does not add suggestions or objections to those expressed in those portions, to which CalRecycle has responded separately.

Comment B-19-2

February 2, 2026

Dear CalRecycle,

Anthony Vineyards Inc. submits these comments regarding the Jan. 29, 2026, SB 54 draft. We are deeply concerned that the revised language in **Section 18980.2** effectively eliminates the categorical exclusion for fresh produce packaging, creating a standard that is operationally and technically unworkable.

The addition of the word "mandatory" and the narrow definition of "reasonably possible" ignore three critical realities:

· **Federal Compliance:** Our packaging is governed by the Food Safety Modernization Act (FSMA) and FDA standards. These federal benchmarks are essential for preventing contamination. The regulation must recognize federal law as a sufficient compliance pathway.

· **Environmental Impact:** Fresh produce packaging is engineered to manage respiration and

moisture. Replacing these materials with unvetted alternatives will increase food spoilage and
greenhouse gas emissions, directly contradicting California's climate and waste reduction goals.

· **Economic Viability:** Without a functional exclusion, producers face significant EPR fees and
potential civil penalties of $50,000 per day, per SKU. These costs threaten California's agricultural
supply chain and will increase food prices for consumers.

The current requirement for producers to prove that no hypothetical redesign could ever meet safety
standards is an unrealistic evidentiary hurdle.

**Anthony Vineyards Inc. respectfully urges CalRecycle to restore a workable categorical exclusion
that recognizes the essential role of packaging in food safety and waste mitigation.** We ask that the
Department align these regulations with the practical constraints of the fresh produce industry.

Sincerely,

Domenick Bianco
Owner/President
Anthony Vineyards Inc.

Response to B-19-2

Comment rejected. Section 18980.2(a)(2) expressly does "recognize federal law as a sufficient compliance pathway." Unless food packaging can meet federal requirements, section 18980.2(a)(2) excludes it from the definition of "covered material." See, also, CalRecycle's response to comment B-3-1, which raises the same concerns and makes the same recommendation as does this comment. As further explained in that response, section 18980.2(a)(2) does not require proof that "no hypothetical redesign could ever meet safety standards."

B-20: Alta Vista Farms (Chris Matthews)

Comment B-20-1

To CalRecycle:

I am submitting comments on the Jan. 29, 2026, final draft "SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act" regulation on behalf of my company, a grower of fresh berries operating in California.

The revised language in Section 18980.2 (Categorically Excluded Materials) is deeply concerning. The addition of the word "mandatory" and the narrow definition of what is "reasonably possible" effectively eliminates the categorical exclusion pathway for fresh produce packaging.

Federal food safety packaging statutes, regulations and FDA guidance represent the current, widely accepted compliance pathway for the fresh produce industry. Packaging decisions are driven by food safety requirements, including FSMA and FDA food-contact standards, which are designed to prevent contamination and protect public health. These federal requirements have long served as the appropriate benchmark for determining whether packaging is safe and legally compliant.

In addition to food safety, fresh produce packaging serves many other critical functions for fresh produce, including optimizing the supply chain to prevent food waste and greenhouse gas emissions, and ensuring the delivery of quality fruits and vegetables to Californians. Packaging is necessary to maintain the integrity throughout harvesting, cooling, transportation and retail handling. Fresh produce packaging is highly technical and carefully engineered to:

Protect fragile produce from physical damage during transit and handling
Optimize transportation efficiency which reduces energy demands on the supply chain
Maintain airflow, moisture control and structural stability
Preserve shelf life and product quality
Fresh produce packaging is also designed to keep produce alive longer by managing respiration and moisture. These functions:

Reduce spoilage and contamination across the supply chain
Reduce food waste, which directly reduces greenhouse gas emissions associated with wasted food production, transportation and disposal
Packaging changes that conflict with established federal food safety guidance or compromise package integrity or shelf life will increase food waste and associated GHG emissions, undermining California's environmental and climate objectives.

As drafted, the regulation requires producers to prove that:

No alternative packaging complies with FSMA, FDA food-contact requirements and California law. The fresh produce industry is constantly evaluating alternatives to further enhance food quality and safety. Most alternatives do not provide the same functionality as the industry gold standard, leading to increased risk of food waste, contamination, and costs to consumers.

Conflicts cannot be resolved through liners, coatings or closures. Removing access to tools that can support the transition to alternatives packaging will stifle advancements and packaging technology advancements.
A full package redesign would still fail food safety or legal requirements. Food safety is a critical priority for the fresh produce industry.
This standard is unworkable and does not reflect real-world food safety, operational and supply-chain constraints. In many cases, alternative materials either do not exist or would increase contamination risk, compromise package integrity, shorten shelf life or increase food waste.

Without a viable categorical exclusion, SB 54 would impose:

Unrealistic recycling and recyclability mandates

Permanent caps on single-use plastic packaging with no accommodation for business growth

Significant EPR fees and exposure to civil penalties of up to $50,000 per day, per SKU

I respectfully urge CalRecycle to revise the final regulation to restore a clear, workable categorical exclusion that recognizes federal food safety packaging guidance as the accepted compliance pathway and the essential role of packaging in food safety, package integrity, waste reduction and greenhouse gas mitigation.

Thank you for considering these comments.

Sincerely,
Chris Matthews
Alta Vista Farms

Comment B-21-1

Comments on SB 54 Final Draft Regulations – 15-Day Comment Period

To CalRecycle:

I am submitting comments on the Jan. 29, 2026, final draft “SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act” regulation on behalf of my company, a small/medium sized farm of fresh produce operating in California.

The agricultural industry cannot withstand more regulations and more fees. That's all we have seen from every regulatory body in California for the last 18 years. Many of the regulations we see do not make sense or conflict with other regulations. This is one of those that is conflicting and unnecessary. Food Safety is a very serious issue that must take precedence over this proposed regulation.

The revised language in Section 18980.2 (Categorically Excluded Materials) is deeply concerning. The addition of the word "mandatory" and the narrow definition of what is "reasonably possible" effectively eliminates the categorical exclusion pathway for fresh produce packaging.

Federal food safety packaging statutes, regulations and FDA guidance represent the current, widely accepted compliance pathway for the fresh produce industry. Packaging decisions are driven by food safety requirements, including FSMA and FDA food-contact standards, which are designed to prevent contamination and protect public health. These federal requirements have long served as the appropriate benchmark for determining whether packaging is safe and legally compliant.

In addition to food safety, fresh produce packaging serves many other critical functions for fresh produce, including optimizing the supply chain to prevent food waste and greenhouse gas emissions, and ensuring the delivery of quality fruits and vegetables to Californians. Packaging is necessary to maintain the integrity throughout harvesting, cooling, transportation and retail handling. Fresh produce packaging is highly technical and carefully engineered to:

- Protect fragile produce from physical damage during transit and handling
- Optimize transportation efficiency which reduces energy demands on the supply chain
- Maintain airflow, moisture control and structural stability
- Preserve shelf life and product quality

Fresh produce packaging is also designed to keep produce alive longer by managing respiration and moisture. These functions:

- Reduce spoilage and contamination across the supply chain
- Reduce food waste, which directly reduces greenhouse gas emissions associated with wasted food production, transportation and disposal

Packaging changes that conflict with established federal food safety guidance or compromise package integrity or shelf life will increase food waste and associated GHG emissions, undermining California's environmental and climate objectives.

As drafted, the regulation requires producers to prove that:

- No alternative packaging complies with FSMA, FDA food-contact requirements and California law. The fresh produce industry is constantly evaluating alternatives to further enhance food quality and safety. Most alternatives do not provide the same functionality as the industry gold standard, leading to increased risk of food waste, contamination, and costs to consumers.

• Conflicts cannot be resolved through liners, coatings or closures. Removing access to tools that can support the transition to alternatives packaging will stifle advancements and packaging technology advancements.
• A full package redesign would still fail food safety or legal requirements. Food safety is a critical priority for the fresh produce industry.

This standard is unworkable and does not reflect real-world food safety, operational and supply-chain constraints. In many cases, alternative materials either do not exist or would increase contamination risk, compromise package integrity, shorten shelf life or increase food waste.

Without a viable categorical exclusion, SB 54 would impose:
• Unrealistic recycling and recyclability mandates
• Permanent caps on single-use plastic packaging with no accommodation for business growth
• Significant EPR fees and exposure to civil penalties of up to $50,000 per day, per SKU

I respectfully urge CalRecycle to revise the final regulation to restore a clear, workable categorical exclusion that recognizes federal food safety packaging guidance as the accepted compliance pathway and the essential role of packaging in food safety, package integrity, waste reduction and greenhouse gas mitigation.

Response to B-21-1

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment B-3-1, which is substantively the same as this comment.

B-22: ogCompanies (Thea Eubanks)

Comment B-22-1

ogCompanies(Thea Eubanks)

Response to B-22-1

Comment rejected. No response to this comment is necessary because it does not concern the revisions made to the proposed regulations.

Comment B-22-2

The updated draft of SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act" regulation effectively eliminates the categorical exclusion pathway for fresh produce packaging.
We truly believe the way this regulation is proceeding, we are headed down a path of virtually eliminating all fresh cut produce from consumer shelves negatively impacting the health of consumers.
Unachievable mandates:
Sets mandatory reduction requirements in both weight and number of plastic packaging components (10% by 2027, 25% by 2032)
Sets mandatory recyclable/compostable packaging directives that if not met by 2032, deems the packaging illegal to sell in CA.
ARTICLE 2 – Categorically Excluded Materials (Section 18980.2)
Addition of the word "mandatory" dramatically raises the burden of proof
Narrow definition of what is "reasonably possible" under Section 18980.2(a)(2)(B)

Response to B-22-2

Comment rejected. CalRecycle rejects this comment for the reasons provided in response to comment B-3-1, which raises the same objections to section 18980.2(a)(2) as does this comment. To the extent the commenter's reference to recyclability, compostability, and source reduction requirements as "unachievable mandates" does not concern section 18980.2(a)(2), no further response is necessary because no other relevant provisions of the proposed regulations have been revised.

Comment B-22-3

Additional concerns:
Packaging elimination compromises food safety and traceability, negatively affecting public health
It will ultimately increase food waste in the system and negate any environmental gains.
The current packaging protects the product from cross contamination in the supply chain and maintains the quality of fresh produce which is critical in a balanced, healthy diet.
Alternative packaging does not yet exist that meets our functionality needs to ship products from growing regions to consumers that are fresh and safe to eat, which in turn impacts consumers and their accessibility to fresh produce.
The costs are significant and cannot be absorbed by producers.
It increases packaging cost 10-20% and will result in a 5-10% finished good markup for the consumer.
This has not been transparently communicated to the consumer.
There is no public communication so the general public can understand the financial impact that they must bear as a result of the finished goods markup.
4 additional US states coming online in 2026 – Maine, Maryland, Minnesota, Washington

Response to B-22-3

Comment rejected. No response to this comment is necessary because it does not concern the revisions made to the proposed regulations.

B-23: Latitude 36 Foods (Michelle Shaw)

Comment B-23-1

Subject: Comments on SB 54 Final Draft Regulations – 15-Day Comment Period

To: CalRecycle

Latitude 36 Foods packages portion-controlled food components for fresh salad kits, meal kits, snacks, and foodservice. The company converts bulk ingredients into small, sealed portion sizes at commercial scale to meet food safety, quality, and shelf-life requirements.

For example, in a typical master kit, Latitude 36 Foods purchases croutons, cheese, and seasoning in bulk, along with pre-portioned dressing sachets. These components are portioned as needed and assembled into a finished master pack that is supplied to customers for use in fresh salad kits.

Packaging Functionality and Technical Constraints

Our portion packs and master packs primarily utilize **OPP-based films** for dry, shelf-stable products. For meat, cheese, and seasoning applications, packaging film incorporate **EVOH or other multi-polymer structures** to achieve the oxygen and moisture barrier performance required for fresh food applications at commercial scale. These materials are selected based on demonstrated performance in high-speed production environments and validated shelf-life studies. Latitude 36 Foods has invested significant time and resources testing mono-material packaging alternatives in support of recyclability and circular economy goals. However, for small-format portion packs, our testing has consistently shown that mono-material structures introduce material risks, including:

• Reduced oxygen and moisture barrier performance compared to OPP/EVOH structures
• Increased risk of microbial growth, oxidation, and flavor degradation
• Higher seal failure and leakage rates at commercial production speeds

Latitude will continue to test and invest additional resources as this journey evolves, and more viable sustainable packaging options become available.

In addition to in-house portioning, Latitude 36 Foods also purchases **pre-portioned sachets** of dressings, cheeses, and other components from manufacturers across the United States. These sachets are then incorporated into our finished master kits.

Many of these upstream manufacturers rely on similar multi-material films to meet food safety, shelf-life, and sealing requirements. Currently, these suppliers are still working towards having a viable mono-material alternatives that meet performance and regulatory standards for these applications. The current SB 54 draft regulations do not account for this supply-chain reality.

Requiring immediate or near-term compliance without a workable categorical exclusion would:
• Disrupt national supply chains for pre-portioned food components
• Limit availability of compliant ingredients for California-bound products
• Force redesigns that upstream suppliers are not technically or commercially prepared to implement
• Create downstream impacts for retailers and consumers through reduced product availability, higher costs, and increased waste

Concerns with the Revised Categorical Exclusion Standard
The revised language in Section 18980.2 (Categorically Excluded Materials) is deeply concerning. The addition of the word **"mandatory"** and the narrowed definition of what is **"reasonably possible"** effectively eliminate a workable categorical exclusion pathway for applications like ours.
The requirement to prove that:
• No alternative packaging provides effective qualitative performance expected through product shelf life to satisfy customer and consumer expectations.
• A full package redesign would still fail qualitative performance, food spoilage management, safety, or legal requirements while incrementally decreasing operational and supply-chain effectiveness
does not reflect real-world food safety, operational, or supply-chain constraints for portioned food packaging.
For these applications, limited multi-material structures are **functionally necessary, not discretionary.** Forcing the adoption of lower-barrier materials would increase contamination risk, shorten shelf life, increase food waste, and undermine California's climate and environmental objectives.
Request
Without a viable categorical exclusion, the current draft regulation would subject companies like ours to unrealistic recyclability mandates, permanent caps tied to historical baselines with no accommodation for significant compliance and enforcement risk despite good-faith efforts to improve packaging sustainability.
Latitude 36 Foods respectfully urges CalRecycle to revise the final SB 54 regulations to restore a clear, workable categorical exclusion that:
• Recognizes federal food safety and qualitative performance standards as the appropriate compliance benchmark
• Allows limited multi-material packaging structures where necessary for food safety, product quality, and shelf life, while minimizing food waste
• Acknowledges the operational and supply-chain realities of portioned food packaging
• Acknowledges the technical limitations of mono-material packaging for small-format, high-barrier food applications
• Accounts for supply-chain dependencies, including reliance on upstream suppliers that do not yet have compliant mono-material alternatives
• Avoids unintended consequences that could disrupt national food supply chains or limit product availability in California
• Provides regulatory certainty for companies making good-faith efforts to improve packaging sustainability

Preserving this flexibility is essential to protecting public health, minimizing food waste, and achieving the Act's environmental goals.

Sincerely,

Leslie Surber
President
Latitude 36 Foods

Response to B-23-1

Comment rejected. CalRecycle rejects this comment for the reasons provided in response to comment B-3-1, which raises the same concerns as does this comment. As further explained in that response, the revisions to section 18980.2(a)(2) do not narrow the exclusion or render it unattainable. Moreover, the commenter's concern over packaging that is "functionally necessary, not discretionary," is misplaced because if packaging is necessary and cannot comply with the Act, it would either be excluded under section 18980.2(a)(2) or would likely qualify for an exemption under section 18980.2.4. Regarding the list of functions that the commenter requests that section 18980.2(a)(2) address, those functions are unaccompanied by particular changes for CalRecycle to consider with respect to each one. However, CalRecycle interprets the commenter's overall recommendation to "restore a clear, workable categorical exclusion" to mean that the version of section 18980.2(a)(2) in the 45-Day Changes would address that list. For the reasons set forth in response to comment B-3-1, CalRecycle declines to restore that version.

B-24: GoodFarms, Inc. (Alan Thorne)

Comment B-24-1

Subject: Comments on SB 54 Final Draft Regulations - 15-Day Comment Period
To CalRecycle:
I am submitting comments on the Jan. 29, 2026, final draft "SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act" regulation on behalf of my company, a grower/packer/shipper/distributor of fresh produce operating in California.

The revised language in Section 18980.2 (Categorically Excluded Materials) is deeply concerning. The addition of the word "mandatory" and the narrow definition of what is "reasonably possible" effectively eliminates the categorical exclusion pathway for fresh produce packaging.

Federal food safety packaging statutes, regulations, and FDA guidance represent the current, widely accepted compliance pathway for the fresh produce industry. Packaging decisions are driven by food safety requirements, including FSMA and FDA food-contact standards, which are designed to prevent contamination and protect public

health. These federal requirements have long served as the appropriate benchmark for determining whether packaging is safe and legally compliant.

Over decades, the produce industry has optimized packaging systems to ensure food safety, maintain quality, and reduce food waste across a complex supply chain. This supply chain often includes harvesting and packing directly in the field, where materials must withstand extreme weather, moisture, dust, handling stress, and extended transit before reaching retail. Fresh produced packaging is highly technical and carefully engineered to:

- Protecting fragile produce from physical damage during transit and handling
- Optimize transportation efficiency, which reduces energy demands on the supply chain.
- Maintain airflow, moisture control, and structural stability.
- Preserve shelf life and product quality.

- Keep produce alive longer by managing respiration and moisture.
- Reduce spoilage and contamination across the supply chain.
- Reduce food waste, which directly reduces greenhouse gas emissions associated with wasted food production, transportation, and disposal.

The current draft would incentivize rapid shifts to alternative materials that are unproven at commercial levels or unable to provide the same level of product protection as existing packaging. In practice, this would lead to higher rates of product damage, shorter shelf life, and increased spoilage. The environmental consequence of this outcome would be counterproductive. Increased food waste results in higher greenhouse gas emissions from wasted production inputs, transportation, refrigeration, and disposal, ultimately undermining California's environmental and climate objectives. As drafted, the regulation requires producers to prove that:

- No alternative packaging complies with FSMA, FDA food-contact requirements, and California law. The fresh produce industry is constantly evaluating alternatives to further enhance food quality and safety. Most alternatives do not provide the same functionality as the industry gold standard, increasing the risk of food waste, contamination, and higher costs for consumers.
- Conflicts cannot be resolved through liners, coatings, or closures. Removing access to tools that can support the transition to alternative packaging will stifle advancements in packaging technology.
- A full package redesign would still fail food safety or legal requirements. Food safety is a critical priority for the fresh produce industry.

The produce industry is not resistant to change. Growers, packers, and distributors continue to evaluate and test new materials and formats to improve environmental performance. However, solutions that meet food safety requirements, perform across the full supply chain, and reduce overall environmental impact have not yet reached the required scale. Advancing regulations that effectively eliminate the categorical exclusion

before such alternatives exist will not drive innovation. Instead, it will push the industry backward, increasing food waste and operational risk.

Without a viable categorical exclusion, SB 54 would impose:

- Unrealistic recycling and recyclability mandates
- Permanent caps on single-use plastic packaging with no accommodation for business growth
- Significant EPR fees and exposure to civil penalties of up to $50,000 per day, per SKU

I respectfully urge CalRecycle to revise the final regulation to restore a clear, workable categorical exclusion that recognizes federal food safety packaging guidance as the accepted compliance pathway and the essential role of packaging in food safety, package integrity, waste reduction, and greenhouse gas mitigation.

Thank you for considering these comments.
Sincerely,
Alan

Response to B-24-1

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment B-3-1, which is substantively the same as this comment.

B-25: Coast Beacon (Sang Phan)

Comment B-25-1

Hello,
We're a wholesaler / importer of seafood that uses paper and plastic in packaging. Majority of our customers are other smaller wholesalers who may sell our products in California and in the other states that do not have EPR (Arizona, Texas, etc.) Their customers may in turn do the same. This process may repeat several times as it's common in seafood trading.

I'm OK with reporting the TOTAL amount we import into California and paying one-time EPR fee on them. I'm concerned with the prospect of multiple downstream layers of customers reselling the same products that I have reported and paid for and the state will mandate me to not only report on them but also pay EPR fee again on them. The nature of "double taxation" is both unfair and adds uncertainty which can be financially detrimental to our company. An example is that we pay $0.05/lb on the total import into CA. We can treat this as the cost of doing business and incorporate it into our price. This is clear and fair. However, under the current regulation, we will be asked to pay x times this fee if the products are resold multiple times. If the fee gets to $0.15/lb or

more, we will be losing money, potentially putting us out of business, risking job losses and tax losses (sales, income, corporate, etc.) to the state.

Response to B-25-1

Comment rejected. No response to this comment is necessary because it does not concern the revisions made to the proposed regulations.

B-26: Horizon Ag-Products (Peyton Bynum)

Comment B-26-1

I work for Horizon Ag-Products, and we are attempting determine if we are subject registering with CAA for the packaging producer responsibility reports and fees.
We produce soil amendments and fertilizers that are packaged in supersacks, totes, and bottles.
Around 95% of our product is purchased by another company who places our material into their blends. That company does have locations in California that we ship to. Would we be responsible for reporting all of that packaging? Or just the other 5% that goes out with our name on it?
Additionally, I was wondering if there are exemptions for products such as bags produced with an enzyme that helps them break down faster.
Any guidance you can provide would be appreciated.

Response to B-26-1

Comment rejected. No response to this comment is necessary because it does not concern the revisions made to the proposed regulations.

B-27: Repurpose, Inc. (Lauren Gropper)

Comment B-27-1

California Department of Resources Recycling and Recovery (CalRecycle)
1001 I Street Sacramento, CA 95814
Re: SB 54 Plastic Pollution Prevention & Packaging Producer Responsibility Act Regulations
To CalRecycle,
I'm writing as the Founder & CEO of Repurpose, a California C-Corp with headquarters in Los Angeles, California. We have 25 employees and have been in business for 15 years. We manufacture and distribute compostable household goods through 15,000 retailers nationwide including Costco, Target, Amazon, Kroger and Albertsons. We have been at the forefront of educating and providing consumers with plant based, compostable and non toxic alternatives to single use household products. The proposed language will have a significant negative impact on our Company, to the point of

closure, as well as harming markets nationwide and hurting consumers that want clearly labeled sustainable products and packaging.

As a champion of its goal to make all covered products and packaging in California reusable, recyclable, or compostable by 2032, we'd like to respond to challenge the validity of the proposed regulations, as they remain inconsistent with both statutory text and existing California law PRC Chapter 5.7.
We also highlight specific issues that render the proposed regulations inconsistent with available scientific evidence, despite CalRecycle's duty to protect human health and the environment.

We appreciate that CalRecycle continues to take industry feedback and has incorporated previous recommendations that support the environmental goals of SB 54. As the rulemaking moves towards finalization, Repurpose continues to have concerns with the proposal. Thank you for your responsiveness to these priorities as we work together to foster an improved packaging ecosystem in California.

Section 18980.1 (Definitions)

We request the addition of a separate definition of "polymers" and repeat the following: The definition of "polymer" should be defined as in ASTM D883 to reflect both the intent and the language in the existing statute. It should be noted that the ASTM D883 definition is referenced for the meaning of "polymer" in both ASTM D6400 and ASTM D6868. It remains imperative that CalRecycle define "polymers" separately from "plastics" for the purposes of this regulation because plastics are articles made from a small subset of polymers—polymers are simply long-chain molecules and can be found in nearly every item in our daily lives. By not defining "polymers", the very narrow exemption to meet safety and performance criteria in current statute enshrined as PRC 42356.1(d) is now a very wide one. Polymers are likely included in most certified compostable products, especially fiber-based products, to some extent; this is why we have a certification to ASTM standard specifications to ensure that they are biodegradable, do not negatively impact disintegration, and do not add any toxic effects. Should this definition not be properly addressed, the inevitable result is that companies that do all the careful product design and testing to ensure integrity of the resulting compost will have to compete with companies that need not. We already know that products containing non-biodegradable polymers end up in composting facilities, filled with untested and unknown components, and threatening the integrity of soil in California is at risk. As such, the proposed regulations need to include a specific definition of "polymers" and the definition of "plastics or polymers" should refer to this definition of polymers to differentiate between compliant products that support high quality compost and the untested, persistent, and toxic products that threaten it.
We iterate: rationale previously provided by the department in the ISOR document misunderstands the statute in multiple ways. First, the need to test and certify products with polymers is not limited to the "rate of composting." The relevant ASTM standard specifications include requirements for ecotoxicity and constituents, in addition to

biodegradation and disintegration, all of which are necessary to protect the quality of the resulting compost. Furthermore, the claim that fiber is itself a polymer does not change the need for other "incorporated" polymers to be tested. It has always been intended and understood that the exemption for paper and fiber-based products without polymers applies only to an extremely narrow subset of products such as wooden stir sticks. This is also why certification entities like BPI require testing for countless uncoated paper and fiber products, to prevent persistent and/or toxic elements from being introduced into compost. CalRecycle has ignored the clear purpose of the law for the purpose of drawing an arbitrary distinction between product types.
Section 18980.2.2 (Exclusion of Certain Types of Packaging)

We remain concerned about the exclusions for "de minimis" elements as the language is inappropriate and vague as it relates to compostable products. Unlike recyclable products that can often be deconstructed to remove non-recyclable components, any "size" or "weight" of non-compostable components within covered products, regardless of "weight or volume," can persist as a contaminant in a compost pile. Fortunately, SB 54 references existing California law (PRC Chapter 5.7), including standard specifications such as ASTM D6400 and D6868 that already set pass/fail criteria to prove the performance of compostable items. This includes testing for biodegradation, which is a microscopic process and cannot be measured in a compost facility but rather requires laboratory testing, in addition to separate laboratory testing for ecotoxicity. ASTM D6400 and D6868 are the appropriate standard specifications, and an element should be considered "de minimis" only if it complies with these standards.
All mention of "composting" and "compostable" should be removed from this de minimis allowance, and that components small in weight and/or size are adjudicated as part of a whole product, as covered by existing law designed for this purpose. Alternatively, we request that the relevant provisions be revised to clarify that an element be considered "de minimis" only if the whole product still complies with ASTM D6400 and D6868. Without one of these corrections, the applicable provisions create uncertainty and allow for products to be considered compostable for purposes of the proposed regulations even if they do not meet these strict standards that ensure such products do not cause harm to human health or the environment.
Section 18980.4 (Responsible End Market Criteria)
Statute affirms that responsible end markets must be defined "in a way that benefits the environment and minimizes risks to public health and workers." Yet, compostable covered products are suggested to have different end market requirements despite being tested to identical standards guaranteeing environmental benefit and public health. This is especially confounding given that compostable products are not typically separated out by type into distinct batches of compost, unless CalRecycle recommends that such bifurcation would be conducted with funding from this program.
We also remain alarmed that compost facilities as end markets are not required to provide the conditions necessary to responsibly process covered compostable products into a stable and mature finished compost.

Section 18980.4(a)(4)(C) does not require items comprised of fiber or paper substrates (that may contain persistent polymeric components) to fully break down, creating

unequal treatment of material types that not only betrays the underlying science of compostability, it also betrays PRC Chapter 5.7 of California law that requires paper and fiber products containing any plastic or polymer to undergo testing and certification. Removing the entirety of section 18980.4(a)(4)(B)-(C), including "fully biological decompose," solves this and ensures that compostable paper or fiber products are clearly defined, while contaminants are clearly separated.

Furthermore, while a "marketable" compost product as described in section (C) might ensure proper pathogen reduction, etc., the term is insufficient for ensuring conditions necessary for compostable products to break down. By not establishing relevant criteria, CalRecycle is risking substantial harm to the environment, and acting contrary to the text and principles of SB54. We request that this section 18980.4(a)(4)(B)-(C) therefore be removed and replaced by recently published field-testing test methods ASTM D8618 or D8619 provide clear ranges of operating conditions, based on general practices for composting (that aren't unique to compostable products) and clear thresholds for compost stability and maturity. By simply requiring composters to submit an ASTM D8618 or D8619 test report to show that suitable operating conditions are met, a stable and mature compost is produced, and compostable products can confidently break down. This will ensure that composting facilities receiving funding are designed and operated to manage certified compostable products in the program and therefore are "responsible."

Finally, we reiterate that the previously published ISOR incorrectly states that certified compostable plastics cannot be a "recycled organic product," even though by definition, compostable plastics are made of organic carbon that is fully consumed by microorganisms, as evidenced by biodegradation testing that counts carbons, just like other compost feedstocks.

Section 18980.11.1. (Extensions or Exemptions for Local Jurisdictions and Recycling Service Providers)

As stated previously, we support the consideration of "program efficacy; technological or economic limitations; legal restrictions or requirements; effects on the environment, environmental justice, worker health and safety; public health; hazardous waste generation; and transportation safety." However, these extensions and exemptions fail to consider whether such limitations, requirements, or effects can be mitigated by funding from the program itself, despite the entire program being engineered to create such opportunities. We also remind the department once more that all lawfully labeled compostable products are tested and certified based on the same conditions. Therefore, a local jurisdiction or service provider that requests an exemption for one material or covered product type, but not another, based on performance claims, could not do so credibly without providing a detailed test performed by a third party that included operating conditions.

It is important for the SB 54 regulations to recognize the growing nature of the plant-based products industry and foster, rather than discourage their use. By minimizing barriers and establishing clear, achievable criteria for both compostable and recyclable products, the market for plant-based solutions can expand.

Thank you for your continued consideration of these comments.

Please contact me at lauren@repurpose.com with any questions.
Sincerely,

Lauren Gropper
Founder & CEO

Response to B-27-1

Comment rejected. No response to this comment is necessary because it does not concern the revisions made to the proposed regulations.

B-28: Ross Neely (Ross Neely)

Comment B-28-1

Re: Comments on Proposed Regulations for the Plastic Pollution Prevention and Packaging Producer
Responsibility Act (SB 54) 15 Day Comment Period

To Whom It May Concern,

Kemira appreciates the opportunity to provide comments on the targeted revisions to the SB 54 implementing regulations related to food and agricultural packaging during the current 15-day public comment period, including
updates to **Section 18980.2 – Categorically Excluded Materials.** Kemira previously submitted comments on the draft regulations, emphasizing the importance of a science-based, innovation-friendly framework that advances California's circular economy goals while ensuring product safety, regulatory clarity, and practical implementation.

Kemira is a global leader in sustainable chemical solutions for packaging and water treatment. In North America, we work closely with packaging producers, industrial partners, and municipalities to deliver technologies that support circular packaging systems, enable safer water, and reduce reliance on non-sustainable solutions.

We strongly support California's leadership in advancing circular economy goals and addressing plastic pollution. SB 54 represents a significant step forward in shifting toward systems that emphasize reduction, recyclability, and compostability. Our comments below are intended to ensure that the program successfully achieves these objectives while also supporting innovation.

Response to B-28-1

No response to this portion of the commenter's submission is necessary because it is an introduction to later, more detailed portions of the submission and does not add suggestions or objections to those expressed in those portions, to which CalRecycle has responded separately.

Comment B-28-2

Support for SB 54 Goals

Kemira supports the revised approach under **Section 18980.2** requiring entities seeking an exclusion for food or agricultural packaging to clearly identify specific regulatory conflicts and to demonstrate that no reasonably possible alternative packaging or packaging components exist. The three-part feasibility standard; granted only if no lawful alternative packaging exists that meets safety and structural standards, and if the regulatory conflict cannot be resolved through component replacement or by redesigning the packaging as a whole, appropriately ensures that exclusions remain narrow, justified, and aligned with the intent of SB 54. This framework promotes accountability and helps prevent overly broad carve-outs that could undermine the law's environmental objectives.

Kemira encourages CalRecycle to further clarify within **Section 18980.2** that the evaluation of "reasonably possible alternatives" explicitly includes innovative and next-generation packaging solutions. This should encompass recyclable fiber-based materials supported by advanced barrier technologies, as well as bioplastics such as polyhydroxyalkanoates (PHAs), polyhydroxybutyrate (PHB), and other emerging bio-based, compostable, and biodegradable materials such as enzymatically produced alpha-glucan polysaccharides – materials whose origins, structures, end-of-life pathways, and environmental impacts differ significantly from conventional petroleum-derived plastics. As Kemira noted in its prior comments, innovation in packaging materials continues to accelerate, and many of these solutions are designed to meet both food safety requirements and sustainability performance goals when appropriately recognized and incentivized within regulatory frameworks.

While Kemira recognizes the critical importance of compliance with mandatory food safety and related federal and state regulations, exclusions under Section 18980.2 should remain limited to specific, demonstrated conflicts rather than applied broadly across packaging categories. Broad or categorical exclusions risk discouraging the adoption of innovative recyclable, compostable, and bio-based packaging solutions that are increasingly capable of meeting safety, performance, and environmental objectives. Maintaining a rigorous, case-by-case exclusion process will help ensure that SB 54 continues to drive material innovation and packaging redesign rather than perpetuating reliance on traditional plastic materials.

Kemira also supports the Department's authority under Section 18980.2 to review exclusion notices for completeness and to identify potential alternative packaging solutions not addressed by the submitting entity.

This transparent review process will promote consistent implementation, encourage thorough evaluation of emerging materials, and reinforce alignment with SB 54's statutory intent to reduce plastic pollution and advance circular solutions.

Response to B-28-2

Comment rejected. The commenter requests section 18980.2(a)(2) be further revised to expressly identify certain types of packaging, described as "next-generation" and "emerging biobased" materials, as alternatives to be considered per se "reasonably possible." CalRecycle declines to do so because any packaging, not just the types of packaging the commenter identifies, would still need to meet the standards set forth in section 18980.2(a)(2)(B) to be

considered reasonably possible, and listing types of packaging would make that case-specific evaluation no easier. Even if the commenter did not intend to recommend that entire categories be considered per se "reasonably possible," listing certain categories of materials would still be problematic. Despite that intent, the list might still be misinterpreted as a determination that all alternatives within those categories are reasonably possible or that packaging within categories not listed cannot be considered "reasonably possible. That outcome would reduce the clarity of section 18980.2(a)(2) and not serve the commenter's stated purpose of avoiding "[b]road or categorical exclusions." Section 18980.2(a)(2) serves that purpose as written.

Comment B-28-3

Partnership with California

Kemira is committed to serving as a proactive, science-based partner in advancing California's transition to a circular economy. We stand ready to provide technical expertise on sustainable barrier technologies, fiber-based packaging solutions, and advanced chemistries; share performance data and lifecycle assessment insights on innovative materials, including bioplastics; and actively engage in stakeholder workshops, technical working groups, and advisory processes to support transparent, evidence-driven regulatory decisions that accelerate market adoption of sustainable packaging solutions.

Closing

Kemira appreciates CalRecycle's continued engagement with stakeholders and its efforts to refine the regulatory framework to support both environmental outcomes and practical implementation. We look forward to continued collaboration as the SB 54 regulations are finalized and implemented, and we remain committed to supporting policies that encourage innovation, enable sustainable packaging solutions, and deliver meaningful environmental benefits for California.

Response to B-28-3

Comment rejected. No response to this comment is necessary because it does not concern the revisions made to the proposed regulations.

B-29: Buoy, LLC (Adrian Colesberry)

Comment B-29-1

I wanted to commend your defining a reusable per the current statutes rather than putting an unnecessarily high bar and regulatory burden on plastic reusables.

Response to B-29-1

Comment rejected. No response to this comment is necessary because it does not concern the revisions made to the proposed regulations.

B-30: Perkins Coie LLP (Jeffrey Hunter)

Comment B-30-1

Dear Csilla Richmond:

Thank you for the opportunity to provide public comments on the latest draft of the Plastic Pollution Prevention and Packaging Producer Responsibility Act (SB 54) Proposed Regulations. We look forward to continued engagement with CalRecycle throughout the implementation of SB 54.

Perkins Coie LLP represents producers in various industries including retail, food, home and garden, paper products, apparel, building materials, and shipping packaging. Some of our clients will be directly impacted by the revisions to the regulations relating to federally regulated food and agricultural packaging.

We are submitting these comments on behalf of our clients and request that CalRecycle take these comments into consideration in the final rules.

Response to B-30-1

No response to this portion of the commenter's submission is necessary because it is an introduction to later, more detailed portions of the submission and does not add suggestions or objections to those expressed in those portions, to which CalRecycle has responded separately.

Comment B-30-2

A. Food packaging exemptions should be consistent across states

The growing patchwork of EPR laws has created challenges for producers who must closely track and monitor various state exemptions in order to accurately report their covered materials. Some states like Oregon are proposing clear statutory exemptions for certain types of food and agricultural products that are not subject to further approval from the state. Oregon's proposed exemptions include fresh berries that are subject to federal food packaging requirements and "[n]oncompostable packaging that comes in direct contact with any amount of fresh or processed meat, poultry, fish or seafood." *See* Oregon HB 4030.

Response to B-30-2

Comment rejected. CalRecycle rejects this comment and comment B-30-3 together. The comments request that CalRecycle create "carveouts" similar to those proposed in Oregon for its EPR program. That recommendation has three major flaws. First, the commenter only points to provisions from a bill proposed in the Oregon legislature, not a currently enacted law in that state or any regulation currently under consideration there. Therefore, the commenter's proposal might

not ultimately result in the outcome sought. Second, the commenter's proposal is not based on any provision in the Act and therefore would exceed CalRecycle's authority. In particular, no provision of the Act authorizes a categorical carveout specific to packaging that contacts certain types of food. Instead, the Act allows CalRecycle to exempt packaging that CalRecycle identifies as presenting "unique challenges" or health and safety risks (Public Resources Code section 42060(a)(3) and (4)). Moreover, section 18980.2.7 provides that CalRecycle can apply those exemptions to entire classes of packaging. Taken together, these provisions mean that CalRecycle might establish the categorical exemptions sought by the commenter, but only once CalRecycle can determine that they are justified as required by the Act. Even if such determinations could be made without further assessment, codifying such determinations in regulations would be inappropriate because they could not efficiently adapt to marketplace changes, such as technological advances in packaging materials. Third, the commenter erroneously points to Public Resources Code section 42060(b)(1) in support of consideration of Oregon law. That provision concerns federal regulations, not state regulations.

Comment B-30-3

Section 18980.2(a)(2) of the EPR regulations should provide carveouts for specific types of food packaging similar to the proposed exemptions in Oregon to reduce both the burden on producers to submit notices for each exempt covered material and the administrative costs associated with processing these notices. This is consistent with the provisions under PRC § 42060(b)(1) prohibiting CalRecycle from imposing any requirement in conflict with any federal law or regulation. Having clear exemptions will allow producers to continue packaging their products consistent with federal law and in a manner that does not compromise food safety and contamination risks.

Response to B-30-3

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment B-30-2, of which this comment is a continuation.

Comment B-30-4

B. A broader exemption for food packaging protects consumers

CalRecycle should revert the exemption for federally regulated food packaging in section 18980.2(a)(2) to exempt any type of food packaging subject to federal standards regardless of whether the standard is mandatory or not. A broader exemption would allow producers to continue using existing federally approved packaging that has been specifically designed to increase the shelf life of food, protect consumers against foodborne illnesses, and reduce food waste. Our clients have experimented with alternative packaging formats for produce, which ultimately caused more food to be thrown away, as the alternative packaging did not protect and preserve the product as well as standard packaging. Customers also did not purchase as much of the produce when presented in alternative packaging formats.

In addition, certain types of meat, poultry, fish, and seafood packaging have been specifically designed to be both food safe and extend the shelf life of the product. Even if alternative packaging that complied with the federal standards was available, butcher paper, compostable trays, and/or compostable wraps are not as safe to handle and cause the items to spoil faster than if contained in federally approved plastic packaging. Accordingly, a broader exemption protects consumers and reduces food waste in the long run.

Response to B-30-4

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment B-3-1. That response addresses all of the concerns and recommendations stated in this comment.

Comment B-30-5

C. CalRecycle does not have authority to decide whether federally approved packaging does not qualify for the exclusion

Although 18980.2(a)(2) only requires producers to fill out a “notice” that identifies the provisions of SB 54 that are in conflict with federal laws in order to qualify for an exclusion, CalRecycle has retained the final authority to determine whether the packaging or packaging component qualifies. As a result, CalRecycle has essentially given itself the authority to determine whether the producer is required to use alternative packaging instead of continuing to use federally required packaging. This provision raises serious preemption issues as states are not allowed to impose packaging requirements that are inconsistent with federal packaging requirements for foods such as poultry (21 U.S.C. § 467e), meat (21 U.S.C. § 678), and eggs (21 U.S.C. § 1052). As noted above, PRC § 42060(b)(1) expressly prohibits CalRecycle from imposing any requirement in conflict with any federal law or regulation.

Response to B-30-5

Comment rejected. CalRecycle rejects this comment because it effectively requests that CalRecycle relinquish the right to enforce the Act. The comment is also nonsensical because it claims that, through section 18980.2(a)(2), CalRecycle asserts the authority to require use of alternatives in lieu of "federally required packaging" and "impose packaging requirements that are inconsistent with federal packaging requirements for foods such as poultry." Section 18980.2(a)(2) does the exact opposite: It acknowledges that CalRecycle must not apply the Act in a way that prevents use of packaging necessary to satisfy federal requirements.

Comment B-30-6

D. Conclusion

Thank you for the opportunity to comment on the SB 54 Proposed Regulations, and we appreciate CalRecycle's consideration of these comments. We look forward to working with CalRecycle to address these issues.

Response to B-30-6

Comment rejected. No response to this comment is necessary because it does not concern the revisions made to the proposed regulations.

B-31: Kimberly Kovacs

Comment B-31-1

CalRecycle SB 54 Packaging EPR Framework
From: RENW INC. Industrial Hemp Fiber and Packaging Manufacturer
Re: Packaging EPR Framework and Covered Material Categories - SB 54
To: CalRecycle Packaging EPR Rule-making Team

CalRecycle Team,

Thank you for the opportunity to submit additional comments regarding implementation of the Plastic Pollution Prevention and Packaging Producer Responsibility Act (SB 54) and the associated Packaging Extended Producer Responsibility framework.

We are an industrial hemp fiber and packaging manufacturer producing plant-based packaging materials designed to replace higher-impact conventional packaging formats. We support California's goals to reduce packaging waste, increase recovery rates, and accelerate adoption of recyclable and compostable materials. Our comments focus on ensuring that emerging plant-fiber materials, including industrial hemp fiber packaging, are clearly and appropriately addressed within the regulatory framework.

We support California's updated SB 54 regulatory language related to administrative and process updates. We also appreciate the state's continued leadership in advancing forward-looking policy that recognizes and enables innovative materials that meet compostability and recyclability objectives.

Thank you for your consideration and valuing our previous comments, summarized below.

Respectfully submitted,
Kimberly Kovacs
CEO, RENW INC

RENW Previous Comments for SB54
Recognition of Hemp Fiber Within Plant-Fiber Packaging Categories

We respectfully request that industrial hemp fiber packaging be clearly recognized within plant-fiber or molded fiber covered material categories where material performance characteristics are comparable. Hemp fiber packaging functions similarly to other accepted plant-fiber packaging formats and should be evaluated under the same recyclability and compostability criteria.
Explicit recognition will reduce classification ambiguity and improve reporting consistency for producers and Producer Responsibility Organizations.

Performance-Based Material Evaluation
We encourage CalRecycle to maintain performance-based eligibility standards rather than material-type restrictions. Hemp fiber packaging should qualify where it meets established recyclability or compostability thresholds under recognized testing standards.
Performance-based evaluation supports SB 54's environmental objectives while allowing innovation in lower-impact packaging materials.

Distinction from Multi-Material and Laminated Formats
Plant-fiber hemp packaging should be distinguished from multi-layer plastic laminates and composite barrier materials that present recovery challenges. Hemp-based molded fiber packaging does not create the same recycling stream contamination risks and should not be grouped with problematic mixed-material flexible packaging categories. Clear differentiation will improve recovery pathway accuracy.

Standardized Testing Pathways
We recommend that CalRecycle identify acceptable third-party recyclability and compostability testing standards that alternative fiber materials can use to demonstrate compliance. Providing recognized evaluation pathways will enable consistent qualification of emerging plant-fiber packaging formats.

Avoiding Unintended Barriers to Lower-Impact Materials
Without clear classification pathways, rapidly renewable plant-fiber materials risk being unintentionally excluded despite aligning with source reduction and circular economy goals. Clarifying eligibility criteria for alternative fiber packaging supports environmental performance while maintaining regulatory clarity.

We appreciate CalRecycle's work to modernize packaging recovery systems and would welcome continued technical dialogue on plant-fiber and hemp-based packaging materials within the SB 54 framework.

Response to B-31-1

Comment rejected. No response to this comment is necessary because it does not concern the revisions made to the proposed regulations.

B-32: Markon Cooperative, Inc. (Nelia Alamo)

Comment B-32-1

Dear Director and Staff:
I am submitting these comments on behalf of Markon Cooperative, Inc., a California-based foodservice distributor and brand owner of fresh produce operating throughout the state.
Markon supports responsible environmental stewardship and recognizes the importance of regulatory frameworks that reduce plastic pollution while protecting public health. However, we are deeply concerned the revised language in Section 18980.2 (Categorically Excluded Materials)—specifically the addition of the word "mandatory" and the narrowed interpretation of what is "reasonably possible"—effectively eliminates the categorical exclusion pathway for fresh produce packaging.
For the fresh produce industry, packaging is first and foremost a food safety control mechanism. Markon relies on federal statutes, regulations, and guidance administered by the U.S. Food and Drug Administration (FDA), including requirements under the Food Safety Modernization Act (FSMA), as the governing compliance framework for food-contact materials. These federal standards establish uniform, science-based requirements to prevent contamination and protect consumers.
Fresh produce packaging is highly engineered to serve multiple safety and environmental functions simultaneously. Our packaging is designed to:
• Protect delicate commodities from bruising and damage during harvesting, cooling, and transportation
• Maintain airflow, moisture control, and structural integrity
• Extend shelf life and preserve product quality
• Reduce spoilage and contamination across the supply chain
• Minimize food waste and associated greenhouse gas emissions
In recent years, Markon has proactively tested liner-free and alternative material configurations, including advanced polymer-coated corrugated cases. In controlled supply chain trials, these alternatives resulted in measurable increases in decay, shrink, and damage. Increased food waste is not a theoretical outcome since food waste directly contributes to landfill use and greenhouse gas emissions.
As drafted, the regulation requires producers to demonstrate:
• No alternative packaging complies with FSMA, FDA food-contact standards, and California law
• Conflicts cannot be resolved through liners, coatings, or closures
• A full package redesign would still fail food safety or legal requirements

Response to B-32-1

CalRecycle rejects this comment and the rest of the commenter's submission (B-32-1 through B-32-3) for the reasons stated in response to comment B-3-1,

which raises the same concerns and offers the same recommendation as does this comment .

Comment B-32-2

This standard is not workable in practice. The proposed regulation presumes 6all potential alternatives must be exhausted regardless of technical feasibility, contamination risk, or real-world supply chain performance. In many instances, viable substitutes either do not exist or materially compromise product integrity, increase food waste, or elevate consumer cost.

Response to B-32-2

CalRecycle rejects this comment and the rest of the commenter's submission (B-32-1 through B-32-3) for the reasons stated in response to comment B-3-1, which raises the same concerns and offers the same recommendation as does this comment.

Comment B-32-3

Absent a meaningful categorical exclusion pathway, SB 54 would impose:
• Unrealistic recyclability mandates for materials that serve essential food safety functions
• Effective caps on certain single-use packaging formats without accommodation for business growth or food safety requirements
• Significant EPR fees and potential civil penalties of up to $50,000 per day, per SKU
• Additional inflationary cost pressures on California businesses and consumers already facing elevated food prices
We respectfully urge CalRecycle to preserve and clarify the categorical exclusion pathway for federally regulated fresh produce packaging. The regulatory framework should recognize that food safety, environmental sustainability, and operational practicality are not mutually exclusive. A balanced approach is necessary to avoid unintended consequences, including increased food waste and higher consumer costs.
Markon remains committed to innovation and continuous improvement in sustainable packaging. We welcome continued dialogue with CalRecycle to develop workable solutions that protect both public health and the environment.
Thank you for your consideration of these comments.
Sincerely,
Andy Hamilton
Chief Executive Officer
Markon Cooperative, Inc

Response to B-32-3

CalRecycle rejects this comment and the rest of the commenter's submission (B-32-1 through B-32-3) for the reasons stated in response to comment B-3-1, which raises the same concerns and offers the same recommendation as does this comment.

B-33: Church Brothers Farms, LLC. (Mishalin Modena)

Comment B-33-1

To CalRecycle,

The fresh produce sector is navigating a pivotal moment as it faces a growing number of packaging-related pressures that are increasingly difficult to reconcile. These challenges stem from a patchwork of evolving local, state, and federal regulations, overlapping and sometimes conflicting buyer requirements, and the limited availability of packaging alternatives that can meet the functional demands of fresh food systems. Collectively, these factors create real risks for food safety, supply chain efficiency, and environmental outcomes.

As a grower, harvester, processor, and shipper of fresh vegetables supplying customers nationwide, we are deeply concerned that the current draft fails to reasonably accommodate the food safety, shelf-life, and operational realities of fresh produce packaging.

At the center of this challenge is a sustainability paradox: the need to prevent food and material waste and reduce greenhouse gas (GHG) emissions, while simultaneously facing regulatory and public pressure to eliminate or restrict packaging based on material focused assumptions without fully accounting for life-cycle performance and environmental tradeoffs. In fresh produce systems, inadequate packaging increases spoilage, raises supply-chain costs, and drives higher overall emissions through food waste and lost production inputs—ultimately increasing the cost of healthy foods for consumers.

> **Response to B-33-1**
>
> Comment rejected. No response to this comment is necessary because it does not concern the revisions made to the proposed regulations.

Comment B-33-2

Conflicts with Federal Food Safety Requirements

I am submitting this comment in response to CalRecycle's January 29, 2026 draft permanent regulations for SB 54, the Plastic Pollution Prevention and Packaging Producer Responsibility Act.

These draft regulations introduce requirements that directly conflict with existing federal and state food safety and food-contact laws, including the Food Safety Modernization Act (FSMA), FDA food-contact regulations, and California food safety requirements. These conflicts are not theoretical; compliance with SB 54, as currently drafted, would require actions that undermine or violate established food safety obligations. For fresh produce operations, where packaging is integral to food protection, traceability, labeling, and shelf-life management, these conflicts create regulatory impossibilities that must be addressed. Without a practical compliance pathway, these combined pressures could

strain the fresh food system's ability to reliably produce and distribute affordable fresh food.

Packaging Is Not Optional for Food Safety
Under federal law, we are legally obligated to prevent adulteration and control microbial risk in processed foods. Packaging material, permeability rates, and structural integrity are not discretionary business 'decisions; they are components of federally mandated preventive controls.
By requiring producers to prove that no alternative material exists and to redesign packaging to comply with SB 54 material criteria, the draft regulation forces us to choose between maintaining federally required food safety controls and meeting state packaging mandates. This is not an operational inconvenience; it is a direct regulatory conflict.
Food packaging is essential to protecting public health. Since the 2006 spinach outbreak, the produce industry has made extensive investments to strengthen food safety systems and reduce cross-contamination risks throughout the supply chain. Packaging plays a critical role in protecting product integrity, maintaining traceability, and safeguarding food from harvest through processing, transportation, distribution, and retail environments.

Our operations rely on both flexible and rigid packaging solutions, including modified atmosphere packaging (MAP), to extend shelf life and safely transport fresh vegetables across the country.
Fresh produce packaging is unique among food categories because it contains a living, respiring product, requiring a symbiotic relationship between packaging performance and product physiology to maintain safety, quality, and shelf life. These technologies are essential-not optional-for maintaining quality, reducing spoilage, and ensuring food reaches consumers safely. Packaging functionality directly reduces product shrink and food waste, which is one of the largest contributors to GHG emissions. Extending shelf life is therefore not only a business necessity, but also a critical environmental objective.

Response to B-33-2

Comment rejected. CalRecycle rejects this comment for the reasons provided in response to comment B-3-1, which raises the same concerns this comment raises. CalRecycle also rejects this comment's core assertion, that the revisions to the proposed regulations "introduce requirements that directly conflict with existing federal and safety food safety and food-contact laws." That outcome is logically impossible, because the revisions to section 18980.2(a)(2) do not change the effect of that section, which is to exclude packaging for food and agricultural goods from the Act if there is such a conflict. The commenter even expressly acknowledges that they "are legally obligated" to achieve certain outcomes. Where those obligations exist and cannot be met while complying with the Act, section 18980.2(a)(2) clearly provides that packaging will not be subject to the Act.

Comment B-33-3

Environmental Impact and Packaging Performance

Life Cycle Assessment (LCA) studies consistently show that agricultural production accounts for a substantial portion of the environmental footprint of fresh produce. When packaging or supply chain systems fail and food is lost or wasted, the entire environmental investment in that food is also lost. Sustainability policy must therefore prioritize packaging performance and functionality alongside material reduction goals to accurately reflect total environmental impact.

Limitations of Current Packaging Alternatives

While our industry continuously works to reduce plastic use where feasible and actively pursues packaging optimization to save resources and reduce costs, there are real limitations with current alternatives. The use of 100% recycled plastic is restricted to certain applications due to food-contact regulations, processing equipment limitations, and material performance requirements.

Compostable packaging, though promising, is not a viable substitute at scale. California lacks a consistent, widely accessible industrial composting infrastructure, and manycompostable products do not break down as marketed in existing facilities, undermining circular economy objectives. Additionally, these materials do not yet provide the level of functionality required to safely ship fresh produce nationwide.

Additionally, under California AB 1201 (California Compostable Packaging Labeling Law), compostable packaging must meet specific labeling and certification requirements. At the same time, compostable materials used in packaging for organic products must comply with National Organic Program (NOP) listing requirements, which become enforceable in July 2027. At present, most compostable packaging materials do not meet these standards, effectively eliminating them as viable alternatives for fresh produce operations.

> **Response to B-33-3**
>
> Comment rejected. No response to this comment is necessary because it does not concern the revisions made to the proposed regulations. To the extent the issues discussed in this comment are relevant to portions of the commenter's submission that do relate to those revisions, CalRecycle has addressed the issues as required by responding to those comments.

Comment B-33-4

The Categorical Exclusion Pathway Is Not Workable in Practice

The January 29, 2026, draft regulations significantly restrict the categorical exclusion pathway in a way that does not reasonably accommodate food safety and regulatory realities. The new "mandatory" standard and narrow interpretation of what is "reasonably possible" under Section 18980.2 create unrealistic compliance expectations that conflict with FSMA, FDA food-contact requirements, and California law. Eliminating workable categorical exclusions increases food safety risk, drives additional food waste, and places disproportionate cost and legal burdens on growers,

packers, shippers, and distributors, many of whom are treated as "producers" simply for selling into California, costs that ultimately reach consumers and families who rely on access to affordable, fresh vegetables.

Economic Impact
The financial impact of these requirements is substantial and cannot be absorbed within the fresh produce supply chain. Under existing EPR fee structures, we have already experienced packaging cost increases of approximately 10-20 percent. A complete redesign of our packaging systems to comply with the draft regulation wouldsignificantly increase unit costs and add additional transportation and distribution expenses across the supply chain. These cumulative cost pressures directly affect food affordability and consumer access.

Response to B-33-4

Comment rejected. Regarding the assertion that section 18980.2(a)(2) is not "workable in practice," CalRecycle rejects this comment for the reasons stated in response to comment B-3-1, which offers the same assertion. Regarding financial impact, the commenter's concern is misplaced because the regulation does not require "complete redesign," and, even if drastic measures were required to comply with the Act, that would not be sufficient basis for revising section 18980.2(a)(2) in the manner requested. The exclusion under 18980.2(a)(2) is based on direct conflict with federal laws, not the burdens, such as financial impact, inherent in complying with the Act. The commenter does not explain why such costs would justify a blanket exclusion for produce packaging but not all other types of packaging, and the commenter's concession that packaging could be redesigned "to comply with the draft regulation" is an admission that excluding the packaging would be inconsistent with the Act. The Act unambiguously acknowledges that regulating single-use packaging requires incursion of costs; imposition of those costs on producers is the core function of the Act, not a justification for certain packaging not to be subject to the Act. Instead, if there are special circumstances applicable to produce packaging, so that extraordinary burdens must be met to comply with the Act, an exemption with a phase-in plan pursuant to Public Resources Code section 42060(a)(3) provides a remedy, as described in section 18980.2.4.

Comment B-33-5

Challenges with the Current Categorical Exclusion Standard
The current categorical exclusion framework effectively requires a fundamental redesign of fresh produce packaging systems. For our industry, packaging is not a simple component that can be easily replaced without consequence; it is an integrated part of federally mandated food safety, structural integrity, and shelf-life controls. The level of research, testing, and documentation required to even be considered for an exclusion or exemption is not commercially or scientifically feasible for fresh produce operations. The categorical exclusion standard, as currently drafted, establishes an unworkable burden of proof. To qualify, producers must demonstrate that no alternative packaging

is available that satisfies all applicable mandatory safety and structural integrity standards, creates no new
unavoidable legal conflict, and cannot be modified, redesigned, or replaced to eliminate such conflict. In practice, this standard requires producers to evaluate every potential material and design option while still maintaining full compliance with FSMA preventive controls, FDA food-contact regulations, and California law.

Response to B-33-5

Comment rejected. CalRecycle rejects this comment for the reasons provided in response to comment B-3-1, which raises the same concerns as does this comment. As explained in greater detail in that response, section 18980.2(a)(2) does not effectively require "fundamental redesign," impose an "unworkable burden of proof," or require evaluation of "every potential material and design option."

Comment B-33-6

Why the Current Standard Is Not Achievable in Practice

For fresh produce packaging, this standard is not achievable in practice. Packaging materials, permeability rates, structural integrity, and equipment compatibility are interdependent components of federally required food safety systems. Altering one component, whether through material substitution, liner removal, or full redesign-fundamentally changes the safety and shelf-life performance of the product. The regulation assumes that conflicts can be resolved through redesign, but for living, respiring commodities, redesign often creates new food safety risks or compliance conflicts.

The level of testing, research, and documentation required to meet this burden places an unrealistic administrative, technical, and legal strain on growers, packers, and processors. The standard does not reflect commercial feasibility, scientific limitations, or the operational realities of food safety compliance.

We respectfully urge CalRecycle to revise the draft regulations to restore a practical and science-based categorical exclusion pathway for fresh produce packaging-one that fully accounts for food safety, shelf-life extension, environmental tradeoffs, and current technological limitations.
Effective sustainability policy must balance environmental goals with the critical need to safely deliver fresh, nutritious, and affordable food nationwide to avoid unintended consequences across the food system.

Thank you for the opportunity to provide comments and for considering the real-world impacts of these regulations on the fresh produce supply chain.

Sincerely,

Brian Church
CEO

Church Brothers Farms, LLC.

Response to B-33-6

CalRecycle rejects this comment for the reasons stated in response to comment B-3-1, which raises the same concerns and offers substantially the same recommendation as does this comment. CalRecycle also specifically rejects the assertion that the regulation "assumes that conflicts can be resolved through redesign." The opposite is true: Section 18980.2(a)(2) expressly acknowledges that it might not be possible to redesign packaging to resolve conflicts.

B-34: Grimmway Produce Group (Dana Brennan)

Comment B-34-1

February 12, 2026
Submitted Electronically via CalRecycle's Public Comment Portal
Csilla Richmond
SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act Regulations
California Department of Resources Recycling and Recovery (CalRecycle)
Regulations Unit
1001 I Street, MS-24B
Sacramento, CA 95814

Re: Senate Bill 54: Plastic Pollution Prevention and Packaging Producer Responsibility Act

Dear Ms. Richmond:

On behalf of Grimmway Produce Group (GPG), a large producer of carrots, potatoes, and organic vegetables operating in California, I am submitting comments on the January 29, 2026, final draft regulations implementing SB 54.

We understand SB 54's environmental objectives and appreciate the State's commitment to reducing waste and advancing a circular economy. At the same time, our core mission is to nourish families every day with safe, healthy, and affordable fresh produce. That mission depends on strong food safety protections, reliable supply chains, and practical regulatory frameworks.

Unfortunately, the revised language in Section 18980.2 undermines these essential objectives. Specifically, the addition of the term "mandatory" to Section 18980.2 and the narrowed definition of "reasonably possible" impose an obligation that conflicts with federal food safety requirements and real-world supply-chain conditions. These changes disregard the regulatory framework governing food packaging and place producers in an untenable position.

Fresh produce packaging is governed by comprehensive federal statutes, regulations, and FDA guidance, including the Food Safety Modernization Act and food-contact standards. These requirements are designed to prevent contamination and protect public health. Compliance with these standards is vital to public health, not discretionary, and cannot be subordinated to recyclability mandates.

Safe and effective packaging is fundamental to our ability to fulfill our mission of delivering safe, nutritious, high-quality produce to families across California and beyond. Packaging also plays a critical role in preventing food waste and reducing emissions by protecting product integrity, preserving shelf life, and enabling efficient transportation. Materials that fail to meet necessary performance and safety standards increase spoilage, emissions, and costs for consumers.

Without a workable categorical exclusion, SB 54 will impose unrealistic recyclability mandates, effectively cap the use of essential food-safety packaging, and expose producers to substantialfinancial penalties. These outcomes threaten food affordability, supply-chain stability, and environmental progress, particularly for lower-income consumers who are most sensitive to price increases.

We respectfully urge CalRecycle to revise Section 18980.2 to restore a clear, practical categorical exclusion for fresh produce packaging. The regulation should expressly recognize compliance with applicable federal food safety standards as the appropriate benchmark and allow necessary packaging where no equivalent, commercially viable alternative exists.

Absent these revisions, the regulation will increase food waste, raise emissions, and reduce access to safe, healthy, and affordable fresh produce for Californians, undermining our shared goal of nourishing families and supporting public health.

Should you have any questions about the comments contained in this letter, please contact Dana Brennan, VP of Corporate Affairs, at DBrennan@grimmwayproduce.com.

Thank you for your consideration.

Regards,
Jeff Huckaby, President & CEO
Grimmway Produce Group

Response to B-34-1

Comment rejected. CalRecycle rejects this comment for the reasons provided in response to comment B-3-1, which raises the same objection as this comment raises. Moreover, the commenter acknowledges that food and agricultural packaging is subject to "federal food safety requirements" and are required to comply with "standards" that the commenter also describes as "requirements." The term "mandatory" clarifies that section 18980.2(a)(2) concerns those requirements—it does not mean that a regulation, rule, or guideline must mandate specific packaging for it to be considered "mandatory" —and ensures that businesses are not required to use packaging that violates them.

B-35: Reborn Materials Inc (Jason Kang)

Comment B-35-1

February 12, 2026
Submitted to: California Department of Resources Recycling and Recovery (CalRecycle)
Re: SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility

Act – Regulatory Revisions

Submitted by the Agricultural Packaging Execution Consortium:

- Reborn Materials Inc.
- GemPack Berries LLC
- QNA Technology S.A.
- ZYEN Biotech Inc
- GgenTec Inc

Executive Statement

We supported the SB 54 regulatory framework prior to its withdrawal and continue to support the timely adoption of regulations that sustain California's leadership in reducing plastic pollution and strengthening producer responsibility.

This comment does not request:

- Amendments to statutory recovery or source reduction targets
- Redefinitions of recycling or compostability
- Modifications to mitigation surcharge obligations
- Exemptions for agricultural packaging
- Changes to PRO authority

Instead, this comment seeks clarification within existing rulemaking authority to ensure that SB 54's enforcement mechanisms operate where verification is feasible and responsibility can be credibly attributed in agricultural systems The issue addressed here concerns execution clarity, not policy ambition.

Implementation Perspective and Regulatory Continuity

SB 54 is an evidence-based producer responsibility framework. It requires measurable recovery outcomes, producer-attributable responsibility, enforceable compliance determinations, and documentation capable of audit.

The Covered Material Category (CMC) framework provides necessary statewide structure. However, category-level recovery averages aggregate materials moving through fundamentally different operational systems.

Agricultural rigid plastic packaging, including PET clamshells, is currently evaluated within

category averages dominated by uncontrolled consumer disposal streams. These averages reflect no-control systems rather than structured operational environments. Applying category-average assumptions to materials moving through controlled agricultural systems introduces measurable implementation risk, including:

- Performance masking
- Loss of infrastructure incentive
- Implementation drift where administrative compliance proceeds without measurable recovery improvement

This is not a statutory deficiency. It is a measurement alignment issue.

Agricultural Packaging in Operational Context

There exists established, well-defined operational environments where federal compliance is already actively managed and documented, including agricultural packaging which operates under federal food safety frameworks. We believe verification boundaries under SB 54 should align with these defined operating environments, and specifically, operating environments relating to agricultural packaging.

Agricultural packaging differs from conventional consumer packaging in ways that directly
affect where and how verification can occur.
For certain commodities, including strawberries:
● Packaging is received at agricultural packaging distribution and staging facilities.
● Empty packaging is issued to field crews.
● Packing occurs in the field rather than on fixed-line packing equipment.
● Finished goods are consolidated prior to transfer to third-party logistics.
● Operational control ends at the facility exit.
These facilities represent realistic control environments where custody and aggregation are documented.
Retail handling, consumer use, and municipal disposal occur outside this operational control boundary and should not serve as enforcement anchors for producer-specific compliance determinations.
Clarifying this verification boundary strengthens regulatory defensibility by aligning compliance expectations with operational reality.

Illustrative Execution Approach in Agricultural Systems

To provide context, the consortium is deploying an execution model within agricultural packaging systems that aligns verification with operational control points.
In this model:
● Packaging is physically identified at manufacturing or packaging conversion.
● Batch-level documentation is established at production.
● Packaging receipt and issuance are documented at agricultural facilities.
● Aggregated quantities are reconciled at defined facility exit points.
● End-of-life pathways are clearly separated between qualifying recycling, validated biological processing, and residual management.
This approach does not alter statutory requirements. It demonstrates how real environmental outcomes associated with material recovery in controlled supply chains and facility-based verification can occur within SB 54's existing framework.

End-of-Life Pathway Integrity

To preserve SB 54 integrity and public trust, recycling, biological processing, and residual management must remain clearly and conservatively classified.
This comment does not advocate reclassification of disposal pathways or expansion of recycling definitions. Clear pathway separation strengthens enforceability and credibility.

Requested Clarification

We respectfully request that CalRecycle clarify, within existing regulatory authority, that:
Verified, facility-based agricultural packaging flows operating within documented control environments may be measured and attributed as distinct execution sub-systems for purposes of performance verification and reporting, without altering statutory targets, material definitions, mitigation surcharge obligations, or recovery classifications.
Such clarification enhances enforceability while preserving full producer accountability.
This clarification also reduces the risk of compliance distortion which unintentionally shifts costs onto operations that are functioning within regulatory and food safety compliance frameworks.
We acknowledge that this clarification does not fully address tracking across the entire product lifecycle, including recycling and composting; however, we believe this

clarification is a meaningful step toward such end-to-end packaging traceability systems.

Conclusion

California's leadership on plastic pollution depends not only on ambitious targets but on durable and enforceable implementation.

Clarifying verification boundaries for controlled agricultural systems:

● Improves audit defensibility
● Strengthens attribution clarity
● Supports measurable performance differentiation
● Preserves statutory integrity
● Bolsters SB 54's objective while ensuring implementation remains consistent with existing frameworks and the reality of Californian agricultural systems

We appreciate CalRecycle's continued leadership and submit this comment in support of durable, evidence-based implementation aligned with operational reality.

Respectfully submitted,
Reborn Materials Inc. (USA)
Gem-Pack Berries LLC (USA)
QNA Technology S.A. (Poland)
ZYEN Biotech (South Korea)
GgenTec Inc (South Korea)

Response to B-35-1

Comment rejected. No response to this comment is necessary because it does not concern the revisions made to the proposed regulations.

B-36: Andrew Durant (Andrew Durant)

Comment B-36-1

DRAFT

February 12, 2026

Director Zoe Heller
CalRecycle
1001 I Street
Sacramento, CA 95814

Submitted via email to: regulations@calrecycle.ca.gov

RE: ***SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act Regulations (15-day comment period)***

Dear Director Heller,

My name is Bruce Duerringer, and I write in my capacity as President of Kaneka Green Planet, a division of Kaneka America Holdings, Inc. ("Kaneka") to comment on your revised SB 54 regulations. We appreciate this opportunity to provide comments and would be pleased to respond to any questions or provide additional information.

Over the past three years, Kaneka has engaged in multiple discussions with CalRecycle and members of the State Assembly and Senate to educate them on the benefits of PHA compostable materials, and to outline our own views on the need for significant investment in the type of composting infrastructure needed to replace conventional plastics as well as to divert food waste from landfills and to thereby significantly reduce one of America's greatest sources of greenhouse gas emissions.

Prior to offering these comments, we briefly summarize PHA performance characteristics and trends:

1. PHAs are the only bioplastics that are fully biobased, home- and industrially compostable, soil- and marine biodegradable, and anaerobically digestible. PHAs meet numerous international certification standards for compostability and biodegradability, including ASTM standards for industrial compostability and European (TUV) standards for home compostability and marine and soil biodegradability.

2. PHAs are made from numerous renewable feedstocks, including sewage waste gas, methane, and waste cooking oil. In the not-too-distant future we believe that direct carbon capture from the atmosphere will become viable.

3. PHAs are approved for food contact applications by the FDA and counterpart regulators in Europe, Japan, Korea, the UK and elsewhere.

4. In 2025, the European Commission released its new Bioeconomy Study, confirming that biobased compostable plastics are a strategic pillar of the EU's future industrial base. Industry analysts view this as a significant shift in direction, and a recognition of the role that compostable materials should play in Europe's ongoing transition from conventional single use plastics.

5. A February 2022 article published by the scholarly journal Bioengineering wrote that PHA biopolymers: "...mimic the functionalities of many of the top-selling plastics of petrochemical origin, but biodegrade in soil, freshwater, and marine environments, and are both industrial- and home-compostable...**PHA materials on the market or under advanced development mimic the properties of the seven most popular plastics, which account for 230 million tons of annual plastic production** [*emphasis ours*]."

6. Research by Closed Loop Partners Composting Consortium tested over 23,000 units of compostable packaging in 10 different locations (including Napa Recycling) using different composting techniques. It reports that "on average, compostable products and packaging broke down 98 percent by surface area when composted." Compostable plastic broke down successfully regardless of composting method of compost processing time.

7. Significant new investments to increase PHA production are being made in the United States and around the world while research continues to develop new applications, such as a replacement fiber for textiles, and can therefore address another significant source of pollution as addressed under the Responsible Textile Recovery

Act, a separate California EPR law on apparel and footwear. According to PMMI and Ameripen, the market for compostable packaging is growing four times faster than demand for conventional plastic packaging and is projected to grow 16% per annum through 2032. Licensing agreements and modular design will allow production to scale up rapidly in the developing world, creating green jobs and circularity.
8. PHA's replace some of the most littered products with a biodegradable product that looks and feels like plastic.

Closer to home, Dr. Marcus Eriksen, the Co-Founder of California-based NGO 5 Gyres discussed PHAs extensively in testimony before the United States Senate Committee on Environment in October 2023. Portions of his testimony are reproduced below:
"Recycling has had 40 years to prove its effectiveness, but these systems have failed for single-use plastics. We need to accept that we're not going to recycle our way out of this problem. Fortunately, the private sector is meeting this challenge head on. Successful business models showcasing reusable and refillable packaging are proving that you can do business without causing harm or a waste management burden for taxpayers.
"However, reuse and refill systems might not work for every sector of plastic use in society. In those cases, we can turn to the promising research and innovation that continues to emerge around novel biomaterials. Biomaterials are polymers derived from natural origins, like paper, plant fibers, or a variety of bioplastics like polyhydroxybutyrate (PHB), which is produced by microorganisms. 5 Gyres recently completed an 18-month field study that measured the fragmentation of bioplastics in different terrestrial and marine settings. We took 22 items, including straws, film, and forks, and put them in real-world environments (ocean, desert, forest, wetlands) across three states. The results showed that when biomaterials end up in realistic environments, some do not last long" (see Attachment 2).
"Looking at the five types of straws in the study, some of the biomaterials were gone in 16 weeks or less. **We found that PHB , which has the functionality of some plastics, degraded as fast as paper, while the polyethylene straw was unchanged. When we look at different types of film, we find the polyhydroxyalkanoates (PHA) is gone at 16 weeks, while polyethylene remains unchanged throughout the study. Likewise, the utensils made of biomaterials largely degraded over the course of 18 months. However, the bamboo utensil did not, and the polystyrene looked as new as day one.** [*emphasis ours*]
"The innovation and entrepreneurship in this space gives me hope for the future. We're seeing new business models emerge across our country, and dozens of biomaterial companies are making tremendous headway in the packaging space. These companies are replacing fossil fuels with regenerative materials, like seaweed, waste methane, and mushrooms. This offers a new opportunity for significant job creation in industries that don't endanger people's health. The U.S. has an opportunity to lead the way here."

On January 30th, we submitted comments to DTSC responding to their November 2025 Background Document on Microplastics. In that submission, we discussed the biodegradability and compostability of PHAs and then summarized scientific research on the question of whether the biodegradation of PHAs creates persistent microplastics.

Finally, we highlighted some of the applications for our PHA materials that are being used to make products highlighted in their Background Document. We appreciate that this is a separate investigation that is independent of SB 54 and this rulemaking process, but believe it fits within the overall mandate of CalRecycle, and the multiple laws enacted by the legislature and signed into law by Governor Newsom.

Summary and Comments

SB 54 was enacted in recognition of the failure of current systems and infrastructure to meet California's earlier mandate that 75 percent solid waste be source reduced, recycled, or composted by 2020. According to the SB 54 preamble, only 5% of single use plastics are being recycled. SB 54 anticipates raising $550 million over the next 10 years through a variable fee structure that will incentivize companies to migrate towards using fewer and better materials. We believe that CalRecycle should maintain a focus on these long-term objectives and the positive role that compostables can plan in this transition.

1. We appreciate that the Covered Material Category list published in December 2025 has been expanded to cover more compostable products as it illustrates a pathway for composters to be compensated for investments that they make to process compostable packaging and single-use plastics.

2. Many composters in California and across the US already accept compostable packaging. While it should be left to the individual compost operator to determine whether they want to accept compostable bioplastics, those who opt not to accept compostable bioplastics should not receive funding from the EPR fees unless their refusal is based on existing facility limitations that can be remedied within a specific and reasonable time frame through investments in the facility that can be funded through the EPR fees.

3. Any claims based on compostable product performance (incomplete disintegration) should be thoroughly and independently documented. To ensure that conditions are optimal, we recommend CalRecycle use the newly published ASTM standard to ensure that compost facilities provide optimal conditions for compostable materials.

4. We strongly believe all materials sent to compost should be subject to the same ASTM standards. California law stipulates this. However, the draft regulations continue to provide preferential treatment for paper and fiber products which may not completely degrade in finished compost piles. t

We very much appreciate this opportunity to provide additional comments and are available to answer any questions that you may have.

Best regards,

Bruce Duerringer

3 PHB is in the family of PHAs

Response to B-36-1

Comment rejected. No response to this comment is necessary because it does not concern the revisions made to the proposed regulations.

B-37: Charter Next Generation

Comment B-37-1

Charter Next Generation is submitting comments as a manufacturer of specialty packaging films for food applications in California. We are supportive of allowing exclusions in cases where packaging solutions cannot be reasonably developed to meet both SB54 and FDA/USDA requirements. It is important that when these exemptions are approved, they include exempting the packaging material from all components of the SB54 program, including source reduction requirements.
However, we are concerned about the use of the word "mandatory regulations, rules or guidelines" in Section 18980.2. Categorically Excluded Materials. This significantly narrows the opportunity to obtain exclusions where they would be greatly needed to not only deliver food safety to the retail shelf but also provide other operational and environmental benefits. For example, food packaging solutions serve many other critical functions, including optimizing the supply chain to reduce food waste and greenhouse gas emissions, topics for which the USDA and FDA do not have authority. Thus, the regulations, as written, which aim to reduce waste, may lead to increased food waste and environmental impacts, as well as increased operational and consumer food costs.
Overall, we feel the exclusion process can be made much more administratively efficient through a categorical exclusion for key food and agricultural products (e.g. all meat, cheese, produce) vs. the exclusion design as currently written.

Response to B-37-1

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment B-3-1.

B-38: Youngstown Grape Distributors Inc. (MICHAEL FORREST)

Comment B-38-1

To: Csilla Richmond
Department of Resources Recycling and Recovery

Dear Ms. Richmond:

We submit this comment in response to the 15-day proposed changes to the permanent regulations implementing the SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act.

We are a California-based grower, packer, and shipper of fresh fruit, including fresh-cut pomegranate arils and bagged stone fruit. Our products are perishable, high-moisture food items that require sealed plastic packaging for food safety, shelf life preservation, and leak prevention.

We respectfully object to the unreasonable scope of the regulations as currently structured, particularly as applied to fresh, moisture-dependent produce packaging.

1. Food Safety and Federal Compliance Conflict

Fresh-cut arils and similar products require moisture-barrier, sealed, food-grade packaging to comply with FDA Food Safety Modernization Act (FSMA) preventive controls. Fiber-based alternatives are not technically viable for wet produce and would materially increase microbial and spoilage risks.

The regulations must explicitly clarify that compliance obligations shall not require packaging substitutions that compromise food safety or violate federal standards.

Response to B-38-1

Comment rejected. Section 18980.2(a)(2) expressly excludes packaging that cannot be replaced by alternatives that comply with federal requirements, such as those cited by the commenter. No clarification is required with respect to packaging that presents such a conflict. To the extent the commenter asserts that 18980.2(a)(2) should apply when there are food safety concerns that alternatives could not address for reasons other than a conflict with federal requirements, CalRecycle declines to make such a change. As described in detail in response to comment B-3-1, section 18980.2(a)(2) concerns direct legal conflicts only, and the Act addresses scenarios like those the commenter

describes by allowing exemptions for "unique challenges" and health and safety risks under section 18980.2.4. Those exemptions are sufficient to address, for example, the necessity of using certain packaging for particular food products when other packaging would be not reasonably safe or otherwise impractical.

Comment B-38-2

2. Lack of Moisture-Dependent Produce Exemption
The rule does not adequately distinguish between discretionary single-use packaging and essential, food-safety-driven packaging for wet produce. Fresh-cut fruit and high-moisture refrigerated products should be subject to tailored standards recognizing their structural packaging requirements.

Response to B-38-2

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment B-38-1. Those reasons apply equally to this comment, which merely raises an example of a scenario where an exemption due to unique challenges or health and safety risks may be appropriate if there is no legal conflict concerning federal requirements.

Comment B-38-3

3. Source Reduction Mandate Is Misaligned with Fresh Produce
The 25 percent source reduction requirement fails to account for lifecycle impacts. Plastic produce packaging reduces food waste, shrink, and handling damage. Increased spoilage will increase greenhouse gas emissions through methane from decomposing food, undermining the law's climate objectives.
4. Infrastructure Realities
Many flexible films used for produce packaging are unlikely to meet recyclability thresholds under current statewide infrastructure. Imposing compliance without functional recycling pathways creates liability without a practical compliance route.
5. Disproportionate Economic Impact on California Agriculture
California growers and packers operate under thin margins and face extensive existing regulatory burdens. Sweeping agricultural producers into a CPG-oriented EPR framework risks unintended competitive harm to in-state agriculture.
Requested Revisions
We respectfully request:
• A clear exemption or tailored compliance pathway for moisture-dependent fresh produce packaging
• Explicit protection against food-safety conflicts
• Recognition of lifecycle food-waste tradeoffs in source-reduction requirements
• Phased implementation tied to demonstrated recycling infrastructure readiness
We support responsible environmental stewardship. However, the regulations must reflect the operational realities of fresh food production and distribution.
Respectfully submitted,
Michael Forrest
President

Youngstown Grape Distributors Inc.

Response to B-38-3

Comment rejected. No response is necessary to the numbered items in this comment because they do not concern the revisions made to the proposed regulations. Regarding the unnumbered items labeled as "Requested Revisions," to the extent the first two items relate to section 18980.2(a)(2), CalRecycle has addressed them in response to comments B-38-1 and B-38-2. No response is otherwise necessary regarding the unnumbered items because they do not concern the revisions made to the proposed regulations.

B-39: NatureSweet (Skip Hulett)

Comment B-39-1

Subject: Comments on SB 54 Final Draft Regulations – 15-Day Comment Period (Jan. 29, 2026 Notice)

To CalRecycle, Regulations Unit:
I am submitting comments in response to CalRecycle's January 29, 2026, Notice of 15-Day Changes to the proposed SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act Permanent Regulations. I submit these comments on behalf of NatureSweet, a U.S.-based, Texas-headquartered fresh produce company.

1) Comment scope for the 15-day changes

We understand CalRecycle will consider comments limited to the changes identified in the 15-day notice, including revisions to section 18980.2(a)(2) and related provisions addressing categorically excluded materials. Our comments focus on those revisions—particularly the tightened standard for categorical exclusion and the apparent narrowing of what is "reasonably possible" for fresh produce packaging.

2) Section 18980.2 categorical exclusion changes are unworkable for fresh produce packaging

The revised language in Section 18980.2 (Categorically Excluded Materials) is deeply concerning. By tightening the exclusion test—including an apparent emphasis on "mandatory" requirements and a restrictive interpretation of what is "reasonably possible"—the revision risks making the categorical exclusion pathway effectively unattainable for many fresh produce packaging formats, even when those formats serve critical product integrity and perishability functions.

Fresh produce packaging decisions are governed by non-negotiable operational realities: maintaining sanitary handling, minimizing damage, preserving quality, and ensuring shelf life across harvesting, cooling, distribution, and retail. These are not discretionary features; they are fundamental to delivering safe, high-quality, affordable produce to Californians.

Response to B-39-1

Comment rejected. CalRecycle rejects this comment for the reasons provided in response to comment B-3-1, which raises the same concern as does this comment with regard to the term "mandatory" and the attainability of an exclusion under section 18980.2(a)(2).

Comment B-39-2

3) NatureSweet's recommended policy direction: a Fresh Food Waste Credit, with food safety as a guardrail

We respectfully recommend that CalRecycle restructure the approach reflected in the proposed revisions in two ways:

A. Do not force the exclusion question into an all-or-nothing "food safety exemption" test.

Food safety is an essential technical and compliance constraint for fresh produce packaging—but centering the exclusion pathway primarily on a narrow "mandatory" food safety conflict sets up an impractical evidentiary burden.

Importantly, any SB 54 "safety" or "compliance" showing must be fully consistent with the FSMA and FDA's existing compliance framework and should not create additional state-level barriers or duplicative requirements that effectively move the goalposts for food-contact packaging. The appropriate benchmark for safety-related packaging compliance is the established federal system (including FDA food-contact requirements and FSMA-aligned preventive controls), and SB 54 implementation should avoid layering additional, non-uniform burdens that could disrupt interstate perishable supply chains.

B. Align SB 54 implementation with SB 54's environmental objectives through a performance-based Fresh Food Waste Credit.

For perishable foods, reducing food waste and shrink are often the biggest levers for reducing environmental harm, because the upstream footprint (water, land, energy, fertilizer, refrigeration, transportation) is embedded in the food itself. When produce is wasted, those impacts are wasted as well, and disposal can increase methane emissions. In many cases, the environmental gains from preventing spoilage and shrink will materially exceed the gains from marginal packaging "tweaks" that risk shortening shelf life or increasing damage. A policy pathway that credits packaging's role in preventing spoilage is therefore more directly aligned with SB 54's environmental goals than a framework that unintentionally incentivizes changes that increase waste.

Produce packaging frequently delivers net environmental benefits by preventing spoilage and reducing food waste. Regulatory design should account for those lifecycle realities rather than focusing narrowly on packaging attributes alone.

Response to B-39-2

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment B-3-1. That response addresses the commenter's objection with respect to conflicts with federal requirements and the alleged imposition of an "evidentiary burden." Moreover, the commenter's own description of federal law demonstrates that section 18980.2(a)(2) is appropriate

as written. The commenter acknowledges that federal law creates a "compliance framework" and imposes "requirements." Section 18980.2(a)(2) ensures that packaging will not be required to comply with the Act if doing so would conflict with complying with the federal framework and associated requirements. CalRecycle also rejects this comment's suggestion of a "fresh food waste credit." That suggestion is vague; CalRecycle cannot discern what change would constitute such a "policy pathway" or identify a provision of the Act that would authorize CalRecycle to create a "performance-based" credit directed specifically at food waste. To the extent the commenter intended to refer to a credit for purposes of fees paid to the Producer Responsibility Organization fees pursuant to Public Resources Code section 42053, CalRecycle rejects this comment for the reasons provided in response to comment B-39-4.

Comment B-39-3

4) Specific requested changes for the 15-day revisions

We respectfully urge CalRecycle to revise the 15-day changes to restore a workable pathway for fresh produce by:

1. Clarifying "reasonably possible" to include perishability and food waste outcomes

Define "reasonably possible" in a manner that recognizes produce packaging's functions (damage reduction, shelf-life extension, moisture/airflow control, and quality preservation) and avoids creating incentives that increase spoilage, shrink, or contamination risk.

Response to B-39-3

Comment rejected. While the commenter labels this portion of their submission as setting forth "[s]pecific requested changes," this comment does not offer a specific suggestion. Instead, it restates the objection raised earlier in the submission regarding the "reasonably possible" standard, which the commenter alleges has been narrowed. CalRecycle therefore rejects this comment for the reasons stated in response to comment B-39-1. Moreover, as explained in greater detail in response to comment B-3-1, the exemptions described in section 18980.2.4 for unique challenges and health and safety risks are adequate to accommodate compliance obstacles and practical limitations related to packaging functions and effectiveness.

Comment B-39-4

2. Creating an explicit performance-based Fresh Food Waste Credit (or preferred fee treatment)

Add regulatory language or implementing criteria that allow packaging formats to qualify for lower fees / eco-modulation through a Fresh Food Waste Credit when supported by evidence such as retail shrink reduction, shelf-life testing, and damage-rate reductions.

Response to B-39-4

Comment rejected. Public Resources Code section 42053(d) sets forth the factors on which the PRO's fee schedule must be based, and section 42053(e) lists the factors based on which the PRO must adjust fees for producers (referred to as "malus fees" and "credits"). Generally, the factors relate to the funding necessary for the PRO and producers to meet their statutory obligations. The Act does not authorize CalRecycle to dictate the fee schedule, mandate specific malus fees and credits, or modify the factors the PRO must consider; instead, the PRO is authorized to propose a fee schedule, and CalRecycle must approve it if it satisfies all statutory requirements.

Comment B-39-5

3. Treating food safety as a guardrail aligned with FSMA and FDA requirements—without added compliance barriers

Maintain protections so SB 54 requirements do not penalize packaging changes that materially increase contamination risk, undermine sanitary handling, or degrade traceability expectations. At the same time, ensure that any safety-related documentation or thresholds align with FSMA and FDA's existing compliance framework and do not impose new, duplicative barriers that are impractical for perishable foods and multi-state supply chains.

Response to B-39-5

Comment rejected. While the commenter labels this portion of their submission as setting forth "[s]pecific requested changes," this comment does not offer a specific suggestion. Instead, this comment repeats the objection raised in comment B-39-2 concerning alignment with existing frameworks and allegedly duplicative and impractical requirements. CalRecycle cannot respond to the commenter's reference to "traceability expectations" because the commenter does not adequately explain it. CalRecycle cannot discern how "SB 54 requirements" might "penalize packaging changes that materially . . . degrade traceability expectations" or why the commenter asserts that those requirements should not do so.

Comment B-39-6

5) Food security and undue burden: avoid compounding current pressures on American farmers and growers

SB 54 implementation should explicitly account for the current economic reality facing American farmers and growers. Fresh produce operates on small margins, with limited ability to absorb additional costs or administrative burdens. Today, many growers are navigating rising input and labor costs, evolving compliance requirements, market variability, and more limited access to capital. In this context, introducing additional EPR fees and potential penalties—without a practical, produce-specific pathway—could create additional operational challenges for farms and grower-packers.

This food security concern is heightened by the government's increasing focus on improving health outcomes through access to affordable, whole foods, with fresh fruits

and vegetables playing a vital role. Policies that unintentionally raise costs or reduce the availability of fresh produce run counter to those objectives.
If the categorical exclusion pathway is effectively closed and no performance-based Fresh Food Waste Credit exists, SB 54 risks:
• increasing costs across the produce supply chain,
• delaying investment and innovation in sustainable production,
• reducing availability and increasing prices of affordable whole foods,
• and shifting sourcing and market share away from domestic growers—undermining food security and resilience.
A performance-based Fresh Food Waste Credit that recognizes measurable reductions in food waste and shrink is a pragmatic way to avoid undue burden while advancing SB 54's environmental goals. It helps ensure California's approach supports both climate outcomes and continued access to affordable fresh fruits and vegetables.

Conclusion

NatureSweet supports the objectives of SB 54. However, the 15-day revisions to the categorical exclusion provisions risk creating an unworkable standard for fresh produce packaging and may unintentionally increase food waste—undermining environmental goals while placing undue burden on growers and perishable supply chains.
We respectfully request CalRecycle revise the 15-day changes to: (1) restore a workable interpretation of "reasonably possible" for perishable foods; (2) establish a performance-based Fresh Food Waste Credit (or preferred fee treatment); and (3) treat food safety as a guardrail aligned with FSMA and FDA's compliance framework, without imposing additional barriers or duplicative requirements.
Thank you for considering these comments.
Sincerely,
Skip Hulett
Chief Legal Officer
NatureSweet
shulett@naturesweet.com

Response to B-39-6

Comment rejected. While the commenter labels this portion of their submission as setting forth "[s]pecific requested changes," this comment does not state additional objections to section 18980.2(a)(2) or recommended changes to it. While the comment adds food policy considerations and factual context concerning the alleged consequences of maintaining section 18980.2(a)(2) as written, those additions do not fix the flaws with the commenter's suggested approach, discussed in responses to comments B-39-2 through B-39-4. CalRecycle also rejects this comment for the reasons stated in response to comment B-3-1, which raises objections substantially similar to those raised in this comment.

B-40: Beta Analytic (Benjamin Kling)

Comment B-40-1

California Department of Resources Recycling and Recovery (CalRecycle)
SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act | Stakeholder Input

This comment is specifically intended to recommend that the proposed SB 54 implement a definition of the term "biobased" which directly requires the carbon-14 testing method following ASTM D6866 Method B to determine the share of biobased carbon embodied in materials seeking recognition under the program. Biobased content measurements following standards such as ASTM D6866 Method B currently provide critical value to similar existing programs and can play a key role in achieving SB 54's objectives.

Included here you will find:
Recommendations for SB 54 1
What is Biogenic Testing (Carbon-14)? 5
ASTM D6866 Method B - The Most Reliable Method 6
About Beta Analytic 7
ISO/IEC 17025:2017 laboratory 7
Required tracer-free facility for Carbon-14 8
References 8

Recommendations for SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act

Our recommendation for SB 54 is to incorporate a definition of the term "biobased," which is consistent with the definition used by ASTM D6866 and requires direct biobased content testing following ASTM D6866 Method B for any biobased materials seeking recognition under the law. This would create consistency with similar initiatives throughout the federal government, particularly the USDA's BioPreferred® Program, and would help CalRecycle achieve SB 54's goals of reducing petrochemical pollution from plastics and packaging.

Since SB 54 includes "aliphatic biopolyesters" in its definition of the term plastic (42040 (t)), it chooses not to regulate biobased materials and bioplastics separately from traditional plastics. By doing so, CalRecycle fails to make the decarbonization benefits of biobased plastics available to California's transition away from petrochemicals. This decision benefits traditional petrochemical plastic producers by failing to make more sustainable alternatives available to consumers, and even further by communicating to California consumers that CalRecycle considers fossil and biobased materials to be equally sustainable. This directly compromises SB 54's ability to achieve its intended outcomes.

Beta recommends that SB 54 should include a specific definition of the term “biobased,” following the ASTM D6866 definition.1 Including the ASTM D6866 definition would guarantee that only products
containing renewable content benefit from the biobased label because it relies on direct testing to verify claims. Products which can prove they embody biobased content should be recognized as a pathway to achieving SB 54’s goals for displacing petrochemicals. Even further, the use of direct testing in this definition would allow CalRecycle to exclusively incentivize the biobased portion of these products. This would also create consistency with the USDA BioPreferred® Program’s 20-year accepted definition of biobased that is sustained by direct product testing under ASTM D6866.2

The USDA recently issued a major update to the BioPreferred Program, combining the federal procurement and voluntary labeling portions of the program into one unified pathway, which relies on direct testing following ASTM D6866 to demonstrate biobased content.3 This is an important rule toconsider because USDA upheld the importance of the ASTM D6866 definition of biobased, specificallresponding to commenters who advocated for the introduction of calculation-based approaches such as mass balance. USDA’s response to those comments said, “The Agency notes that products produced by mass balance methods are not Biobased Products as defined by this final rule. To maintain the integrity of the Label and to prevent diluting public understanding of what the Label means, the Agency must maintain a consistent definition of what it means for a product to be biobased.”4 It is critical to follow this approach of a consistent definition to make the term biobased meaningful to consumers and guarantee that biobased products are truly providing the decarbonization benefits the term is intended
to promote.

The BioPreferred definition of “biobased” should specifically be used to inform Section 18980.6.7(j) on developing a credit for producers who use plastic-covered material derived from renewable materials (included below). Since the goal would be to give this credit only to the renewable portion of products and not materials of mineral or fossil origin, ASTM D6866 testing should be required to demonstrate the renewable content.

(j) Pursuant to paragraph (7) of subdivision (e) of section 42053 of the Public Resources Code, a PRO shall provide a credit for producers who use plastic-covered material derived from renewable materials.
(1) “Renewable materials,” for the purposes of paragraph (7) of subdivision (e) of section 42053 of the Public Resources Code, means materials that are wholly derived from natural resources that are not of mineral or fossil fuel origin, without resulting in the net depletion of any of the resources. Examples of potentially renewable material include those derived from wood, mycelium, algae, or plants such as cotton, corn, sugar cane, or wheat

Direct biobased testing requirements are the established best practice for determining renewable content under leading public and private incentive programs for biobased products. For reference, ASTM D6866 is required for reporting the biobased content of

renewable chemicals, bioplastics and other biobased products under the following prominent programs (please see specific rules hyperlinked):
- The USDA BioPreferred Program requires ASTM D6866 Method B testing for any biobased products, including renewable chemicals, seeking recognition of renewable content.5
- The EU's Policy Framework for Biobased, Biodegradable and Compostable Plastics recommends direct Carbon-14 testing as its preferred method for determining biobased products.6
- Four US states have Renewable Chemicals Act laws which provide incentives for biobased chemical production requiring ASTM D6866 testing: Iowa, Kentucky, Minnesota and Maine. The 2024 bill for a federal Renewable Chemicals Act also proposed to require ASTM D6866 testing, as have several previous versions of the bill.
- The leading biobased product certification programs in the market require Carbon-14 testing to verify biobased content, including TUV Ok Biobased, DIN CERTCO Biobased, UL 9798 biobased content validation, SGS Green Mark, Nordic Swan Ecolabel, Germany's Blue Angel Ecolabel, Braskem I'm Green™, Leadership in Energy and Environmental Design (LEED) and CertiPUR-US®
- ASTM D6866 was also the proposed methodology for identifying biobased practices in the 2024 Biomanufacturing and Jobs Act.

In addition to the USDA BioPreferred® Program, we encourage CalRecycle to review the EPA's proposed Label Program for Low Embodied Carbon Construction Materials.7 This proposed program further demonstrates the importance of recognizing and incentivizing biobased content as an approach to displacing petrochemicals. By failing to recognise biobased materials as a distinct category and incentivizing their use, the proposed draft text of SB 54 would continue to promote the use of petrochemical plastics in these long-term embodied materials. This is particularly relevant to consider because while many of the materials the proposed EPA label would address are difficult to decarbonize and may not be feasible for compostability yet, SB 54 can incentivize the transition away from petrochemicals in these products by including a definition of the term "biobased".

If SB 54 incorporates a definition of the term biobased, it is critical that materials receiving this designation be required to submit routine direct testing, rather than allow calculation-based approaches such as mass balance. These calculations allow producers to assume that all of their biomass inputs end up in their facilities' outputs, despite it being well understood in the industry that the input of renewable feedstocks is not the same as the output. Renewable feedstocks will often have different activity than their fossil counterparts and won't necessarily produce the same quantity of outputs.8 By basing their calculations solely on production inputs rather than outputs, these methods systematically over-report the renewable share of fuels.

Even further, mass balance calculations allow producers to freely attribute the renewable content of feedstocks among end products, making these operations extremely difficult to audit and creating an environment ripe for greenwashing and fraud.9 The risk of allowing the mass balance approach can be seen in the case of

fraudulent ISCC mass balance certified biofuels, which plummeted the value of European biofuels in June of 2023.10 Beta Analytic urges CalRecycle to ensure that SB 54 reflects the integrity of the term “biobased” by including direct product testing under ASTM D6866 in its definition.

In August 2024, the US Environmental Protection Agency (EPA) launched a federal action against the mass-balance methodology used in the recycling sector. The Agency notably highlighted concerns about this methodology being used to assess the recycled content of plastics, as it routinely overestimates the actual recycled content of bioplastics, which misleads consumers and does not contribute to the circular economy and decarbonisation goals. This methodology can be used to artificially inflate the recycled content of products to take advantage of incentives and to sell their products at a higher price for the recycled content incorporated into their process. A ProPublic investigation published in June 2024 found that products advertised as 30% recycled through mass balance often contained less than 1% recycled content. Similar concerns were shown by the US EPA as early as 2023, which described the mass-balance methodology as deceptive and advised against promoting it.11 Following the publication of the federal case, the US EPA updated the methodology for its Safer Choice label, requiring the recycled content to be determined by weight post-consumer, effectively prohibiting the mass-balance methodology from being used to certify products under the Safer Choice program.

This led California Attorney General Rob Bonta to file a lawsuit against ExxonMobil in September 2024, claiming that the oil major “deceptively” promoted chemical recycling as a solution to the plastic crisis, citing their use of mass balance calculations such as ISCC Plus.12 That lawsuit directly challenges the standard’s use of ISCC’s free allocation method as a system designed to enable greenwashing.13 This is the same issue facing the biobased products industry from ISCC certifications and associated terminology like “bio-attributable” and “biomass balanced,” which are being promoted in other comments for this update to SB 54. The New York Times also recently published a relevant article on the challenges that mass balance presents to the recycling industry, which aligns with the challenges experienced in the renewable products industry.14

Based on these challenges, ISCC and other calculation-based certifications should not be eligible to apply for designation as third-party certifications under SB 54. The role of major oil and petrochemical companies on the organisation’s board of directors15 should be considered a direct conflict with Section 18981 (b)(2), which requires that approved third-party certifications, “[m]ust be independent, impartial, and not have any conflict of interest with respect to granting the certification.” This conflict led the New York Times article discussed above to refer to ISCC as a “self-certification system,” designed by these influential corporations in the industry.16 Especially given that the state is suing ExxonMobil, citing the ISCC Plus certification as a deceptive practice, this scheme should not be approved for any purpose, whether for recycled or biobased content.

The issue of free attribution has led industry proponents of mass balance to propose the use of broad terms such as “bio-attributable,” and “mass balance biobased,” which are specifically intended to allow commercial interests to avoid compliance with the ASTM D6866 definition.17 By failing to include a definition of biobased, which is tied to direct testing, this draft of SB 54 creates consumer confusion to the benefit of these competing definitions designed to enable greenwashing of fossil-based products. Including the ASTM D6866 definition would clearly communicate to consumers that only the portion of products directly derived from biomass should be considered renewable.

One other important policy to consider for SB 54 in this connection is the EU’s Policy Framework for Biobased, Biodegradable and Compostable Plastics. The framework states that, “It is also important to ensure that biobased content is measured precisely. **Radiocarbon-based methods should be preferred** as their results are robust and their use is widely accepted. Documenting the use of biomass through a chain of custody and attributing a share to end-products through mass balance accounting is a method which is not considered suitable for confirming the actual share of biobased content.”18 Even further, under its Packaging and Packaging Waste Directive (PPWD), the European Commission is required to complete a review of the state of bio-based plastic packaging, and to propose legislation by 2028 to create a biobased label, in which radiocarbon verification should be the preferred method to measure their renewable content.19 SB 54 should use this same approach when incorporating biobased content to ensure products seeking the designation provide real decarbonization benefits and avoid greenwashing from calculations like mass balance.

In summary, Beta urges CalRecycle to include a definition of the term biobased in SB 54, which is tied to routine biobased content testing. Direct test results following ASTM D6866 Method B will be the most effective tool for the program to validate and track the decarbonization of plastics and packaging achieved by the use of biobased content under this policy.

What is Biogenic Testing (Carbon-14)?

Carbon-14 analysis is a reliable method used to distinguish the percentage of biobased carbon content in a given material. The radioactive isotope carbon-14 is present in all living organisms and recently expired material, whereas any fossil-based material that is more than 50,000 years old does not contain any carbon-14 content. Since Carbon-14 is radioactive, the amount of carbon-14 present in a given sample begins to gradually decay after the death of an organism until there is no carbon-14 left. Therefore, a radiocarbon dating laboratory can use carbon-14 analysis to quantify the carbon-14 content present in a sample, determining whether the sample is biomass-based, fossil fuel-derived, or a combination.

The analysis is based on standards such as ASTM D6866 and its international equivalents developed for specific end uses, such as the European standard ISO 16620. ASTM D6866 is an international standard developed for measuring the biobased

carbon content of solid, liquid, and gaseous samples using radiocarbon dating.20 There are also many specific international standards based on the use of direct carbon-14 testing, such as ISO 16620 which is an international standard that measures the biobased carbon content of plastic products, polymers, and additives.21

Carbon-14 analysis yields a result reported as % biobased carbon content. If the result is 100% biobased carbon, this indicates that the sample tested is completely sourced from biomass material such as plant or animal byproducts. A result of 0% biobased carbon means a sample is only fossil fuel-derived. A sample that is a mix of both biomass sources and fossil fuel sources will yield a result that ranges between 0% and 100% biobased carbon content. Carbon-14 testing has been incorporated into several regulations as the recommended or required method to quantify the biobased content of a given material.

ASTM D6866 Method B - The Most Reliable Method

Carbon-14 is a very well-established method which has been in use by many industries (including the fossil fuel industry) and academic researchers for several decades. Carbon-14 measurements done by commercial third party testing is robust, consistent, and with quantifiable accuracy/precision of the carbon-14 amount under **ASTM D6866 method B.** The EN 16785 is the only standard that allows a variant of the Mass Balance (MB) method of 'carbon counting' under EN 16785-2. The EN 16785-1 requires that the biocarbon fraction be determined by the carbon-14 method. However, when incorporating this EN 16785 method, certification schemes like the "Single European Bio-based Content Certification" **only** allow the use of EN 16785-1 due to its reliability and the value of a third-party certification. http://www.biobasedcontent.eu/en/about-us/

In ASTM D6866 method B, the carbon-14 result is provided as a single numerical result of carbon-14 activity, with graphical representation that is easily understood by regulators, policy makers, corporate officers, and more importantly, the public. The overwhelming advantage of carbon-14 is that it is an independent and standardized laboratory measurement of any carbon containing substance that produces highly accurate and precise values. In that regard, it can stand alone as a quantitative indicator of the presence of biobased vs. petroleum feedstocks. When carbon-14 test results are challenged, samples can be rapidly remeasured to verify the original reported values (unlike mass balance).

The quantification of the biobased content of a given product can be as low as 0.1% to 0.5% (1 relative standard deviation – RSD) based on Instrumental error for Method B (AMS). This error is exclusive of indeterminate sources of error in the origin of the biobased content, and manufacturing processes. As such a total error of +/-3% (absolute) has been assigned to the reported Biobased Content to account for determinate and indeterminate factors.22

It is also important that the program should always require ASTM D6866 Method B, rather than allow Method C for any use. Where ASTM D6866 Method B uses the AMS

Instrument to measure 14C, Method C uses Liquid Scintillation Counting (LSC). In Method B, the AMS Instrument directly measures the 14C isotopes. However, in Method C, scintillation molecules indirectly absorb the beta molecules that release with the decay of 14C and convert the energy into photons which are measured proportionally to the amount of 14C in the sample. Since Method B directly measures the 14C isotopes and Method C measures them indirectly, Method B is significantly more precise and should be prioritized in regulations.23 LSC measurements, like those used in Method C, are commonly used as an internal testing tool when samples are limited and accuracy does not need to be extremely high.

About Beta Analytic

Beta Analytic was among the originators of the use of Accelerator Mass Spectrometry (AMS) for the ASTM D6866 biobased / biogenic testing standard using Carbon-14 to distinguish renewable carbon sources from petroleum sources. Beta began testing renewable content in 2003 at the request of United States Department of Agriculture (USDA) representatives who were interested in Beta's Carbon-14 capabilities for their BioPreferred® Program (www.biopreferred.gov). At their request, Beta joined ASTM under subcommittee D20.96. Beta's previous president, Darden Hood, was positioned as a technical contact for the USDA and within 3 months completed the ASTM D6866-04 standard. The Carbon-14 technique is now standardized in a host of international standards including ASTM D6866, CEN 16137, EN 16640, ISO 16620, ISO 19984, BS EN ISO 21644:2021, ISO 13833 and EN 16785. Carbon-14 analysis can be used on various types of samples (gas, liquids and solids). Beta Analytic continues to be a technical contact for ASTM D6866 with current president Ron Hatfield and is involved with all their latest ASTM D6866 versions.

The Carbon-14 standardized method is also incorporated in a variety of regulatory programs including the California AB32 program, US EPA GHG Protocol, US EPA Renewable Fuels Standard, United Nations Carbon Development Mechanism, Western Climate Initiative, Climate Registry's Greenhouse Gas Reporting Protocol and EU Emissions Trading Scheme.

We are currently technical experts on Carbon-14 in the following committees:

ASTM D6866 (D20.96) Plastics and Biobased Products (Technical Advisor)
ASTM (D02.04) Petroleum Products, Liquid Fuels and Lubricants (Technical Advisor)
ASTM (061) US TAG to ISO/TC 61 Plastics (Technical Expert)
USDA BioPreferred® Program TAC (Technical Advisor)
ISO/TC 61/SC14/WG1 Terminology, classifications, and general guidance (Technical Expert)
CEN/TC 411 Biobased Products
CEN/TC 411/WG 3 Biobased content
CEN/TC 61/SC 14/WG 1 Terminology, classifications, and general guidance (Technical Expert)

ISO/IEC 17025:2017 Accredited Laboratory

To ensure the highest level of quality, laboratories performing ASTM D6866 testing should be ISO/IEC 17025:2017 accredited or higher. This accreditation is unbiased, third party awarded and supervised. It is unique to laboratories that not only have a quality management program conformant to the ISO 9001:2008 standard, but more importantly, have demonstrated to an outside third-party laboratory accreditation body that Beta Analytic has the technical competency necessary to consistently deliver technically valid test results. The ISO 17025 accreditation is specifically for natural level radiocarbon activity measurements including biobased analysis of consumer products and fuels, and for radiocarbon dating.

Required tracer-free facility for Carbon-14

For carbon-14 measurement to work, be accurate, and repeatable, the facility needs to be a tracer-free facility, which means artificial/labeled carbon-14 is not and has never been handled in that lab. Facilities that handle artificial carbon-14 use enormous levels relative to natural levels and it becomes ubiquitous in the facility and cross contamination within the facility, equipment and chemistry lines is unavoidable. Results from a facility that handles artificial carbon-14 would show elevated renewable contents (higher pMC, % Biobased / Biogenic values), making those results invalid. Because of this, Federal contracts and agency programs (such as the USDA BioPreferred® Program) require that AMS laboratories must be 14C tracer-free facilities in order to be considered for participation in solicitations.

Areas where cross-contamination might occur include but are not limited to; biomedical or nuclear reactors, isotope enrichment / depletion columns, water, soil, plant, or air samples collected near or at biomedical / nuclear reactor sites, medical, industrial, or hazardous waste sites, samples specifically manipulated to study the uptake / fractionation of stable isotopes due to biological or metabolic processes. To learn more about the risks associated with testing natural levels Carbon-14 samples in a facility handling artificially enhanced isotopes please see the additional information provided after this commment.

RE: SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act Proposed Regulations

Dear Ms. Richmond,

CalRecycle has issued proposed revisions to the SB 54Plastic Pollution Prevention and Packaging Producer Responsibility Act Permanent Regulations.[1] The Alliance for Automotive Innovation (Auto Innovators)[2] appreciates the opportunity to provide comments on this next step in California’s implementation of its extended producer responsibility (EPR) program. Our members will be significantly impacted by these regulations, and our comments reflect our commitment to a continued constructive dialogue with CalRecycle staff.

Although these proposed revisions do not impact our previous comments, we want to urge the Agency to consider adopting our previously stated revisions in the final regulations. The proposed regulations as written lack clarity on key parts of the

proposal, including basic definitions and compliance deadlines. Further, we recommend that the Agency expressly exempt business to business operations. Our previous comments are incorporated by reference and attached to this letter.

Additionally, based on the proposed revisions in the updated regulatory text, Auto Innovators also requests that CalRecycle provide an exemption for any covered material needed to comply with federal or state laws. Several federal and state requirements exist that require automakers to produce covered materials that would fall under the requirements of these regulations, including the Monroney label, Proposition 65 warnings, and recall notices. Other states have exempted covered materials used for documents that are required to be produced on covered materials by applicable laws, and the language in the updated regulation indicates California's willingness to create these exemptions for covered products in the food and agricultural packaging industry. Accordingly, we request that the Agency broadly exempt any covered materials that are produced to comply with federal and state laws.

Again, we appreciate this opportunity to provide constructive comment and recommendations for making this program more workable and less burdensome for both CalRecycle and impacted industry sectors. We appreciate CalRecycle's efforts to create workable regulations for all industries and look forward to continued engagement.

Sincerely,

Emily Jones
Director, Energy & Environment Policy
Alliance for Automotive Innovation

Response to B-41-1

Comment rejected. CalRecycle rejects this comment because it does not concern the revisions made to the proposed regulations. Instead, it urges CalRecycle to adopt revisions that the commenter suggested during the 45-day comment period concerning the 45-Day Changes. To the extent the third

paragraph of this comment was intended to suggest broadening section 18980.2(a)(2) so that it encompasses all possible conflicts between state and federal laws. CalRecycle declines to do so because exemptions where "unique challenges" or health and safety risks present compliance obstacles are sufficient to provide relief where such conflicts arise. Section 18980.2(a)(2) specifically addresses federal requirements concerning food and agricultural packaging because Public Resources Code section 42060(b)(1) expressly identifies conflicts with regulations issued by U.S. Food and Drug Administration and the U.S. Department of Agriculture only, indicating that food and agricultural packaging is of special concern.

RE: SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act Proposed Regulations

Dear Ms. Richmond:

CalRecycle has issued a Notice of Action for implementation of SB 54 “Plastic Pollution Prevention and Packaging Producer Responsibility Act Regulations.”[3] The Alliance for Automotive Innovation (Auto Innovators)[4] appreciates the opportunity to provide comments on this next step in California’s implementation of its extended producer responsibility (EPR) program. Our members will be significantly impacted by these regulations, and our comments reflect our commitment to a continued constructive dialogue with CalRecycle staff.

Auto Innovators represents the auto manufacturing sector, including automakers that produce and sell around 95% of the new light-duty vehicles in the United States. Our mission is to work with policymakers to realize a future of cleaner, safer, and smarter personal transportation and to work together on policies that further these goals, increase U.S. competitiveness, and ensure sustainable, well-paying jobs for citizens throughout the country. Millions of packaged auto parts are transported across the country and across the globe in order to repair and maintain the vehicles that our members sell; therefore, EPR programs have a substantial impact on automakers.

We appreciate that CalRecycle has refined this second iteration of proposed regulations to reduce some of requirements and resultant burdens and costs outlined in the May 2024 SB 54 proposed regulations.[5] However, we are concerned that in some cases the

current proposal creates a program that actually extends the reach of the program beyond plastics reaching consumers – the stated intent of the Act.[6] Our comments here reflect the basis for our concerns and recommendations to further reduce burden both for CalRecycle and impacted industry sectors.

Key Definitions Needing Clarity

We have specific concerns regarding CalRecycle's proposed definitions for "consumer" and "distribution" and the implications that they have for business-to-business distribution.

The term "consumer" means the end user of an item, or the last person in the supply chain who acquires and uses an item. For example, a retailer that obtains and uses a covered material item in its business operations, without selling or otherwise further distributing the item, is the consumer of the item.

"Distribution" and "distribute," as used in the Act and this chapter, mean the act of transferring products to another person within the supply chain or to the end user of the products, and "import" means the act of bringing products from outside the state into the state for purposes of sale or distribution…[7]

We request that both of these definitions specifically exclude or exempt business-to-business operations. Including business-to-business operations such as pallet wrap, protective films, and replacement parts as covered activities substantially increases administrative burden and distracts from efforts to reduce single-use packaging. Many companies are already working towards this in business-to-business operations, including by introducing reusable materials and
replacing plastic wrap with more sustainable alternatives where possible. For example, Minnesota has recognized this and has defined covered products so that it excludes materials that a producer distributes to another producer and are not further distributed to a person other than the commercial or business entity that first received the product.[8]

Additionally, defining "consumer" in a way that clarifies that a consumer is a person who purchases goods for personal use would add needed clarity and meet the intent of the Act.

Exemption for Business-to-Business Distribution

In keeping with the intent of the Act and to ensure a workable program, we request that CalRecycle expressly exempt business-to-business operations. In addition to other exemptions in the proposed regulations, such as the hazardous materials exemption,[9] we believe that an exemption such as that cited above for Minnesota would be in keeping with the need to identify plastics reaching consumers. We see no constraints regarding the legislation that would prohibit
this type of exemption.

Concerns with Proposed Fee Calculations

SB54 stipulates that a fee will be imposed on participants but does not specify how that fee should be collected, giving CalRecycle leeway in how fees should be calculated.

The plan shall include a fee for participants of the [producer responsibility organization] PRO consistent with the provisions of Section 42053, set forth the calculation of the fee, and describe the process through which the PRO will collect the fee from producers that are participants of the PRO's approved plan.[10]

In the draft regulations CalRecycle proposes that the fee be calculated using the following guidelines in the statute:

A PRO shall structure the fee schedule required pursuant to subdivision (a), delineated by covered material category and based on the following factors: (1) The costs to ensure each covered material category meets the requirements of this chapter. Covered material that is easier and less expensive to recycle or compost or that is designed to be recycled into a
similar covered material or a material that is easier to be composted shall be subject to lower fees. The costs may include all of the following:
(A) Costs to develop and sustain viable responsible end markets for each covered material category.
(B) Costs to collect, sort, avoid or remove contamination, aggregate, and transport the covered material into defined
streams to support the viable responsible end markets for the remanufacturing of the covered material either through curbside collection or other means.[11]

Our further understanding is that fees will be calculated based on the number of plastic components and the weight of plastic covered materials. We would recommend that CalRecycle include additional factors that would make this process more equitable and workable. For example, we recommend CalRecycle consider allowing more simplified/averaged reporting (e.g., an industry calculator),[12] exempting specific components (especially smaller items such as replacement parts), and items that are more difficult to report such as plastic inks and adhesives.

Compliance Deadlines

We are concerned that the proposed regulations do not extend the compliance deadlines even though key components of the program have yet to be developed. Significant guidance needs to be developed to clarify the requirements that "covered material offered for sale, distributed, or imported in or into the state on or after January 1, 2032, is recyclable or compostable," "that plastic covered material offered for sale, distributed, or imported in or into the state meets specified recycling rates," and that "not less than 65% of plastic covered material to be recycled on and after January 1, 2032."[13] This timing issue holds true for the exemption process outlined in the proposed regulations. It is not clear what form that process will take nor how long it will take. Until

such guidance and the specifications that CalRecycle will require are developed, it will be challenging for producers to request an exemption or for covered items to move to acceptable alternatives.

Conclusion

Again, we appreciate this opportunity to provide constructive comment and recommendations for making this program more workable and less burdensome for both CalRecycle and impacted industry sectors. We strongly recommend that CalRecyle include a business-to-business exemption that would be a practical approach to implementation. We see this as going hand in hand with tightening up the definitions identified above. We also have concerns with the fee calculation approach and would recommend that CalRecycle convene a group of impacted industries to provide real world approaches that would be more effective. And finally, given the delays in the development of this proposal, we urge reconsideration of the compliance dates.

Sincerely,

Emily Jones

Response to B-41-2

Comment rejected. CalRecycle rejects this comment because it does not concern the 15-Day Changes. The comment is a resubmission of the letter the commenter submitted concerning the 45-Day Changes and is not relevant to the revisions included in the 15-Day Changes.

B-42: Youngstown Grape Distributors (David Anthony)

Comment B-42-1

Department of Resources Recycling and Recovery (CalRecycle)
P.O. Box 4025
Sacramento, CA 95812-4025

We submit comments below in response to the 15-day proposed changes to the permanent regulations implementing the SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act.

We are a California-based grower, packer, and shipper of fresh fruit, including fresh-cut pomegranate arils and bagged stone fruit. Our products are perishable, high-moisture food items that require sealed plastic packaging for food safety, shelf life preservation, and leak prevention.

We respectfully object to the unreasonable scope of the regulations as currently structured, particularly as applied to fresh, moisture-dependent produce packaging.

1. Food Safety and Federal Compliance Conflict
Fresh-cut arils and similar products require moisture-barrier, sealed, food-grade packaging to comply with FDA Food Safety Modernization Act (FSMA) preventive controls. Fiber-based alternatives are not technically viable for wet produce and would materially increase microbial and spoilage risks.

The regulations must explicitly clarify that compliance obligations shall not require packaging substitutions that compromise food safety or violate federal standards.

Response to B-42-1

CalRecycle rejects this comment as described in response to comment B-38-1, which is identical to this comment.

Comment B-42-2

2. Lack of Moisture-Dependent Produce Exemption

The rule does not adequately distinguish between discretionary single-use packaging and essential, food-safety-driven packaging for wet produce. Fresh-cut fruit and high-moisture refrigerated products should be subject to tailored standards recognizing their structural packaging requirements

Response to B-42-2

CalRecycle rejects this comment as described in response to comment B-38-2, which is identical to this comment.

Comment B-42-3

3. Source Reduction Mandate Is Misaligned with Fresh Produce

The 25 percent source reduction requirement fails to account for lifecycle impacts. Plastic produce packaging reduces food waste, shrink, and handling damage. Increased spoilage will increase greenhouse gas emissions through methane from decomposing food, undermining the law's climate objectives.

4. Infrastructure Realities

Many flexible films used for produce packaging are unlikely to meet recyclability thresholds under current statewide infrastructure. Imposing compliance without functional recycling pathways creates liability without a practical compliance route.

5. Disproportionate Economic Impact on California Agriculture

California growers and packers operate under thin margins and face extensive existing regulatory burdens. Sweeping agricultural producers into a CPG-oriented EPR framework risks unintended competitive harm to in-state agriculture.

Requested Revisions

We respectfully request:

• A clear exemption or tailored compliance pathway for moisture-dependent fresh produce packaging
• Explicit protection against food-safety conflicts
• Recognition of lifecycle food-waste tradeoffs in source-reduction requirements
• Phased implementation tied to demonstrated recycling infrastructure readiness

We support responsible environmental stewardship. However, the regulations must reflect the operational realities of fresh food production and distribution.

Response to B-42-3

CalRecycle rejects this comment as described in response to comment B-38-3, which is identical to this comment.

B-43: Pro Citrus Network (Jen Doxey)

Comment B-43-1

To CalRecycle:

I am submitting comments on the Jan. 29, 2026, final draft "SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act" regulation on behalf of my company, a grower/packer/shipper of fresh produce operating in California.

The revised language in Section 18980.2 (Categorically Excluded Materials) is deeply concerning. The addition of the word "mandatory" and the narrow definition of what is "reasonably possible" effectively eliminates the categorical exclusion pathway for fresh produce packaging.

Federal food safety packaging statutes, regulations and FDA guidance represent the current, widely accepted compliance pathway for the fresh produce industry. Packaging decisions are driven by food safety requirements, including FSMA and FDA food-contact standards, which are designed to prevent contamination and protect public health. These federal requirements have long served as the appropriate benchmark for determining whether packaging is safe and legally compliant.

In addition to food safety, fresh produce packaging serves many other critical functions for fresh produce, including optimizing the supply chain to prevent food waste and greenhouse gas emissions, and ensuring the delivery of quality fruits and vegetables to Californians. Packaging is necessary to maintain the integrity throughout harvesting, cooling, transportation and retail handling. Fresh produce packaging is highly technical and carefully engineered to:

- Protect fragile produce from physical damage during transit and handling
- Optimize transportation efficiency which reduces energy demands on the supply chain
- Maintain airflow, moisture control and structural stability
- Preserve shelf life and product quality

Fresh produce packaging is also designed to keep produce alive longer by managing respiration and moisture. These functions:

- Reduce spoilage and contamination across the supply chain
- Reduce food waste, which directly reduces greenhouse gas emissions associated with wasted food production, transportation and disposal

Packaging changes that conflict with established federal food safety guidance or compromise package integrity or shelf life will increase food waste and associated GHG emissions, undermining California's environmental and climate objectives.

As drafted, the regulation requires producers to prove that:

No alternative packaging complies with FSMA, FDA food-contact requirements and California law. The fresh produce industry is constantly evaluating alternatives to further enhance food quality and safety. Most alternatives do not provide the same functionality as the industry gold standard, leading to increased risk of food waste, contamination, and costs to consumers.

Conflicts cannot be resolved through liners, coatings or closures. Removing access to tools that can support the transition to alternatives packaging will stifle advancements and packaging technology advancements.

A full package redesign would still fail food safety or legal requirements. Food safety is a critical priority for the fresh produce industry.

This standard is unworkable and does not reflect real-world food safety, operational and supply-chain constraints. In many cases, alternative materials either do not exist or would increase contamination risk, compromise package integrity, shorten shelf life or increase food waste.

Without a viable categorical exclusion, SB 54 would impose:

- Unrealistic recycling and recyclability mandates
- Permanent caps on single-use plastic packaging with no accommodation for business growth
- Significant EPR fees and exposure to civil penalties of up to $50,000 per day, per SKU.

I respectfully urge CalRecycle to revise the final regulation to restore a clear, workable categorical exclusion that recognizes federal food safety packaging guidance as the accepted compliance pathway and the essential role of packaging in food safety, package integrity, waste reduction and greenhouse gas mitigation.

Thank you for considering these comments.

Sincerely,
Jen Doxey
VP, Business Operations
Pro Citrus Network
Visalia, CA

Response to B-43-1

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment B-3-1, which is substantively the same as this comment.

B-44: North Shore Greenhouses, Inc. (Kymberly Stewart)

Comment B-44-1

To: CalRecycle:

I am submitting comments on the January 29, 2026, draft regulations implementing SB 54, specifically the revisions to Section 18980.2 (Categorically Excluded Materials), on behalf of our company, a California culinary herb grower.

The revised language significantly narrows the categorical exclusion standard and creates serious concerns for fresh produce operations. Packaging for culinary herbs is driven first and foremost by federal food safety requirements, including FSMA and FDA food-contact standards. These materials are carefully selected to prevent contamination, maintain proper respiration and moisture balance, and preserve shelf life. Any regulatory framework that forces rapid material changes without full consideration of these requirements risks compromising food safety, package integrity, and product quality.

Beyond food safety, fresh herb packaging is engineered to withstand harvesting, rapid cooling, transportation, and retail handling while minimizing spoilage. Changes that reduce structural integrity or limit functional materials will increase shrink, shorten shelf life, and ultimately drive higher food waste—undermining California's environmental and climate goals.

The operational and cost impacts of the revised standard are also substantial. Specialty crop growers operate on narrow margins and have limited ability to absorb increased packaging costs, redesign expenses, supply-chain disruptions, or ongoing EPR fees. These added costs will ultimately be passed through to retailers and consumers.

Finally, the revised exclusion criteria appear impractical in real-world agricultural settings. Requiring producers to demonstrate that no alternative material could possibly comply with food safety laws, and limiting consideration of coatings or design solutions, creates a standard that is extremely difficult—if not impossible—for fresh produce packaging to meet. In many cases, viable alternatives simply do not exist without increasing contamination risk, reducing shelf life, or compromising package performance.

We respectfully urge CalRecycle to reconsider the revisions to Section 18980.2 and restore a clear, workable exclusion pathway that recognizes federal food safety requirements and the essential role packaging plays in protecting public health, reducing food waste, and maintaining supply-chain integrity.

Thank you for the opportunity to provide comments.

Sincerely,
Kymberly Stewart
Purchasing Manager
North Shore Greenhouses, Inc.
Thermal, CA

Response to B-44-1

Comment rejected. CalRecycle rejects this comment for the reasons provided in response to comment B-3-1, which raises all the objections that this comment raises. As explained in greater detail in that response, the revisions to section 18980.2(a)(2) clarify how to apply the "not reasonably possible" standard; it did not change the scope of what could be excluded pursuant to that provision or render the exclusion unattainable. Also as explained in that response, the exemptions addressed in section 18980.2.4 adequately address the compliance obstacles—including those related to safety, functionality, or financial constraints or and other practical limitations—that may exist despite there not being any conflict with federal requirements.

B-45: Kingsburg Orchards (mike jackson)

Comment B-45-1
Subject: Comments on SB 54 Final Draft Regulations - 15-Day Comment Period

To Cal Recycle:

I am submitting comments on the Jan. 29, 2026, final draft "SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act" regulation on behalf of my company, a [grower/packer/shipper/distributor] of fresh produce operating in California.

The revised language in Section 18980.2 (Categorically Excluded Materials) is deeply concerning. The addition of the word "mandatory" and the narrow definition of what is "reasonably possible" effectively eliminates the categorical exclusion pathway for fresh produce packaging.

Federal food safety packaging statutes, regulations and FDA guidance represent the current, widely accepted compliance pathway for the fresh produce industry. Packaging decisions are driven by food safety requirements, including FSMA and FDA food-contact standards, which are designed to prevent contamination and protect public health. These federal requirements have long served as the appropriate benchmark for determining whether packaging is safe and legally compliant.

In addition to food safety, fresh produce packaging serves many other critical functions for fresh produce, including optimizing the supply chain to prevent food waste and greenhouse gas emissions, and ensuring the delivery of quality fruits and vegetables to Californians.

Packaging is necessary to maintain integrity throughout harvesting, cooling, transportation and retail handling. Fresh produce packaging is highly technical and carefully engineered to:

- Protect the fragile produce from physical damage during transit and handling
- Optimize transportation efficiency which reduces energy demands on the supply chain
- Maintain airflow, moisture control and structural stability
- Preserve shelf life and product quality

Fresh produce packaging is also designed to keep produce alive longer by managing respiration and moisture. These functions:

- Reduce spoilage and contamination across the supply chain
- Reduce food waste, which directly reduces greenhouse gas emissions associated with wasted food production, transportation and disposal

Packaging changes that conflict with established federal food safety guidance or compromise package integrity or shelf life will increase food waste and associated GHG emissions, undermining California's environmental and climate objectives.

As drafted, the regulation requires producers to prove that:

- No alternative packaging complies with FSMA, FDA food-contact requirements and California law. The fresh produce industry is constantly evaluating alternatives to further enhance food quality and safety. Most alternatives do not provide the same functionality as the industry gold standard, leading to increased risk of food waste, contamination, and costs to consumers.
- Conflicts cannot be resolved through liners, coatings or closures. Removing access to tools that can support the transition to alternatives packaging will stifle advancements and packaging technology advancements.
- Unrealistic recycling and recyclability mandates
- Permanent caps on single-use plastic packaging with no accommodation for business growth
- Significant EPR fees and exposure to civil penalties of up to $50,000 per day, per SKU

I respectfully urge Cal Recycle to revise the final regulation to restore a clear, workable categorical exclusion that recognizes federal food safety packaging guidance as the accepted compliance pathway and the essential role of packaging in food safety, package integrity, waste reduction and greenhouse gas mitigation.

Thank you for considering these comments.

Sincerely,

Mike Jackson Owner

Response to B-45-1

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment B-3-1, which is substantively the same as this comment.

B-46: SeaCa Plastic Packaging (Erika Frayser)

Comment B-46-1

Why This Draft Is Concerning

New language makes categorical exclusions nearly impossible to obtain
Food safety and regulatory conflicts are no longer reasonably accommodated
Compliance requirements are unprecedented, costly and legally risky
Distributors are treated as "producers" simply for selling into California

We have worked to develope a recyclable alternative to a non-recyclable packaging option (wax coated cartons) and have created our own recycling program to support this out of good faith. No large recycling organization was willing to help, but we developed a network to reclaim as much of this packaging as possible. We work directly with end users to identify recycling routes, but this bill puts all our efforts at risk because it increases the cost of a recyclable commodity that works great for packers and shipper of wet veg produce.

Response to B-46-1

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment B-3-1. That response addresses the concerns raised in this comment except for the assertion regarding "distributors" and the case-specific objection regarding the the "recyclable alternative" the commenter claims to have developed. That objection cannot justify changes to section 18980.2(a), which accommodates the commenter's concern because, if the commenter is correct that the packaging it developed is "recyclable" and an

"alternative" (which CalRecycle understands to mean packaging that is lawful under federal requirements), there would be no federal requirement preventing compliance with the Act. If the commenter's objection is that real-world restrictions render its packaging not "recyclable" for purposes of the Act, then it would not be considered an "alternative" for purposes of section 18980.2(a)(2).

Regarding the commenter's assertion that, under the proposed regulations, "[d]istributors are treated as 'producers' simply for selling into California," that is not a valid objection. The statute (Public Resources Code section 42041(w)(1) through (3)), not the proposed regulations, dictates that the act of selling goods into California may, under certain circumstances, render the entity doing so a "producer." Moreover, that effect is not relevant to any of the revisions made to the 45-Day Changes. The changes in section 18980.2(a)(2) concern when certain packaging should be considered not "covered material." Section 18980.2(a)(2) is only relevant to whether an entity is a producer because it might affect whether there is any producer at all (i.e., whether there is any packaging subject to the Act). The changes do not affect the extent to which a distributor may be a "producer" based on their sale of goods whose packaging is covered material.

Comment B-46-2

Sustainability Opportunity!

SeaCa Plastic Packaging isready to help you easily plug into the sustainable CORR Program that reduces and problem-solves packaging waste. Quickly boost your sustainability impact by leveraging a 100% closed-loop recycling operation developed by SPP and approved by the FDA.

Let's Close The Loop

We need your help to close the loop! Mostlikely you have piles or bales of empty mixed material taking up space and resources. Unlike using wax corrugated cartonsthat must be disposed of in landfills, SPP has another way. SPP invested in developing a wax alternative for environmentally friendly recyclable packaging. Recycle resin #5 polypropylene (PP) is used to create plastic corrugated cartons that divert waste from landfills, increase package efficiency, and reduce trucking costs with lighter packaging design. This means fewer harmful emissions, less ground pollution, and a lighterload on our planet.

Our Challenge

The challenge is to collaborate on collecting recyclable cartons at their end-of-use life. By working together we can use collection process methods that are ideal for your operations and regions. This effort will help integrate PCR (post-consumerresin) back into the closed loop recycling operation. SPP hasimplemented a series of collection programsfrom large retailers to local co-opsto collect PP corrugated packaging. **SPP is excited and ready to welcome you intothe CORR Program.**

CORR Program

The CORR Program began with SPP who set out to develop a recycling program—Creating Opportunity with Recycle Resin—that would be able to reintroduce collected material into new packaging as part of the cartons core. This reintroduction of PCR would help achieve the goal of being able to support customers with a carton that has at least 25% PCR content. SPP invested in a joint venture project with a local recycler near their Arizona manufacturing plant to cut down on transportation costs and ensure efficiency in theirrecycling efforts. They had this process approved by the FDA and received their official FDA NOL in 2019. Their goal is to provide the end users with compensation for their collection, which is all calculated from a delivered price at the recycler less transportation And/or other costs accrued.

7 CORR Steps – Boiler Plate Plan

Step One
SPP manufactures polypropylene (PP) corrugated cartons

Step Two
Processors pack and ship product direct to customer or distributors in cartons

Step Three
DC (distribution center) receives and distributes products in cartons to stores for stocking

Step Four
After stocking, stores separate and collect cartons to ship back to DC

Step Five
DC receives cartons for collection and shipment to SPPs approved recycler
Current Collection Methods Available:
1. Standard
2. Consolidated Pick-up Routes
3. Drop Trailer
4. Baler Payback
5. Recycling/MRF Partnership

Step Six
Approved recyclerreceives bales, reprocesses them and generates PCR (post-consumer resin) to send back to SPP

Step Seven
PCR is received back at SPP for reintroduction into new cartons

Customer Testimonial - Partnering for a Better World

Lakeside believes in improving health and well-being for both people and planet. All our commodities are freshly delivered in 100% recyclable cartons. We have partnered with SPP since 2017 to develop and field test their polypropylene corrugated cartons. PP corrugated cartons meet all of our packaging requirements at fullscale for performance

and durability. By choosing to use these 100% recyclable cartons we could keep up to 6 million pounds of wax cartons out of landfills annually.

Contact for CORR Program Info

Response to B-46-2

Comment rejected. No response to this comment is necessary because it does not concern the revisions made to the proposed regulations. It does not concern any element of the proposed regulations.

B-47: Ippolito International (Ron Mondo)

Comment B-47-1

To CalRecycle:
I am submitting comments on the Jan. 29, 2026, final draft "SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act" regulation on behalf of my company, Ippolito International LP, a [grower/packer/shipper/distributor] of fresh produce operating in California.
The revised language in Section 18980.2 (Categorically Excluded Materials) is concerning and unduly restrictive. The addition of the word "mandatory" and the narrow definition of what is "reasonably possible" effectively eliminates the categorical exclusion pathway for fresh produce packaging.
California is currently one of the nation's top producers of fresh vegetables. Over many decades, growers in this state have worked and innovated to provide healthy foods that can be efficiently and safely transported to the end consumer. Along the way, technologies in packaging have contributed significantly towards fresh, intact arrival to many millions of homes. It is fair to say that vegetables are more enjoyable, consumed more frequently, and contribute to a healthier America as a result of the use of protective packaging materials.
Based on this, the revised language in Section 18980.2 (Categorically Excluded Materials) is misguided. Amidst many regulatory changes, California produce growers and processors in California have committed to compliance with Federally mandated food safety regulations. Food safety requirements are diligently followed (along with additional voluntary measures) . Plastic packaging currently is the standard.
In addition to food safety, fresh produce packaging serves many other critical functions for fresh produce, including optimizing the supply chain to prevent food waste and greenhouse gas emissions, and ensuring the delivery of quality fruits and vegetables to Californians. Packaging is necessary to maintain the integrity throughout harvesting, cooling, transportation and retail handling. Fresh produce packaging is highly technical and carefully engineered to:
Protect fragile produce from physical damage during transit and handling
Optimize transportation efficiency which reduces energy demands on the supply chain

Maintain airflow, moisture control and structural stability
Preserve shelf life and product quality
Fresh produce packaging is also designed to keep produce alive longer by managing respiration and moisture. These functions:
Reduce spoilage and contamination across the supply chain
Reduce food waste, which directly reduces greenhouse gas emissions associated with wasted food production, transportation and disposal
Packaging changes that conflict with established federal food safety guidance or compromise package integrity or shelf life will increase food waste and associated GHG emissions, undermining California's environmental and climate objectives.
As drafted, the regulation requires producers to prove that:
No alternative packaging complies with FSMA, FDA food-contact requirements and California law.
Many alternatives have been tested. Thus far, these alternatives have not been able to provide the same functionality as the industry gold standard. With the risk of increased of food waste, contamination, and costs to consumers.
Conflicts cannot be resolved through liners, coatings or closures. Removing access to tools that can support the transition to alternatives packaging will stifle advancements and packaging technology advancements.
A full package redesign would still fail food safety or legal requirements. Food safety and healthy nutrition is a top priority for the fresh produce industry.
This standard is unworkable. It does not reflect real-world food safety, operational and supply-chain constraints. In many cases, alternative materials either do not exist or would increase contamination risk, compromise package integrity, shorten shelf life or increase food waste.
Without a viable categorical exclusion, SB 54 would impose:
Unrealistic recycling and recyclability mandates
Permanent caps on single-use plastic packaging with no accommodation for business growth
Significant EPR fees and exposure to civil penalties of up to $50,000 per day, per SKU
I respectfully urge CalRecycle to revise the final regulation to restore a clear, workable categorical exclusion that recognizes federal food safety packaging guidance as the accepted compliance pathway and the essential role of packaging in food safety, package integrity, waste reduction and greenhouse gas mitigation.
Thank you for considering these comments.
Sincerely,
Ron Mondo

Response to B-47-1

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment B-3-1, which is substantively the same as this comment..

B-48: vicolo wholesale (Raghupreet Singh)

Comment B-48-1

I represent a pizza manufacturing facility serving the State of California.

While I recognize SB 54 and EPR legislation as efforts toward environmental reform, the regulations as currently written will materially impair our ability to operate efficiently while maintaining compliance with USDA and FDA food safety requirements.

There are no commercially viable alternatives to plastic-based flexible packaging for our products. We cannot transition to paper, glass, or other materials without compromising product safety, integrity, and regulatory compliance. Although recyclable or "recycle-ready" resins are under development, there is currently no established recycling stream in the United States for packaging that has been in direct contact with perishable food products. In addition, many of these emerging materials have not been validated for performance in high-abuse supply chains.

Materials such as nylon and polyester are critical to protecting our perishable products. Nylon provides puncture resistance necessary to withstand distribution and handling. Without it, spoilage and failure rates increase significantly (estimated 15–20%). Polyester substrates are essential to maintaining line speeds and operational efficiency. Removing them would reduce production efficiency by approximately 20–25%, increasing run time, emissions, rework, and spoilage.

The most sustainable packaging solution for perishable goods is one that protects and extends shelf life. This approach aligns with USDA and FDA requirements and helps reduce food waste. In the United States, over one-third of food is wasted. Compromising packaging performance will increase spoilage and overall carbon emissions across the supply chain.

As written, SB 54 may create conflicts with federal food safety regulations. We respectfully request that exemptions be granted where compliance with recyclability mandates would undermine food safety and increase waste.

Thank you.

Response to B-48-1

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment B-9-1, which raises the same issues and makes the same request as does this comment.

B-49: CMI Orchards, LLC (Bob Mast)

Comment B-49-1
Comments on SB 54 Final Draft Regulations – 15-Day Comment Period

To CalRecycle:

I am submitting comments on the Jan. 29, 2026, final draft “SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act” regulation on behalf of CMI Orchards, a grower, packer, and shipper of fresh produce operating in California.

The revised language in Section 18980.2 (Categorically Excluded Materials) is deeply concerning. The addition of the word “mandatory” and the narrow definition of what is “reasonably possible” effectively eliminates the categorical exclusion pathway for fresh produce packaging that is essential to reducing food waste and mitigating greenhouse gas
(GHG) emissions.

Preventing food loss is one of the most effective climate strategies in the produce supply chain. Fresh fruits and vegetables are highly perishable, and packaging plays a central role in preserving quality, preventing shrink, and keeping produce viable throughout harvesting, cooling, transportation, and retail handling. Fresh produce packaging is engineered to:

- Protect fragile produce from physical damage during transit and handling
- Optimize transportation efficiency, reducing energy demands on the supply chain
- Maintain airflow, moisture control and structural stability
- Preserve shelf life and product quality

These functions are not merely aesthetic, or marketing driven; they directly reduce food waste and, by extension, GHG emissions associated with farming, cooling, transportation, and disposal of unsold foods. As multiple lifecycle studies show that the climate impact of food waste far exceeds the impact of the packaging used to prevent that waste, policies should prioritize waste prevention performance as a core environmental benefit.

Additionally, federal food safety packaging statutes, regulations, and FDA guidance represent the current, widely accepted compliance pathway for the fresh produce industry. Packaging decisions are driven by food safety requirements, including FSMA and FDA food-contact standards, which are designed to prevent contamination and protect public health. These federal requirements have long served as the appropriate benchmark for determining whether packaging is safe and legally compliant.

Packaging changes that conflict with established federal food safety guidance or compromise package integrity or shelf life will increase food waste and associated GHG emissions, undermining California's environmental and climate objectives.

As drafted, the regulation requires producers to prove that:

- **No alternative packaging complies with FSMA, FDA food-contact requirements, and California law.** The fresh produce industry is constantly evaluating alternatives to further enhance food quality and safety. Alternative packaging that does exist requires additional transportation, as it takes up more space to ship, resulting in an increase in emissions. Alternative packaging also costs more to sell fewer pieces of fresh produce.
- **Conflicts cannot be resolved through liners, coatings or closures.** Removing access to tools that can support the transition to alternative packaging will stifle advancements and packaging technology advancements. Produce is packed in a wet environment. Liners are required to ship products in a fiber container to avoid compromising structural integrity of the product.
- **A full package redesign would still fail food safety or legal requirements.** Food safety is a critical priority for the fresh produce industry. Without plastic or wax liners on fiber packaging, moisture can create a food safety risk.

This standard is unworkable and does not reflect real-world food safety, operational and supply-chain constraints. In many cases, alternative materials either do not exist or would increase contamination risk, compromise package integrity, shorten shelf life, or increase food waste.

Without a viable categorical exclusion, SB 54 would impose:

- Unrealistic recycling and recyclability mandates
- Permanent caps on single-use plastic packaging with no accommodation for business growth
- Significant EPR fees and exposure to civil penalties of up to $50,000 per day, per SKU

I respectfully urge CalRecycle to revise the final regulation to restore a clear, workable categorical exclusion that recognizes the environmental benefit of reducing food waste and GHG emissions through packaging use, federal food safety packaging guidance as the accepted compliance pathway and the essential role of packaging in food safety.
Thank you for considering these comments.
Sincerely,
President, CMI Orchards
CMI Orchards
Wenatchee, Washington

Response to B-49-1

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment B-3-1, which is substantively the same as this comment.

B-50: Emerald Packaging (Kevin Kelly)

Comment B-50-1

February 13, 2026

Submitted Electronically via: https://calrecycle.commentinput.com/?id=3ikJbFpZN

Csilla Richmond
SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act Regulations
California Department of Resources Recycling and Recovery (CalRecycle)
Regulations Unit
1001 "I" Street, MS-24B
Sacramento, CA 95814

RE: SB 54 Plastic Pollution and Packaging Producer Responsibility Act Permanent Regulations 15- Day Comment Period

Dear Ms. Richmond:

Emerald Packaging thanks you for the opportunity to provide comments to CalRecycle on the proposed Senate Bill SB 54 (Allen, 2022) ("SB 54" or the "Act") Plastic Pollution Prevention & Packaging Producer Responsibility Act Permanent Regulations published on January 29, 2026 ("Draft" or "Draft Regulations"). Emerald is the largest manufacturer of flexible packaging for produce in the country, comprising around 98% of our revenue. We're a family-owned company founded in 1963 based in Union City, California, where we employ 265 people who earn a living wage, on average over $40/hour.

More importantly, we're one of the leaders in sustainability in the flexible packaging industry. We were one of several California flexibles companies that proposed creating a recycling system for our packaging in 2000. Back then, small groups like ours had to get the support of the American Chemistry Council to introduce any legislation impacting plastics. They summarily killed it. As early as 2002 we teamed with Walmart and used compostable corn-based films for their fresh-cut spinach packaging. We rolled out food grade 30% post-consumer recycled resin packaging in 2024. Today we run over one million pounds of PCR annually in romaine, lettuce, and cauliflower bags, amongst other commodities. For the last two years we've been working on a path to commercialize paper for produce, a project that requires considerable research and expense. Finally, we collaborate extensively with the Western Growers Association on extended producer responsibility issues, our customer's main trade association.

Our company supported the August 22, 2025, SB 54 Draft Regulations as the language offered a viable and clear framework for compliance for fresh produce packaging with the ability to apply for a categorical exclusion, as permitted by Public Resource Code section 42060(a)(3)-(4) and as required by section 42060(b), in written comments submitted on October 7, 2025 with the Western Growers Association. While I understand the Department's challenges in creating regulations while buffeted by political pressures on all sides, the revised language in Section 18980.2 Categorically Excluded Materials is unworkable for the produce industry. The January 29, 2026, revisions introduce requirements that are effectively impossible for fresh produce packaging to satisfy. They eliminate the workable framework CalRecycle proposed in August 2025 and replace it with an exclusion pathway that is unattainable, raising concerns regarding the ability of my customers and myself to comply.

Instead of the current language, we instead propose wording that even Senator Allen, author of SB54, may like while accommodating the needs of food packaging. We support modifying the categorical exclusion language in Article 2, Section 18980.2, which is firmly grounded in existing statutory authority and limited to circumstances where no reasonably possible compliant alternative exists. To ensure that the language is both feasible to meet and narrowly focused on the needs of food packaging that must comply with applicable federal state laws, rules, and guidelines, we recommend removing the words "food" and "mandatory", and the three qualifiers under subsection (B) (i), (ii), and (iii) in this section. In many ways this tightens the requirements for exclusion but provides relief to sectors that were supposed to receive it in the first place. I only know this since I've been involved with the Western Growers on issues surrounding the passage and implementation of SB54 since 2021.

The exemption language in Section 18980.2.4 doesn't work for produce. No doubt it does give companies the opportunity to argue for relief. But it also presents challenges that are as significant and more burdensome than those in the categorical exclusion. The exemption process only gives a two-year reprieve from complying with recycling rates but still paying the high fees imposed by Circular Action Alliance. There's the possibility of a five-year extension but with very stiff rules around obtaining. The applying organization has to review every possible replacement for a plastic package no mater whether it complies with the function plastic serves. It has to explain the science behind the materials to non-scientists with little or no knowledge of the sector. The language is also too permissive regarding how CAA evaluates applications and retains discretion over whether to advance it to CalRecycle. As written, there is little incentive for the PRO to consider applications. I'd suggest the language change from "may" to "shall".

The timeframe to develop new food packaging materials is long, backbreaking and expensive. Products must undergo extraction studies and testing to determine compliance with the Code of Federal Regulations (CFR), a process that can take months to years. The resulting data must then be submitted to the FDA for review, a process which can take several additional years. Finally, even when packaging

materials are already FDA compliant, development timelines for the packaging itself often spans years to complete. This development process, called the “Valley of Death” by the scientists and researcher, is the high-risk phase between lab validation and market-ready production, where many startups fail due to misjudged scaling and funding, among other reasons.

Scaling production of any new materials will take billions of dollars and decades to achieve. I began working with compostable packaging over 25 years ago. Capacity remains very limited thanks to the expense of the material and it’s failure to match the functionality of plastics. Plastic is central to the preservation of fresh-cut salads because they keep the lettuce alive by letting oxygen into the package and carbon dioxide out, a miracle of science that extends shelf-life and reduces food waste. No compostable material has that function. Moreover, building out a corn or cellulose-based packaging industry wouldn’t happen in my lifetime even with eco-modulation fees. Like anything, it takes a long time to raise money and build factories. This is the real world, unfortunately.

Making the case for plastic isn’t just done by industry. The Oregon State Department of Environmental Quality (DEQ) performed a study to assess the connection between food waste and packaging. The report's central thesis is that packaging should be viewed as a tool to protect the "embedded" environmental resources of food. Among their many findings, they state, "Packaging plays an important role in protecting food from damage and contamination and extends the useful life of food items on the retail shelf and at home, thus potentially reducing wasted food and its environmental impacts.” In assessing the relationship between food waste and GHG they concluded, "In general, the GHGE [Greenhouse Gas Emissions] associated with manufacturing food packaging is typically small relative to the emissions associated with producing and processing the food itself.”

The report argues that for fresh produce, the "net environmental benefit" of packaging is high because produce is resource-intensive to grow but very easy to damage. In short, the most "sustainable" package is the one that ensures the food actually gets eaten. The Oregon DEQ report concludes that the most effective way to reduce the environmental footprint of our food system is prevention. Because packaging is a primary tool for prevention, "more" or "better" packaging is often the greenest option. The report is available here at: State of Oregon Department of Environmental Quality (DEQ). "Food Product Environmental Footprint Literature Summary: Packaging and Wasted Food" 2017 https://www.oregon.gov/deq/FilterDocs/PEF-Packaging-FullReport.pdf.

Just this past January the government of Canada weighed in on the implications of banning produce packaging to costs across the user chain, including consumers. Agriculture and Agri- Food Canada estimated that prices at the grocery store for produce would rise 5% to 10% if plastic were replaced by other materials, like compostables, because of the cost differential between plastic and any possible replacement. It also found that shipping produce without any packaging would

dramatically increase food waste across the supply chain, thereby increasing Greenhouse Gas Emissions (GHG). In fact, the increase in GHG from food waste would swamp that from the production of plastic. The full report is available here: https://agriculture.canada.ca/en/sector/horticulture/reports/estimating-cost-implications-reducing-plastic-packaging-fresh-produce.

I understand and appreciate the work that CalRecycle has put into formulating the regulations to enact SB54. I know myself and many others in the produce industry deeply support recycling because we do it in our own businesses every day. In fact, Emerald became a certified California Green Business several years ago in part because we recycle almost everything we touch. But the harm done to certain foods including produce in the latest draft will loom large in two or three years when the implication of the proposed regulations becomes all too clear, giving recycling a bad name it doesn't deserve.

Best wishes

Kevin Kelly

Response to B-50-1

Comment rejected. CalRecycle rejects this comment for the reasons provided in response to comment B-3-1, which raises the same objections and makes the same recommendations as does this comment. CalRecycle also rejects the assertion that removing the word "mandatory" and the criteria contained in 18980.2(a)(2)(B)(i) through (iii) would "tighten[] the requirements for exclusion." Regarding the word "food," no explanation is given for why that term should be removed; CalRecycle declines to remove it because doing so would narrow the exclusion so that it would fail to fulfill the mandate of Public Resources Code section 42060(b), which is not concerned only with agricultural products. In addition to the reasons provided in response to comment B-3-1, CalRecycle also declines to remove the word "mandatory" because the act of "complying" with some regulation, rule, or guideline is logically incompatible with the regulation, rule, or guideline not presenting any requirement (i.e., something "mandatory"). Similarly, removing the criteria in clauses (i) through (iii) would leave unclear how CalRecycle would uniformly apply the requirement that it be "not reasonably possible" to use an alternative to comply with relevant federal requirements. Without these provisions, the proposed regulation would fail to meet the "clarity" standard of Government Code section 11349.1(a)(3).
Regarding the applicability of section 18980.2.4, which sets forth the exemptions pursuant to Public Resources Code section 42060(a)(3) and (4), the commenter

asserts that it "doesn't work for produce." The commenter, however, does not explain how the burden of applying for such an exemption is particular to produce or why those responsible for single-use packaging for produce, as opposed to those responsible for all other packaging, should be exempt from funding the program intended to reduce such packaging. The commenter also asserts that applying for exemptions requires review of "every possible replacement" and explanation of the "science behind the materials to non-scientists with little or no knowledge of the sector." There is no requirement that "every possible replacement" be reviewed, and the objection to having to explain the justification for the exemption—regardless of whether the commenter's unexplained assumption about the expertise of those reviewing the explanation is correct—is unreasonable on its face, effectively arguing that entities should not have to justify why they are entitled to a benefit under the Act. Regarding the PRO's discretion over applications for exemptions, the process set forth in section 18980.2.4(a) and (b) is consistent with the PRO's overall function and necessary for efficient implementation of the Act, as set forth in greater detail in the Initial Statement of Reasons.

Regarding the commenter's remaining assertions concerning food waste, net benefits, and the cost and time required to develop new packaging, to the extent those assertions are relevant to the revisions made in section 18980.2(a)(2), they do not affect CalRecycle's rationale for not further revising it, as described in this response and in response to comment B-3-1. Moreover, for packaging that cannot qualify for exclusion under section 18980.2(a)(2) but may obtain an exemption due to "unique challenges," development time and expense challenges can be accommodated through the phase-in plan that must be submitted with the application for that exemption.

B-51: VegFresh Farms LLC (bob wright)

Comment B-51-1
Comments Regarding SB54

1. The underlying intent of SB54 is to eliminate plastic or ensure that plastics are recycled.
2. The legislation seems intent to limit any exceptions to this purpose.
a. It makes exclusions impossible to obtain.
3. The assumptions driving SB54 are fundamentally flawed:
a. It is not true that all plastic is bad.
b. It is not true that all plastics can be effectively or economically recycled.

Without plastic packaging:

1. Our food would spoil much faster

2. Nearly ALL convenience-based produce options would be eliminated form grocery shelves.
3. Food waste would increase
4. More packaging would be wasted
5. Food safety would be compromised
6. There are no viable large-scale alternatives to plastic

The proposed legislation will:
a. Increase the cost of plastic packaging by:
i. Requiring PCR content
ii. Adding tax penalties
b. Increase the consumer cost
c. Increase food spoilage
d. Increase total carbon footprint of packaging
i. Alternative products such as paper, for example, have a carbon footprint 4-5 times that of plastic.
ii. Recycled products (PCR) have a higher carbon footprint than virgin material.

What is behind the legislation:
o Recycling lobbyists have heavily participated in legislative efforts.
o These groups have shaped many large corporations "sustainability goals."
o Is their intent to save the planet or to support their recycling businesses?
The recycling industry, after massive public and private investment, after 30 years, has achieved a recycling rate of 5% - 9% of plastic produced depending upon what data you believe. That's 910,800,000,000 pounds of plastic annually that go to landfills, litter, oceans, incinerated, … Recycling companies will quote a statistically skewed~30+% recycled figure. They qualify that by considering only plastic that is PET and only disposed of into the proper recycling stream.)

Why are we trying to tax the consumer to fund an industry with this track record?

There are technological alternatives available today that will eliminate plastic waste problems without compromising packaging performance or cost. These technologies eliminate plastic pollution for polyolefin plastics by incorporating additives that enable bio-assimilation with no residual microplastics.

This legislation effectively discourages the use and development of these opportunities to eliminate plastic waste. These opportunities come at a very low cost, without a tax, and without the consumer financing of the entire recycling industry.

To legislate against the development of better alternatives is NOT in the interests of the environment or the citizens that legislators are empowered to protect.

A stated goal of the plastic recycling industry is to increase the cost of plastic to the point that everyone will want to participate in the recycling effort.

Consider how valuable that plastic bag would have to be to the consumer to ensure that it is recycled instead of discarded?

This tax is just the beginning of an effort to support a failed industry and recycling model on the backs of the consumer who already struggle to afford food.

This legislation is bad for:

- **Consumers**
- **Agricultural and food production industries**
- **Food waste reduction efforts,**
- **Plastic waste reduction efforts**
- **Food safety**
- **Total carbon footprint of packaging.**

Response to B-51-1

Comment rejected. The comment concerns the legislation pursuant to which CalRecycle is proposing regulations, not those regulations themselves. Accordingly, no response is required. To the extent the commenter intended to assert that section 18980.2(a)(2) makes obtaining an exclusion to the statute unattainable, CalRecycle rejects this comment for the reasons stated in response to comment B-3-1, which raises that same objection.

B-52: The Procter & Gamble Company (Julie Froelicher)

Comment B-52-1

February 6, 2026
Via Electronic Submission

Ms. Zoe Heller
Director of CalRecycle
Department of Resources Recycling and Recovery (CalRecycle)
P.O. Box 4025
Sacramento, CA 95812-4025

RE: SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act 15-Day Comment Period

Dear Director Heller:
The Procter & Gamble Company (“P&G1”) submits the following letter in acknowledgment of the permanent regulations for SB 54, the Plastic Pollution Prevention and Packaging Producer Responsibility Act, published on January 29, 2026 (“Permanent Regulations”) that made limited revisions to the Formal Proposed Regulations originally released on August 22, 2025. As the world’s largest consumer goods company, we have a concerted interest that the SB 54 program drives maximum sustainability benefits while ensuring affordability and availability for all Californians; protecting health and safety of California consumers; enabling federal regulatory compliance; and providing continued opportunity for innovation and product quality in California.

1 The Procter & Gamble Company serves nearly five billion people around the world with its brands. The Company has one of the strongest portfolios of trusted, quality, leadership brands, including Always®, Ambi Pur®, Ariel®, Bounty®, Charmin®, Crest®, Dawn®, Downy®, Fairy®, Febreze®, Gain®, Gillette®, Head & Shoulders®, Lenor®, Olay®, Oral-B®, Pampers®, Pantene®, SK-II®, Tide®, Vicks®, and Whisper®. The P&G community includes operations in approximately 70 countries worldwide. Please visit http://www.pg.com for the latest news and in-depth information about P&G and its brands.

Response to B-52-1

Comment rejected. No response to this comment is necessary because it does not concern the revisions made to the proposed regulations.

Comment B-52-2

The limited revisions in the Permanent Regulations do not improve the ability to implement the SB 54 program. These revisions do little to reduce complexity for producers or costs for California consumers. The necessary changes we previously recommended for the Formal Proposed Regulations to best serve the interests of California consumers have gone unaddressed in the Permanent Regulations, so we have appended them again to this cover note to reinforce their criticality for a functional program.

Response to B-52-2

Comment rejected. This comment offers the general objection that the revisions to the proposed regulations "do little to reduce complexity for producers or costs for California consumers." The remainder of the commenter's submission clarifies that this criticism is directed at portions of the 15-Day Changes other than those that CalRecycle has revised. The commenter supports its objections by attaching the comments it submitted in response to the 45-Day Changes (B-11-1 through B-11-12), and none of those comments concern section 18980.2(a)(2), either. CalRecycle has responded to those comments separately. Accordingly, no further response is required. However, to the extent this comment could be construed as a general criticism of the revisions in section

18980.2(a)(2), CalRecycle rejects it for the reasons provided in response to comment B-3-1.

Comment B-52-3

Of significant concern, there are aspects of the Permanent Regulations that conflict with the intent of SB 54 to improve circularity and recycling. The requirements for **Detachable Components** (Section 18980.1. and Section 18980.3) are a clear example. The Permanent Regulations classify any component a consumer can detach, such as a bottle cap or perforated shrink sleeve, as separate and distinct packaging that must comply with all SB 54 requirements. Consumers have long been educated to reattach bottle caps prior to recycling the larger package. Reattaching caps to bottles, regardless of cap size, enables recovery of the cap material within the recycling stream and leads to even greater circularity. The Permanent Regulations should seek to reinforce this favorable consumer recycling behavior and not drive distinction between the bottle cap and the package. Similarly, application of a perforation on a shrink sleeve label is a process aid to help material recycling facilities (MRFs) remove labels in the recycling process. The perforation ensures proper sorting by allowing visibility of the bottle (e.g., clear PET bottles sort properly to clear PET streams). However, the Permanent Regulations render the perforated label a non-recyclable, detachable component. This complexity will discourage producers from adding perforation to shrink sleeve labels, thereby reducing proper sorting in the recycling stream and lowering recycling yields. The Permanent Regulations need to align with the Association of Plastic Recyclers (APR) Design Guides to reinforce optimal recycling behavior and not disrupt it.

P&G strongly urges the Department to **recognize physical recycling technology** as an acceptable responsible end market technology, in addition to mechanical recycling. Physical recycling enables a method to clean plastic and remove contaminants from the recycling stream in a manner that also results in significantly reduced greenhouse gas emissions compared to virgin resin. Physical processes are not chemical recycling because they maintain “plastic to plastic” recycling, as they do not chemically alter the plastic polymers or break chemical bonds but rather remove both intentionally and unintentionally added materials to vastly improve the quality of recycled plastics and produce a high-quality post-consumer recyclate (PCR). This broadens the potential applications for recycled plastic and promotes continued circularity.

The inordinate length of time it has taken to develop regulations for this program has made it untenable to expect compliance by the statutory deadlines. Producers will need to rely upon broad material class exemptions to have sufficient time to make packaging material changes, to wait while recycling infrastructure develops in California, and to comply with the mandated 30% recycling rate by 2028. P&G urges the Department to be prepared to quickly review and process the exemption applications that you will receive from Circular Action Alliance on behalf of producers once the Permanent Regulations are finalized so that California consumers do not suffer from lack of accessibility to products upon which they rely in their daily lives.

Thank you for considering P&G's recommendations that are appended to this cover note and discussed at length. Please contact me if you have any questions or would like more information about the practical impact of the Permanent Regulations on producers and California consumers.

Sincerely,

Julie Froelicher
Senior Director, Global Product Stewardship
The Procter & Gamble Company
1 P&G Plaza
Cincinnati, OH 45202
Froelicher.jm@pg.com

Response to B-52-3

Comment rejected. No response to this comment is necessary because it does not concern the revisions made to the 45-Day Changes.

B-53: House Foods Holding USA Inc. (Fumiya Uni)

Comment B-53-1

Comments on SB 54 Final Draft Regulations - 15-Day Comment Period

Subject: Request for Categorical Exclusion of Packaging for Commercially Packaged Refrigerated Tofu and Similar Pasteurized Perishable Foods (Section 18980.2, SB 54)

To: CalRecycle
Re: SB 54 Draft Regulations — Article 2, Section 18980.2 (Categorically Excluded Materials)

Introduction

Thank you for the opportunity to comment on Section 18980.2 regarding categorically excluded materials under California's SB 54 implementation. Our company manufactures commercially packaged refrigerated tofu products, a category of potentially hazardous foods requiring validated heat processing (pasteurization) and continuous refrigeration to control pathogenic microorganisms. Although refrigerated tofu is not governed by product-specific federal regulations, its food-safety profile necessitates strict controls that only certain packaging materials can reliably achieve. These needs align with the intent of categorical exclusions under SB 54 for materials essential to meeting federal health and safety mandates, specifically under the FDA Food Safety Modernization Act (FSMA) and 21 CFR Part 117 (Current Good Manufacturing Practice, Hazard Analysis, and Risk-Based Preventive Controls for Human Food).

1) Characteristics of Refrigerated, Packaged Tofu Relevant to Product Safety

- Neutral pH
- High water activity
- High protein content
- No preservatives added
- Cannot be produced under sterile conditions*

*Sterile conditions cannot be maintained throughout upstream steps (coagulating, molding, pressing, and cutting), and pressure sterilization (retort) is not feasible for tofu because it degrades shapes, texture, and flavor.

These characteristics create favorable conditions for microbial growth. To ensure product safety, tofu undergoes a company validated post-packaging thermal treatment (pasteurization), typically above **176°F (80°C) for at least 30 minutes** in water at atmospheric pressure, followed by rapid cooling and cold-chain distribution to prevent the growth of heat-resistant pathogens. This underscores its classification as a high-risk, perishable food.

Implication: These properties heighten susceptibility to pathogen growth if packaging cannot withstand heat processing stresses, rapid cooling, or if seal integrity fails. Robust hermetic seals and thermally durable packaging structures are therefore essential.

2) Manufacturing & Packaging Overview of Refrigerated Tofu

- Whole soybeans are soaked, then ground with water. The resulting slurry is cooked at temperatures above 212°F (100°C) for 3–10 minutes, after which the pulp (okara) is removed to produce soymilk.
- The soymilk is mixed with coagulants; the resulting curd is broken into small pieces, transferred to a mold, and pressed to achieve the desired firmness.
- The pressed block is cut, placed into containers, filled with water (as applicable), sealed, and pasteurized in the final package. Because sterility cannot be maintained prior to sealing, post-packaging pasteurization and refrigerated distribution serve as critical controls.
- Common retail formats include:

(a) hermetically sealed, water-filled rigid plastic containers with lidding film
(b) vacuum-sealed flexible packaging (used for firmer tofu varieties that maintain structural integrity without immersion)

3) Packaging Performance Requirements Necessary for Product Safety and Integrity

- Resistance to moisture and immersion in water
- Tolerance to pasteurization temperatures while maintaining structural stability
- Strong hermetic seals capable of withstanding internal pressure and expansion during pasteurization and rapid cooling
- Tamper-evident features and seals that maintain integrity throughout cold-chain distribution
- Rigid containers with adequate mechanical strength and support to preserve product integrity

4-a) Limitations of Recyclable/Mono-Material or Compostable Films (Current Technology)

Currently, no compostable or recyclable mono-material films with a single melting point have demonstrated the ability to withstand the thermal processing required to meet the company validated preventive controls mandated by the FDA Food Safety Modernization Act (FSMA), including moist-heat pasteurization at high temperatures, internal inflation, and the seal stresses generated during heating. Seal failures compromise hermeticity and increase microbial risk. Thus, multilayer construction remains necessary.

4-b) Infeasibility of Achieving the 25% Source-Reduction Target for Rigid Plastic Containers and Flexible Packaging Films

Rigid Containers

A 25% reduction in material thickness would significantly impair hermeticity and structural rigidity, compromising product integrity and safety during post-packaging pasteurization and subsequent distribution.

Safety and Quality Concerns Associated with Lightweighting:

1. **Loss of hermeticity due to container–seal interface leakage during cooling —** Rapid cooling causes internal pressure to drop; insufficient wall thickness can cause the container to pull away from the seal.
2. **Seal failures (peel-off, rupture, bursting) —** Thin flange areas or heat-seal layers cannot maintain hermeticity during thermal expansion; flange flatness declines under stress and polymer seals weaken at high temperatures.
3. **Cracking, corner fractures, or micro-leaks after cooling —** As rigid plastics soften when heated, they must retain adequate thickness to maintain structural rigidity. Failures enable microbial ingress.
4. **Insufficient structural rigidity during manufacturing and distribution —** Tofu is fragile and lacks durability; it requires rigid containers with stable support.

Flexible Films

Reducing gauge or eliminating layers to achieve a 25% weight reduction would compromise hermetic seal integrity under thermal and pressure stresses. This elevates the risk of seal failure, pinholes, microbial contamination, and the creation of public-health hazards.

Expected issues with lightweighted flexible films include:

1. **Seal failures—peel, burst, or micro-leaks —** Thin seal layers lack adequate molten mass or strength to withstand high internal pressure; micro-channel leaks may form after thermal cycling.
2. **Delamination of multilayer laminates —** Thin tie layers lose bonding strength under steam, pressure, and heat, leading to bubbles, wrinkles, or full separation.
3. **Film deformation, pinholes, and flex-cracking —** Thin outer or barrier layers deform during high-temperature pasteurization; thin areas created during thermoforming are especially vulnerable.
4. **Heightened sensitivity to seal contamination —** Thin seal layers cannot absorb minor contaminants; even slight interference significantly increases leak risk.
5. **Punctures and abrasions —** Pasteurization baskets, rails, and contact points more easily damage thinner films.

If Tofu were not a potentially hazardous food, alternative materials such as paper, compostable plastics, or mono-material films might be feasible. However, current science and packaging technologies do not provide safe alternatives capable of withstanding pasteurization while ensuring consumer protection.

Thus, recyclable or compostable films and a 25% reduction in material weight for both flexible films and rigid containers are not reasonably achievable without undermining validated food-safety controls. Rigid containers and multilayer films used for this product category should therefore be deemed categorically excluded under Section 18980.2.

5) Request under SB 54 Section 18980.2

We respectfully request that CalRecycle designate packaging materials used for highly perishable foods requiring post-packaging pasteurization—such as refrigerated Tofu—as categorically excluded under Section 18980.2. This designation is essential for ensuring continued compliance with federal food safety mandates and preserving public-health protections by ensuring continued availability of validated, hermetic, thermally durable packaging and preventing substitution with materials incapable of withstanding pasteurization, which would increase food-safety risks.

Conclusion

Refrigerated Tofu presents unique microbiological hazards that require multilayer flexible films and rigid containers capable of maintaining hermeticity throughout post-packaging pasteurization and refrigerated distribution. Currently, no recyclable or compostable mono-material alternative films can fulfill these safety-critical functions. Likewise, achieving a 25% reduction in packaging weight for either flexible films or rigid containers is not feasible without compromising product safety and quality.

We respectfully urge CalRecycle to recognize these constraints and classify such packaging as categorically excluded under Section 18980.2 to avoid compromising consumer protection.

Thank you for your consideration of these comments.

Sincerely,
Takayuki Doue, CEO
House Foods Holding USA Inc.
Garden Grove, California

Response to B-53-1

Comment rejected. No response is necessary to any portion of this comment that does not relate to the revisions made to the proposed regulations. This comment relates to section 18980.2(a)(2) only with respect to the request that packaging for "highly perishable foods requiring post-packaging pasteurization" be granted a categorical exclusion. No change is appropriate because codifying a categorical exclusion for a class of products would be based on currently available packaging options, leaving CalRecycle no ability to tailor the exclusion to accommodate advances in packaging except through formal rulemaking. More importantly, section 18980.2(a)(2) already fully accommodates the commenter's stated concerns. The commenter bases the request on the need to comply with "federal food safety mandates," but section 18980.2(a)(2) ensures that packaging needed for such compliance will not be considered "covered material." To the extent the commenter's request is based on health and safety issues that may arise despite there not being any conflict with federal requirements, CalRecycle rejects the request because, as explained in greater detail in response to comment B-3-1, the exemptions available under Public Resources Code section 42060(a)(3) and (4) (addressed in section 18980.2.4 of the proposed regulations) accommodate that concern. Lastly, regarding the commenter's concern over source reduction, that concern is based on a misunderstanding of source reduction requirements. There is no requirement that each packaging item be reduced by 25 percent or that every producer achieve that reduction. Rather, Public Resources Code section 42057(a) applies to the PRO generally, requiring it to implement a plan that achieves the 25-percent reduction.

B-54: BSH Home Appliances Corporation (Alicia Cafferty)

Comment B-54-1

February 13, 2026

Via calrecycle.ca.gov

Csilla Richmond
SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act Permanent Regulations
Department of Resources Recycling and Recovery, Regulations Unit
1001 “I” St., MS-24B, Sacramento, CA 95814

BSH Home Appliances Corporation Comments: SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act Permanent Regulations

Dear Csilla Richmond:

Thank you for the opportunity to provide comments on the SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act Permanent Regulations. While we recognize that this 15-Day comment period is limited to the Department’s recent modifications, the revised language must necessarily be evaluated in the context of the regulation as a whole. The modifications alter how several provisions will operate in practice and, as a result, highlight implementation questions and ambiguities that directly affect compliance with related sections.

Our comments are offered to describe the foreseeable impacts of these revisions and to assist the Department in developing final regulations that are clear, consistent, and workable.

As a producer of durable goods, we must make packaging decisions with long-term consequences now, well before all certification programs and guidance are finalized. Because packaging design decisions must be finalized years in advance of market entry, regulatory ambiguity today directly determines whether producers will be able to comply tomorrow. In specific cases, the rule requires engineering decisions without corresponding engineering standards. We urge the Department to include a provision allowing producers to rely in good faith on any guidance or approved certification pathways in effect at the time packaging design decisions are made.

Compostability Criteria and Third Party Certification Infrastructure

The 15-Day revisions relating to compostability criteria create uncertainty regarding the applicability of Section 18980.3.3 to natural materials such as ISPM-15 heat-treated wood used in packaging applications. ISPM-15 heat treatment is a thermal

phytosanitary process that does not introduce additives, and the resulting material remains untreated solid wood.

As revised, the regulation does not clarify whether such natural wood materials are presumed compostable organic matter, whether ASTM compostability testing is required, or what documentation or evidentiary standard producers must maintain to substantiate compliance. We respectfully request clarification to ensure consistent implementation and to avoid unnecessary testing burdens for natural wood packaging components.

Furthermore, Public Resources Code §42357 condition compostability certification on the Department's approval of third-party certification entities, which do not yet exist. This creates a significant challenge for producers operating on multi-year product development timelines. We respectfully request that CalRecycle:
 Clarify the timeline for approving and publishing the list of third-party certification entities.
 Confirm how compliance will be evaluated in the interim, before an approved certification system is operational for the required one-year period.

De Minimis Component Criteria

The 15-Day revisions increase reliance on the de minimis provision as an important compliance pathway for packaging components. As revised, however, the regulation relies on qualitative criteria requiring producers to demonstrate that a component has "no effect" on recyclability, does not make recycling or composting more difficult, and enables the use of recyclable, compostable, reusable, or refillable packaging, without establishing objective standards for how these determinations are to be evaluated or documented.

In practice, packaging for large and durable goods like home appliances includes small but functionally necessary components that represent minimal weight. The absence of defined evidentiary standards, measurable thresholds, or safe-harbor examples creates significant uncertainty. It is unclear whether compliance will be assessed at the component level or the finished package level, or if these determinations could be retrospectively challenged during enforcement. Absent objective criteria, producers cannot determine in advance whether a component qualifies, creating risk that compliant design decisions could later be reinterpreted.

This reliance on subjective determinations makes it difficult to design packaging with the regulatory certainty needed for long-term planning. We respectfully request that CalRecycle provide objective guidance, illustrative examples, or measurable benchmarks to ensure the de minimis criteria can be applied consistently and predictably.

We appreciate the Department's continued engagement throughout this rulemaking process and respectfully request consideration of these comments. Providing clear,

prospective standards will allow producers to align packaging decisions with regulatory expectations while supporting consistent and efficient program implementation. We welcome continued dialogue as the regulations are finalized.

Respectfully,
Alicia Cafferty
Head of Government Relations
BSH Home Appliances Corporation

Background
BSH Home Appliances Corporation (BSH), headquartered in Irvine, California, produces and markets small and major home appliances that are known for their high-quality and superior innovation. BSH sells its Gaggenau, Thermador and Bosch branded products throughout North America, through distributors, independent appliance dealers, national and regional retailers, builders and large buying groups. BSH supports efforts to protect our environment and accepts a responsibility in building a sustainable future for all.

Response to B-54-1

Comment rejected. No response to this comment is necessary because it does not concern the revisions made in the 15-Day Changes.

B-55: CR&R Environmental (Noam Elroi)

Comment B-55-1

February 13, 2026

Ms. Karen Kayfetz
Branch Chief, CalRecycle Product Stewardship Branch
1001 I Street
Sacramento, CA 95814
Emailed to: packaging@calrecycle.ca.gov

Re: SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act Regulations – Comments on Draft Regulation Changes Released January 29, 2026.

Dear Ms. Kayfetz,

On behalf of CR&R Environmental Services, I thank you for the opportunity to comment on CalRecycle's SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act (SB 54) regulatory process. Below are comments on the proposed revisions to the Draft Regulations released January 29, 2026.

Founded in 1963, CR&R is a Southern California-based waste and recycling collection company, serving more than 3 million people and over 25,000 businesses in Orange,

Los Angeles, San Bernardino, Imperial, and Riverside counties. CR&R is contracted with approximately 55 local entities to provide waste and recycling services that support compliance with state laws. With over 2,000 employees, many of whom work under a collective bargaining agreement with Teamsters Local 396, CR&R has long been a leader in the development of climate-friendly, closed-loop waste collection and processing. CR&R owns and operate one of the largest Anaerobic Digestion facilities in North America, providing critical services for meeting organics diversion and short-lived climate pollutant reduction requirements of SB 1383 (Lara, 2016) and the waste stream circularity requirements of SB 54 (Allen, 2022).

We are pleased to see the amendments to Section 18980.2 on categorically excluded materials. Specifically, we appreciate the clarification that only packaging which cannot be made compliant with both SB 54 and mandatory Federal rules, regulations, or guidelines, may be categorically exempted. This change brings the scope of covered materials more in line with the original intent of the statute. However, this same type of clarification— that only conflicts with mandatory USDA and FDA requirements trigger exclusions— should be applied across section 18980.2 wherever mentions of legal conflict arise.

Further, clarification that repeat applications for exclusion do not automatically trigger removal from the covered materials list is a welcome fix to a potential loophole. This is an important limit on an already generous exclusion timeline.

Response to B-55-1

Comment rejected. CalRecycle cannot discern what change the commenter proposes. The commenter requests that the clarification that "only conflicts with mandatory USDA and FDA requirements trigger exclusions" be applied in section 18980.2 "wherever mentions of legal conflict arise." There are no other "mentions of legal conflict" in section 18980.2. If the commenter intended to refer to the exclusions listed in paragraphs (1) and (3) through (6) of subdivision (a), the recommendation is nonsensical because those paragraphs present statutory exclusions from the definition of "covered material" and do not concern "legal conflict."

Comment B-55-2

Although we appreciate the improvement made to the scope of covered materials, we are disappointed to see that the many critical issues for recycling service providers outlined in our October 2025 letter remain unaddressed. These are summarized briefly below, but can be found in full in our October 2025 letter.

§18980.1(a)(2)

Alternative collection could undermine local franchise systems, MRF financing, diversion tracking, and bond obligations unless approved by and run in coordination with relevant recycling service providers and local governments.

§18980.8(g)(4)
Unclear reimbursement timelines create financing difficulties; regulations should set firm deadlines so recycling service providers can responsibly plan debt and capital investments.

§18980.8(g)(6)
Non-optional, performance-based reimbursement conflicts with SB 54's mandate to fully reimburse costs and risks leaving jurisdictions unpaid for good-faith investments.

§18980.11(d)&(e)
CalRecycle—not the PRO—should clearly retain independent authority to approve exemption and extension applications based on real-world end market and sorting constraints.

§18980.13(b), §18980.13.1
Proposed penalties on recycling service providers and jurisdictions are excessive and misaligned with SB 54; enforcement should be graduated and focused on compliance assistance first.

CR&R has been a pioneer in circular economy waste collection and processing in California for decades and understands the role recycling service providers play in helping local governments and the PRO achieve the goals of SB 54. Again, on behalf of CR&R, I greatly appreciate your consideration of our comments.

Sincerely,
Alex Braicovich
Senior Vice President, Environmental Services
CR&R Environmental Service

Response to B-55-2

Comment rejected. No response to this comment is necessary because it does not concern the revisions made to the proposed regulations.

B-56: The Nunes Company, Inc. (John Rosans)

Comment B-56-1

February 13, 2025

Re: Comments on Proposed Regulations Implementing SB 54 (Packaging Producer Responsibility Act)

To CalRecycle:

We are writing on behalf of The Nunes Company, Inc., a private, family-owned, grower-shipper of conventional and organic vegetables that represents farmers growing in California, Arizona, and Nevada. Formed in 1976 and known for our Foxy® and Foxy Organic® brands, our company has a long-standing legacy in the Salinas Valley, offering a diverse range of conventional and organic fresh vegetables and strawberries. Among other innovations, our founders, Bob and Tom Nunes, pioneered the practice of film-wrapping lettuce in plastic for freshness.

Today, that practice remains vital to our industry, not just for freshness, but for food safety. We therefore appreciate the opportunity to comment on the January 29, 2026 draft regulations implementing SB 54. Our comments focus on the treatment of field-level and value-added food-contact packaging and the need for a regulatory pathway that recognizes packaging used to comply with federal and industry food-safety requirements.

I. Food Safety Regulations Require Packaging and Food Contact Materials That Prevent Contamination.

a. FSMA Produce Safety Rule Requirements

Under the Food Safety Modernization Act (FSMA), the Produce Safety Rule (21 CFR Part 112) establishes mandatory standards for growing, harvesting, packing, and holding produce. Key provisions include:

- **21 CFR §112.11**: Requires "appropriate measures to minimize the risk of serious adverse health consequences or death from the use of, or exposure to, covered produce, including those measures reasonably necessary to prevent the introduction of known or reasonably foreseeable hazards into covered produce, and to provide reasonable assurances that the produce is not adulterated under section 402 of the Federal Food, Drug, and Cosmetic Act on account of such hazards."
- **21 CFR §112.116:** Food-packing material must be "adequate for its intended use", which includes being: (1) Cleanable or designed for single use; and (2) Unlikely to support growth or transfer of bacteria.

In field packed leafy greens operations, the plastic bag itself is a primary food contact surface. It prevents cross contamination from soil, harvest equipment, workers' hands, and transport containers. No commercially viable non plastic alternative currently meets FSMA's sanitation, durability, and microbial control requirements in field conditions.

b. California LGMA Standards

The California Leafy Greens Marketing Agreement (LGMA) (1) requires:

- All food contact surfaces, including harvest containers, liners, and packaging materials, to be designed, constructed, and maintained to prevent contamination.
- Packaging materials to be stored, handled, and used in a manner that prevents contamination.

These requirements apply directly to field packed leafy greens. Packaging is a core component of the contamination prevention system, not a discretionary marketing feature.

c. Buyer and Third Party Audit Requirements

Major retail and foodservice buyers require compliance with GFSI benchmarked schemes (2) and their own supplier standards. These programs require:

- Documented control of food contact packaging materials
- Demonstrated prevention of cross contamination
- Validation that packaging is fit for purpose and does not introduce microbial hazards

These requirements apply directly to field-packed leafy greens. Packaging is an essential food-contact surface that plays a critical role in preventing cross-contamination after harvest; it is not a discretionary marketing feature.

II. Plastic Packaging Is the Only Viable Material for Field-Packed Produce Under Current Food-Safety and Operational Requirements.

Field-packed produce – including leafy greens, broccoli, cauliflower, celery, and other high-moisture, high-respiration commodities – requires packaging that performs multiple critical functions simultaneously: helping protect the product from contamination, maintaining quality during rapid cooling, preventing moisture loss, and withstanding the physical demands of harvest and distribution. At present, only plastic films meet these combined functional and food-safety requirements in commercial field conditions. Alternative materials fail to provide the necessary microbial protection, durability, moisture control, and performance characteristics required under FSMA, LGMA, and GFSI-benchmarked buyer standards.

a. Functional Performance Requirements for Field-Packed Produce

Field-packed produce is harvested and packaged outdoors, often in dusty, wet, or variable environmental conditions. Packaging must therefore meet the following safety, operational, and functional requirements:

- Serve as a primary food-contact surface that prevents cross-contamination from soil, harvest equipment, workers' hands, and transport containers;
- Maintain structural integrity when wet, as leafy greens and brassicas release moisture continuously;
- Provide appropriate oxygen transmission rates (OTR) to prevent anaerobic conditions while slowing respiration and spoilage;
- Withstand vacuum cooling and hydrocooling, which impose rapid pressure changes and require packaging that does not collapse, tear, or deform;
- Protect against mechanical damage during harvest, stacking, transport, and retail handling;
- Maintain high humidity to prevent wilting while avoiding condensation that promotes microbial growth.

Plastic films are uniquely capable of meeting all of these requirements simultaneously. They provide predictable OTR, excellent moisture barrier properties, durability under wet conditions, compatibility with cooling systems, and sufficient strength and flexibility for field operations.

b. Alternative Materials Are Simply Not a Viable Option

Alternative packaging materials, like the ones discussed below, are simply not a viable option for field-packed produce.

1. Paper and Fiber-Based Packaging

Paper, molded fiber, and coated paper fail for one overriding reason: they cannot survive moisture. Field-packed produce releases water continuously, and paper absorbs it. Once wet, paper collapses, tears, sheds fibers, and becomes a microbial substrate. These failures make paper fundamentally incompatible with:

- FSMA's requirement that food-contact materials be "adequate for their intended use";
- LGMA's requirement that packaging prevent contamination; and
- Vacuum cooling, which destroys wet paper instantly.

Because paper cannot maintain structural integrity or sanitary conditions when exposed to moisture, it cannot be used for leafy greens, broccoli, cauliflower, or any high-moisture field-packed crop.

2. Compostable and Bioplastic Films

Compostable films fail for one core reason: they cannot deliver the moisture and oxygen-control performance required for fresh produce. These materials:

- Absorb or transmit moisture too quickly, causing wilting and microbial growth;
- Have inconsistent or too-low oxygen transmission rates, creating anaerobic conditions; and
- Become brittle at cold temperatures used in produce cooling.

These deficiencies directly conflict with FSMA and GFSI requirements to control microbial hazards and validate packaging performance. Compostable films simply cannot maintain the environmental conditions needed to keep produce safe.

3. Laminates, Coated Papers, and Waxed Materials

Likewise, "hybrid" materials fail for one central reason: they break down when exposed to moisture and physical stress.
In field conditions, these materials:

- Delaminate, exposing raw paper fibers;
- Tear at seams or folds; and
- Lose integrity during vacuum cooling.

Once compromised, these materials no longer protect the product from contamination. Moreover, they also appear to remain "Covered Materials" under the current draft of SB 54, offering no regulatory benefit while still failing operationally.

III. Plastic Packaging Is Likewise the Only Viable Material for Value-Added Processed Leafy Greens and Other Vegetables

Processed produce – including chopped Romaine, spring mix, baby spinach, broccoli and cauliflower florets, etc. – requires packaging that performs far more demanding food-safety and functional roles than field-packed commodities. Once produce is cut, its natural protective barriers are removed, respiration rates increase sharply, and susceptibility to microbial growth rises. Under these conditions, plastic packaging is the only material capable of maintaining product safety, quality, and regulatory compliance.

a. Regulatory Requirements Under 21 CFR Part 117

Processors subject to the Preventive Controls Rule must ensure that packaging:

- Does not introduce hazards;
- Maintains product safety throughout shelf life;

- Controls environmental parameters necessary to prevent microbial growth, including OTR and moisture; and
- Is durable, sanitary, and appropriate for its intended use.

These provisions require processors to validate and verify that packaging consistently maintains safe conditions for cut produce throughout its intended shelf life.

b. Processed Produce Therefore Requires Plastic Packaging

Because cut vegetables demand precise control of oxygen transmission, moisture retention, and package integrity under cold, wet, and high-pressure conditions, only engineered plastic films can be validated to meet these regulatory requirements. Plastic is the only material that withstands vacuum sealing, maintains the modified atmosphere needed to prevent microbial growth, protects cut surfaces from contamination, and survives distribution without routine failure. The alternative materials discussed above simply cannot deliver these validated safety and performance functions.

(1) The LGMA is science-based, voluntary-entry program created in 2007 to ensure the safety of leafy greens. LGMA members produce approximately 90% of the leafy greens grown in the United States, and members are subjected to mandatory government audits provided by USDA-certified, government inspectors. LGMA members are audited multiple times throughout the season and must achieve 100 percent compliance with the LGMA food safety practices
(2) The GFSI (Global Food Safety Initiative) is an industry-driven organization that benchmarks and recognizes various third-party food safety certification programs (often called "schemes" or "standards"). These programs are not created by GFSI itself but are developed and owned by independent CPOs (Certification Programme Owners). Major retailers and foodservice companies often require suppliers to hold certification to one of these GFSI-recognized schemes as part of their supplier approval processes.

To the extent subsequent portions of the commenter's submission do propose changes or raise objections, CalRecycle has responded to them separately.

Comment B-56-2

IV. The Proposed Amendments Exceed CalRecycle's Statutory Authority and Misinterpret Federal Food-Safety Law

The Legislature placed clear limits on CalRecycle's authority when it enacted SB 54, and the proposed amendments to Section 18980.2 exceed those limits. Under Government Code § 11349(d), a regulation is invalid if it exceeds the scope of the enabling statute. SB 54 further requires that any implementing regulations be

"reasonable and necessary" to carry out the statute (PRC § 41821.5(c)). The proposed amendments – particularly the introduction of a new "mandatory" qualifier – are neither reasonable nor necessary to implement the statutory exclusion for food and agricultural commodity packaging.

The statute itself makes the Legislature's intent unmistakable. PRC § 42060(b)(1) directs CalRecycle to "ensure that any regulations adopted pursuant to this chapter consider guidelines and do not conflict with regulations issued by the United States Food and Drug Administration and the United States Department of Agriculture." PRC § 42060(b)(2) goes further, prohibiting CalRecycle from imposing "any requirement . . . in direct conflict with a federal law or regulation, including . . . the federal FDA Food Safety Modernization Act," and expressly barring the Department or a PRO from imposing "a postconsumer recycled content requirement for covered material for fresh produce."

The proposed amendments conflict with these statutory protections. By conditioning the categorical exclusion on packaging that is "mandatory" under federal law, the draft regulation imposes a requirement that has no basis in FDA's regulatory framework. FDA does not mandate specific packaging materials or designs for produce. Instead, FDA establishes performance-based obligations: packaging must protect food from contamination and must not introduce contaminants. The only "mandatory" aspect of FDA regulation is the duty to ensure food-contact materials are safe – not the use of particular materials. Because FDA does not issue material-specific mandates, CalRecycle's new "mandatory" qualifier effectively nullifies the exclusion the Legislature created.

The draft regulation also fails to provide clear standards for what information companies must submit or how CalRecycle will evaluate that information. Regulated entities cannot determine what constitutes adequate documentation, what threshold must be met, or how CalRecycle will interpret "reasonably possible." This lack of clarity violates California's rulemaking standards, which require regulations to be clear, consistent, and provide fair notice of what is required (Gov. Code § 11349(c)–(d)).

The Legislature created the exclusion in PRC § 42060 precisely because federal food-safety requirements can conflict with SB 54's packaging restrictions. The exclusion was intended to be functional and accessible – not so narrow that it becomes unusable. The proposed amendments undermine that purpose by creating a standard that no food-contact packaging can realistically satisfy.

V. SB 54 Must Provide a Regulatory Pathway That Accounts for the Unique Food-Safety and Operational Realities of Agricultural Packaging

To function as the Legislature intended, SB 54 must include a clear regulatory pathway for packaging that is legally required for food safety and for which no viable alternative exists. Fresh-produce packaging is selected to meet federal and state food-safety obligations – not marketing preferences or shelf appeal – and growers and processors

cannot substitute away from materials that are necessary to prevent contamination, maintain product integrity, and comply with FSMA, LGMA, and other audit requirements.

The proposed amendments to Section 18980.2 effectively eliminate the statutory exclusion in PRC § 42060 by introducing a "mandatory" qualifier that does not exist in federal law and by adopting an unduly narrow view of what is "reasonably possible." Without a functional categorical exclusion, SB 54 will impose fees on packaging that the agricultural sector is legally obligated to use. For an industry that already operates on narrow margins, these added costs will inevitably flow downstream to retailers and consumers -- an outcome that would disproportionately burden the disadvantaged and low-income communities the Legislature identified as needing protection.

In addition to these economic impacts, the proposed amendments would create unintended food-safety and traceability risks. By effectively eliminating the categorical exclusion for packaging required under federal law, the regulation disincentivizes the use of wrapped, protected product and instead encourages the sale of "naked," unbranded produce. This outcome is inconsistent with FSMA's requirements for controlling food-contact surfaces and directly undermines the enhanced traceability obligations established under FSMA 204, which depend on labeled, unit-level identification to support rapid traceback during outbreaks.

A workable regulatory exclusion therefore is essential to avoid undermining food safety, disrupting the fresh produce supply chain, and increasing costs for the communities SB 54 was designed to support. We respectfully urge CalRecycle to revise the final regulation to restore a clear, functional categorical exclusion that reflects federal food-safety requirements and the operational realities of agricultural production.

Thank you for considering these comments.
John Rosans, Legal Counsel
Jacob Odello, Director of Food & Industrial Safety

Response to B-56-2

Comment rejected. Regarding the effect of the term "mandatory" and the assertion that the revisions to section 18980.2(a)(2) render it no longer a "functional categorical exclusion," CalRecycle rejects this comment for the reasons provided in response to comment B-3-1. The commenter expressly concedes that the FDA establishes "obligations" and a "duty to ensure food-contact materials are safe," that federal law imposes "requirements for controlling food-contact surfaces," and that federal law governs what packaging "the agricultural sector is legally obligated to use." It is untrue, therefore, that the federal framework does not impose "mandatory" restrictions, and nothing in section 18980.2(a)(2) requires there to be federal requirements dictating "specific packaging materials or designs" for the requirements to justify exclusion. Regarding the clarity standard and "adequate documentation," CalRecycle rejects this comment for the reasons stated in response to comment O-31-5 and

because subparagraph (A) through (C) make clear what notices must include and explain the related procedures. Notices must identify the conflict between the Act and federal requirements, describe the packaging at issue, and explain the contention that it is not reasonably possible to satisfy all such requirements, an explanation that is subject to the objective criteria set forth in subparagraph (B). Subparagraph (C) makes clear that, as long as the notice contains those elements, CalRecycle may only reject it if CalRecycle identifies packaging that might serve as an alternative. In such instances, the submitter may resubmit the notice to demonstrate otherwise.

The commenter also objects to the possibility that "SB 54 will impose fees on packaging that the agricultural sector is legally obligated to use." To the extent that the commenter did not intend to refer to "penalties" instead of "fees," that objection is without merit. There is no logical reason why the mere obligation to use certain packaging under any other law, without there being any conflict with the Act, would exclude it from being "covered material" under the Act. If the commenter intended to refer to penalties for using packaging that the "agricultural sector is legally obligated to use" under federal law, section 18980.2(a)(2) unambiguously establishes a pathway to avoid such penalties. Regarding the commenter's reliance on economic impacts, food-safety, and traceability, those concerns are not relevant under section 18980.2(a)(2) except to the extent they can demonstrate that packaging that satisfies the Act's requirements cannot be used without violating federal requirements. If known alternatives can be used to satisfy the Act and federal requirements but are merely disfavored due to significant challenges or health and safety reasons, exemptions under the standards established in section 18980.2.4 provide the appropriate remedy.

B-57: Scully Packing Company, LLC (Hanna Scully)

Comment B-57-1

SB 54 Regulations Rulemaking File
[Submitted via CalRecycle’s 15-day comment portal]

Re: Comments on SB 54 Final Draft Permanent Regulations (Jan. 29, 2026) – 15-Day Comment Period (Jan. 29–Feb. 13, 2026)

To CalRecycle:

On behalf of the Scully Packing Company, LLC., we submit these comments on CalRecycle's Jan. 29, 2026 final permanent draft regulations for the Plastic Pollution Prevention and Packaging Producer Responsibility Act (SB 54) during the 15-day comment period (Jan. 29–Feb. 13, 2026).

Scully Packing Company is a grower, packer, and shipper of California Pears. We produce approximately 40% of all California Bartletts and represent 15 other farming families. We strongly support California's goals to reduce waste and advance a circular economy. However, we are deeply concerned that revisions to Article 2 – Categorically Excluded Materials (Section 18980.2) make categorical exclusions functionally unattainable for many fresh-produce applications and fail to reasonably accommodate unavoidable food safety, food-contact, and operational constraints.

1) Section 18980.2 revisions make categorical exclusions nearly impossible to obtain
The Jan. 29 draft significantly departs from earlier versions by raising the burden of proof for categorical exclusions—particularly through changes that increase what producers must demonstrate regarding "mandatory" requirements and what is "reasonably possible." As written, the regulation effectively requires fresh produce companies to compile extensive legal and technical documentation to prove that no feasible packaging alternative can meet FSMA, FDA food-contact expectations, and applicable state requirements while also maintaining the necessary performance attributes that protect public health and prevent spoilage.

2) Pear packaging is driven by food safety, shelf life, and damage prevention—changing materials can increase food waste
Fresh pears are highly susceptible to bruising, compression damage, and quality loss if packaging does not maintain appropriate protection and performance throughout harvest, cooling, storage, transportation, and retail handling. Packaging for pears is engineered to support critical functions, including:
• Protecting fruit from physical damage during handling and transit
• Maintaining appropriate airflow and temperature performance for cold-chain movement
• Managing moisture and reducing contamination risks
• Preserving shelf life and quality to reduce food waste
Packaging changes that compromise package integrity, shelf life, or contamination controls can increase food waste, which undermines California's climate and environmental goals.

3) The draft eliminates reasonable accommodation for real-world compliance pathways
We are particularly concerned the draft no longer reasonably accommodates compliance pathways that are commonly used to safely transition packaging, including the continued use of liners, coatings, or closures where necessary to meet food safety and food-contact performance requirements. The draft also appears to set an "all-or-nothing" standard for redesign that does not reflect how fresh produce packaging innovation occurs in practice—incremental changes validated for food safety and performance over time.

4) Distributor-as-"producer" treatment and penalties create significant legal and operational risk

We share concerns that the draft's approach can treat entities as "producers" simply for selling products into California, expanding compliance exposure in ways that are difficult to manage across complex produce supply chains.

We are also concerned about the scale of potential penalties and compliance risk described in the SB 54 regulatory framework, including exposure to significant civil penalties and packaging sale restrictions for noncompliance.

Requested revisions:
To support successful implementation of SB 54 while protecting public health and food system efficiency, Scully Packing Company & California pear growers respectfully request CalRecycle:
1. Restore a clear, workable categorical exclusion pathway that is realistically achievable for fresh-produce packaging where food safety and food-contact requirements limit alternatives.
2. Recognize established federal food safety and food-contact compliance frameworks as the appropriate benchmark for evaluating whether alternatives are feasible for fresh produce packaging.
3. Allow reasonable use of liners, coatings, and closures where needed to maintain food safety and shelf-life performance while alternatives are developed and validated.
4. Clarify supply-chain roles and obligations to avoid inappropriate producer assignment for downstream entities that do not control packaging design or material choices.

California pear growers are committed to waste reduction and innovation. We respectfully urge CalRecycle to revise the final regulations to ensure SB 54 is implemented in a way that protects food safety, avoids increases in food waste, and remains workable for the fresh produce supply chain.

Thank you for considering our comments.
Scully Packing Company, LLC.

Response to B-57-1

Comment rejected. CalRecycle rejects this comment for the reasons provided in response to comment B-3-1, which encompasses the objections and recommendations made in this comment that are relevant to the changes made in section 18980.2(a)(2). Regarding the fourth requested revision, no response is necessary because none of the revisions made to the 45-Day Changes concern "producer assignment." Nothing in those revisions relates to the commenter's allegation that "the draft's approach can treat entities as 'producers' simply for selling products into California." Whether an entity is a "producer" under Public Resources Code section 42041(w) is addressed in various provisions in section 18980.1 and 18980.1.1, neither of which has been revised.

Csilla Richmond
SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act Regulations
California Department of Resources Recycling and Recovery (CalRecycle)
Regulations Unit
1001 “I” Street, MS-24B
Sacramento, CA 95814

RE: SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act Permanent Regulations 15-Day Comment Period

Dear Ms. Richmond,

I am submitting comments on the Jan. 29, 2026, final draft "SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act" regulation on behalf of Driscoll's Inc., a shipper of fresh berries headquartered in Watsonville, California.

Fresh berries are fragile, delicate, and packed by hand in the field. Our packaging must be able to support our product and withstand temperature and moisture extremes throughout the supply chain which includes field, cooling, transport and retail stores. Given these requirements, our packaging decisions are driven first by food safety requirements including FSMA and FDA food-contact standards, which are designed to prevent contamination and protect public health. Additionally, our packaging serves to optimize the supply chain to prevent food waste and greenhouse gas emissions. While we are consistently testing and piloting new package designs and material types, our primary package today is a PET thermoform clamshell, selected for its food-safety performance, recyclability, and ability to protect delicate fruit and minimize food waste.

The revised language in Section 18980.2 (Categorically Excluded Materials) raises significant implementation concerns. The addition of the word "mandatory" and the narrow definition of what is "reasonably possible" effectively eliminates the categorical exclusion pathway for fresh produce packaging.

Packaging is necessary to maintain integrity throughout harvesting, cooling, transportation and retail handling. Our packaging is carefully engineered to:

- Protect fragile produce from physical damage during transit and handling

- Optimize transportation efficiency which reduces energy demands on the supply chain
- Maintain airflow, moisture control and structural stability
- Preserve shelf life and product quality by managing the respective respiration rates of each of the berries

As drafted, the regulation requires producers to prove that "no alternative packaging complies with FSMA, FDA food-contact requirements and California law."

The fresh produce industry is constantly evaluating alternatives to further enhance food quality and safety. Most alternatives do not provide the same functionality as the industry gold standard, leading to increased risk of food waste, contamination, and costs to consumers. Driscoll's uses directional life cycle assessments (LCAs) to assess different packaging material types and their respective environmental impacts, specifically pertaining to greenhouse gas emissions and water usage. This work has informed prior investments in recycle ready clamshell design, material reductions, and efforts to make PET clamshells recyclable in practice and at scale well in advance of SB 54's implementation.

For consumers, access to fresh berries is an important part of a healthy diet, and effective packaging is critical to preventing food waste and ensuring that fresh produce remains safe, affordable, and available. Packaging innovation must consider the primary package (what the consumer takes home with them), the secondary package (packaging to consolidate the primary packages), as well as the tertiary package (packaging for transportation and delivery). The packaging system must work together, at scale, within real-world food safety, operational and supply-chain constraints to provide safe, delicious, healthy and affordable fresh fruits and vegetables to Californians.
I respectfully urge CalRecycle to revise the final regulation to restore a clear, workable categorical exclusion that recognizes federal food safety packaging guidance as the accepted compliance pathway and the essential role of packaging in food safety, package integrity, waste reduction and greenhouse gas mitigation.
Thank you for considering these comments.

Sincerely,
Jenét DeCosta, Sr Director Public Affairs
Driscoll’s

Response to B-58-1

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment B-3-1, which is substantively the same as this comment.

B-59: Ocean Mist Fams (Chris Drew)

Comment B-59-1

February 11, 2026

To CalRecycle:

I am submitting comments on the Jan. 29, 2026, final draft "SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act" regulation on behalf of my company, Ocean Mist Farms, a grower, packer and shipper of fresh vegetables operating in California.

The revised language in Section 18980.2 (Categorically Excluded Materials) is deeply concerning. The addition of the word "mandatory" and the narrow definition of what is "reasonably possible" effectively eliminates the categorical exclusion pathway for fresh produce packaging.
