Department of Resources Recycling and Recovery

SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act Regulations

FINAL STATEMENT OF REASONS

UPDATE TO INITIAL STATEMENT OF REASONS

The Initial Statement of Reasons (ISOR), released on August 22, 2025, is incorporated by reference herein. The ISOR contained a description of the rationale for the proposed regulations. On August 22, 2025, all Documents Relied Upon and identified in the ISOR were made available to the public. The updates to the proposed regulatory action that were made subsequent to the release of the ISOR and the reasons supporting those changes are set forth below.

UPDATED SPECIFIC PURPOSE AND NECESSITY OF THE AMENDED PROPOSED REGULATION

The following contains updated purpose and necessity statements for the submitted regulation text.

TITLE 14. Natural Resources

DIVISION 7. Department Of Resources Recycling and Recovery

CHAPTER 11.1. Plastic Pollution Prevention and Packaging Producer Responsibility Act

ARTICLE 1: Definitions

SECTION 18980.1. Definitions

Subsection (a)(8)(B)(iii)

The purpose of this subsection is to expressly limit the scope of section 42041(e)(1)(B)(ii) of the Public Resources Code (PRC) so that certain bags subject to a narrower, preexisting statute restricting their use are not considered “bags used in the packaging of food.” More specifically, bags that are “pre-checkout bags” or bags provided to customers at the point of sale by “stores,” as described in statutes applicable to those bags, are not the bags referred to in section 42041(e)(1)(B)(ii). (See, generally, Chapter 5.3 of Part 3 of Division 30 of the PRC (Chapter 5.3), added by Senate Bill 270 (Stats. 2014, Ch. 850), governing single-use carryout bags, including section 42281.2, added by Senate Bill 1046 (Stats. 2022, Ch. 991), governing “precheckout bags”.) This interpretation is necessary because the Act must be read in a way that harmonizes it with Chapter 5.3 of Part 3 of Division 30 of the PRC (Chapter 5.3), which contains its own definitions of “reusable” and “single use” that are inconsistent with the Act’s definitions and defines “recycled paper bag” inconsistently

with how the Act defines “recycle” and “recycling.” (Section 42280 of the PRC.) It also contains its own, narrow standards for pre-checkout bags, requiring them to either be compostable or a recycled paper bag. Furthermore, Chapter 5.3 requires reusable grocery bags to be certified as “reusable” and, for plastic bags, as “recyclable” by third-party certification entities. CalRecycle, in turn, is required to publish a list of reusable grocery bags that are properly certified and therefore not prohibited. Grocery stores and convenience stores throughout the state depend on that mandatory list for identifying bags that they are permitted to distribute. However, if such bags could be considered covered material under the Act, that list would be misleading and possibly superfluous because CalRecycle lawfully must certify bags under the standards of Chapter 5.3, not the Act, so a bag’s presence on the list would not necessarily mean that distribution of the bag is lawful. Moreover, section 42287 of the PRC expressly provides that Chapter 5.3 “occupies the whole field of regulation of reusable grocery bags, single-use carryout bags, and recycled paper bags” distributed by “stores,” as those terms are used in Chapter 5.3. Given the inconsistency between the restrictions imposed by the Act and those imposed by Chapter 5.3, bags distributed by “stores” (e.g., grocery and convenience stores) in a manner subject to the latter must not be considered to be used in the packaging of food for purposes of section 42041(e)(1)(B)(ii) of the PRC.

Lastly, for purposes of harmonizing the Act and these regulations with Chapter 5.3, the exemption under the latter for small retail establishments does not apply. This is necessary because that exemption would result in bags used by smaller retail businesses being subject to the Act, even though the same bags used at large businesses would not be. That result would be inequitable and would mean this subsection would fail its essential purpose with respect to small businesses.

Subsection (a)(17)(F)

This subsection establishes the meaning of “distribution” and “distribute,” specifying that they refer generally to the act of transferring products in the supply chain or to end users of products. Such a transfer need not occur at the moment of sale but must constitute the transfer of ownership to the receiving party. Interpreting these terms is necessary because statute uses them repeatedly but does not define them. Given the manner in which the Act uses the term, it would be inappropriate to interpret it more narrowly to refer to particular types of sales or the delivery of products to those who sell them. The Act’s repeated use of the phrase “sold, offered for sale, or distributed” (or similar terms) indicates that the Legislature intended that phrase as a single reference to all relevant commercial actors, thereby ensuring that there will always be a person defined as the “producer” under section 42041(w) of the PRC. In other words, the phrase encompasses persons that provide products to others, regardless of whether there is an actual sale. Interpreting “distribute” otherwise would read into the Act an obvious loophole: If there is no person in the state that sold certain covered material items to a business in the state, that business could avoid being a producer simply by providing covered material items to others without receiving payment tied specifically to the items. This could result, for example, in there being no producer under section 42041(w)(3) for plastic food service ware items that a food service establishment

provides to patrons free of charge. Moreover, when a manufacturer that manufactures goods on behalf of an in-state brand owner, that brand owner may own the goods immediately once they are manufactured, before they are transported to any party. By requiring a “transfer” of the goods, not the mere “transport” of them, this subsection resolves the ambiguity that otherwise would result in that scenario.

This subsection also provides a definition of “import.” This is necessary because statute uses that term in multiple contexts but does not define it, and it is subject to multiple interpretations (e.g., as referring only to goods moved into the state from foreign countries, as opposed to including goods moved from other states). Broadly interpreting it to refer to all goods entering the state, regardless of origin, is necessary because a narrower interpretation could not reasonably have been intended. If “import” only referred to goods transferred from foreign countries, section 42050 of the PRC would not prohibit covered material from being moved into the state from other states and immediately disposed of, without being sold or offered for sale. That would contravene the express purposes of the Act set forth in section 42050 and the policy priorities referenced in section 42050.

Subsection (a)(17)(F)(i) and (ii)

These subsections clarify and limit the definition provided in subsection (F) for “distribution,” “distribute,” and “import.” As provided in (i), those terms necessarily cannot apply with respect to products that leave the state without ever being provided to consumers or disposed of. If such products could be considered distributed or imported in or into the state, the Act would regulate goods moved in interstate commerce in ways that the Legislature could not reasonably have intended. The express intent behind the Act, as explained in section 42040, and the policy priorities referenced in section 42050 make clear that the Act concerns materials that reach their end of life in the state, not materials that merely move through it. The effect of this subsection is to narrowly interpret the Act’s inclusion of the terms “import” and “imported” alongside “distribute” and “distribution”: Those terms ensure that the Act is understood to concern the sale, offer of sale, and distribution of goods, with no requirement that the goods originated within the state. The terms do not imply that the Act applies generally to goods that merely pass through the state or discriminates between goods based on whether they originated within the state.

Subsection (a)(17)(F)(ii) explains that transportation on behalf of another person must be considered conducted by that person. This is necessary because, otherwise, common carriers and other entities**,** such as logistics providers, that merely move products might be considered relevant to determining the producer of covered material. That result would be nonsensical because such transporters would rarely, if ever, have meaningful control over the covered material used by the products they transport and may not even know what those products are to begin with. Including this subsection provides added clarity for entities endeavoring to identify the producer of covered material.

ARTICLE 2: Covered Material and Covered Material Categories

SECTION 18980.2. Categorically Excluded Materials

Subsection (a)(2)

The purpose of this subsection is to address the statutory mandates concerning conflicts with requirements under federal laws and regulations, including regulations issued by the United States Food and Drug Administration and the United States Department of Agriculture. This subsection does so by ensuring that, when it is not reasonably possible for food or agricultural commodity packaging to comply with both the Act and those requirements, the packaging will be considered not to be covered material, effectively exempting the packaging and the persons that would otherwise be producers of the packaging from all requirements of the Act. This is necessary because such conflict necessarily constitutes a direct conflict that PRC section 42060(b) requires the regulations to avoid. For completeness and context, this subsection also identifies certain examples, with respect to particular federal laws, of the types of direct conflict that might arise. To comport with how PRC section 42060(b)(2) uses the term "guidelines," the word "mandatory" in this subsection qualifies the phrase "regulations, rules, or guidelines." That word is a synonym of "required" and is used in that sense. While "regulations" and "rules" are necessarily "mandatory," a "guideline" might be understood to set forth standards that are merely voluntary. But that term must be limited to federal requirements for two reasons. First, when describing conflicts that the regulations must avoid, PRC section 42060(b)(2) only uses the word "guidelines" as an example of "laws or regulations." Second, a requirement under the Act cannot logically present a conflict with a provision in a "guideline" if the guideline does not set forth a requirement; if "guidelines" are merely suggestions, one cannot violate them. Accordingly, the word "mandatory" in this subsection qualifies the phrase "regulations, rules, or guidelines" to ensure that that logical relationship between the Act and federal requirements is clear.

Subsection (a)(2)(A)

The purpose of this subsection and the following subsection is to establish a procedure that entities must follow when they determine that packaging is not covered material for the reason set forth in paragraph (2). This subsection covers the very first step, explaining that a written notice must be submitted by email unless the Department has made an online submission portal available. This provision is necessary to establish clear, reasonable expectations regarding the procedure that entities must follow to avail themselves of the exclusion described in subsection (a)(2).

Subsection (a)(2)(B)

The purpose of this subsection is to explain what the notices described in subsection (a)(2)(A) must include and what they must show. The requirements are straightforward:

The notices must identify the legal basis for claiming a conflict exists, describe the packaging at issue, and explain the contention that packaging that avoids the conflict cannot be used. This is necessary to establish clear, reasonable expectations regarding the procedure that entities must follow to avail themselves of the exclusion described in subsection (a)(2). It is also necessary to clarify how the Department will assess whether to require resubmission of a notice before deeming it complete, as described in subsection (a)(2)(C), or submission of additional information to assess whether complete notices are sufficient, as described in subsection (a)(2)(E).

Subsections (a)(2)(B)(i) through (iii)

These provisions provide criteria that analytically clarify the phrase “not reasonably possible to use any alternative packaging or packaging components that would avoid the conflict.” The criteria are objective, fact-based conditions that the notice must consider and, applying straightforward logic, must be true for it to be not reasonably possible to use such an alternative. The effect of the criteria is to establish three separate bases on which packaging may be disqualified from the exclusion described in subsection (a)(2). Clause (i) establishes the most basic reason that packaging might not qualify for the exclusion: that there is an alternative that can lawfully be used (including with respect to requirements regarding safety and structural integrity). By specifically explaining that such an alternative must not create “new unavoidable legal conflict with any law,” this clause prevents the proposed regulation from disqualifying packaging based on alternatives that could not lawfully be used for reasons other than the federal requirements cited in the notice. Clause (ii) and (iii) encompass circumstances where the “alternative” packaging is not a discrete packaging alternative but rather an iteration of the packaging itself. Under clause (ii), packaging is disqualified if the conflict can be avoided by no longer using the packaging components that cause it. Under clause (iii), packaging is not excluded from the definition of “covered material” if it can be redesigned or replaced to avoid the conflict. Taken together, these three clauses provide the analytical framework for assessing whether the circumstances described in the notice satisfy the reasonableness standard described in subsections (a)(2) and (a)(2)(B). This is necessary to ensure predictable, uniform application of the exclusion.

Subsection (a)(2)(C)

The purpose of this subsection is to establish a procedure through which the Department will subject notices to initial scrutiny and the substantive standard governing that scrutiny. This is necessary to establish a clear, reasonable mechanism for CalRecycle to prevent bad faith or clearly erroneous notices from resulting in packaging being considered excluded from the definition of “covered material.” Without such a procedure a notice could claim that packaging is not “covered material” even if it is not packaging for food or agricultural goods or if there is no conceivable conflict with federal requirements. The scrutiny required under this paragraph considers only whether the notice contains the elements described in subsection (a)(2)(B) and whether CalRecycle is aware of packaging that would avoid the cited conflict with federal requirements but

that the notice did not address. In either case, the notice may be resubmitted to resolve such defects. This process ensures that entities submitting notices will conduct a good faith evaluation of packaging options available to them and explain why they cannot serve as the alternative described in subsection (a)(2)(B) (i.e., packaging that avoids the conflict with federal requirements). By requiring CalRecycle to notify entities within 90 days that a notice must be resubmitted, this regulation balances the certainty that businesses reasonably need while ensuring CalRecycle has adequate time to evaluate whether requiring resubmission is appropriate.

Subsection (a)(2)(D)

The purpose of this subsection is to establish a procedure through which the Department will give effect to the notices described in subsections (a)(2)(B) and (a)(2)(C). Unless a notice is deemed incomplete pursuant to subsection (a)(2)(C), the Department must add the notice and certain information from it to a publicly accessible database. The information in the notice must identify the packaging subject to the exclusion, the associated products, the date the notice was deemed complete, and the status of any review of the notice by the Department. These provisions result in adequate public notice without requiring disclosure of the entire notice, thereby ensuring that the Department can protect trade secret information. This subsection also explains that the exclusion will be deemed to apply to packaging identified in the database unless the Department determines that the notice and any additional supplementation does not justify the exclusion (see subsection (a)(2)(E).) These provisions are necessary for multiple reasons. First, regulated entities and the public reasonably require clarity concerning when the exclusion will be deemed to apply. Second, without a public database, entities that might be responsible for similar packaging might otherwise not be aware of compliance pathways available to them. Moreover, without such transparency, there would be no ready way for the public to determine whether certain packaging is excluded from regulation under the Act, and the continued use of single-use packaging might thwart consumers' expectations of the Act's effects. Third, by requiring the database to indicate whether a notice is under review or the results of a review, the proposed regulation ensures that the database distinguishes between notices that remain in effect, those that have been disqualified as described in subparagraph (E), and those that are in effect but are pending review pursuant to subparagraph (E). This provides the transparency necessary for the regulated community and the public to understand compliance status of particular packaging.

Subsection (a)(2)(E)

The purpose of this subsection is to establish a procedure, including the means of notifications from the Department, through which the Department will evaluate claims that complying with the Act presents a direct conflict which justifies an exclusion for purposes of the preceding provisions. Providing a procedure specific to such claims is necessary because the notice procedure described above presents circumstances dissimilar to other compliance- and enforcement-related scenarios. Here, entities must

make unilateral decisions concerning their obligations under the Act based on the need to comply with laws other than the Act, and those decisions become effective based on notice to the Department after the Department conducts an initial review to identify clearly inadequate notices. While the notice procedure accommodates the need for businesses to make decisions to address the food-related risks, such as spoilage and contamination, that packaging for food and agricultural goods may present, a process for avoiding unjustified exclusions is also necessary, and such a process must avoid unreasonably burdening businesses' ability to minimize those risks. Therefore, this subsection establishes a process on timelines that avoid unreasonable disruption of business, allowing 60 days for the entity to provide information to the Department and a 180-day grace period before negative determinations by the Department take effect. This process enables entities to have clear, uniform expectations for how the Department's compliance determinations will affect them and reasonable opportunity to plan accordingly.

This subsection also explains that, when the Department deems a notice and any additional information inadequate to sustain the exclusion, notice will be provided to the relevant entity via email and the database will be updated to reflect the change in status of the notice. These provisions are necessary to ensure that the database fulfills its purpose, as described in subsection (a)(2)(D).

Subsection (a)(2)(F)

The purpose of this subsection is to address the possibility of exploitation of the process outlined in the preceding provisions to achieve a perpetual, unjustified exclusion. This subsection provides that, once the Department determines that certain packaging does not qualify for the exclusion, any notices submitted concerning similar packaging will not automatically render the packaging excluded. Instead, such packaging will only be excluded if the Department makes an affirmative determination that the notice establishes that the packaging qualifies for the exclusion. This is necessary because, without such a limitation, notices deemed insufficient pursuant to (a)(2)(E) and notices similar to them could be repeatedly submitted, each time resulting in the exclusion applying until completion of the lengthy process for deeming the notice inadequate.

Subsection (a)(2)(G)

The purpose of this section is to make clear that the same protections for trade secrets applicable under other provisions of these regulations apply to the process outlined in (a)(2) and its constituent parts. This added clarity is necessary because that process is distinct from other processes set forth in the regulations (e.g., for exemptions) and might otherwise be perceived as not incorporating the general trade secret protections set forth elsewhere in the regulations.

SECTION 18980.2.5. Covered Material Category List Updates

Subsection (g): Updated and corrected purpose of this subsection

The purpose of this subsection is to clarify that, notwithstanding any other provisions, updates to the Covered Material Category (CMC) list that impose additional obligations on local jurisdictions or recycling service providers under section 42060.5(a) of the PRC will not go into effect for those entities under that section until one year after the CMC list effectively incorporates the change. This provision is responsive to public comment. Local jurisdictions and recycling service providers cannot instantaneously modify their programs and instead need a certain amount of time to adjust. Where there is no effective date later than the publication date, one year of adjustment is appropriate. A period of longer than one year would delay the positive results expected from the change and would often exceed the period local jurisdictions reasonably require for updating their recycling programs, while a shorter period might be impracticable for a local jurisdiction or recycling service provider. This subsection also explains that the publication date starts the one-year period, regardless of whether the published list states an effective date later than the publication date. This is necessary to preserve the intended effect of the regulation and the statute and to avoid ambiguity concerning the procedure to be followed.

ARTICLE 3. Evaluations for Covered Material Categories

SECTION 18980.3.1. Recyclability of Certain Covered Material Categories Identified by the Department

Subsection (c)

The purpose of this subsection is to establish the second step in the process for identifying materials that might qualify for the exemption at issue. Requiring solicitation of public comments and evidence relevant to that identification is necessary for the implementation of section 42061(a)(3)(B) of the PRC because that section requires CalRecycle to make a complex determination for which it might otherwise lack sufficient information and evidence. Limiting the comment period to 30 days is necessary because it is a reasonable period for comment preparation and ensures that CalRecycle can make determinations pursuant to section 42061(a)(3)(B) without more delay than justified by the benefit of public involvement.

SECTION 18980.3.3. Eligibility to be Labeled Compostable

Subsection (b)(1): Updated and corrected purpose of this subsection

The purpose of this subsection is to identify section 42357(g)(1)(B) of the PRC as setting a categorical requirement to be applied to a covered material category as a whole. That requirement is that material must be an allowable input under the United States Department of Agriculture National Organic Program to be considered compostable for labeling purposes. In the context of the Act, this can be applied on a categorical basis by identifying covered material categories that contain any such materials. This is the only logical way to interpret section 42357(g)(1)(B) for purposes of the “eligible for being labeled ‘compostable’” requirement in section 42050(b).

ARTICLE 4: Responsible End Markets

SECTION 18980.4. Responsible End Market Criteria

Subsection (a)(4): Updated and corrected purpose of this subsection

The purpose of this subsection is to introduce the fourth set of criteria for evaluating whether an entity is a responsible end market. This subsection provides that, to be a responsible end market, an entity must achieve the applicable outcome established in subsection (a)(4)(A), (a)(4)(B), or (a)(4)(C). These outcomes, which include average recycling yields for recyclable covered material (subsection (a)(4)(A)), full biological decomposition of compostable covered material comprised of plastic (subsection (a)(4)(B)), and biological decomposition of compostable covered material comprised of fiber or paper or wholly derived from natural resources (subsection (a)(4)(C)), are necessary to ensure that responsible end markets conduct the recycling and recovery of materials and the disposal of contaminants in a way that benefits the environment and minimizes risks to public health and worker health and safety, consistent with section 42041(ad) of the PRC. This subsection is necessary to ensure responsible end markets minimize the loss of covered materials and maximize the reintroduction of recovered materials into the supply chain, and to ensure materials are managed in a way that is consistent with the waste hierarchy established in section 40051 of the PRC, as required by the Act.

Subsection (a)(4)(B): Updated and corrected purpose of this subsection

The purpose of this subsection is to establish responsible end market requirements with respect to the generation of recycled organic products from covered materials comprising plastic. It provides that, to be a responsible end market for such covered materials, an end market must meet two primary requirements: The plastic covered material must fully biologically decompose, and the recycled organic product must meet standards necessary for sale in the marketplace.

The first requirement (full biological decomposition) is necessary because plastic substances, by themselves, cannot be “recycled organic product” (as defined in section 18980.1(a)(20)). Therefore, an end market cannot logically be said to produce recycled organic product in the first place if that product contains undecomposed plastic. Moreover, substances that otherwise would be recycled organic products but contain particles of undecomposed plastic would necessarily introduce plastic particles into the environment. Pursuant to the requirement of section 42041(aa)(5) of the PRC (requiring regulations to “encourage recycling that minimizes . . . environmental impacts . . . and public health impacts”) and the Legislature’s acknowledgment that plastic in the environment presents health and environmental impacts that must be mitigated (e.g., sections 42040(b) and 42064 of the PRC), facilities can only be responsible end markets (i.e., ones that conduct “recycling”) if their output product does not release such particles into the environment. Relatedly, considering an end market that produces plastic-containing compost to be a “responsible end market” would contravene the

definition of that term in section 42041(ad), which requires that responsible end markets recycle and recover materials "in a way that benefits the environment and minimizes risks to public health." It also authorizes regulations, such as this one, that "establish criteria regarding benefits to the environment."

This subsection includes an explanation of what "full biological decomposition" means. This is necessary because that phrase is technical in nature and might not otherwise be universally and consistently understood. The explanation establishes that the phrase refers to the processes and scientific principles commonly understood to underlie the conversion of materials into compost.

However, this subsection limits the biological decomposition requirement to materials intentionally included in the generation of recycled organic products. This is necessary because unintentionally included materials necessarily were not intended to biologically decompose in the first place. Because those cannot be processed by the facility, they fall within the definition of "incompatible materials" and logically must be treated as such (a requirement addressed in subsection (a)(3)). This requirement is necessary to ensure that end markets can only be considered "responsible end markets" if, as required by the definition of that term in section 42041(ad) of the PRC, its "disposal of contaminants is conducted in a way that benefits the environment and minimizes risks to public health" and satisfies the established criteria "regarding benefits to the environment."

The second requirement (meeting the standards necessary for sale in the marketplace) ensures that composting is understood to be subject to the requirements for any process to be considered "recycling," as section 42041(aa)(1) of the PRC defines that term. In particular, recycling must generate material "that meet[s] the quality standards necessary to be used in the marketplace." The added clarity from expressly incorporating that part of the "recycling" definition is necessary because laypersons often understand "composting" to be distinct from "recycling," but the Act expressly considers "compost" to be the result of "recycling," as defined in 42041(aa)(1). Accordingly, for an end market producing compost to be considered a responsible end market (i.e., one that conducts "recycling"), its compost necessarily must be of such quality that it can be sold in the marketplace.

ARTICLE 6: Requirements for the Producer Responsibility Organization

SECTION 18980.6.1. Producer Responsibility Plan Submission

Subsection (a)

The purpose of this subsection is to specify the date by which an approved PRO must prepare and submit a plan to the advisory board unless it chooses to submit its plan according to the timeline described in subsection (b). This subsection provides that a PRO must submit such a plan to the advisory board by April 1, 2026, or the date that the proposed regulations are filed with the Secretary of State, whichever is later. This

subsection is necessary because, while section 42051.2 of the PRC describes the process and timeline for the various stages of review as part of the PRO's plan submittal, it does not specify the date by which the PRO must initiate this process by submitting its plan to the advisory board. A submittal date of April 1, 2026, or the filing date (if later) is different than the timeline described in subsection (b) because, under section 42051 of the PRC, producers must be participating in an approved plan by January 1, 2027. The earlier submittal date is necessary to allow sufficient time for the advisory board and CalRecycle to review, respond, and for the PRO to make necessary revisions to the plan to be approved by CalRecycle by January 1, 2027. A submission date of April 1, 2026, to the advisory board will allow 60 calendar days for the advisory board to review and comment, 120 calendar days for the PRO to revise its plan in response to the advisory board's comments, and 90 calendar days for CalRecycle to review and respond, consistent with the timeline set forth in section 42051.2 of the PRC. The conditional alternative date (the filing date of the proposed regulations) is necessary as a practical and legal matter because no requirements can be imposed until the regulations are finalized and effective. A date later than that alternative date, while it would serve the timing concerns otherwise addressed by this subsection, also would be inappropriate because it would risk delaying implementation to a degree that would unreasonably risk undermining statutory deadlines.

Subsection (b)

The purpose of this subsection is to establish an optional, alternate timeline to the one described in subsection (a) for the submission of its producer responsibility plan to the advisory board. This subsection allows an approved PRO to submit its producer responsibility plan to the advisory board after the date established in subsection (a) but on or before June 15, 2026, subject to the conditions described in subsections (b)(1) and (b)(2). This subsection is necessary to accommodate the possibility that an approved PRO may need additional time and opportunity following the registration and application of participant producers (pursuant to sections 18980.5(a) and (b) of these regulations) to receive, organize, and analyze relevant participant producer data and to incorporate such data into its proposed plan prior to submittal. This subsection accommodates such challenges by adding limited flexibility to the plan submission timeline.

Subsection (d)

The purpose of this subsection is to specify that a PRO must make its producer responsibility plan publicly available for comment on its website upon submitting the plan to the advisory board. Section 42051.2(a) of the PRC expressly contemplates an opportunity for public comment but does not specify how the public must be made aware of the contents of the plan. The Legislature could not have reasonably intended for there to be a public comment period without any obligation by the PRO to make the plan publicly available. That obligation must reasonably apply to the PRO, not the Department, because section 42051.2(a) expressly requires completion of the comment

process before the PRO submits the plan to the Department. Requiring the publication to be available via the PRO's website is necessary because it comports with the standard means for effective, efficient disclosures by any entity and ensures widespread access. Such publication ensures that the PRO consistently and reliably provides the public with reasonable opportunity to review the contents of any proposed plan. Also, section 42051.2(c) acknowledges that publication of plans on the PRO's website is the appropriate means to give notice to the public.

Consistent with the requirement that the PRO consider public comments, this subsection also establishes that the PRO's obligation under section 42051.2(b)(1), requiring consideration of comments submitted up to 60 days after the PRO publishes its plan, applies to all comments, not just those from the advisory board. Section 42051.2(a) is silent with respect to the period for public comments, creating an ambiguity that the proposed regulation must address. Interpreting the statute to require submission of public comments within the same period afforded to the advisory board is reasonable and was the Legislature's most likely intent. Section 42051.2(b)(1) unambiguously provides that the PRO's obligation to submit the plan to the Department depends on the time the advisory board takes to submit its comments, with the plan due within 120 days after those comments are submitted. This subsection ensures that the PRO cannot proceed within that timeline in a manner that subverts the Legislature's clear intent to permit meaningful opportunity for interested members of the public to submit comments, and requiring the PRO to permit a 60-day period for the advisory board to submit comments indicates that such a period is reasonable for comments generally.

Additionally, CalRecycle received feedback from interested parties during the informal rulemaking process in March 2023 and July 2023 concerning the PRO and producer responsibility plan requirements. Interested parties sought opportunities for public input regarding plans, including plan development, updates, and amendments. This provision is responsive to that feedback.

SECTION 18980.6.3. Review of Updated Producer Responsibility Plan

Subsection (b)

The purpose of this subsection is to establish the endpoint of the comment period for the PRO's proposed updated plan. This is necessary because the Act expressly establishes a timeline for the advisory board's consideration of an initial proposed plan (60 days, pursuant to sections 42051.2(a) and 42070(h) of the PRC) but does not explicitly address a timeframe for comments by the advisory board or the public for proposed plan updates.

This provision clarifies that the comment period set forth in sections 42051.2(a) and 42070(h) of the PRC applies to proposed updated plans just as it applies to initial proposed plans. Because the effect of an updated plan is identical to that of an initial plan—it generally governs the PRO's program and is effective for five-years—it is

reasonable to subject it to the same requirements for public transparency and input as applicable to initial plans.

Another purpose of this subsection is to specify that the PRO must make the proposed updated plan available for public comment by publishing it to its website when it submits the plan to the advisory board. This subsection also clarifies that the PRO must consider all comments (including those from the public, not just those from the advisory board) submitted to it within 60 days of such publication. These two requirements are the same as those established in section 18980.6.1(d) with respect to initial plans, as described above. The purpose and necessity of these requirements are the same as the purpose and necessity set forth above with respect to section 18980.6.1(d).

SECTION 18980.7. Independent Producer Plan Submission

Subsection (b)

The purpose and necessity of this subsection is the same as the purpose and necessity of section 18980.6.1(d), except with respect to initial submissions of Independent Producers' producer responsibility plans. When an Independent Producer opts to implement its own plan, such plan must meet the same requirements as do PRO plans, subject to section 18980.8(b) of these proposed regulations. Accordingly, the rationale explained above for section 18980.6.1(d), which concerns PRO plans, applies equally to Independent Producers.

SECTION 18980.7.2. Review of Updated Independent Producer Plan

Subsection (b)

The purpose and necessity of this subsection is the same as the purpose and necessity of section 18980.6.3(b), except with respect to Independent Producers' updated producer responsibility plans. When an Independent Producer opts to implement its own plan, such plan must meet the same requirements as do PRO plans, subject to section 18980.8(b) of these proposed regulations. Accordingly, the rationale explained above for section 18980.6.3(b), which concerns PRO plans, applies equally to Independent Producers.

ARTICLE 8: Producer Responsibility Plan Requirements

SECTION 18980.8.2. Closure and Transfer Plan Requirements

Subsection (b)(7)

The purpose of this subsection is to specify that the PRO must submit to CalRecycle a written electronic notice of intent to dissolve or terminate its plan no fewer than 180 days prior to the proposed dissolution or plan termination date, and introduce a list of information that must be included in the notice.

In order to ensure that the PRO is proposing dissolution or termination and to ensure that all parties clearly understand the proposed date, it is necessary for a PRO to notify

CalRecycle in writing to establish a record of the date of submission of the notice. If verbal notice were permitted, CalRecycle might misunderstand the nature of the request and initiate the process where no termination was requested or fail to initiate the process where a termination was requested. Specifying submission via email is necessary because it facilitates near instantaneous transmittal to CalRecycle, thereby supporting the PRO in meeting submission timelines, enabling effective document retention by CalRecycle, allowing for the appropriate CalRecycle personnel to easily access the submission for review, and minimizing the cost and time burden associated with mailing.

Additionally, the notice must be at least 180 days prior to the PRO dissolving or terminating to allow the PRO, CalRecycle, and the trustee or agent sufficient time to prepare for the execution of the Closure and Transfer Plan, and to ensure the PRO fulfills its outstanding obligations. Allowing a PRO to submit a notice more than 180 days before dissolving or terminating its plan ensures that a PRO is not forced to satisfy all outstanding obligations in an unrealistic timeline. Requiring the notice at least 180 days prior to PRO dissolution or plan termination provides all parties sufficient time to prepare for the Closure and Transfer Plan execution maximizing the likelihood of effective implementation. Without a provision explaining how the PRO will inform CalRecycle of its intended termination or dissolution, the effective date of the Closure and Transfer Plan would not be ascertainable. Moreover, this provision fulfills, in part, section 42051.1(f) of the PRC requirement to describe a process for notifying CalRecycle of the PRO's dissolution.

ARTICLE 10: Registration and Data Reporting Requirements

SECTION 18980.10. Registration and Maintaining Address on File

Subsection (a)

The purpose of this subsection is to establish and clarify the registration obligations of producers. This subsection provides that each producer, including those seeking an exemption under sections 18980.2.3, 18980.2.4, or 18980.5.2 of the regulations, must register electronically through the Department's online reporting system. This is necessary to implement section 42060(a)(2) of the PRC, which requires CalRecycle to establish a mandatory process for producers to register with CalRecycle, and to ensure that CalRecycle receives information necessary to implement and enforce the Act. To effectively oversee, implement, and enforce the Act, CalRecycle must have complete and accurate information on file for all producers that are subject to the Act, including those that request an exemption. Furthermore, electronic registration via a single, uniform system is necessary for CalRecycle to efficiently receive, maintain, and organize the registration submission.

Another purpose of this subsection is to specify the registration obligation of retailers and wholesalers. This subsection provides that retailers and wholesalers are not subject to this requirement if they are not the producer pursuant to section 42041(w) of the PRC

of any covered material used by goods they sell, offer to sell, or distribute. While section 42060(a)(2) of the PRC requires CalRecycle to establish a mandatory process for retailers and wholesalers to register with the Department, the relevant statutory provisions only govern the conduct of retailers and wholesalers that are producers of covered material used by goods they sell, offer for sale, or distribute. CalRecycle does not have any use or need for registration information pertaining to retailers or wholesalers that are not producers under the Act. This subsection is therefore necessary to interpret an ambiguous statutory provision and to avoid the unnecessary expense and burden of requiring all retailers and wholesalers in the state to register with CalRecycle.

SECTION 18980.10.1. Data Reporting Submission

Subsections (c) and (c)(1) through (c)(3)

The purpose of these subsections is to establish the required process, timeline, and contents for the submission of reports under section 42052(a) of the PRC. The subsections provide that data reports must be submitted electronically using CalRecycle's online reporting system and are due annually on July 1, except for the PRO's initial report, which must be submitted with its producer responsibility plan as required under 18980.6.1(a) or (b). The subsections further provide that a report's data must pertain to the previous calendar year and must use the CMC list that was current as of January 1 of the previous calendar year.

These subsections are necessary to establish a clear and uniform process that all reporting entities will be able to understand and follow. An electronic application process is necessary for CalRecycle to efficiently receive, evaluate, organize, and maintain the reported data, ensuring it receives reports in a manner that will best enable it to implement and enforce the Act. Requiring reporting via a single, uniform system is necessary for CalRecycle to efficiently receive, maintain, and utilize the information submitted to it. July 1 was chosen as the due date in response to public comments submitted to CalRecycle during the rulemaking process because it provides reporting entities with sufficient time to compile data from the previous calendar year and to prepare a report in compliance with this section, while still ensuring that CalRecycle will receive the data reports regarding the previous calendar year without unreasonable delay. It is necessary to specify that reports shall use data pertaining to the previous calendar year because that is the most recent, complete, and accurate data that will be available. Finally, it is necessary to rely on the CMC list that was current as of January 1 of the previous calendar year because the reporting entity is required to report data for the entire year, and the list that was current as of January 1 is the list on which a reporting entity will have based its decisions at the outset of the calendar year.

However, because the PRO must submit its plan either by April 1, 2026, pursuant to 18980.6.1(a) or by some later date (but no later than June 15, 2026) pursuant to 18980.6.1(b), this subsection ties the due date for the PRO's initial report to the date of

the plan submission. This is necessary to ensure that the initial plan is accompanied by the critical information identified in section 42051.3(a) of the PRC. That information logically must relate to the plan itself, so it is reasonable and logical to require that the initial report be submitted with the plan.

The purpose of this section is to address how reporting entities submit data reports to the Department. The revisions prescribe that reports be submitted to the Department through its online reporting system. Requiring reporting via a single, uniform system is necessary for CalRecycle to efficiently receive, maintain, and utilize the information submitted to it.

VARIOUS PROVISIONS: 18980.2.3(b) and (g)(1); 18980.2.4(c) and (h)(1); 18980.2.5(f)(2); 18980.2.6(b); 18980.5.1(a); 18980.5.2(a); 18980.6.6(a)(1); 18980.7.5(a)(1); 18980.9(a); 18980.11.1(c) and (h)(2)(C); 18981(c)

For each of the provisions identified above, the purpose and necessity are the same as stated in the Initial Statement of Reasons, except the identified provisions also explain that documents or information must be submitted to the Department by email unless there is an online submission portal available. This limitation is necessary to set reasonable expectations regarding how interested parties must communicate with the Department and ensure the Department can efficiently, reliably receive and review submissions.

NONSUBSTANTIAL CHANGES MADE TO THE REGULATION TEXT

CalRecycle made nonsubstantial changes to the regulation text for spelling, grammar, formatting, punctuation, cross-citations, and dates.

LOCAL MANDATE DETERMINATION

CalRecycle has made the following determinations:

Mandate Imposed on Local Agencies: Yes

Costs to any local agency which requires reimbursement in accordance with Part 7 of Division 4 of Title 2 of the Government Code: None

The statute mandates that local jurisdictions and recycling service providers (local agencies) include certain materials in their collection and recycling programs. Fulfilling that mandate involves collaboration with the producer responsibility organization (PRO) and certain producers to undertake various activities, such as education and outreach, material collection and processing, infrastructure improvement, and related investments. Local agencies' costs for fulfilling their mandate are influenced by local circumstances, including population density and market proximity. While certain costs may be initially borne by local agencies, they are not reimbursable by the State because, under the Act and the proposed regulations, the PRO and certain producers must pay local agencies to cover the expenses they incur to meet their statutory obligations.

Mandate Imposed on School Districts: None

REASONABLE ALTERNATIVES TO THE REGULATIONS AND CALRECYCLE'S REASON FOR REJECTING THOSE ALTERNATIVES

CalRecycle has evaluated two alternative scenarios: a lower cost scenario that results in fewer benefits than the proposed regulations, and a higher cost scenario that results in similar benefits to the proposed regulations. Set forth below are the reasonable alternatives considered and the reasons the alternatives were rejected. For a more detailed discussion of the alternatives, refer to the Alternatives section of the SRIA.

ALTERNATIVE 1

Alternative: Less stringent classification of plastic covered materials. Covered materials that are made of paper and plastic would be allowed to contain up to 20 percent plastic while still being classified as a paper covered material, thus not subjecting them to the source reduction and recycling rate requirements. Alternative 1 would result in direct costs of $20.5 billion, approximately $516 million lower than the proposed regulations.

Alternative 1 would result in 1,138 tons fewer material being categorized as plastic covered material and 62,000 fewer metric tons of CO2 equivalent greenhouse gas reductions than the proposed regulations would.

Some businesses that are not producers will be impacted by the Act through an increase in the cost of goods and materials. Alternative 1 would lessen the average annual cost for businesses that are not producers from $4,806 to $4,688. Regardless, implementation costs associated with the Act are expected to be absorbed by large producers of covered material, with a projected pass-through of costs to other businesses not classified as large or small producers of covered material.

Reason for Rejecting: Alternative 1 was rejected because it would not reduce the amount of covered material with small amounts of plastic, which contribute to the environmental and human health impacts that the Act was intended to address.

ALTERNATIVE 2

Alternative: Higher frequency of required producer reporting. Producers would be required to report their activities to the PRO quarterly as opposed to the annual reporting requirement per the proposed regulations. Alternative 2 would result in direct costs of $21.2 billion, approximately $218 million more than the proposed regulations.

Alternative 2 would not result in increased benefits over the proposed regulations, as the only change to direct cost would be for producer reporting rather than infrastructure or meeting the program requirements.

Reason for Rejecting: Alternative 2 was rejected because it is more costly and would not result in an increase in benefits compared to the proposed regulations.

CONSIDERATION OF ALTERNATIVES

For the reasons set forth in the ISOR, NOPA (including the statement of benefits prepared pursuant to Government Code section 11346.5(a)(3)(C)), SRIA, in CalRecycle's summary and response to public comments, and in this FSOR, CalRecycle has determined that no alternative considered by CalRecycle would be more effective in carrying out the purpose for which the regulatory action was proposed, would be as effective and less burdensome to affected private persons than the adopted regulation, or would be more cost effective to affected private persons and equally effective in implementing the statutory policy or other provision of law than the action taken by CalRecycle.

STATEMENT REGARDING SMALL BUSINESS ALTERNATIVES

CalRecycle has determined that the proposed regulations will affect small businesses. CalRecycle has estimated that 58% of businesses impacted by the proposed regulations are considered small businesses. Small businesses that meet the definition of producer pursuant to section 42041(w) of the PRC, may be considered small producers, wholesalers, or retailers by the Act if in the most recent calendar year they had gross sales of less than one million dollars ($1,000,000) in the state. The Act authorizes CalRecycle to develop a process to exempt these entities from most requirements of the Act. Producers of covered material granted an exemption will be considered "small producers," will be exempt from the requirements of the Act other than the restrictions in section 42050(b) of the PRC, and will incur an annual cost of approximately $155 for record keeping and preparation of exemption applications.[1] Small businesses that meet the definition of producer per section 42041(w) of the PRC but are denied an exemption based on a determination by CalRecycle will need to join an approved PRO or satisfy their legal obligations independently.

CalRecycle expects small businesses to benefit from increased revenue from the sale of products made from recycled material. Additionally, less effort will be needed to review recyclability claims of packaging, and there will be an increased ease of providing product packaging to fit consumer demand. There will also be a reduction in the cost of disposal services as more recyclable material is generated. However, the reduction in disposal costs may shift to recycling services as materials shift to recycling and composting collection streams.

[1] The updated forecasts incorporated into the Direct Impacts Model (see response to DOF Comment #3) do not change this number.

No alternatives were considered by CalRecycle nor otherwise identified and brought to CalRecycle's attention that would lessen any adverse economic impact on small business, pursuant to Government Code section 11346.9(a)(5).

INCORPORATION BY REFERENCE

The Notice of Proposed Action listed the below documents as incorporated by reference, and they remain incorporated by reference.

- ISO/IEC 17025:2017(E), "General requirements for the competence of testing and calibration laboratories," International Organization for Standardization/ International Electrotechnical Commission, November 2017
- ISO/IEC 17065:2012(E), "Conformity assessment—Requirements for bodies certifying products, processes and services," International Organization for standardization/International Electrotechnical Commission, September 2012.
- State Administrative Manual, section 9213.1, Allocation of Costs—Indirect Cost Rate Determination Methodology, California Department of General Services (as published on 01/2022).
- ISO 59014: 2024(en), "Environmental management and circular economy — Sustainability and traceability of the recovery of secondary materials — Principles, requirements and guidance," International Organization for Standardization, October 2024.

The publication of these incorporated documents in full in the California Code of Regulations would be cumbersome, unduly expensive, or otherwise impractical because they are available online or for purchase, as specified in the Notice of Proposed Action, dated August 22, 2025, and in print would be approximately 112 pages of text in total.

SUMMARY AND RESPONSE TO COMMENTS RECEIVED DURING THE 45-DAY AND 15-DAY COMMENT PERIODS

Summary of Comments Received

Written comments were received by CalRecycle during the 45-day comment period which began on August 22, 2025, and ended on October 7, 2025, 2025. Written and oral comments were additionally received at a public hearing on October 7, 2025. Written comments were also received by CalRecycle during a subsequent 15-day comment period, which began on January 29, 2026, and ended on February 13, 2026.

The comments received during the 45-day comment period and public hearing are displayed on the attached SB 54 Rulemaking 45-day Comment Matrix, which shows the corresponding comment code, the commenter's name, and CalRecycle's response to the comment. Please refer to the SB 54 Rulemaking Comment Matrix for the list of 1,224 total comments received during the 45-day comment period and public hearing. The SB 54 Rulemaking 45-Day Comment Matrix is included in the final rulemaking file and is incorporated by reference.

Please note that comment submission codes I-55, I-56, and I-57 were deleted from the SB 54 Rulemaking Comment Matrix as those comments were submitted to CalRecycle's comment portal to verify technical functionality, and thus were not comments on the proposed regulations. Additionally, comment submission code O-69 was withdrawn by the submitter. With the exception of these removed comment submission codes, all of the codes designating comments in the SB 54 Rulemaking Comment Matrix are in sequential order, and all comments on the proposed regulations have been considered and responded to by CalRecycle.

The comments received during the 15-day comment period are displayed on the attached SB 54 Rulemaking 15-day Comment Matrix, which shows the corresponding comment code, the commenter's name, and CalRecycle's response to the comment. Please refer to the SB 54 Rulemaking 15-Day Comment Matrix for the list of 382 total comments received during the 15-day comment period. The SB 54 Rulemaking 15-Day Comment Matrix is included in the final rulemaking file and is incorporated by reference.

Because comments are designated using sequential codes for comments submitted within each comment period, certain codes for comments submitted during one period are reused for comments submitted during other periods. Unless otherwise indicated, when a comment response cross-references other comments, the cross reference is to comments submitted during the same comment period as the comment being responded to.

CalRecycle's Response to Comments Received

CalRecycle would like to express its appreciation to the numerous organizations, agencies, and individuals that participated in the 45-day comment period and public hearing, as well as the subsequent 15-day comment period. Following the 15-day comment period, CalRecycle concluded that no additional substantial amendments to the regulatory language were necessary in response to comments received. All comments are responded to in both the SB 54 45-Day Rulemaking Comment Matrix and the SB 54 15-Day Rulemaking Comment Matrix.

SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act Regulations: 45-Day Comment Matrix

To enhance efficiency, CalRecycle, in collaboration with the Office of Data and Innovation, utilized a model to organize public comments submitted in the SB 54 rulemaking. This approach enabled staff to process and aggregate twelve hundred unique comments, ensuring that stakeholder input was addressed by staff thoroughly and in a timely manner. All public comments were reviewed by CalRecycle staff and all responses to public comments were developed by CalRecycle staff.

I-1: Anonymous

Comment I-1-1

Hi, this law is very important. Do not let others decide that your health can affected for a dollar $. Recycling and composting, removing waste from landfills and the ground is the most important issue CA faces today.

> **Response to I-1-1**
>
> Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

I-2: Manvir Singh

Comment I-2-1

I’m writing as the owner of a small gas station and convenience store here in northern California to share my concerns about SB 54, the Plastic Pollution Prevention and Packaging Producer Responsibility Act.

While I understand and support the goal of reducing waste and improving our environment and saving it for the future generations, the way this law is structured will put an extra burden on small businesses like mine. We already operate on thin margins, and this adds more compliance costs, reporting requirements, and packaging changes that we simply don’t have the same resources to absorb as large corporations do.

On top of the financial stress, we’ll be the ones directly dealing with customer confusion and frustration as packaging changes roll out. For example, if familiar cups, lids, or containers disappear or change in quality, customers are going to have questions and complaints—and our staff will be the ones caught in the middle. That can hurt sales, slow down service, and create a stressful environment for employees.

My concern is that the law, as it stands, will disproportionately affect small businesses and their workers while larger companies can more easily shift costs or hire staff to handle compliance. I believe there needs to be more consideration for how SB 54 is implemented so that its environmental goals are met without putting local businesses like mine at risk.

I appreciate your time in reading this and hope you'll take into account the very real challenges this creates for small business owners, our employees, and the communities we serve.

Thank You
Manvir Singh

Response to I-2-1

Comment rejected. This comment raises objections to the statute itself, not to any particular portion of the regulations, which cannot lawfully change how the statute is "structured" or eliminate its compliance costs, producers' reporting requirements, or statutory packaging restrictions. Although the comment also refers to "how SB 54 is implemented," it does so only in the general sense, without identifying any particular elements of the regulations or how they might be changed to address the commenter's concerns.

I-3: Jonathan Levy

Comment I-3-1

Dear Ms. Richmond,

PakTech would like to thank CalRecycle for giving us an opportunity to share our thoughts related to the *SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act Regulations August 2025 Draft (Draft Regulations)*. We congratulate CalRecycle for its work developing these regulations and the countless hours of stakeholder input and feedback it solicited that led to the release of the Draft Regulations. With that in mind, we hope our comments are received in the spirit they were written as we are interested in seeking clarity with some sections while also helping to improve the final draft.

Paktech is a manufacturer of HDPE plastic handles that utilize recycled resin as a feedstock. With facilities located in Eugene, Oregon, PakTech's products are made from post-consumer recycled HDPE resin ("rHDPE") sourced from curbside collection programs. Using rHDPE feedstock is part of our commitment to sustainability and ensuring this material remains in the circular economy. You may be familiar with PakTech's carrier handles as they can be found in
"big box" stores located throughout the state and anywhere beer and wine may be sold. As mentioned earlier, PakTech's handles utilize rHDPE as its feedstock and to date (January to August 2025) we have provided the demand to ensure that over 5.8 million milk jugs have been recycled and turned into recycled resin for our products shipped to California by our customers. In terms of weight, that is 777,000 lbs. of recycled resin. Nationwide, during the same time frame, we have ensured that over 65 million milk jugs have been recycled, which is the equivalent of over 8 million lbs. of recycled HDPE resin being consumed. While our company may be small in size, our consumer footprint is considerable. As such, we are experts when it comes to discussing issues related to

recycling programs, the cycles of supply and demand, and having a broad view of how the plastic recycling industry works. The demand we (and other manufacturers) create for rHDPE is the engine that drives the entire plastic recycling industry.

As is the case with many stakeholders, this is not the first time we have shared our opinion on the impact these regulations will have not only on our business, but on our customers and the recycling industry as well. Unfortunately, from our point of view we do not see anything materially different from the regulations that were released in May of 2025, or those that were released in 2024, and our objections to certain provisions still remain the same. We believe that without significant revision, these regulations specifically, as well as the underlying statute generally will materially harm plastic recycling. We believe that without such revisions, the key goal to reduce plastic litter and increase plastic recycling will not be achieved. With that in mind, we once again submit our comments on several aspects of these regulations
and hope CalRecycle consider our suggestions.

Response to I-3-1

Comment Rejected. No substantive response to this portion of the commenter's submission is necessary because it only references the commenter's recommendations; it doesn't set those recommendations forth. To the extent the issues raised require responses, CalRecycle has addressed them in response to other portions of the submission discussing the issues in detail.

Comment I-3-2

DISCUSSION:

1. Definitions

1.1. Definition of “Component”

Through several rounds of comment periods we have remained steadfast in our contention that the Draft Regulations do not go far enough in ensuring that manufacturers of component parts are not identified as producers. **We submit again for your consideration our suggested language for amending the definition of “component”** that declares manufacturers of component parts are not considered Producers (included in *underlined italic* text)

“Component,” with respect to covered material, means a covered material item that has no physically distinct subparts, or a piece or subpart of a covered material item, if the piece or subpart is distinct with respect to its composition or function or is otherwise physically distinct from other pieces or subparts. “Item” is defined in paragraph (12). Manufacturers of “component” parts are not considered producers and responsibility for such items are the responsibility of the producer of the packaging in which the component part is affixed.

Component parts are by their nature a business-to-business item and only serve their purpose once affixed to a primary package. Due to the transactional nature between the Brand Owner and component manufacturer, the Brand Owner should have the ability to

report on the number and types of components it purchases. It is this transactional nature that clearly assigns responsibility to the Brand Owner and in these cases should be considered the producer for these items. From a reporting perspective, CalRecycle or the Producer Responsibility Organization (“PRO”) can go to the Brand Owner for this information. This reporting information can then be used to ensure the producer of the primary package and the components to which it was affixed are dealt with accordingly.

As stated earlier, manufacturers of components are typically engaged in business-to-business transactions and provide those items based on the direction from the primary packaging manufacturer. Once a component is affixed to the primary package, the component manufacturer has no control over how the component will be used and as such, responsibility should rest with the primary packaging manufacturer or brand owner.

It is our continued contention that once the extended producer responsibility law goes into full effect, the status of who is and who is not a producer will be hotly debated. We believe that CalRecycle can alleviate much debate by accepting our suggestion and amending the definition of component.

Response to I-3-2

Comment rejected. The proposed definition of "Component" is unnecessary because it would not change the effect of the regulations. Materials are only "packaging" when they are used with a good, and any material that is not "packaging" (or food service ware) is not covered material and has no producer. Moreover, which person manufactured packaging is irrelevant to identifying the packaging's producer: PRC section 42041(w)(1) concerns the manufacturer of the good that is packaged, not the manufacturer of packaging itself. For the same reasons, the commenter's concern over the definition of "item" is unfounded and does not merit any revision.

Comment I-3-3

1.2. Definition of “Item”

As we read the latest draft, the definition of “Item” constitutes the entire physical package – this includes all components, labels and other “things” affixed to the primary package. The addition of this definition further supports our contention that once a component is affixed to the primary package, it loses its distinctiveness and becomes part of the primary package. **As such, the producer of the primary package should bear responsibility for all of the components affixed to that package**. We ask that CalRecycle accept our suggestion above and amend the definition of “component” to clearly identify the primary packaging manufacturer or Brand Owner as the producer of all components affixed to a primary package.

Response to I-3-3

Comment rejected. In this comment, the commenter points to the definition of "item" as additional support for the request the commenter made in comment I-3-2 concerning the definition of "component." However, the definition of "item" does not support that request. Section 18980.1(a)(12) clearly explains how the proposed regulation uses the term "item." That term is used where the regulations concern physical embodiments of covered material, packaging, or food service ware. In other words, the term signals that the text is not referring to things in the abstract or referring to an amount of a material. Section 18980.1(a)(12) further explains that "item" encompasses all components that constitute a group of detachable components. In other words, it enables more concise phrasing than "a group of detachable components." Nothing in the definition suggests, as the commenter claims, that the term always encompasses "all components, labels, and other 'things' affixed to the primary package." CalRecycle therefore maintains its rejection of the commenter's suggested change for the reasons stated in response to comment I-3-2.

Comment I-3-4

2. Exclusion of Certain Types of Packaging
2.1.Disparity Between Material Types When Considering the de-minimis Exemption

In reviewing the Initial Statement of Reasons, the explanation for determining that “Independent Plastic Components” are ineligible for the *de minimis* exemption is given:

The purpose of this subsection is to incorporate the statutory limitation on when components can be considered to have de minimis weight or volume: They cannot be independent plastic components, as defined in subsection (b)(1)(B). This is necessary to give full effect to statute.1

Although the statute has a goal to reduce plastic pollution, another stated goal of the statute is to encourage plastic recycling. Recycling is a commodity driven business that relies on demand from producers that use post-consumer resins in their products. As mentioned earlier, PakTech’s handles utilize rHDPE as its feedstock and to date (January to August 2025) we have provided the demand to ensure that over 5.8 million milk jugs have been recycled and turned into recycled resin for our products shipped to California by our customers. In terms of weight, that is 777,000 lbs. of recycled resin. This demand driver fuels the entire recycling supply chain and without it, no matter how much money the PRO invests in infrastructure, or CalRecycle regulates, recycling won’t work. This definition harms plastic recycling and the entire recycling infrastructure because it depresses the demand manufacturers will have for using recycled plastic. Because **section 42041(s)(4) gives the Department the latitude to develop this definition as they determine, we suggest the Department take this opportunity to increase the use of post-consumer recycled content and encourage better design of such components.** By creating a definition which allows plastic components that incorporate post-consumer resins to be eligible for the *de minimis* exemption while

excluding those components made wholly from virgin resins, CalRecycle would be providing an incentive to manufacturers to consume more PCR and meet its goal of reducing the amount of virgin plastic being used. This is a prime opportunity for CalRecycle to use its authority in a constructive manner and rely on the expertise of those in the recycling industry that are driving plastic recycling forward. Therefore, we suggest the Department redefine “Independent Plastic Component” as follows (in *italic underlined* text):

“Independent Plastic Component” is a packaging component, or a group of components that wholly or partially comprises plastic and is not made from post-consumer recycled plastic and has characteristics that may prevent recyclability.

In addition to depressing demand for post-consumer resins, the current definition is patently unfair and provides benefits for applications made from materials other than plastic. An independent life cycle assessment2 has shown fiber-based packaging handles contribute more greenhouse gas emissions and have a larger carbon footprint when compared to our mono-material, fully recoverable and recyclable package handles. However as currently drafted, the regulations allow fiber-based detachable components to qualify for the de-minimis exemption, while similarly designed plastic components are excluded. We believe this creates a material disparity and may cause manufacturers to switch to less sustainable designs simply because it is not made from plastic.

We find this ironic because while this material disparity exists, CalRecycle will actually be encouraging the use of products that will greatly contribute to climate change. We don’t believe the Legislature intended to increase greenhouse gas emissions and make climate change worse when they drafted the law. Unfortunately, CalRecycle will be going against the Legislature’s intentions if it keeps the current definition in place by encouraging a far worse and much less sustainable packaging choice.

Response to I-3-4

Comment Rejected. Regarding the suggested definition of "Independent Plastic Component," that definition has no legal support. The phrase "as the determined by the department" in 42041(s)(4)(A) establishes CalRecycle's authority to decide whether elements are "independent plastic components," not the authority to define that phrase without regard to its plain meaning or the context in which it appears. The commenter's suggested definition gives no effect to the word "independent." Instead, it recapitulates the concept of material being "plastic" and adds criteria for post-consumer content and preventing recyclability. There is no legal basis for the post-consumer content criterion, and effects on recyclability are more appropriately addressed in the other requirements stated in paragraph (2) (see subparagraphs (B) through (D)).

Comment I-3-5

Conclusion

We thank CalRecycle for the opportunity to provide our feedback on the Draft Regulations and look forward to working with all stakeholders in this process to develop rules for the Plastic Pollution and Packaging Producer Responsibility Act that will ensure that the program works as the Legislature intended and consumer packaging is handled in the most responsible manner possible.

Response to I-3-5

Comment rejected. No response specific to the commenter's submission is necessary. This closing paragraph summarizes the commenter's recommendations, to which CalRecycle has responded separately (comments I-3-1 through I-3-5).

I-4: Kayla Cain

Comment I-4-1

Hello. I would like to know if there will be any attempts made to secure funding to assist in single-use replacements for operators of the National School Lunch Program. So far, compostable products have doubled my work's cost for consumables. Also, some of the compostable items are only able to compost on a large scale. Maybe there can be funding for reginal composting stations?

Response to I-4-1

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process. Moreover, while a producer responsibility organization's plan might provide for investments in composting operations, funding directly by CalRecycle is outside the scope of the statute.

I-5: Lisa Hart

Comment I-5-1

The weakening of SB 54 is unconscionable and not what was intended.

Response to I-5-1

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process. The comment provides no explanation of what "[t]he weakening of SB 54" refers to.

I-6: Juliet Burton

Comment I-6-1

Dear CalRecycle,
Please implement SB 54 as written. Plastic waste is overwhelming our communities, environment and health. Revising SB 54 increases the risks for chemical recycling or incineration – these are not solutions as this would only worsen these harms. California should lead by example and stand up for proper recycling solutions. Keep SB 54 as written to reduce harm and make the package producers accountable for the cost of recycling.
Best regards, Juliet Burton

Response to I-6-1

Comment rejected. The commenter requests that CalRecycle "[k]eep SB 54 as written." However, the regulations do not alter SB 54; rather, they interpret and implement the statute as written. In particular, the statute does not expressly forbid chemical recycling, so the regulations cannot lawfully do so, either. Regarding "incineration," PRC section 42041(aa)(2)(B) expressly excludes that from the definition of "recycling," and nothing in the regulations contradicts that exclusion. Lastly, section 18980.8(g) implements the statutory provisions intended to ensure producers are "accountable for the cost of recycling."

I-7: Pegah Rashti

Comment I-7-1

Plastic waste is everywhere -- our parks, beaches and neighborhoods. We deserve real solutions that protect our communities, not false fixes like incineration. KEEP THE LAW AS IT IS.

Response to I-7-1

Comment rejected. CalRecycle appreciates the commenter's support for the proposed regulations. Nevertheless, the comment must be rejected and no response is required because the comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process. If the commenter did not intend to express support for the proposed regulations but instead meant "KEEP THE LAW AS IT IS" as a request that the proposed regulations be changed so that they do not change the statute, CalRecycle rejects that suggestion because the regulations are mandatory and do not change the statute, which expressly prohibits incineration from being considered recycling; they interpret and implement it.

I-8: Xiao Fei Mao

Comment I-8-1

Burning or chemically breaking down plastics is not a solution! we need to come up with a better solution than this because it is only aggravating our current situation not helping.

Response to I-8-1

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process. Moreover, the statute does not expressly forbid "chemically breaking down plastics," so the regulations cannot lawfully do so, either. Statute does exclude "incineration" (i.e., "burning") from the definition of "Recycling" (see section 42041(aa)(2)(B)), and nothing in the proposed regulations contradict that exclusion.

I-9: Julia Trainor

Comment I-9-1

We need to pass SB-54 as it was written! Plastic and packaging companies need to reduce single-use plastic packaging by 25% and move toward compostable or catchable packaging ! Newsom, you are a leader in so many ways, but look weak in this. Be strong and help make a better place to live now and for our kids future!

Response to I-9-1

Comment rejected. The commenter's recommendation is that the regulations "pass SB-54 as it was written," with no specific recommendation concerning the regulatory text. The Legislature, not CalRecycle, has already "passed" SB-54, and the regulations clarify, interpret, and implement the legislation as written.

I-10: Margaret Cherene

Comment I-10-1

I am outraged at the amount of plastic waste that I find every day on the streets of Los Angeles as well as on the beaches and in our parks! I routinely volunteer for cleaning up our beaches and I always wash out and reuse bags. There is no excuse for allowing the plastics industry to continue to flood our society with more plastics and then take no responsibility for recycling it. Please enforce the provisions of SB 54.

Response to I-10-1

Comment rejected. No substantive response is necessary because the commenter provides no identifiable suggestions as to how the regulations could better address the commenter's concern over plastic pollution. To the extent the

request that CalRecycle "enforce" the statute is a recommendation regarding regulations addressing enforcement, it identifies no suggestion to which CalRecycle can respond. As explained in greater detail in the Final Statement of Reasons, the regulations lay out the statutory interpretations that will govern that enforcement.

I-11: Marcia Nation

Comment I-11-1

Plastics are a wonderful thing when used and then recycled or disposed of responsibly. However, plastic waste has found its way into our terrestrial and aquatic ecosystems to the detriment of people and planet.

SB 54 will protect families in California and this beautiful land we call home. Implementing SB 54 as written would show the world how to take meaningful action against plastic pollution.

Response to I-11-1

Comment rejected. The commenter requests "implementing SB 54 as written." However, the regulations do not alter SB 54; rather, they interpret and implement the statute as written. The commenter provides no identifiable suggestions as to how the regulations could better address the concern over plastic pollution.

I-12: Abby Krieckhaus

Comment I-12-1

Dear Cal Recycle,

Please implement SB 54 as written. Plastic waste is overwhelming our communities, environment and health. Revising SB 54 increases the risks for chemical recycling or incineration - these are not solutions as this would only worsen these harms. It is so extremely disappointing to watch California following the lead of the current federal government and rolling back all progress that actually protects us. There is so much potential to do good here and for California to continue to be a leading example of meaningful progress. I am so disheartened by the current state of legislation and having no representation that is fighting for true and meaningful change, and I hope this shows us something different. Represent the people and not corporations.

California should lead by example and stand up for proper recycling solutions. Keep SB 54 as written to reduce harm and make the package producers accountable for the cost of recycling.

Response to I-12-1

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment I-6-1, which is substantively the same as this comment.

I-13: Sara Foster

Comment I-13-1

Please implement SB 54 as written. Plastic waste is overwhelming our communities, environment and health. Revising SB 54 increases the risks for chemical recycling or incineration—these are not solutions as this would only worsen these harms.

Burning plastic is not a viable solution to this problem. Instead of fixing the problem, it exacerbates it.

California should lead by example and stand up for proper recycling solutions. Keep SB 54 as written to reduce harm and make package producers accountable for the cost of recycling.

Response to I-13-1

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment I-6-1, which is substantively the same as this comment.

I-14: Nichole Mihara

Comment I-14-1

Keep SB 54 as written. Plastic waste is continuing to defile our health environment and communities. Revising SB 54 increases the risks of chemical recycling or incineration which increases the risks to our environment and health.

California must continue to lead the way and stand up for safe and sustainable recycling solutions. Keep SB 54 as written to reduce harm and make the package producers accountable to the cost of recycling

Response to I-14-1

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment I-6-1, which is substantively the same as this comment.

I-15: Pearl Sires

Comment I-15-1

Please implement SB 54 as written. Plastic waste is overwhelming our communities, environment and health. Revising SB 54 increases the risks for chemical recycling or incineration - these are not solutions as this would only worsen these terms. California should lead by example and stand up for proper recycling solutions. Keep SB 54 as written to reduce harm and make the package producers accountable for the cost of recycling.

Response to I-15-1

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment I-6-1, which is substantively the same as this comment.

I-16: Zachariah Kahn

Comment I-16-1

Plastic waste is everywhere our parks beaches and neighborhoods. We deserve real solutions that protect our communities not false fixes like incineration.

Response to I-16-1

Comment rejected. No substantive response is necessary because the commenter provides no identifiable suggestions as to how the regulations could better address the commenter's concern about plastic waste. Regarding "incineration," PRC section 42041(aa)(2)(B) expressly excludes that from the definition of "recycling," and nothing in the regulations contradicts that exclusion.

I-17: Stephanie Mandelblum

Comment I-17-1

Dear CalRecycle,

I just signed the CALPIRG petition and am writing to you to please implement SB 54 as written. Plastic waste is overwhelming our communities, environment and health. Revising SB 54 increases the risks for chemical recycling or incineration - there is proof that plastic is responsible for these harms and would only worsen them. These are not solutions, and as someone in my 30's, I feel strongly that I don't want to live the rest of my life worried about cancer or environmental destruction in the name of consumerism.

California should lead by example and stand up for proper recycling solutions. Keep SB 54 as written to reduce harm and make the package producers accountable for the cost of recycling.

Thanks!

Response to I-17-1

Comment rejected. The comment incorrectly asserts that the proposed regulations "revis[e] SB 54." As explained in greater detail in response to comment I-6-1, that assertion is incorrect, and no change is appropriate.

I-18: Jennifer Rossini

Comment I-18-1

Plastic waste is everywhere — our parks, beaches, and neighborhoods. We deserve real solutions to protect our communities, not false fixes like incineration. California has been a leader in environmental policy. Implementing SB 54 as written would show the world how to make meaningful action against plastic pollution.

Response to I-18-1

Comment rejected. The comment incorrectly asserts that the proposed regulations do not implement SB 54 "as written." As explained in greater detail in response to comment I-6-1, that assertion is incorrect, and no change is appropriate.

I-19: David Weeshoff

Comment I-19-1

Governor Newsom: As a long term advocate for reducing plastic pollution flowing into our land and and oceans, I agree that if fully implemented, our landmark anti-plastic pollution law, the Plastic Pollution Prevention and Packaging Producer Responsibility Act (SB 54), will reduce plastic pollution and litter, protect public health, improve reuse and recycling, and lower costs for all Californians. However, the current draft regulations to implement the act greatly weaken the law, with broad exemptions for food products and weakened protections against a process known as "chemical recycling". Please remove the exceptions and keep the law as aggressive as possible.
I urge strong implementation of SB 54 that reflects the intent of the law.

Response to I-19-1

Comment partially rejected and partially accepted.

CalRecycle rejects the assertion that there is a "broad exemption" in the regulations for products merely on the basis that they are food products. CalRecycle interprets that assertion to concern section 18980.2(a)(2), which addresses when packaging for food and agricultural products will not be considered "covered material." Rather than establishing a broad exemption that always applies to food and agricultural products' packaging, that provision recognizes that PRC section 42060(b)(1) and (2) and (d) require exclusion of packaging when it would otherwise be not reasonably possible to comply with federal laws. To the extent the commenter's objection is that single-use packaging for food and agricultural products should always be considered covered material (i.e., that 18980.2(a)(2) should be removed), that approach would be unlawful under 42060(b)(1) and (2) because it would require CalRecycle to ignore potential conflicts with federal law.

Regarding "chemical recycling," the comment neither identifies any particular process ("chemical recycling" is a generic term) nor suggests alternative approaches for CalRecycle to consider. Accordingly, no change is appropriate in response to this comment. CalRecycle also rejects this comment with regard to chemical recycling for the reasons stated in response to comment O-62-1.

However, to the extent the commenter alleges that the exclusion from the definition of "covered materials" in section 18980.2(a)(2) was unclear in scope or effect, was insufficiently clear regarding what renders it "not reasonably possible" to resolve conflicts with federal laws, or would have been overbroad in effect due to the potential for the exclusion to be applied despite the conflicts being avoidable, CalRecycle accepts this comment. CalRecycle has revised section 18980.2(a)(2) to establish factual criteria that must be met for it to be considered not reasonably possible to use alternative packaging to avoid the conflict[AB6.1]. Those criteria constitute a clear, objective test and address the various ways alternative packaging might be used to avoid the conflict: using alternatives that satisfy all applicable mandatory standards without violating any law, eliminating or replacing the packaging components that cause the conflict, or redesigning packaging altogether. As explained in detail in CalRecycle's response to comment I-59-2, the revisions also clarify that the statute's reference to "guidelines" must be interpreted to refer only to mandatory guidelines, not voluntary ones.

The revisions also more clearly describe the procedures related to establishing that the exclusion applies, and those procedures have been modified to prevent entities from availing themselves of the exclusion in bad faith or without sufficient justification. In particular, the draft regulations now more clearly establish that: All submissions are subject to a completeness review by the Department before the exclusion can apply, the exclusion only applies when the packaging at issue is identified in the database (now described in subparagraph (D)), and entities cannot cause the exclusion to apply by submitting insufficient or unjustified notices substantially the same as those already deemed insufficient by the Department.

See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

I-20: Elizabeth Rosen

Comment I-20-1

Plastic waste is everywhere, including in our bodies. We deserve real solutions that protect our communities, not false fixes like incineration. Burning or chemically breaking down plastics is NOT a solution.
We asked for a policy to reduce harm, which resulted in SB 54. Please don't take this away.
Sincerely,
Elizabeth Rosen

Response to I-20-1

Comment rejected. The regulations do not alter SB 54; rather, they interpret and implement the statute as written. In particular, the statute does not expressly forbid chemical recycling, so the regulations cannot lawfully do so, either. Regarding "incineration," PRC section 42041(aa)(2)(B) expressly excludes that from the definition of "recycling," and nothing in the regulations contradicts that exclusion.

I-21: Travis Gibrael

Comment I-21-1

For the sake of our bodies, our water, soil, and a livable planet, it's crucial that we end the practice of producing and disposing of single use plastics immediately. All single use containers should be compostable. Recyclable containers are very often a misnomer, as a very small percentage actually get recycled, and many that do use a chemical process that is essentially no different than burning it all. SB 54 went a long way towards making this a reality, but the proposal being here considered watered that progress down in a way that is wholly unacceptable. As a resident of California and an organism that relies on the Earth's ecosystems to live, I strongly encourage you to revert back to the original spirit of the bill and disregard Governor Newsom's efforts to weaken this regulation in service of his ego-driven and surely doomed presidential bid.

Response to I-21-1

Comment rejected. The law does not authorize CalRecycle to require any packaging to be compostable. Section 42050(b) expressly requires recyclability, determined according to PRC section 42355.51(d), to be sufficient. Regarding

the recommendation to "revert back to the original spirit of the bill," that recommendation is vague and sets forth no further proposed change.

I-22: Anonymous

Comment I-22-1

Local governments should not bear the responsibility of waste management for products it does not create, manufacture, or produce. Companies have a responsibility to know that whatever they put out into the world, they must also receive. Especially since they are classified as an individual in this country for whatever reason. Waste continues to be a large issue in California, and the implementation of this legislation, if done correctly, will greatly improve the cleanliness of California.

Response to I-22-1

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

I-23: Polly Estabrook

Comment I-23-1

Please implement SB 54 as written. Plastic waste is overwhelming our towns and contaminating our forests. It is floating in our oceans, entangling our marine animals, and washing up on islands far away - our wastes ruining their shores and making it more and more difficult to continue their livelihoods. We MUST take care of our garbage responsibly and not foist it off on animals and those humans who did not create it to the LARGE extent that we have.

Please implement SB 54 as written. Burning plastic is not a GREEN Way to deal with it. It releases noxious chemicals into the air and increases our air pollution. And here in Los Angeles, we already do not consistently meet the federal air quality levels.

In fact, those who create the plastic should bear the responsibility and cost of recycling it. If it is NOT recyclable NOW, it should not be permitted.

CA has been a leader in environmental policy. Let's do the right thing! Let's continue to lead and not greenwash our issues.

Your loyal and admiring Californian,
Polly Estabrook

Response to I-23-1

CalRecycle rejects this comment for the reasons stated in response to comment I-6-1.

I-24: Andrea Simmons

Comment I-24-1

I am seeking some clarification to SB54 Plastic Pollution Prevention and Packaging Producer Responsibility Act. In the definitions the regulation states the following:
(e) (1) **"Covered material"** means both of the following:
(A) Single-use packaging that is routinely recycled, disposed of, or discarded after its contents have been used or unpackaged, and typically not refilled or otherwise reused by the producer.
(B) Plastic single-use food service ware, including, but not limited to, plastic-coated paper or plastic-coated paperboard, paper or paperboard with plastic intentionally added during the manufacturing process, and multilayer flexible material. For purposes of this subparagraph, "single-use food service ware" includes both of the following:
(i) Trays, plates, bowls, clamshells, lids, cups, utensils, stirrers, hinged or lidded containers, and straws.
(ii) Wraps or wrappers and bags sold to food service establishments.
Further, it defines packaging as such:
s) **"Packaging"** means any separable and distinct material component used for the containment, protection, handling, delivery, or presentation of goods by the producer for the user or consumer, ranging from raw materials to processed goods. "Packaging" includes, but is not limited to, all of the following:
(1) Sales packaging or primary packaging intended to provide the user or consumer the individual serving or unit of the product and most closely containing the product, food, or beverage.
(2) Grouped packaging or secondary packaging intended to bundle, sell in bulk, brand, or display the product.
(3) Transport packaging or tertiary packaging intended to protect the product during transport.
(4) Packaging components and ancillary elements integrated into packaging, including ancillary elements directly hung onto or attached to a product and that perform a packaging function, except both of the following:
(A) An element of the packaging or food service ware with a de minimis weight or volume, which is not an independent plastic component, as determined by the department.
(B) A component or element that is an integral part of the product, if all components or elements of the product are intended to be consumed or disposed of together.
So, my question is in regards to what is packaging versus what is the product and its applicability. For the purposed of understanding I included some examples.
For a product that is non-food and comes in a can (in this case it is an air freshener), the product is the fragranced material in the can. The can is an integral part of the product and remains as the product until end of life, then thrown away. This is not transport packaging, not secondary packaging, is the can required to be reported? It is the product and thrown out when the product is gone?

Another example, lipstick. The product is the tube of lipstick and in this case it is packaged in a box. The box and any inserts would be required to be reported, but what about the lipstick tube?
If the “devices” are an integral part of the product and are a function of the product, can you confirm these items are not reportable?

Response to I-24-1

Comment rejected. The commenter does not propose any revision to the regulations. Rather, the commenter requests that CalRecycle provide guidance concerning reporting requirements related to specific types of packaging. One purpose of the regulations is to establish rules for evaluating specific circumstances that arise, and the regulations do so. See, for example, section 18980.1(a)(4) and (17) (addressing what constitutes "components" of packaging and what constitutes a "product') and section 18980.6.8 (reporting requirements).

I-25: Clara Castronovo

Comment I-25-1

My name is Clara Castronovo, and I am an organizer with CALPIRG students. I am writing in support of implementing SB54 to the fullest extent, in order to protect our environment for future generations. I believe it is important for us to reduce our plastic consumption because plastic just keeps building up in our world. Plastic trash litters our coastline, microplastics invade our bodies, and every time we clean it up, more and more is pumped out to replace it. Clearly we need to stop producing so much plastic to begin with. The idea that recycling will fix our problems is a false one. At the moment, very little of the plastic produced actually gets recycled, meaning this is not actually a solution making a significant impact. The more time that goes by where we produce at such high rates, the bigger and bigger the problem becomes. In particular, "chemical recycling" is not the solution, and I am worried that the current regulations do not protect against this. Chemical recycling contributes to air pollution and creates toxic pollutants, and does not even actually recycle the plastic into new plastic, but is simply incineration by another name. This should not be allowed in our state. I support CalRecycle to strengthen the regulations so that only real recycling technologies are allowed. In addition, the broader categorical exemptions included in the draft regulations, reduce the efficacy and intent of the law. The point is to reduce plastic production. I urge CalRecycle to ensure the packaging for over-the-counter drugs and food and agricultural commodities are fully covered by the regulations. California is extremely influential, and can be a leader on the environment and plastic pollution if SB54 is implemented strongly. Even though implementing these regulations fully will be difficult, it is important to protect the environment and protect our future. Please consider implementing SB54 to reflect the full intent of the law. Thank you.

Response to I-25-1

Comment partially rejected and partially accepted. CalRecycle rejects the implied suggestion that recyclability should not be considered sufficient for packaging to comply with the law because such a requirement would contravene PRC section 42050(b), which expressly states that being recyclable pursuant to PRC section 42355.51(d) is acceptable. Regarding "chemical recycling," the comment neither identifies any particular process ("chemical recycling" is a generic term) nor suggests alternative approaches for CalRecycle to consider. Regarding incineration, see CalRecycle's response to comment I-6-1. Regarding chemical recycling more generally, CalRecycle further rejects this comment for the reasons stated in response to comment O-62-1.

Regarding the assertion that there are "broader categorical exemptions," no response is required because the commenter does not identify the exemptions alleged to be "broader." The commenter also does not explain how any provision could be assessed to be "broader." CalRecycle cannot evaluate that assessment because the commenter sets forth no comparison between the draft regulations and any other text (the commenter provides no alternative text for CalRecycle to consider). Regarding over-the-counter drugs, section 18980.2(a)(6) correctly interprets PRC section 42041(ee)(2)(A) as not exempting those that are cosmetics, as explained in detail in the Initial Statement of Reasons. See, also, CalRecycle's response to comment O-49-1.

Regarding agricultural commodities, there is no general exemption for packaging for such goods, as explained in response to comment I-19-1. However, CalRecycle accepts this comment to the extent it asserts that section 18980.2(a)(2) was unclear in scope or effect, was insufficiently clear regarding what renders it "not reasonably possible" to resolve conflicts with federal laws, or would have been overbroad in effect due to the potential for the exclusion to be applied despite the conflicts being avoidable. See CalRecycle's response to comment I-19-1, explaining the revisions responsive to this and similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

I-26: Joshua Bacolod

Comment I-26-1

My name is Joshua Bacolod, and I am from Placentia, California. I am currently a student attending UC Berkeley, and I am also a member of the California Public Interest Research Group's chapter at the university. I care about Senate Bill 54 because the plastics industry in the United States is responsible for an enormous amount of greenhouse gas emissions. Five years ago, the industry was responsible for emissions equivalent to the output of 116 average-sized coal power plants. Five years from now,

emissions from plastics production may surpass emissions from coal. This fact demonstrates the pressing need for California to lead the country in limiting emissions caused by plastic production. Additionally, current regulations permitting 'chemical recycling' do not effectively solve the problem at hand. The process is just another euphemism for burning plastic waste, which releases deadly toxins into the air that threaten public health and the health of the environment. I want to voice my support for CalRecycle in strengthening regulations that cut back on our current reliance on chemical recycling. Only recycling technologies that do not poison us and our environment should be allowed. I would also like to voice my opposition to exemptions for over-the-counter drugs and agricultural commodities, and I hope to see that these goods are fully covered by the regulations enforced by CalRecycle. I urge the implementation of Senate Bill 54 that reflects the spirit of the law, which intends to reduce terrible health impacts of plastic production and disposal on public and environmental health. As the state with the largest economy in the country, this bill is a critical opportunity for California to lead the rest of the United States in the global struggle against plastic pollution. We should not let this opportunity go to waste, and we must not undermine the progress our global community has made in putting an end to this issue.

Response to I-26-1

CalRecycle partially rejects and partially accepts this comment as described in response to comment I-25-1, which is substantively the same as this comment.

I-27: Mikki Horiguchi

Comment I-27-1

My name is Mikki Horiguchi from Manhattan Beach, California. I am currently a senior at the UC Berkeley CALPIRG Chapter interning for our Save the Bees campaign. Like many of my fellow Californians, I am deeply disappointed at the changes in the new draft regulations. SB 54 should be a leap towards properly addressing plastic pollution but without it being implemented at its fullest extent, it undermines the goals that would have held producers accountable for the cost of managing their plastic waste. As someone that grew up right on the water where the beach was an integral part of the town's culture, it's safe to say that this environment raised me and it's absolutely unforgivable and ridiculous to see such a beautiful place destroyed. Future generations should also be able to enjoy the nature and wildlife that California has to offer but instead, the equivalent of a dump truck of plastic is being dumped into the ocean every 45 seconds.

The new changes to SB 54 severely weaken protections against chemical recycling. It's incredibly disappointing to see this old and dirty practice being used as a bandaid solution for processing plastics when really, the name is misleading and it is simply a euphemism for one of the most harmful methods, incineration. Plastics-to-fuel plants have been proved to be less effective and efficient and is clearly not a viable alternative to traditional recycling methods as it does not help the plastic waste crisis at hand. To allow this in our state is a disservice to every Californian as it not only puts our wildlife

affected by marine debris at risk and dirties our homes but is a genuine public health concern. The burning of plastics releases toxic chemicals, contributes to air pollution, and escalates global warming. As a state famous for its abundant flora and fauna as well as the stunning Golden Coast, California should be championing real recycling technologies. I need CalRecycle to strengthen the regulations to ensure that our state is a leader in protecting our people from toxic pollutants. I also would like to see packaging for over-the-counter drugs and food and agricultural commodities are fully covered by the regulations.
California is at a defining moment in the global battle against plastic pollution. As the world's fourth-largest economy, its actions carry immense weight, and the implementation of SB 54 will send shockwaves across the nation and far beyond. The stakes could not be higher. How California enforces this law will determine whether it becomes a model of bold leadership or a missed opportunity that stalls momentum elsewhere. California must rise to the challenge, set the standard for the world, and drive forward, not dilute the progress already underway.

Response to I-27-1

CalRecycle partially rejects and partially accepts this comment as described in response to comment I-25-1, which is substantively the same as this comment. Additionally, section 18980.8(g) implements the statutory goal of holding producers "accountable for the cost of managing their plastic waste." The commenter does not explain how that provision fails to do so, nor does the comment propose any alternative approach.

I-28: Katy Nicholas

Comment I-28-1

My name is Katy Nicholas and I'm the Campus Organizer of the UCLA chapter of CALPIRG. Like others, I am greatly concerned with many of the changes in the new draft regulations.
I am also very disappointed by the edits which weaken protections against harmful chemical "recycling" The previous regulations, such as SB 54, were strong in their ability to communicate that technologies were absolutely unacceptable and not allowed if they created more hazardous waste than mechanical recycling. Now, the prohibition is vague and leaves a lot of room open for negative interpretation. This is not how we should be protecting our communties. Plastics-to-fuel plants are absolutely not recycling. They do not reduce demant for new plastics and they produce even more fossil fuels, contributing to air pollution and global warming. Even if they were good in theory, in reality they release harmful carcinogenic chemicals into the air.

California should be a leader in protection our communities from toxic pollutants. These regulations are sending us backward.

In conclusion, we need regulations that reflect the intent of SB 54 which is to greatly reduce the amount of plastic we are producing and discarding into our environment, and

to protect our communities from the environmental and health impacts of plastic production and disposal.

Response to I-28-1

Comment rejected. The commenter refers to "previous regulations" (described as "SB 54," which is legislation, not regulations) without presenting or recommending any particular provision being referenced. Regarding the general assertion that the regulations should further restrict technologies that generate hazardous waste, CalRecycle rejects that assertion because the comment presents no alternative to consider, and for the reasons stated in response to comment O-62-1. Moreover, CalRecycle rejects the recommendation that the regulations be revised so that "plastics-to-fuel plants" are categorically deemed not "recycling." No change is necessary because fuel generation (except for anaerobic digestion of certain organic materials) is already categorically not "recycling," as provided in Public Resources Code section 42041(aa)(2)(D) and acknowledged in section 18980.3.5(c) of the proposed regulations.

I-29: Anonymous

Comment I-29-1

I'm a resident of San Diego and very concerned about plastic pollution. Right now very little plastic gets recycled, most of it ends up overflowing in our landfills and in our environment. Plastic production isn't slowing down, it's growing faster than ever. The equivalent of a dump truck of plastic goes into the ocean every 45 seconds. We cannot continue on this path, we need real action!

Response to I-29-1

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment I-29-2

I'm concerned that current regulations do not protect against harmful chemical recycling, which is really just a new term for incineration and creates toxic pollutants that harm our environment and threaten public health. I want CalRecycle to strengthen the regulations so that only real recycling technologies are allowed in our state.

Response to I-29-2

Comment rejected. No substantive response is necessary because the commenter provides no identifiable suggestions as to how to "strengthen the regulations so that only real recycling technologies are allowed in our state." The regulations do not alter SB 54; rather, they interpret and implement the statute as written. In particular, the statute does not expressly forbid chemical recycling, so the regulations cannot lawfully do so, either. Regarding "incineration," PRC

section 42041(aa)(2)(B) expressly excludes that from the definition of "recycling," and nothing in the regulations contradicts that exclusion.

Comment I-29-3

CalRecycle needs to ensure the packaging for over-the-counter drugs and food and agricultural commodities are fully covered by the regulations.

Response to I-29-3

CalRecycle partially accepts and partially rejects this comment. With respect to over-the-counter drugs, CalRecycle rejects the comment for the reasons provided in response to comment O-49-1. Regarding agricultural commodities, CalRecycle rejects this comment to the extent it suggests that there should be no exclusion for food and agricultural packaging, for the reasons stated in response to comment I-19-1. CalRecycle otherwise accepts this comment, however, to the extent it asserts that section 18980.2(a)(2) was unclear or potentially overly broad or unclear with respect to the exclusion of such packaging. See CalRecycle's response to comment I-19-1, explaining the revisions responsive to this and similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

Comment I-29-4

California is at a pivotal moment in the global fight against plastic pollution. California is the fourth largest economy in the world, and the impacts of SB 54 are likely to ripple across the country and around the globe. How our state implements these policies is critical to the law's success. California must not squander this opportunity to lead the way!

Response to I-29-4

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

I-30: Vincent Chen

Comment I-30-1

As a Californian, I'm generally really proud to say that we're at the forefront of environmental policy, specifically on reusing, reducing, and recycling. For example, passing SB 619, we were the first state to have "bring your own container" laws, leading the way for Oregon and now Washington, and we were also the first state to have a statewide plastic bag ban for retailers (2016). In many ways, we are setting the example for how other states can transition to sustainability.
Which is why it saddens me that, on one of the most significant pieces of recycling legislation this decade, we are shying away from full effectiveness. CalRecycle's new

Standardized Regulatory Impact Assessment (SRIA) (released this past June) showed that, under full implementation, SB 54 could be saving both consumers and businesses a net 32 BILLION dollars, and could protect the environment to the tune of 25 BILLION dollars (in damages).

Response to I-30-1

Comment rejected. The comment suggests, without explanation, that CalRecycle is "shying away from full effectiveness." That vague assertion does not suggest changes to the proposed regulations or raise objections related to the rulemaking process, so no substantive response is possible. As set forth in greater detail in the Final Statement of Reasons, the proposed regulations fully interpret the law and ensure its implementation.

Comment I-30-2

I understand that, in the fix of draft regulations, we had to clear up some definitions, and I guess it makes sense that we have to move the clause about chemical recycling as an addendum in End-Market Identification. Sure.
But I think it's really unfair that we're being robbed of the common-sense policy that we deserve. One of the most important clauses that was entirely cut out was that products that are reusable and recyclable should be labeled and designed to be reusable and recyclable (18980.2.1). It's just common sense that, if I know a product is refillable, I can learn where to go to refill it. It's just common sense that a product that is meant to be reusable can last more than 4 uses, and can be washed. Cutting these common-sense sections from a watershed piece of recycling legislation is honestly a disservice to us Californians.
I'm all for revising regulations to be more streamlined and clear when it comes to definitions. But I can not support regulations that fundamentally ignore common sense definitions of a reusable product in legislation that is all about recycling. I can not support regulations that give up billions in savings for consumers and businesses right at the finish line. I can not support regulations that, as a Californian, I can't feel proud of.

Response to I-30-2

CalRecycle rejects this comment, which misconstrues the proposed regulations as "cutting" provisions from the legislation. The proposed regulations do not purport to, nor could they, nullify the provisions of Public Resources Code section 42041(af), which define "reusable" and "refillable" by setting forth the criteria that refillable and reusable items must meet. In tandem with the clarifications established in section 18980.2.1 of the proposed regulations, those requirements (including the requirement that products are "explicitly designed and marketed to be utilized multiple times for the same product") can be applied to factual circumstances on a case-by-case basis, without disregarding common sense. CalRecycle also rejects this comment to the extent it refers to recyclable items and recyclability. There is no recyclability requirement in statute for reusable items to be recyclable, and the statutory provisions to which the

comment relates (the "reusable" and "refillable" criteria) do not concern recyclability.

I-31: Eva Devyatovska

Comment I-31-1

I am reaching out to request clarification on the requirements for foreign producers under California's SB 54 (Plastic Pollution Prevention and Packaging Producer Responsibility Act).
Specifically, we would like to understand:
• Are companies without a U.S. legal presence required to appoint an authorized representative in order to register and comply with SB 54?
• If so, what are the qualifications or criteria for such a representative?
• Will detailed guidance on this be published by CalRecycle or through the Circular Action Alliance?

Response to I-31-1

Comment rejected. The commenter does not propose any revision to the regulations. Rather, the commenter requests that CalRecycle answer questions concerning how the statute applies to specific circumstances. One purpose of the regulations is to establish rules for evaluating specific circumstances that arise, not to answer all questions about specific scenarios. To the extent presenting example scenarios would be helpful to demonstrate how the regulations resolve questions like those posed in this comment, no changes to the proposed regulations are necessary for CalRecycle to do so. Moreover, to the extent that the commenter intended to request that the regulations specifically clarify how non-US companies can register and comply, no such clarification is necessary. The regulations contain no restrictions based on company location on how companies register and comply with the law.

I-32: Barbara Collins

Comment I-32-1

I'm a resident of Oceanside, CA and I am very concerned about plastic pollution, it's everywhere even in our bodies. We need to move now to cut plastic use, especially single use plastic and hold producers responsible!

Very little plastic is recycled, most of it ends up in our landfills and in our environment. Plastic production isn't slowing down, it's growing faster than ever. The equivalent of a dump truck of plastic goes into the ocean every 45 seconds. We cannot continue on this path, we need real action!

Response to I-32-1

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment I-32-2

I'm concerned that current regulations do not protect against harmful chemical recycling, which is really just a new term for incineration and creates toxic pollutants that harm our environment and threaten public health. I want CalRecycle to strengthen the regulations so that only real recycling technologies are allowed in our state. CalRecycle needs to ensure the packaging for over-the-counter drugs and food and agricultural commodities are fully covered by the regulations.

Response to I-32-2

CalRecycle partially accepts and partially rejects this comment for the reasons provided in response to comment I-25-1, part of which includes substantially all of this comment.

Comment I-32-3

California is at a pivotal moment in the global fight against plastic pollution. California is the fourth largest economy in the world, and the impacts of SB 54 are likely to ripple across the country and around the globe. How our state implements these policies is critical to the law's success. California must not squander this opportunity to lead the way!

Response to I-32-3

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

I-33: Gary Cohen

Comment I-33-1

My name is Gary Cohen, and I am including a report below that my company, GSC Consulting LLC, commissioned from a recognized food safety consulting firm regarding Article 2 exemptions.

I am a recently retired, 40-plus-year veteran of the packaging industry, a Food and Sustainable Packaging Specialist, an SQF Practitioner with more than 25 years of food safety experience. Today, I serve as the volunteer Executive Director of Tennessee Waste to Jobs, a coalition working to pass EPR legislation in Tennessee. I am fully committed to seeing SB 54 succeed and serve as a model for other states.

Response to I-33-1

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment I-33-2

My concern is that the current draft exemptions could unintentionally set a precedent that makes it harder for other states, including Tennessee, to adopt effective EPR legislation. **Based on my experience with FSMA (Food Safety Modernization Act) and HACCP protocols, I believe the draft language could potentially exempt 70–80% of food packaging found in a typical supermarket.**

Food safety and packaging are deeply interconnected, and HACCP principles are foundational to FSMA. Yet in conversations with stakeholders who follow SB 54, I often find little to no familiarity with HACCP. This raises the question of whether the regulatory implications for food packaging are being fully considered in the Article 2 amendments. Out of deep concern for the success of SB 54, I personally commissioned and funded an independent assessment to validate these risks. That report is being submitted below with these comments. **My request is simple: before finalizing Article 2, please pause and consult with qualified food safety experts to ensure that the draft exemptions do not unintentionally undermine the very goals and financial stability of SB 54.**

Response to I-33-2

Comment partially accepted and partially rejected. No explanation is provided for how any exemption might affect other states' ability to adopt EPR legislation, nor is the ability for states to do so a consideration authorized under statute. Instead, PRC section 42060(c) states that CalRecycle shall consider programs and approaches in other states (i.e., not the mere potential for such programs and approaches). Accordingly, no change is necessary to address this concern. Likewise, no change is necessary in response to the request that CalRecycle "pause and consult with qualified food safety experts." That request does not put forth any particular revision for CalRecycle to consider.

Regarding food packaging, as explained in response to comment I-19-1, the draft regulations do not broadly exempt packaging merely because it is used with food. CalRecycle accepts this comment, however, to the extent it alleges that section 18980.2(a)(2) was unclear in scope or effect, was insufficiently clear regarding what renders it "not reasonably possible" to resolve conflicts with federal laws, or would have been overbroad in effect due to the potential for the exclusion to be applied despite the conflicts being avoidable. See CalRecycle's response to comment I-19-1, explaining the revisions responsive to this and similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

Comment I-33-3

Assessment of SB54 Draft Article 2 – Exemptions for Food Packaging Commissioned by: GSC Consulting LLC, Nashville, TN
Date: August 28, 2025
Executive Summary
This document summarizes an expert assessment of Article 2 (Section 18980.2) of California's SB54 draft regulations published by CalRecycle on August 22, 2025, specifically the categorically excluded materials section. The assessment was funded by GSC Consulting LLC and conducted by Mark A. Dargay of Comprehensive Food Safety (CFS), a recognized leader in food safety and regulatory compliance. **see footnote

Overview of SB54 and Article 2
SB54 mandates packaging producers achieve a 25% reduction in single-use plastic packaging by 2032. Article 2 of the draft regulations (Section 18980.2) defines 'categorically excluded materials,' allowing certain food packaging to be exempt when required to meet food safety, microbial prevention, or structural integrity standards under FDA, FSMA, or similar regulatory frameworks.

SB54 Overview and Examples – Mark Dargay's Analysis
"Regarding SB54, especially Article 2: Covered Material and Covered Material Categories Section, 18980.2 / Categorically Excluded Materials, it is my (Mark Dargay's) opinion that as written, the regulation provides the opportunity for many food products to be exempt. Mark explains "In section (a) (2), it states the following: " "A determination of exclusion pursuant to this paragraph may consider standards to prevent microbial contamination or to maintain the safety or structural integrity of packaging under the Food, Drug, and Cosmetic Act; the FDA Food Safety Modernization Act..."

Key Findings from the Assessment
Mark Dargay's analysis indicates that many food packaging formats could/would qualify for exemption under Article 2, including:
Examples would be:
• A box of cereal: The cereal is placed in a film with a barrier to provide safety, quality, and shelf-life. A primary package. Food Contact Surface. This would be exempt.
• The cereal package is in a printed kraft board box. This is used for food safety to protect the contents of the cereal in the film package. A secondary package. This would be exempt
• 12 boxes of cereal may be in a corrugated case. This is used to protect the safety of the individual box of cereal. A tertiary package. This, too, could be exempt.

• A jar of pickles or tomato sauce: The metal lid and the glass jar contain the edible product and are used to kill any microorganisms in the product through pasteurization/retorting. These are food contact and the primary package. This would be exempt.
• If there was a tamper-resistant seal around the collar of the jar, this would be exempt.

• The glass jars of pickles are placed either on a corrugated tray with shrink wrap to contain them or in a corrugated case. Both are used to protect the product from foreign material contamination. This is a secondary package and would be exempt.
• A single container of Mentos Gum: The package has a complete shrink-wrapped label that covers the main container and the lid. The main container and the lid preserve the safety of the contents with the tamper-resistant seal built into the entire shrink-wrap. These are the primary and possibly the secondary package. Both would be exempt
• The individual containers of gum are placed in a kraft board 6-pack, but only for shelf presentation. This could be recycled, and the producer could possibly NOT be exempt.
• The 6-packs of gum are then packed in a corrugated case for shipping. This could be recycled, and the producer could possibly NOT be exempt.

Summary and additional examples of potential exemptions
• Barrier films used as primary packaging for cereals or perishables.
• Glass jars and metal lids used in pasteurized or retorted products.
• Tamper-evident shrink sleeves for products like gum or candy.
• Corrugated secondary packaging used to protect food containers during transit.
• Kraft board boxes designed for structural or microbial protection.

Mark Dargay's Conclusions & Recommendations
Based on the language in SB54, particularly Article 2, Section 18980.2 on categorically excluded materials, the regulation appears to create a broad scope for exemptions in food packaging. Because many food packaging components are directly tied to food safety, microbial control, or structural integrity under FDA and FSMA requirements, a wide range of primary and secondary packaging types—such as barrier films, glass jars, metal lids, tamper-evident seals, kraft board boxes, and corrugated shipping cases; could qualify as exempt.

As written, this framework has the potential to significantly reduce the applicability of SB54 to much of the food sector. While certain tertiary or display-related packaging may remain within scope, the vast majority of packaging used to protect food safety and shelf stability would likely fall under exclusions. This interpretation could substantially limit the regulations intended impact of packaging reduction and recycling within the food industry and SB54.

Based on these conclusions, I would recommend the following differentiation between exempt and non-exempt covered materials and provide case examples with regulators and industry stakeholders to test criteria against real packaging formats.

Recommended Exemption Framework
The assessment recommends distinguishing exempt vs. non-exempt packaging based on function:
**Safety-Driven Exemptions: **
1. Direct food contact packaging
2. Microbial/contamination control layers
3. Packaging needed for thermal/structural integrity

4. Tamper-resistant closures or seals

**Convenience-Driven (Non-Exempt) Packaging: **
1. Decorative or display packaging
2. Bundling or outerwrap for logistics only
3. Redundant layers not tied to food safety
4. Convenience components not required for safety

Conclusion
This assessment highlights the broad potential for exemption of food packaging under SB54's Article 2 language. The findings will support public comments to CalRecycle and internal evaluations by NSAC and other policy working groups. **Mark Dargay is the Director of Regulatory Compliance of Comprehensive Food Safety. His experience in the food industry is diversified and spans over forty years. Working in food safety and quality for all these years in three of the Fortune 500 global top ten food companies, coupled with extensive food safety consulting experience has provided Mark a deep and vast knowledge of food safety and packaging. CFS is an established, full-service, international food safety consulting leader, and specializes in providing best practice food safety and quality consulting, auditing and training services. The parent company is Rentokil, a $9 billion global leader that provides system and process auditing of food manufacturing companies with a focus of their compliance to regulatory requirements and industry food safety standards. They provide best practices for these programs to assure safe products are being manufactured to the public sector. They provide public and private food safety training on many areas of food safety that are components of federal, state, and local regulations.

Response to I-33-3

Comment partially rejected and partially accepted. This comment implies that it is inappropriate for many types of packaging for food not to be considered covered material. That assertion fails to acknowledge that PRC section 42060(b) requires the regulations to accommodate requirements under federal law for such packaging. As further explained in response to comment I-19-1, the proposed regulations do not exempt any packaging merely because it is food packaging or subject to laws relating to food safety. Moreover, the comment provides no analysis, such as how requirements under federal laws relate to packaging at

issue, to support its assertions that certain packaging would be considered not covered material under the proposed regulations. For other packaging, the comment merely states that packaging would potentially be excluded. In other words, the comment concedes that various types of packaging of concern may not be excluded.

Lastly, the comment proposes an "exemption framework" based on the function of packaging. That approach is unsupportable because it ignores the directive of PRC section 42060(b): The regulations must consider restrictions under federal law. Those restrictions may generally be "safety-driven," but nothing in statute allows CalRecycle to limit its consideration of federal law to such restrictions. Moreover, the distinction between "safety-driven" and "convenience-driven" packaging is not necessarily clear. Components or design features might serve both safety and convenience purposes, and the latter is inherently subjective. For these reasons, CalRecycle rejects the commenter's proposal.

CalRecycle accepts this comment, however, to the extent it alleges that section 18980.2(a)(2) was unclear in scope or effect, was insufficiently clear regarding what renders it "not reasonably possible" to resolve conflicts with federal laws, or would have been overbroad in effect due to the potential for the exclusion to be applied despite the conflicts being avoidable. See CalRecycle's response to comment I-19-1 explaining the revisions responsive to this and similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

I-34: Shelly Hughes

Comment I-34-1

I have lived in Northern California for 50 years. The land and the people need protection. We need a long term vision of sustainability and innovation that includes discontinuing the use of plastics as much as possible. We need to strengthen our resolve to make laws that create less plastic waste. Why do the big chain grocery stores still provide plastic bags? Why do restaurants still provide plastic bags and utensils for take out orders? There are alternative products out there that we should use instead - these alternatives are biodegradable.
We need stronger regulations that will actually help us achieve a reality in which the plastics industry does not produce over 232 million tons of greenhouse gas emissions per year, any plastic that is made can actually be recyclable, and people don't have to buy a plastic bag along with their fruits and vegetables.

Response to I-34-1

Comment rejected. No substantive response is required because the comment raises general concerns without stating any specific recommendation or

explanation of its objections to the proposed regulations. Regarding, "strengthen[ing] our resolve to make laws that create less plastic waste" and "need[ing] stronger regulations that will actually help us achieve a reality in which the plastics industry does not produce over 232 million tons of greenhouse gas emissions per year," the Legislature, not CalRecycle, makes laws. The regulations clarify, interpret, and implement SB 54 as written.

Comment I-34-2

The new exemptions to products that are regulated by the FDA and USDA will not effectively address the plastic waste crisis we're facing. Without a strong regulatory system in place products in the grocery store will continue to be made from nonrecyclable plastic that will end up hurting our environment and our health.

Response to I-34-2

Comment partially accepted and partially rejected. The commenter does not provide any detail for the assertion concerning the effect of "new exemptions" nor puts forth any recommended revision. In any event, as explained in response to comment I-19-1, the regulations do not generally exempt "products that are regulated by the FDA and USDA." To the extent this comment asserts that section 18980.2(a)(2) was unclear or potentially overbroad, however, CalRecycle accepts it for the reasons set forth in response to comment I-19-1. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

Comment I-34-3

I'm concerned that the new language will not protect against chemical recycling, which is just incineration under a new name and actually creates toxic pollutants that get into our air and water. Pyrolysis is completely bankrolled by the fossil fuel industry and their investors because it will increase their profits - at the expense of public health.
We can't keep allowing plastic to take over our lives, so I strongly urge you to strengthen regulations so that the majority of foodware and packaging will actually need to be recyclable and compostable.

Response to I-34-3

CalRecycle rejects this comment for the reasons provided in response to comments I-19-1 and I-25-1.

I-35: Patrick Mundy

Comment I-35-1

CalRecycle - please do NOT water down the strict intentions of the original legislation, by creating loopholes and exceptions for prescription drugs and food.

Response to I-35-1

Comment rejected. As explained in response to comment I-19-1, the regulations do not broadly exempt packaging merely based on it being food packaging. Regarding prescription drugs, the regulations create no loophole or exception. The statute itself (PRC section 42041(e)(2)(A)(i)) unambiguously excludes packaging for them from the definition of covered material.

Comment I-35-2

Above all, do NOT allow exceptions for so-called "chemical recycling." This is a green-washing term for a set of practices (pyrolysis, gasification, and solvolysis) which require very high energy inputs, produce significant toxic emissions and waste, and whose primary output (things like pyrolysis oil) end up as fuel which, when burned, contribute greenhouses gases and toxic substances.

The EPA continues to pro-actively affirm that pyrolysis is equivalent to "other solid waste incineration" because ultimately, when you consider the downstream combustion of the resulting fuels that are produced, you have the same net impact on the atmosphere and environment - just some of the emissions are delayed in time. Weakening the original legislation's clear intent for California to be a leader in strong reduction of plastics use would be a gross dereliction of duty for CalRecycle. Don't fall prey to the industry green-washing. Preserve the strength of the original legislation and help us create a better and less-toxic future.

Response to I-35-2

CalRecycle rejects this comment for the reasons stated in response to comment I-6-1, O-6-1, and I-25-1.

I-36: Tim and Karen Hudson

Comment I-36-1

We are writing in favor of retaining SB54s California's plastic pollution reduction law. We are against plastic recycling and incineration..

Response to I-36-1

Comment rejected. No substantive response is necessary because the commenter does not suggest changes to the proposed regulations. The regulations do not alter SB 54; rather, they interpret and implement the statute as written.

I-37: Karalina Hulbert

Comment I-37-1

Dear CalRecycle,
I am writing to provide public comment on the proposed amendments to California's landmark pollution reduction law, SB 54. Specifically, I strongly object to any amendments that weaken protections against so-called "chemical recycling" (also referred to as plastic pyrolysis or gasification).
Amended Section(s): [Insert the exact section reference once identified in the proposed regulations]
Reason for Objection:
"Chemical recycling" is not true recycling. It is a harmful form of plastic incineration that uses high heat to melt plastic and convert it into oil or other fuels, which are then burned and release toxic emissions. Reclassifying or permitting this practice under SB 54 would undermine the law's intent, which is to reduce plastic pollution at the source and ensure a transition to a safer, circular economy.
Allowing chemical recycling as a compliance pathway for producers will:
Increase greenhouse gas emissions and toxic air pollution in communities, particularly those already overburdened by environmental harms.
Undercut investments in real recycling solutions and upstream waste reduction strategies.
Contradict the purpose of SB 54, which is to reduce single-use plastics, not provide loopholes for the plastics and petrochemical industries.
Recommendation:
I urge CalRecycle to:
Reject any amendments that weaken SB 54 by permitting "chemical recycling" as an acceptable form of recycling or diversion.
Uphold the original intent of SB 54 by prioritizing source reduction, reuse, and non-toxic recycling methods.
Ensure transparency and accountability by requiring that all compliance strategies demonstrate measurable pollution reduction, not just repackaged incineration practices.
California has an opportunity to lead the nation in bold, meaningful plastic reduction. Weakening SB 54 at this stage would be a step backward, jeopardizing both public health and environmental justice.
Thank you for considering my comment. I urge you to protect the integrity of SB 54 and reject harmful loopholes for "chemical recycling."
Sincerely,
Karalina Hulbert

Response to I-37-1

Comment rejected. The regulations do not alter SB 54; rather, they interpret and implement the statute as written. In particular, the statute does not expressly forbid chemical recycling, so the regulations cannot lawfully do so, either. Also regarding "chemical recycling," the comment neither identifies any particular

process ("chemical recycling" is a generic term) nor suggests alternative approaches for CalRecycle to consider. Regarding "incineration," PRC section 42041(aa)(2)(B) expressly excludes that from the definition of "recycling," and nothing in the regulations contradicts that exclusion. For greater detail, see comments I-6-1, O-6-1, and I-25-1.

I-38: Stephanie DeMott

Comment I-38-1

I am a mother and homeowner in Rohnert Park, CA.

I'm extremely concerned that CalRecycle is on the verge of gutting California's landmark plastic pollution reduction law, SB 54. The latest proposed regulations threaten to seriously weaken the law by loosening restrictions on so-called "chemical recycling" — a misleading term for what is essentially plastic incineration.

Let's be clear: "chemical recycling" is just a rebranding of an old, dirty practice. It involves melting plastic at high heat and turning it into oil, producing toxic emissions in the process. It's not recycling — it's incineration by another name, and it has no place in a law meant to reduce plastic waste and protect our environment and public health.

CalRecycle must stand by the intent of SB 54 and close the loopholes that would allow this dangerous industry to flourish under the false banner of sustainability.

Response to I-38-1

CalRecycle rejects this comment for the reasons stated in response to comment I-6-1, O-6-1, and I-25-1.

I-39: Shirley Freriks

Comment I-39-1

A voice from the Nevada County community - and WasteNOT Plastics - Single-use plastics - mostly food containers - are the target of our marketing and public events like Plastic Free July. We are working with our restaurants and takeout businesses to stop using SUPs with pretty good success. But the big markets are the main source of consternation. Some want to make a change, but their hands are tied to do a really good job of stopping SUPs but UNTIL THE INDUSTRY MAKES NON-TOXIC, TRULY COMPOSTABLE PACKAGING, the huge problem will not be solved. Even the Coop cannot get much converted.
HEALTH OF PEOPLE, PETS, AND THE ENVIRONMENT ARE AT STAKE because of MICROPLASTICS, AND THE TOXINS that come from them to our bodies and the body of our Earth. PLEASE REINSTATE the appropriate language in SB 54 to force the Producers to take responsibility and change their unhealthy way of doing business - and

be good citizens to protect our health. I know they can do it - and clearly they have the big money to be able to do the research and make substantial changes. Let's help them DO it.

Response to I-39-1

Comment rejected. No substantive response is required because the comment raises general concerns without stating any specific recommendation or explanation of its objections to the proposed regulations.

I-40: Sam Trezona

Comment I-40-1

Plastic pollution threatens everything that we stand for: our air, our water, and our protected land. The U.S. plastics industry was responsible for at least 232 million tons of C02e gas emissions in 2020, equivalent to the average emissions from 116 average-sized coal-fired power plants. These emissions are contributing to our climate crisis, threatening all of our livelihoods.

Plastic also just ends up everywhere. The equivalent of a dump truck of plastic goes into the ocean every 45 seconds. Plastic has been found in our bodies. Plastic has even been found at the bottom of the Mariana's Trench, the deepest point in the Ocean.

So, we must be doing everything we can do to prevent C02 emissions and more plastic from being created.

California is supposed to be a leader in plastic reduction. But, current regulations do not protect against harmful "chemical recycling," which is mostly just a new term for incineration. Chemical recycling creates toxic pollutants that harm our environment and our public health. Chemical recycling also doesn't reduce demand for new plastic creation, either.

CalRecycle should strengthen the regulations to exclude chemical recycling from an exemption of SB 54. There are recycling technologies that decrease emissions, decrease the need to create new products, and increase the lifetime of our materials. Those are the technologies that should be exempt.

Response to I-40-1

CalRecycle rejects this comment for the reasons stated in response to comments I-6-1 and O-62-1. More specifically, Public Resources Code section 42041(aa)(5) does not authorize CalRecycle to categorically exclude an entire class of recycling technologies; rather, it requires consideration of particular technologies with respect to generation of hazardous waste. Regarding the assertion that "recycling technologies that decrease emissions, decrease the need to create new products, and increase the lifetime of our materials" should

be exempt, no response is required because the commenter does not identify such technologies, and CalRecycle cannot discern what it would mean to render a technology "exempt." That phrasing could, for example, refer to excluding certain technologies from the definition of "recycling," but that effect would conflict with the commenter's apparent position that the technologies should be favored over others. To the extent the commenter intended to assert that "chemical recycling" should not be considered "recycling," CalRecycle also rejects the comment for the reasons stated in response to comment O-62-1.

I-41: Anonymous

Comment I-41-1

Hello, my name is Bithia Ramos. I currently reside in Long Beach, CA.

Since I was young, I saw the convenience of plastic, as it was normalized literally everywhere. Since its explosion in the recent decades, studies have shown its many detrimental and negative impacts. To hear good news, is rare but always accepted. So, to hear of SB54 and its passing of it in 2022, was a huge relief to many Californians that knew regulations were needed to curb plastic pollution, because it is and was getting out of hand. The proposed regulations would put it all on the Producer, which was a huge victory to consumers. This was a landmark anti-plastic pollution law that would change everything for the better. Now this is being changed? to the benefit of who? because it's not what the people want. This new chemical recycling option which is just incineration of plastic plus exempting big plastic producers, which include food and agricultural products, which will setback what this law and why this law was established in the 1st place which again is to curb plastic pollution.

Exemptions do not belong in this law. Producers must be held accountable. Regulations need to be strengthened. No chemical recycling should be occurring when talking about curbing plastic and its pollution specially when there are far better and safer alternatives, like enforcing SB54 in its entirety as first proposed and accepted. Do the right thing for the people. Thank you for your time.
.

Response to I-41-1

CalRecycle partially accepts and partially rejects this comment. To the extent this comment concerns incineration and asserts that chemical recycling should be categorically prohibited, CalRecycle rejects it for the reasons stated in response to comment I-25-1. To the extent this comment asserts that the proposed regulations would exempt all food and agricultural packaging, CalRecycle rejects that assertion for the reasons provided in response to comment I-19-1. CalRecycle accepts this comment, however, to the extent it asserts that section 18980.2(a)(2) was unclear or potentially overbroad. See CalRecycle's response to comment I-19-1, explaining the revisions responsive to this and similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in

response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

I-42: Adrian Martinez

Comment I-42-1

My name is Adrian Martinez and I live in Long Beach. I am a member of Csulb CALPIRG California. When I first heard of SB 54 I felt that we were moving in the right direction. I care about plastic pollution as I believe it is the key issue that will determine our future as it is already affecting us as a society now. Chemical recycling is the main issue spreading toxic and dangerous pollutants towards the public. According to the EPA Toxics Release Inventory in 2023 found about 500 toxic chemicals in the air.. I personally relate to this issue as I have lived in West Long Beach which is the closest part of Long Beach to the refineries in Wilmington that burn and develop smog around the lower part of LA county. I've been told countless times that our life expectancy is about 3 years lower than the national average. With all this in mind I hope we can push towards cleaner recycling and for Cal recycle to strengthen regulations on recycling.

Response to I-42-1

Comment rejected. This comment only addresses regulations by urging CalRecycle to "strengthen regulations on recycling." That nonspecific statement about regulations does not assert any objection or recommendation that CalRecycle can respond to. Accordingly, no substantive response is required.

I-43: Colin Loveland

Comment I-43-1

My name is Colin Loveland, and I am from Highland, California. I go to UCR and am a board member of the UCR chapter of CALPIRG Students. As someone who deeply cares about the environment and the state of the world I will inherit from previous generations and will pass along to future generations, I am greatly concerned about the proposed gutting of SB 54 and the addition of chemical recycling into California.
All Californians have witnessed firsthand the pervasive plastic pollution throughout both our urban and our natural environments. I have seen plastics washing into storm drains that eventually lead into rivers (and then the ocean) during storms in my neighborhood. Then, in December 2023, my family and I were in Palm Springs exploring the desert filled with blooming purple verbena - only for the splendor of the natural environment to be marred by plastic bags and other waste buried in the blowsand, embedded in the dunes, and entangled in the roots of the plants. While we did the best we could to clean it up, the ever shifting winds of the Coachella Valley would render our efforts futile by blowing in more plastic that would settle in the spaces that we had cleaned.

Not only are all these plastics toxic to animals and plants, they are also very dangerous to humans. In 2020, the US plastics industry was responsible for at least 232 million tons of CO2 gas emissions, which is equivalent to the average emissions of 116 average-sized coal power plants. Therefore, the plastics industry represents a vicious accelerant in the process of climate change that continues to harm the planet.
In 2022, California rose to meet the moment by passing the landmark SB 54, which is projected to reduce plastic pollution by 23 million tons over 10 years in its current form. That would be monumental in the fight against plastic pollution. However, new proposed regulations would undermine this goal by opening broad exemptions into the policy. Additionally, new regulations would introduce chemical recycling - essentially incineration - into California. This process, hailed as a gamechanger by the plastics industry, instead represents a false god, as burned plastic gets converted into fuel that will be reused to make new plastics and releases further carbon emissions that worsen climate change.
California, as the 4th largest economy in the world and the home of nearly 40 million people, must remain at the forefront of the fight against climate change in order to help lead the world into a more sustainable future. Therefore, instead of weakening the regulations, CalRecycle should institute a strict exemption process for those who truly need it and prevent harmful, toxic chemical recycling from taking root in California.

Response to I-43-1

CalRecycle rejects this comment for the reasons stated in response to comment I-19-1 and 1-25-1.

I-44: Caleb Weis

Comment I-44-1

Hi, my name is Caleb Weis and I am a Campaign Associate for Environment California, based in Oakland.

I have cared deeply about the environment since I was a kid growing up in the woods of northern Vermont. I never imagined, however, that we would reach a point when protecting our environment would be so intertwined with protecting ourselves. The statistics about microplastics' impact on health are downright scary, and when coupled with the terrifying amount of plastic waste that we currently produce—2,000 truckloads per day!—provide more than enough reason to significantly limit our plastic consumption, as SB54 set out to do.

Therefore, I would like to state my strong opposition to recent provisions which both allow chemical recycling under certain circumstances and implement broad exclusions of packaging for over-the-counter drugs, food, and agricultural products. Both of these practices would significantly threaten the efficacy of SB54. Chemical recycling creates toxic pollutants that harm our environment and threaten public health, and doesn't reduce our demand for new plastic to be created. Meanwhile, broad exclusions for over-

the-counter drugs, food, and agricultural products will result in more plastic being sent to landfills or left to pollute our environment.

I urge you to strengthen SB54 regulations so that only real recycling technologies are allowed in our state. Furthermore, I ask that you ensure that packaging for over-the-counter drugs and food and agricultural commodities are fully covered by the regulations. Thank you.

Response to I-44-1

CalRecycle partially accepts and partially rejects this comment. Regarding over-the-counter drugs, CalRecycle rejects this comment for the reasons stated in response to comment O-49-1. To the extent this comment asserts that chemical recycling should be categorically prohibited, CalRecycle rejects it for the reasons stated in response to comment I-25-1. See, also, CalRecycle's response to comment O-62-1 regarding chemical recycling. To the extent this comment asserts that the proposed regulations would exempt all food and agricultural packaging, CalRecycle rejects that assertion for the reasons provided in response to comment I-19-1. CalRecycle accepts this comment, however, to the extent it asserts that section 18980.2(a)(2) was unclear or potentially overbroad. See CalRecycle's response to comment I-19-1, explaining the revisions responsive to this and similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

I-45: Mark O'Connor

Comment I-45-1

I volunteer with Surfrider San Diego and work on reducing the amount of plastic being used. Plastic contains harmful chemicals that leach into the environment. We are breathing, eating and drinking these nano plastics into our bodies. The chemicals that are in the plastic are carcinogenic. They cause cancer which is killing people of all ages.

That is what makes this so important. Micro and Nano plastics with their chemicals are killing us. We need to keep SB54 as a starting block to reduce the use of some of these plastics. It must come to an end. We need to transition to organic compostable products where we can. Let's stop this destruction of ourselves and keep SB54 strong so we can live healthier lives. I ask you for your support. Mark O'Connor

Response to I-45-1

Comment rejected. CalRecycle rejects this comment to the extent the comment raises general concerns without stating any specific recommendation or explanation of its objections to the proposed regulations. Further, the Legislature,

not CalRecycle, "passed" SB-54, and the regulations clarify, interpret, and implement the legislation as written. CalRecycle does not have the authority to go beyond the legal framework of SB 54, and the law specifically allows recyclability versus composability for certain products, such as packing (section 42050(b) expressly requires recyclability, determined according to PRC section 42355.51(d)). Regarding the recommendation to "keep SB54 strong," that recommendation is vague and sets forth no further proposed change.

I-46: Yen Nguyen

Comment I-46-1

I'm concerned that current regulations do not protect against harmful chemical recycling, which is really just a new term for incineration and creates toxic pollutants that harm our environment and threaten public health. I want CalRecycle to strengthen the regulations so that only real recycling technologies are allowed in our state. CalRecycle needs to ensure the packaging for over-the-counter drugs and food and agricultural commodities are fully covered by the regulations.

California is at a pivotal moment in the global fight against plastic pollution. California is the fourth largest economy in the world, and the impacts of SB 54 are likely to ripple across the country and around the globe. How our state implements these policies is critical to the law's success. California must not squander this opportunity to lead the way!"

Response to I-46-1

CalRecycle partially accepts and partially rejects this comment as described in response to comment O-110-2, which raises the same objections as does this comment.

I-47: Kathy Schaeffer

Comment I-47-1

When SB 54 was signed into law, Californians celebrated a path forward for significant reduction in plastic waste. We looked forward to a healthier environment with less demand for petrochemical products. Sadly, SB 54 rulemaking seems to benefit the plastic petrochemical industry instead of curbing plastic production and subsequent waste. The chemical recycling industry could now have "permission" to create more plastic and more pollution. Chemical recycling does NOT solve our plastic problem. Creation of more plastics with chemical recycling adds to emissions and encourages greater production of plastic that will continue to harm the health of people and the environment. Carve-outs that support the plastic industry and chemical recycling should not be allowed. Please do not take us backward after all of the work that has been done to reduce plastic production, plastic waste, and its devastating effects.

Response to I-47-1

Comment rejected. The statute does not expressly forbid chemical recycling, so the regulations cannot lawfully do so, either. Accordingly, no change is appropriate in response to this comment. CalRecycle further rejects this comment for the reasons provided in response to comment O-62-1.

I-48: Katharine Pan

Comment I-48-1

Plastic is everywhere. Bags, utensils, even food from the supermarket comes wrapped in plastic. And all that plastic eventually finds its way into the ocean, harming countless plants and animals along the way. The equivalent of a dump truck of plastic goes into the ocean every 45 seconds. And that makes its way back to our communities. Microplastics have been found in drinking water and even in people's brains. We need tighter regulations on the overabundance of plastic that is harming our environment and our bodies.

The current regulations do not protect against harmful "chemical recycling", which is mostly just a new term for incineration. Burning plastic creates toxic pollutants that further harm our environment and threaten public health. The current regulations unlawfully exclude new, broad categories of products (namely food and agricultural products as well as over-the-counter drugs), which will result in more plastic being sent to landfills or left to pollute our environment. Adding these clauses weakens the original bill and does little, if anything, to address the problem of plastic abundance.

CalRecycle should strengthen regulations so that we can work toward a future where the environment and public health don't have to suffer because of the overproduction of plastic.

Response to I-48-1

CalRecycle partially accepts and partially rejects this comment as described in response to comment O-110-2, which is substantively the same as this one.

I-49: Anonymous

Comment I-49-1

American Home Furnishing Alliance Comments to CalRecycle on EPR Packaging
Re: Public Comments on Draft Regulations for SB 54 – Proposed Exemptions for Furniture Packaging

Dear CalRecycle,

On behalf of the American Home Furnishings Alliance (AHFA), we respectfully submit the following public comments regarding California's draft regulations under Senate Bill 54 (the Plastic Pollution Prevention and Packaging Producer Responsibility Act). We urge CalRecycle to include an explicit exemption for Furniture Packaging associated with finished furniture goods and products.

Product Integrity and Long-Term Protection Are Crucial
Furniture requires robust packaging to safeguard their integrity during long-distance transit from manufacturing facilities to retail showrooms and directly to consumers. One piece of furniture produced and sold domestically can be cross docked an average of more than 13 times before reaching its final destination. Furniture packaging performs a durable, multi-function protective role that ensures products arrive in saleable condition, thereby reducing waste from damage or returns and repairs.

Existing Packaging Compliance Standards Are Already High
AHFA members companies and furniture manufacturers already adhere to rigorous industry standards such as ISTA (International Safe Transit Association) testing and National Motor Freight Classification (NMFC) Rule 181 protocols which verify packaging efficacy and safety. These established practices help prevent damage, reduce returns, and ensure a better environmental outcome. A broad sweep of SB 54's EPR obligations to include furniture packaging would duplicate existing safeguards and introduce unnecessary compliance burdens.

Consistent with Broader Exemption Framework
The proposed regulatory drafts already include exemptions for packaging subject to federal food and agricultural standards as well as secondary/tertiary packaging related to California Redemption Value (CRV) products. Extending the same logic to durable furniture packaging is both consistent and equitable, given its functional parallels.

Administrative and Economic Realities
Including furniture packaging in SB 54's compliance would introduce undue reporting, fee obligations, and operational complexity for producers already committed to ensuring product integrity. Furniture packaging has numerous interpack and covered materials from pamphlet instructions, plastic bags containing screws and hardware, various corner and angle pads, wood skids, etc. Not all packaging in our industry for specific products is the same and no standardization exists because of the unique aspects of our products. The strenuous reporting burden for every aspect of a packaging material adds an enormous amount of work for furniture compliance professions and many furniture manufacturers cannot support or afford to add more compliance workers to their payroll amid constant economic uncertainties and already thin margins in the industry.

Using Inferior Packaging Materials will Increase Carbon Emissions
Requiring furniture manufacturers to replace effective protective interpack materials such as wood skids, Styrofoam, etc. with bulkier or less durable and more expensive substitutes (e.g., honeycomb or excess layers of corrugated paper) will have unintended

environmental consequences. Inferior packaging requires larger and heavier cartons to achieve the same level of product protection, which reduces how many units can be loaded onto a single truck. Fewer units (pieces per load) mean more trucks on the road, more fuel consumed, and ultimately higher greenhouse gas emissions associated with transporting the same amount of furniture into California. Rather than reducing impacts, this shift would inadvertently increase the overall carbon footprint of furniture distribution.

Existing Furniture Packaging Recycling Streams
A significant portion of furniture packaging already flows smoothly into existing recycling streams through well-established dealer delivery and backhaul systems. In most cases, consumers never even handle the packaging materials, as retailers, third-party carriers and delivery partners are responsible for unpacking products, collecting the materials, and channeling them into delineated recycling programs. This closed-loop system ensures that corrugated, foam, and other packaging materials are consolidated at scale, where recycling is most efficient and verifiable. Rather than layering duplicative obligations, a more effective path would be to recognize this existing infrastructure and tie any reporting requirements to measurable commitments from our industry to continue transitioning toward more environmentally friendly materials over time.

Proposed Exemption Language
We propose that CalRecycle explicitly recognize an exemption for packaging used to protect finished furniture goods during transport, on the basis that: It qualifies as “long-term protection” packaging for goods with a lifespan greater than five years and due to our transportation and delivery protocols already demonstrated through ISTA and Rule 181 standards. Furniture packaging is not single-use material but essential to product protection and avoiding waste and limiting more carbon emissions and greenhouses gases into the environment.

Conclusion
AHFA respectfully requests that CalRecycle codify an exemption in the SB 54 regulations for finished furniture goods that meet the criteria outlined above. This approach supports both environmental goals—by preventing damage-related waste—and regulatory intent—by focusing EPR burdens where they will drive meaningful reduction of single-use packaging.
Thank you for your consideration. If helpful, we would welcome the opportunity to discuss supporting data or participate further in the rule-making process.
Sincerely,
American Home Furnishings Alliance

Response to I-49-1

Comment rejected. The commenter requests that CalRecycle "codify" an exemption for a particular category of goods: finished furniture goods. However, CalRecycle does not have general authority to create categorical exemptions not established by statute. In any event, the proposed regulations accommodate the commenter's concerns because any packaging not within a categorical

exemption (e.g., for reusable packaging or for packaging of goods enumerated in Public Resources Code section 42041(e)(2)) might qualify for other exemptions based on public health, safety, and other special compliance challenges. See, e.g., PRC section 42060(a)(3) and (4), and section 18980.2.4 of the proposed regulations. Accordingly, the proposed regulations accommodate that commenter's concerns, and no change is necessary.

To the extent the commenter's suggestion is that Public Resources Code section 42041(e)(2)(F) ("[p]ackaging used for the long-term protection or storage of a product that has a lifespan of not less than five years") applies to transport packaging for furniture goods, CalRecycle declines to adopt that interpretation. That interpretation is untenable on its face because transport packaging is not used for long-term storage; it is used for transporting packaging and expressly identified as non-exempt "packaging" in Public Resources Code section 42041(s)(3).

I-50: Charlotte Ward

Comment I-50-1

Nearly half of all plastic that is produced is intended for one time use, and as a young person growing up in the silicon valley, I have seen the devastating impact that single use plastics lifespan can have on California's environment, and I value California's efforts to break away from their harmful implications. However, the current regulations do not protect against harmful "chemical Recycling", which is mostly just a new term for incineration. Chemical recycling creates toxic pollutants that harm the environment and threaten the public's health and does not reduce the demand for new plastics to be created. I urge CalRecycle to strengthen current regulations to discourage broad exclusions of product packaging and instead institute an exemption process, as well as ensure that only real recycling technologies are allowed in our state.

Response to I-50-1

Comment partially accepted and partially rejected. The commenter requests that CalRecycle "strengthen" the regulations in regard to chemical recycling yet fails to provide any specific changes to the regulatory text by which to accomplish this. Further, regarding the commenter's concerns about "incineration," PRC section 42041(aa)(2)(B) expressly excludes that from the definition of "recycling," and nothing in the regulations contradicts that exclusion. Therefore, no changes concerning chemical recycling are necessary in response to this comment. To the extent the comment proposes that all processes that may be defined as "chemical recycling" be prohibited, CalRecycle further rejects the comment for the reasons stated in response to O-62-1. Regarding incineration specifically, CalRecycle rejects the comment for the reasons stated in response to comment I-6-1. Likewise, no change is necessary regarding the nonspecific assertion that the regulations should "discourage broad exclusions" because the comment does not identify regulatory provisions relevant to that assertion or provide

alternatives for CalRecycle to consider. To the extent that part of the comment was intended to concern the effect and scope of section 18980.2(a)(2) (concerning conflicts with federal law), however, CalRecycle accepts it for the reasons stated in response to comment I-19-1. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2). To the extent it was intended to concern section 18980.2(a)(4)-(6) (regarding medical-related goods), CalRecycle rejects it for the reasons stated in response to comment O-49-1.

I-51: Peter Slote

Comment I-51-1

Unless I am mistaken, there is no statutory prohibition to recipients of SB 54 cost reimbursements (i.e., service providers that make eligible capital investments to process covered materials) from also obtaining or seeking to obtain reimbursement for those same costs from rate payers, that is, "double dipping". The absence of such statutory prohibitions is a glaring omission in legislation expressly intended to shield rate payers of those very costs.

There is a proposed means by which local jurisdictions will be apprised of costs for which their service providers are reimbursed by the PRO. While this will be a helpful tool to enhance transparency, it is not a statutory prohibition from including reimbursed costs in rate payers' rates. "Double dipping" needs to be illegal.

Relying solely on that informational tool to deter fraud and abuse will disproportionately burden local jurisdictions with policing and enforcing the exclusion of reimbursed costs from rates. CalRecycle should not dismiss how burdensome that would be.

High stakes disputes between service providers and local jurisdictions over capital costs are not uncommon, and are often complex, contentious, and costly to resolve. The faith expressed by some who dismiss this threat and think that the routine (and highly variable) local administration of franchise agreements is adequate protection against some portion of the billions in SB 54 reimbursements becoming windfall profits, is misplaced if not terribly naive.

Local franchise agreements are contracts used to establish local services and to fund those services through rates. Local franchise agreements are NOT primarily instruments of law enforcement and should not be relied upon as the primary means to ensure service providers comply with SB 54. At the same time, local franchise agreements rely on state laws and regulations, because franchised service providers are required to follow all laws and regulations, as in any municipal contract. What then would be the basis in law for a local jurisdiction's case, if there is no state statue prohibiting a service provider from including reimbursed costs in its rates? I urge

CalRecycle to incorporate regulations to prohibit "double dipping" uniformly throughout the state and give local franchise agreement administrators a firm legal foundation to reject double dipping should it occur.

Looked at another way, what justifies NOT incorporating a statutory prohibition from including reimbursed costs in rates, in legislation expressly intended shield rate payers from those very costs? "Undue intrusion by CalRecycle in local franchises"? I spent 23 years administering franchise agreements worth billions of dollars in services and I doubt any local franchise administrators would be worried about that whatsoever.

The risk that service providers might include costs for which they are reimbursed in rates is not theoretical. Billions of dollars in capital investments will flow to service providers in the early years of SB 54 implementation. There are myriad means by which providers could foist such costs upon rate payers through misrepresentation, inattention of lack of local controls, misallocation of costs at facilities that serve multiple jurisdictions, brazen profiteering, etc. Given the asymmetrical access to financial information with the service providers having far more information and comprehension than all but the most well-resourced and sophisticated jurisdictions they serve, relying on private and corporate service providers' good faith to diligently exclude reimbursed costs from rates in every instance in every local jurisdiction throughout California is magical thinking, and would fail a reasonable test of due diligence of the state protecting rate payers.

Furthermore, CalRecycle would reasonably be subject to claims of unfunded mandate if it neglects to specify the funding method for these regulations and to clarify that the funding method is NOT local jurisdiction general funds, local ratepayers or taxpayers.

Identifying and incorporating the solution to this flaw in SB 54 should not be the sole responsibility of the PRO. This flaw requires a statutory solution, not a mere procedural tool. However, one common-sense opportunity to help protect rate payers would be to require the PRO to include in its contracts a provision that prohibits recipients of reimbursements from the PRO from seeking to recoup those same costs from any other party, i.e., local jurisdictions or rate payers. Ultimately, CalRecycle must incorporate regulatory prohibitions to deter "double dipping" by service providers and provide local jurisdictions a legal basis to enforce against fraud and abuse.

Response to I-51-1

CalRecycle rejects this comment. The comment primarily identifies a "flaw in SB 54" that the commenter contends "requires a statutory solution." CalRecycle cannot, via regulation, provide such a solution. In any event, to the extent the cost determination and payment process proposed in a producer responsibility plan fails to account for the commenter's concerns about "double dipping" (e.g., costs passed on to ratepayers despite being recovered from the PRO by a recycling service provider), such a plan may be subject to rejection because the plans must provide for funding in a manner that "allow[s] local jurisdictions to protect ratepayers from increased costs" (PRC section 42060(a)(1). A PRO's

plan will be subject to scrutiny with regard to whether it will fund costs accordingly, and revisions may be required pursuant to section 18980.6.2(a), as well as pursuant to section 42051.1(b)(1), which requires plans to detail how the PRO will implement"[a]ctions and investments . . . in order to meet the requirements of [SB 54]." If a plan fails to describe cost determinations and payments with sufficient specificity regarding any relevant requirement, such as those concerning effects on ratepayers, the plan may be subject to rejection. Lastly, CalRecycle does not have the authority to dictate how local jurisdictions allocate SB 54 funds or structure their ratepayer calculations, or any authority over ratepayer assessments. CalRecycle cannot lawfully depart from the statutory provisions in Public Resources Code section 42051.1(g) that require payment of costs to local jurisdictions and recycling service providers incurred due to requirements of the Act. The proposed regulation at section 18980.8 is consistent with the statutory text and legislative intent to pay these costs to local jurisdictions and recycling service providers.

See, also CalRecycle's response to comment O-47-2 regarding effects on franchise agreements.

I-52: Emerson Damiano

Comment I-52-1

Hello, my name is Emerson Damiano, and I grew up in Denver, Colorado, and am now a resident of Los Angeles.

I have always been passionate about reducing plastic pollution because it is an incredibly disastrous problem that causes a multitude of health effects and environmental crises. Microplastics have been found in the deepest depths of the ocean, where humans have little to no access, proving the extent of our impact on our surrounding environments via our plastic production. In fact, the equivalent of one dump trunk of plastic goes into the ocean every 45 seconds.

SB54 was a groundbreaking legislation regarding plastic pollution regulation in the United States. However, this legislation is at risk of being weakened. Current regulations do not at all protect against harmful chemical recycling, which is quite literally just a new term for incineration. Chemical recycling creates toxic pollutants that harm our environment and threaten public health and does not reduce demand for new plastic to be created. Additionally, these regulations unlawfully exclude new, broad categories of products, such as food and agricultural products or over-the-counter drugs, which leaves more plastic to pollute the environment.

Therefore, CalRecycle should strengthen the regulations so that only real recycling technologies are allowed in our state, not chemical recycling. CalRecycle should also not allow for board exclusions of packaging for the aforementioned products, but instead institute an exemption process.

Response to I-52-1

CalRecycle partially accepts and partially rejects this comment as described in response to comments I-50-1 and O-110-2, which are, collectively, substantively the same as this comment.

I-53: Felix Byrne

Comment I-53-1

Dear CalRecycle,

The excessive plastic pollution in our world is harming both the environment and people's health everywhere. California's original Plastic Pollution Producer Responsibility Act that mandated to reduce the production of plastic products. That however, will all be pointless if Governor Newsom and CalRecycle allow for what is called "chemical recycling".

The process of "chemical recycling" is contradictory to the original goal, as it takes a great amount of energy, causes pollution itself, and does nothing to stop the production of single-use plastics. This takes away the entire point of the act in the first place, and is not an alternative to the solution.

That is why I, alongside CALPIRG, urge CalRecycle to stand by the original Plastic Pollution Producer Responsibility Act SB 54. This will greatly reduce the use of plastic and plastic pollution in California, therefore helping prevent them from being tossed into our ecosystems, harming plant life and animal life, as well as protecting communities from the health dangers that come with improper disposal and use. If we don't start to change now, it will be too late.

Response to I-53-1

Comment rejected. Regarding "chemical recycling," the comment neither identifies any particular process ("chemical recycling" is a generic term) nor suggests alternative approaches for CalRecycle to consider. Accordingly, no change is appropriate in response to this comment. Please also see responses to I-6-1, I-19-1, I-25-1, and O-6-1.

I-54: Zach

Comment I-54-1

The hijacking of this bill by the plastic packaging industry is nothing short of insidious and self-defeating. The people of CA deserve better than this kowtowing.

Response to I-54-1

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment I-54-2

Exemptions are out of hand, they should be addressed individually, not as a group or sector.

Response to I-54-2

CalRecycle rejects this comment because it lodges a general objection but identifies no specific part of the regulations at issue and offers only a vague suggestion. To the extent a response is required, CalRecycle interprets the suggestion to be that the regulations should not implement any categorical exemptions. That suggestion is untenable because statute expressly calls for certain categorical exemptions in Public Resources Code section 42041(e)(2); the regulations cannot nullify those provisions, nor can they disregard the directive in section 42041(b) that the regulations avoid conflicts with federal laws and regulations.

Comment I-54-3

End the production of single use plastics via their sale in California. That will make a big difference that the industry will need to follow. This bill is instead rolling over to industry and letting them decide on the free market what works.

Response to I-54-3

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment I-54-4

Do not permit "industrial" recycling, or what ever the burning of materials is called. It harms our work in environmental justice and the least fortunate communities in our state.

Response to I-54-4

Comment rejected. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42041(aa) and 42060, and no change is necessary to the implementation of the Act. The comment neither identifies any particular process ("industrial recycling" is a generic term) nor suggests alternative approaches for CalRecycle to consider. To the extent CalRecycle can discern what the commenter means by "industrial recycling," no change is necessary or appropriate. The statute does not expressly forbid "industrial recycling," so the regulations cannot lawfully do so, either. A complete ban on any technology could have been accomplished through straightforward language establishing a prohibition based solely on the type of technology.

Instead, the Legislature chose to word statute in a way that requires consideration of hazardous waste generation, not mere consideration of the type of technology. Finally, regarding "the burning of materials"—i.e., incineration—PRC section 42041(aa)(2)(B) expressly excludes that from the definition of "recycling," and nothing in the regulations contradicts that exclusion.

I-58: Sandy Farley

Comment I-58-1

At a time when federal safety regulations are being weakened, California should be taking the lead in pressing for greater protections for our people [and our planet.]

Response to I-58-1

Comment rejected. No substantive response is required because the comment raises general concerns without stating any specific recommendation or explanation of its objections to the proposed regulations.

I-59: Lori Marra

Comment I-59-1

Please see attached comments related to the draft SB 54 regulations released on August 22, 2025. Fremont appreciates CalRecycle’s responsiveness to several concerns and recommendations that were raised by local government and other stakeholders after the May 2025 draft regulations were released. While we understand the need to finalize regulations given the regulatory restart, we believe there are still several areas in the draft regulations that do not fully align with the intent of SB54.

Please consider the following comments and suggestions to honor the intent to make producers/manufacturers responsible for all costs related to recycling plastic packaging after 2023 and make local governments whole for costs associated with the law’s implementation.

Thank you.

Response to I-59-1

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it only references the commenter's recommendations; it doesn't set those recommendations forth. To the extent the issues raised require responses, CalRecycle has addressed them in response to other portions of the submission discussing the issues in detail.

Comment I-59-2
Article 2: Covered Material and Covered Material Categories

Categorically Excluded Materials – 18980.2

The May 2025 version of the draft regulations added for the first time in the rulemaking process a new pathway for packaging components to be excluded from the law if it is "necessary to comply with rules, guidance, or other standards issued by the [USDA] or [FDA] … to prevent microbial contamination or to maintain the safety or structural integrity of packaging…."

Thank you for the revisions made in section 18980.2(a)(2) of the August 2025 (current) version of the draft regulations to clarify these exclusions only apply when "it is not reasonably possible to use other packaging or packaging components…" and requiring that entities must provide rationale to the Department, including the conflicting federal regulation and explanation as to why no reasonably possible alternative packaging is available.

We support the addition requiring the Department to review exclusion requests and maintain a public list of determinations.

The Department has stated this new categorical exclusion is intended to provide further clarity to statute section 42060(b) which, in summary, states that SB 54's regulations should not conflict with other federal packaging requirements. We believe that should such a conflict arise, producers can utilize the exemption pathway within subparagraph (4) of section 18980.2.4 Exemptions for Certain Covered Materials for (A) unique challenges, (C) health and safety reasons, or (D) materials determined unsafe to recycle.

Unlike categorically excluded materials, exempted materials remain covered under the law, meaning regulated producers must still report and pay fees into the system, with a required phase-in plan to ultimately achieve compliance. Exemptions are also limited to 2-5 years, while excluded materials are permanently removed from the law's purview.

Recommendation:

We urge CalRecycle to remove section 18980.2(a)(2) from the draft regulations and instead rely on the existing exemption process (18980.2.4) for packaging or packaging components used by food or agricultural commodities that are unable to comply with SB54 due to conflicting federal regulations. If CalRecycle determines that section 18980.2(a)(2) must remain in the regulations, we would like to offer the following revisions to improve the current approach:

• Exclusion vs. exemption rationale – Entities should be required to explain why an exemption under section 2.4 does not apply in their case, providing the statutory basis

to exclude their packaging or component from the law entirely rather than request an exemption based on unique challenges or health and safety reasons.

The Department must be able to evaluate the basis for an exclusion vs. exemption and redirect requests to a more appropriate exemption pathway when applicable.

Suggested revisions to section 18980.2(a)(2)(A):

"The basis shall identify the specific provision of this Chapter that causes a conflict, cite the conflicting federal regulations or rules, or guidelines, and explain why no reasonably possible alternative packaging or packaging component is available and why the exemption pathways outlined in section 189890.2.4 do not apply."

Note: We also recommend removing "guidelines" (as shown above), as federal guidelines are not always statutorily compelling.

• Time limits – Packaging design and recyclability are shifting rapidly as a result of SB54. As such, materials excluded under section 18980.2(a)(2) should be limited to 2-5 years, just as exemptions are (18980.2.4(g)) and a phase-in plan or rationale for why a phase-in plan is not feasible should be required, similar to section 18980.2.4(c)(4)(A)viii for exemptions.

Innovation and development of responsible end markets will likely create new compliance pathways for materials that are currently unable to meet the requirements of the law. Excluding currently challenged materials from the law indefinitely goes beyond statutory intent, and should future conditions change, there must be a pathway to integrate excluded material back into the law.

Fremont is also opposed to the addition of language that exempts packaging used for over-the-counter drugs (18980(a)(6), and we oppose the regulatory change that exempts secondary and tertiary packaging of exempted and excluded primary packaging (18980(b)). We feel these changes go beyond the intent of the authors and many stakeholders that negotiated this bill.

Response to I-59-2

CalRecycle partially accepts and partially rejects this comment. CalRecycle rejects the commenter's suggestion to rely only on the exemption process set forth in section 18980.2.4. That suggestion would collapse Public Resources Code section 42060(b) concerning conflicts with federal laws and regulations into the exemption provision of section 42060(a)(3), effectively ignoring the directives of the former. Construing statute by ignoring specific parts of it is not a legitimate approach to statutory interpretation, and the commenter does not suggest that exemptions authorized under section 42060(a)(3) would adequately avoid the conflicts described in 42060(b).

CalRecycle also rejects the recommendation to remove the term "guidelines." The statute itself uses that term, and it uses it as an example of "a federal law or regulation," not a non-mandatory suggestion by federal government entities.

Nor is any revision to address time limits necessary. The proposed regulations place no limitation on when CalRecycle can scrutinize determinations that packaging is exempt due to conflicts with federal law. Therefore, contrary to the commenters assertion, there is a ready "pathway to integrate excluded material back into the law."

CalRecycle accepts this comment, however, to the extent it asserts that section 18980.2(a)(2) was unclear or potentially overbroad. See CalRecycle's response to comment I-19-1. CalRecycle also accepts this comment to the extent it was intended to assert that the term "guidelines" was unclear because it was not limited to mandatory guidelines. The proposed regulation has been revised to expressly state that it applies only to mandatory guidelines. Such an interpretation is logically necessary because it is not possible for a non-mandatory "guideline" to create a direct conflict with the Act; such a guideline imposes legal no obligation and therefore does not interfere with complying with the Act and federal laws and regulations simultaneously.

Regarding the exemption for over-the-counter drugs, CalRecycle rejects the commenter's suggestion for the reasons stated in response to comment O-49-1. Regarding secondary and tertiary packaging, CalRecycle rejects the commenter's objection because statute expressly includes both secondary and tertiary packaging within the definition of "packaging." See, also, CalRecycle's response to comment O-33-6. Moreover, the commenter appears to misread the clear meaning of 18980.2(b). The commenter asserts that that provision "exempts secondary and tertiary packaging of exempted and excluded primary packaging." That provision, however, only states that secondary and tertiary packaging is included in the types of packaging that may be "used for a good or used to contain a good." While that may affect the scope of packaging exempt from the law altogether because it contains one of the goods described in Public Resources Code section 42041(e)(2), it does not affect the scope of section 18980.2(a)(2) of the proposed regulations. That provision concerns the packaging itself and does not say that all packaging used for a particular good is excluded if any of the packaging used for that good is excluded. In every case, packaging is only excluded if it satisfies the requirements stated in section 18980.2(a)(2). See, also, CalRecycle's response to comment O-13-3.

Comment I-59-3

Article 3: Evaluations of Covered Material and Covered Material Categories

Eligibility for Being Labeled “Compostable” – 18980.3.3

AB 1201 prohibits materials from being labeled “compostable” unless they meet specific criteria, including the requirement to be “designed to be associated with the recovery of

desirable organic wastes, such as food scraps and yard trimmings, that are collected for composting, unless the product complies with the department's regulations pursuant to subparagraph (B), to the extent the department elects to adopt such regulations." (PRC 42357(g)(E))

Section 18980.3.3(5) of the draft SB54 regulations clarifies that an item is designed to be associated with the recovery of desirable organic waste "if it is desirable organic waste itself or is marketed, labeled, or otherwise sold or distributed in a manner that directs or otherwise causes users of the item to use and discard it with desirable organic waste."

This regulatory framing essentially provides that any material marketed or labeled to be composted, is considered "associated with the recovery of desirable organic waste" and therefore potentially compostable under SB 54 (if other criteria are met). The intent of section 42357(g)(E) is that a product facilitates the capture of desirable organics, such as food scraps and yard waste. Section 18980.3.3(5) of the current draft regulations effectively says that to be able to be labeled "compostable," a product simply needs to be labeled "compostable," provided it meets the other criteria in section 42357. Allowing all packaging and food ware, regardless of its material composition, bearing a "compostable" label to be considered "desirable" was certainly not the intent of AB 1201, and the draft regulations must be updated to close this unintended loophole. Further, while the SB54 regulations will only affect food ware and packaging, including this definition in these regulations could open the door for the same or similar circular logic to be applied to other products seeking to be labeled compostable.

Recommendation:

We recommend deleting the following sentence from section 18980.3.3(5) of the draft regulations:

"They must satisfy the requirement set forth in subparagraph (E) of paragraph (1) of subdivision (g) of section 42357 of the Public Resources Code concerning association with the recovery of desirable organic wastes. For purposes of this requirement an item is designed to be associated with the recovery of desirable organic waste if it is desirable organic waste itself or is marketed, labeled, or otherwise sold or distributed in a manner that directs or otherwise causes users of the item to use and discard it with desirable organic waste."

Response to I-59-3

Comment rejected. The commenter misdescribes the proposed regulation, which refers to labeling that causes users to discard an item with desirable organic waste, not labeling of the item itself as desirable organic waste. In other words, contrary to the commenter's assertion, the proposed regulation does not purport to consider material "desirable" based on how they are labeled. Rather, such circumstances are relevant to determining exactly what statute requires: whether the material is "designed to be associated with the recovery" of those "desirable"

materials. Moreover, as the commenter acknowledges, 18980.3.3(c)(5) states one criteria among many necessary criteria; it is not an independently sufficient one. Therefore, it cannot possibly create any "loophole" that would negate the other criteria. The only effect a necessary but not sufficient condition can have is to make the necessary criteria, as a whole, more restrictive; it cannot bring more circumstances into the range of those that satisfy the criteria. But the commenter's proposed change (deleting the second sentence of 18980.3.3(c)(5)) would not improve the restrictiveness of 18980.3.3(c)(5); it would only make it more uncertain and could even render it more inclusive because it would render 18980.3.3(c)(5) a mere recitation of Public Resources Code section 42357(g)(1)(E) instead of replacing the deleted text with a narrower interpretation of that provision. In other words, even if the commenter were correct that the proposed regulation interprets the statute too broadly, the proposed change would be inadequate to achieve the commenter's desired effect of more narrowly interpreting statute.

Comment I-59-4

Article 4 – Responsible End Markets

Alternative Recycling Technologies – 18980.4(d)

PRC section 42041(aa)(5) states that the SB54 regulations “shall encourage recycling that minimizes generation of hazardous waste, generation of greenhouse gases, environmental impacts, environmental justice impacts, and public health impacts. The regulations shall also include criteria to exclude plastic recycling technologies that produce significant amounts of hazardous waste.” However, section 18980.4(d)(B) in the current version of the draft regulations goes against this statutory direction and shifts the standard from the generation or production of hazardous waste to its management.

The draft regulations enable — not exclude — technologies that produce significant amounts of hazardous waste, unlawfully shifting the standard from the production of hazardous waste (as required by the statute) to its management. Therefore, the threshold of avoiding only those technologies where hazardous waste is improperly managed and “presents an imminent and substantial risk of harm to public health or to the contamination of the environment” does not achieve the statutory mandate. Further, the draft regulations state that any hazardous waste handled and disposed of in “substantial compliance with an applicable permit” does not pose an imminent and substantial risk. This, too, conflicts with statutory guidance and legislative intent to exclude technologies based on the generation, not management, of hazardous waste.

Additionally, the regulations still fail to address the statutory requirement to encourage minimization of the “generation of greenhouse gases, environmental impacts, environmental justice impacts, and public health impacts.” (The draft regulations currently only address hazardous waste generation/management.) We urge the

Department to add provisions to address these critical concerns and meet the statutory directives.

Response to I-59-4

CalRecycle rejects this comment for the reasons stated in response to comment O-62-1.

Comment I-59-5

Compostability of plastic – 18980.4(a)(4)(B)

We appreciate clarification of the use of the term “fully biologically decompose,” and reference to the ASTM D-6400 standard. We strongly support the Department’s requirements for items “partially or wholly comprising plastic.” Visible particles of compostable plastic in compost products hamper the marketability of those products. There is also a growing body of research showing the compostable microplastic residue has detrimental effects on plant and soil health, and potentially human health.

Compostability of paper and fiber – 18980.4(a)(4)(C) and 18980.3(c)(4)

We completely support the regulatory approach to have different compostability standards for paper and fiber than for plastic. However, with the requirement for testing from an independent laboratory in section 18980.3(c)(4) removed, we are concerned the new proposed compostability standards for paper and fiber may provide a perverse incentive for bad actors to maintain vague or otherwise insufficient documentation demonstrating that the fiber truly is “wholly derived from natural resources.” CalRecycle should require verification of or attestation that a product is wholly derived from natural resources to be submitted.

Response to I-59-5

Comment rejected. With regard to the "Compostability of plastic" portion of this comment, no substantive response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process.

With regard to the "Compostability of paper and fiber" portion of this comment, comment rejected for the same reasons provided in response to comment O-68-6.

Comment I-59-6

Article 8 – Producer Responsibility Plan RequirementsProducer Responsibility Plan Requirements

Reimbursable costs – 18980.8(g)

We appreciate the addition to this section requiring that the PRO or Independent Producer “first” notify the local jurisdiction when costs are deemed covered for a recycling service provider. The notification of payments prior to issuance to service providers supports the transparency needed to help ensure producer payments are not being made for costs already included in solid waste rates.

Response to I-59-6

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment I-59-7

Article 11: Requirements, Exemptions, and Extensions for Local Jurisdictions and Recycling Service Providers

Local jurisdiction requirement – 18980.11(b)

PRC section 42060.5 states “local jurisdictions or recycling service providers shall include in their collection and recycling programs all covered material” contained on the statewide recyclable / compostable list. The current draft of the regulations provides that a “covered material is considered included in a local jurisdiction or recycling service provider’s collection and recycling program if the local jurisdiction or recycling service provider collects the covered material and transfers it to responsible end markets directly or to intermediate supply chain entities.”

We believe that including the requirement to also transfer recyclable and compostable covered material goes beyond the statutory requirement for local jurisdictions. This framing also makes it difficult to attribute violations to the correct party. It must be clear where the enforceability for a violation of this requirement ends for the jurisdiction and the point at which that responsibility is transferred to a recycling service provider or an intermediate supply chain entity. Jurisdictions need clear guidance on what’s expected for compliance and how compliance will be determined.

Recommendation: Delete “and transfers it to responsible end markets directly or to intermediate supply chain entities.”

Response to I-59-7

Comment rejected. The requested deletion would be inappropriate because it would suggest that local jurisdictions could, for any reason or no reason at all, dispose of materials in landfills and still be considered to comply with Public Resources Code section 42060, which requires local jurisdictions or their recycling service providers to include certain covered material in their collection and recycling program. Affording local jurisdictions and recycling service providers that discretion would render section 42060.5(a) wholly meaningless, and the Legislature could not reasonably have intended that outcome. Moreover, the commenter's concern over how compliance will be determined is unfounded.

As explain in response to comment I-66-1, there is no lack of clarity as to how to comply or ambiguity as to "where the enforceability for a violation of this requirement ends for the jurisdiction and the point at which that responsibility is transferred to a recycling service provider or an intermediate supply chain entity."

Comment I-59-8

Article 13: Enforcement Oversight by the Department

The draft regulations must recognize that SB54's Enforcement Authority is limited to producers and the PRO and respect that local jurisdictions and recycling service providers are instead subject to existing enforcement regimes under AB 939. Great lengths are taken in statute to outline the potential enforcement actions that can be imposed against producers or the PRO, yet there is not a single instance in statute that refers to enforcement upon local jurisdictions or recycling service providers. Neither Public Resources Code Sections 42080 nor 42081 contemplate penalties against local governments or recycling service providers.

Local jurisdictions are subject to AB 939's diversion requirements and must develop source reduction and recycling elements outlining how they will achieve the state's solid waste and recycling requirements. Under the AB 939 framework, CalRecycle is required to regularly review jurisdictions and determine whether they have made a good faith effort to implement their source reduction and recycling element, with penalties of up to $10,000/day for noncompliance. Therefore, a local jurisdiction's failure to comply with SB54 should be considered a violation of their existing requirements to implement diversion programs through AB 939 and subject them to these penalties exclusively.

Reporting and compliance review for SB54 should be incorporated into existing Electronic Annual Report (EAR) system run by CalRecycle, as currently utilized for other laws that govern local jurisdiction diversion requirements such as SB1383, AB341, and AB1826 compliance. This existing system can be updated to require local jurisdictions to self-report SB54 compliance by certifying whether they include the required recyclable or compostable covered materials in their programs.

We appreciate the CalRecycle team's openness to feedback and continued dialogue to ensure the final regulations will provide for successful implementation of the law.

Response to I-59-8

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements set forth in the Act, including in sections 42060, 42060.5, and 42081 of the Public Resources Code, and the recommended change is not necessary to the implementation or enforcement of the Act. Section 42081(a)(1) provides that CalRecycle may issue a notice of violation to, and impose an administrative civil penalty not to exceed fifty thousand dollars ($50,000) per day per violation to, any entity not in compliance with the Act or any of the regulations adopted to implement the Act. Section 18980.13.2(a) of the proposed regulations implements this statutory provision by specifying that any entity, including a local

jurisdiction or recycling service provider, not in compliance with the Act is subject to penalties pursuant to section 42081(a).

I-60: Abby Taylor-Silva

Comment I-60-1

On behalf of the signatory organizations (collectively referred to as “organizations”) listed below, we are submitting comments on CalRecycle's recently released draft regulatory language for the Plastic Pollution Prevention and Packaging Producer Responsibility Act (SB 54). Together, our organizations represent companies that will potentially fall under this regulation's scope. The comments presented in this letter reflect the shared perspectives of the undersigned agricultural organizations and are submitted in response to your request for public input.

Response to I-60-1

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment I-60-2

ARTICLE 2: Covered Material and Covered Material Categories

Section 18980.2. Categorically Excluded Materials

We continue to support the categorical exclusions for food and agricultural products that fall under specific state and federal regulations, guidance, or standards. When providing food and agricultural products and their packaging to consumers, critical considerations include protecting human and environmental health through food safety practices and preventing the spread of pests and diseases. Additionally, food quality assurance, through packaging that protects food in transport, at the point of sale, and when handled by the consumer, plays an essential role in minimizing food waste.

Therefore, we support the draft proposal's Section 18980.2, which corresponds to the statutory authority (PRC, Section 42060 (8)(b)(2)) and provides clarity related to the definition of categorically excluded materials required to meet federal rules, guidance, or standards.

Section 18980.2.(a)(2)(A) Categorical Exclusion Reporting and Disclosures

We urge CalRecycle to carefully balance the need for consistent and transparent processes in determining categorical exclusions with the potential risks that publishing detailed lists of packaging information could pose. Such disclosures may inadvertently expose affected entities to harmful actions from the public or competitors, potentially damaging their business interests.

In Section (a)(2)(A), we propose the following language be added (suggested new language in italics) and the strikethrough language removed:

(A) The Department shall maintain on its website a publicly available electronic database of each such determination that includes the entity name, a *general description of* ~~the specification for~~ the packaging and the associated product(s), and the status of any review by the Department of such determination.

Encouraging Consistent Processes in Article 2

Article 2 identifies several product categories that may qualify for categorical exclusions or exemptions from this regulation, as detailed in the following sections:

- Section 18980.2. Categorically Excluded Materials
- Section 18980.2.1. Exclusion of Reusable and Refillable Packaging and Food Service Ware
- Section 18980.2.2. Exclusion of Certain Types of Packaging
- Section 18980.2.3. Exemptions for Specific Material with Demonstrated Recycling Rates
- Section 18980.2.4. Exemptions for Certain Covered Materials
- Section 18980.5.2. Exemptions for Small Producers

The categorical exclusion process for packaging required to meet federal rules, guidance, or standards is clearly defined, and we recommend no changes to Section 18980.2(a)(2) other than the language amendment mentioned above regarding what is posted to the website.

The exemptions related to small producers and covered material that present unique challenges; health and safety concerns; are unsafe to recycle; and specific material with demonstrated recycling rates all include application requirements and some indication of approval criteria.

However, the process of requesting an exclusion for certain types of packaging (e.g., long-term storage, de-minimis weight or volume) or reusable and refillable packaging and food service ware does not detail an approval process. The same is true for exclusions for devices, drugs, and packaging for medical products.

We encourage consistent process details to be included throughout the sections in Article 2 that at a minimum describe the following for each exclusion and exemption process, and clearly states that all exemption or exclusion requests are submitted to CalRecycle, which is also responsible for any qualification determinations:

- What is the process for notification and response regarding whether the application is sufficient?
- What is the timeline for response?

Response to I-60-2

Comment partially accepted and partially rejected. Regarding 18980.2(a)(2)(A), CalRecycle accepts the comment to the extent it suggested removal of the phrase "the specification for." CalRecycle declines to replace that phrase with "a general description of" because descriptions of packaging need to be specific enough (i.e., not "general") to clearly identify the packaging at issue. Instead, the revised regulations require notices to "specifically describe" the packaging at issue (see 18980.2(a)(2)(B)). CalRecycle makes that revision to provide greater clarity, not to address the commenter's concern regarding the alleged potential for the disclosure of packaging information resulting in "harmful actions from the public or competitors." As explained in response to comment I-63-7, such concerns are not legitimate bases for protecting information. The commenter's other proposal is for "consistent process details" for the exclusions and exemptions other than the one addressed in 18980.2(a)(2). However, the proposed regulations lay out the substantive elements of submissions, when required, and a regulation is not necessary for CalRecycle to implement notification practices as needed to fulfil regulatory requirements. Regarding timelines for responses, CalRecycle cannot reasonably predict the precise timeline required to process all submissions to it, and the statute and regulations provide ample ways to ensure that entities do not incur penalties when waiting for the processing of reasonable exemption requests. Corrective action plans and the factors set forth in Public Resources Code section 42081(c) ensure that producers will not face unjust penalties. CalRecycle accepts this comment, however, to the extent that the request for "process details" concerns exclusions under 18980.2(a)(2)(A). Significant procedural details have been added to 18980.2(a)(2)(A) through (F), providing clarity concerning how submissions are to be made, what they must contain, how and when CalRecycle will initially review them and provide a response, and special limitations on submissions concerning submissions for substantially similar packaging.

Comment I-60-3

ARTICLE 6: Requirements for the Producer Responsibility Organization Section

18980.6.4. Producer Responsibility Plan Amendments

This article outlines the approval process for producer responsibility plans, both for initial submission and updates. In both instances, the plan is reviewed by the advisory board and the public, with an opportunity for public comment.

However, when the PRO amends an existing plan, the article requires advisory board review but omits any mention of public comment, unlike the process for initial submissions and updates.

This discrepancy in process is problematic. Producers who could face substantial impacts from plan amendments, as well as other affected parties, must have the opportunity to submit comments before amendments take effect.

In Section (a) and (b), we propose the following language be added (suggested new language in italics) and the strikethrough language removed:

(a) If paragraph (1) of subdivision (e) of section 42051.2 of the Public Resources Code requires a PRO to submit a proposed plan amendment to the advisory board, the advisory board shall have no more than 60 calendar days to review the amendment and provide comments to the PRO. *Affected parties shall receive notice of the amendment and be afforded an opportunity to submit public comments during the same comment period.*

(b) The PRO shall include, with the proposed plan amendment submitted to the Department as required in paragraph (1) of subdivision (e) of section 42051.2 of the Public Resources Code, a summary of all comments received from the advisory board *and affected parties*, and identify revisions, if any, made in response to the comments.

Response to I-60-3

CalRecycle rejects this comment. See the response to comment B-13-8.

Comment I-60-4

ARTICLE 13: Enforcement Oversight by the Department and Administrative Civil Penalties

Section 18980.13.2. Administrative Civil Penalties

The current draft regulation includes the following:

“Any entity, such as a PRO, producer, local jurisdiction, recycling service provider, retailer, or wholesaler, not in compliance with the Act or this chapter is subject to penalties pursuant to subdivision (a) of section 42081 of the Public Resources Code. If a PRO acting on behalf of its participants causes participants to be in violation of the Act or this chapter, such participants shall not be exempt from penalties on the grounds that their noncompliance was caused by the PRO’s conduct.”

The statute creates a producer responsibility system where joining a PRO is the primary compliance pathway (PRC Section 42051(b)). Producers are effectively required to either join a PRO or become Independent Producers. By requiring PRO participation and then holding producers responsible for PRO failures, the draft regulation creates an untenable situation where producers must participate in a system but remain fully liable for its mistakes.

Once producers join a PRO, they have limited to no ability to control operational decisions, oversee implementation of the plan, prevent management failures, and monitor day-to-day compliance activities. Therefore, holding producers liable for conduct by the PRO violates basic principles of fairness and due process. This provision essentially discourages PRO participation because producers are laden with substantial risk and limited control. Additionally, there is no safe harbor for good faith participation in the PRO in the proposed regulation.

While this draft regulation conflates responsibility for a PROs violation, the statute clearly does not do so.

“Failure to comply with the requirements of this chapter, including, but not limited to, failure by a PRO to implement and satisfy the requirements of its plan, shall subject a PRO, producer, wholesaler, **or** retailer to penalties for violations as set forth in this article or revocation of an approved plan. The department may conduct investigations, including by inspecting operations, facilities, and records of producers and PROs and by performing audits of producers and PROs, to determine whether entities are complying with the requirements of this chapter.” (PRC Section 42080(a))

Producers and the PRO should each be responsible for their own actions, and producers who comply with the PRO obligations, such as paying fees, providing accurate data, following PRO requirements, should not be held liable for any of these done on a reasonable basis and in good faith.

In Section (a), we propose the following language be added for clarity (suggested new language in italics) and the strikethrough language removed:

(a) Any entity, such as a PRO, producer, local jurisdiction, recycling service provider, retailer, or wholesaler, not in compliance with the Act or this chapter is subject to penalties pursuant to subdivision (a) of section 42081 of the Public Resources Code. If a PRO acting on behalf of its participants causes participants to be in violation of the Act or this chapter, such participants shall not be ~~exempt from penalties on the grounds that~~ *held responsible if they are deemed* ~~their noncompliance was caused by~~ noncompliant due to the PRO’s conduct.

Response to I-60-4

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements set forth in the Act, including in PRC sections 42050, 42051, 42057, 42060, 42080, and 42081, and the recommended change is not necessary to the implementation or enforcement of the Act. Consistent with PRC sections 42080 and 42081 and sections 18980.13 and 18980.13.2 of the proposed regulations, and based on the considerations set forth in PRC section 42081(c), CalRecycle may initiate an enforcement action and impose penalties as appropriate against any party that, through its own distinct condition, action, or course of action constituting or resulting in a violation of a requirement, causes a violation of the Act. The language included in section 18980.13.2(a) of

the proposed regulations is intended to clarify that, while a PRO may act on behalf of its participating producers in complying with various requirements of the Act for which producers are primarily responsible (see, e.g., section 42051), such producers will not be exempt from penalties for violations of the Act for which they ultimately share a portion of the responsibility. Consistent with PRC section 42081(c), penalties will be imposed on a producer only to the extent the producer has caused or is responsible for the PRO's failure to comply with the requirements of the Act on its behalf. Moreover, to the extent this comment addresses principles of fairness and due process, in every instance, a penalized party will be afforded the opportunity to challenge the appropriateness of the applicable penalty through the administrative hearing process, as described in section 18980.13.4 of the proposed regulations. Therefore, no further change is necessary to ensure that a PRO and participant producers will be responsible for their own actions under the Act.

Comment I-60-5

ENSURE ALIGNMENT WITH STATUTE INTENT RELATED TO CURRENT EPR PROGRAMS

Avoid Conflict with Existing EPR Programs to Protect Valuable Asset and Resource

The statute clearly states that the PRO's plan shall include objective and measurable criteria to describe how the plan is "not in conflict with, disruptive of or adversely affecting the performance of the solid waste network providing services in accordance with local solid waste handling requirements and the intent described in Section 40004, and how the PRO will leverage and utilize existing collection programs and recycling, composting, sorting, and processing infrastructure" (PRC, Section 42051.1). The statute recognizes the valuable asset existing programs are to the state, and the importance of sustaining and expanding upon those.

The producers herein depend upon agricultural inputs for their operations. As such, we request CalRecycle and CAA recognize the unique success of existing EPR programs servicing agricultural input manufacturers in furthering recyclability and not implement duplicative regulatory obligations.

Thank you for your consideration of our comments, we look forward to your response. Please contact us if you have any questions.

Response to I-60-5

CalRecycle rejects this comment. The commenter accurately cites SB 54; however, the commenter raises general concerns without stating any specific recommendation or explanation of its objections to the proposed regulations. In particular, the commenter's request that "CalRecycle and CAA recognize the unique success of existing EPR programs" does not concern the regulations themselves, and, even if it did, the commenter does not identify any "existing

EPR programs," suggest how CalRecycle could "recognize" their successes, or identify which provisions of the proposed regulations it claims impose "duplicative regulatory obligations."

I-61: Matt Sutton

Comment I-61-1

The California Restaurant Association (CRA) is the definitive voice of the state's food service industry, representing nearly 22,000 eating establishments. Restaurants represent one of the most regulated employment sectors and regularly operate on razor thin profit margins. Given this, implementing new mandates in an already strict regulatory environment makes it challenging to mitigate negative impacts on these restaurant employers.

The Act requires California to fundamentally change its approach to managing the production and disposal of single-use packaging and plastic foodware by prioritizing waste reduction and moving to a circular economy that requires a reduction and recycling rate of 25% and 65% respectively by 2032.

Given the monumental task proposed under this regulatory scheme, we ask that CalRecycle, continue to take into consideration the burden of expanding mandates for restaurants within SB 54 and across local jurisdictions. Regulations in SB 54 must also ensure that recycling facilities are in place to reduce the costs to neighborhood restaurants that participate in the collection and of covered products.

The statewide restaurant community continues to suffer from some of the most inhospitable operating environments in the nation, and we must exercise extreme caution in adding on new mandates and direct costs to these neighborhood restaurant operators.

While key issues for restaurants are identified in the CalChamber coalition letter to you, this letter provides additional feedback, clarity and context:

Response to I-61-1

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment I-61-2

I. Ability for entities to reach agreement on who will report to CAA with respect to a given item.

Recommendation: Model language like Minnesota's EPR statute to help ease the burden on industry and allow businesses to comply with this law effectively.

In defining producers, Minnesota's statute, Minn. Stat. § 115A.1441, Subd. 26(a)(6), states that "[a] person is the producer of a covered material sold, offered for sale, or distributed in or into this state, as defined [in the preceding clauses], except: (i) where another person has mutually signed an agreement with a producer . . . that contractually assigns responsibility to the person as the producer, and the person has joined a registered producer responsibility organization as the responsible producer for that covered material under this act. In the event that another person is assigned responsibility as the producer under this subdivision, the producer [under the preceding clauses] must provide written certification of that contractual agreement to the producer responsibility organization[.]"

This language allows for an entity identified as a producer to contractually assign that responsibility to any willing party, so long as that party (1) joins a registered PRO and (2) provides written certification of the contractual agreement to the PRO.

Not only will this allow businesses to comply with SB54 in a way that fits their individual business models, but it will cut down significantly on administrative burden to both CalRecycle and CAA in having to field questions and give guidance on every possible producer obligation scenario that might arise.

Additional Context:

We have encountered multiple instances where reasonable minds may differ as to whom the Obligated Producer should be under the law. (*Is the item "branded?" What if it is co-branded? Is the party a "licensee" of the brand?*) At some point the discussion must end to meet deadlines, and the parties necessarily come to a contractual agreement to settle the debate.

As written, the draft SB 54 regulations appear to allow for this, but as written, the reader must first cross-reference at least two statutes and sift through extremely long hierarchies for determining the producer of both food service ware and packaging.

With so much to parse through, the process of identifying who is or may be the obligated producer in California is rife with opportunity for multiple (and conflicting) interpretations.

Even though the law provides for a scenario where there are "multiple brands or trademarks that may be designated [as the producer]", proposed 14 CCR 18980.1.1(e)(5) states "the owners of brands or trademarks may agree among themselves to designate one of the brands or trademarks [as the producer], provided that the owner or a licensee of that brand or trademark satisfies the criteria to be the producer under this subdivision."

Even assuming all parties can agree on reaching this point in the "decision tree", it appears that the terms "owners of brands or trademarks" and "owner or a licensee of

that brand or trademark" are interchangeable, which muddies the waters on who may enter into such an agreement.

We do not believe California intends to prohibit contractual agreements on the topic – especially since the ability to enter into such an agreement clearly exists in some form as written.

As it stands, however, such agreements appear to be technically allowed, but the waters are so muddied that it will be nearly impossible for parties to come to any agreement – and certainly not without long and protracted negotiations. kri

Response to I-61-2

CalRecycle rejects this comment because it requests statutory changes, not changes to the proposed regulations. Even if the commenter intended to suggest that the regulatory text be modified to mirror the Minnesota statute quoted in the comment, CalRecycle rejects the comment because those changes would fundamentally alter the definition of "producer," which is set in statute and cannot be revised via regulation. The proposed regulations endeavor to permit, to the greatest extent possible, agreements to affect which person should be identified as the producer. However, the absolute right to do that would contradict the clear restrictions in Public Resources Code section 42041(w), which requires the producer to be the owner or licensee of a brand, and only if there is no such owner or licensee in the state can a person be a producer based on their sale or distribution of products. Lastly, to the extent the commenter intended to suggest that the proposed regulations do not make clear who may enter into the agreement described in section 18980.1.1(e)(5), CalRecycle rejects that suggestion because that provision is plain on its face. The commenter professes confusion over whether the terms "owners of brands or trademarks" and "owner or a licensee of that brand or trademark" are interchangeable. But 18980.1.1(e)(5) uses those terms for two clearly different purposes: The first term refers to the parties that can enter into an agreement as to which brand or trademark will be designated, and the latter ensures that there is a party that would qualify as the producer based on that designation. No language in 18980.1.1(e)(5) suggests that any party other than brand or trademark owners may enter into the agreement.

Comment I-61-3

II. Narrowing scope of Covered Materials to only those that enter the residential waste stream.

Recommendation: All packaging & food serviceware that is destined for the residential (including single- family and multi-family) sector should be included in EPR programs. Packaging and food serviceware disposed of at restaurants should NOT be in scope (aka dine-in deduction).

Colorado EPR law has language for this: "Packaging material" covered under the law explicitly does NOT include packaging materials used solely in business-to-business transactions where a covered material is not intended to be distributed to the end consumer.

To further this point, AB 827 requires restaurants/QSRs to provide front of house collection for compost, recycling & landfill. The industry manages and pays for this back-of-house packaging recovery, so commercial/Business to Business should be out of the scope.

California Restaurants are already subject to comprehensive recycling requirements including the collection of organics, plastics, and general waste. All commercial food service establishments that provide food for purchase and immediate consumption on site must comply with AB 827 that are easily accessible by a customer. These programs come at a great cost to operators for many that have been operating this program since 2020. Existing law already puts the responsibility on the operator to facilitate and pay for this collection and mandating additional recycling requirements is duplicative of existing efforts. Although we anticipate that the introduction of more recyclables will be available for consumption, we do anticipate that restaurants might see a reduction in their disposal costs but then see a possible increase in services for recycling and composting.

Response to I-61-3

Comment rejected. The proposed regulations do properly reflect the limitation that wraps and wrappers and bags designed or intended to be used by food service establishments are not "plastic single-use food service ware" under the law, but there is no statutory basis for the commenter's request for interpreting "covered material" generally not to include any packaging or food service ware disposed of at restaurants. The request cites only Colorado law and a California one unrelated to single-use packaging and food service ware.

Comment I-61-4

III. Providing a Viable Compliance Pathway for Compostables

Compostable packaging and food serviceware are critical compliance pathways under SB 54, offering producers additional tools to reduce plastic waste and meet the law’s ambitious recycling and pollution-reduction goals. However, AB 1201 (Ting) fundamentally redefined what it means for a product or package to be deemed “compostable” by tying eligibility to the USDA’s National Organic Program (NOP). This linkage upended the marketplace because the NOP has not yet been updated to recognize many of the new, innovative compostable materials that could help producers achieve SB 54’s objectives. While this presents challenges, SB 54’s success depends on ensuring that compostable pathways remain viable and do not become artificially foreclosed.

Recommendation: Instead of facilitating those pathways, we see the Regulations as adding additional unnecessary barriers. Subsections (B) and (C) of Section 18980.4(a)(4) impose rigid new mandates that go well beyond the statutory framework of SB 54 and AB 1201, creating conflicts and additional compliance uncertainty. For example, subsection (B) requires "full biological decomposition" of covered materials and prohibits transfer of any undecomposed material to subsequent facilities. Such an absolute standard is incompatible with how composting operations actually function, where heterogeneous feedstocks and variable conditions inevitably result in some residuals. By layering on new performance mandates atop AB 1201's already restrictive framework, the Regulations would undermine any realistic compostable compliance pathway. In short, while AB 1201 already imposes significant constraints, the Regulations should not exacerbate those challenges by adding impractical, inconsistent, and duplicative requirements. Subsections (B) and (C) extend well beyond statutory intent, conflict with USDA oversight of compostable labeling, and duplicate existing regulatory standards. For these reasons, they should be stricken in their entirety so that compostable packaging and food serviceware can remain a meaningful compliance pathway under SB 54.

Response to I-61-4

CalRecycle rejects this comment. See the response to comment O-91-8.

Comment I-61-5

IV. Request extension of upcoming reporting and fee deadlines based on timing of final regulations and presumably guidance/education coming subsequent to same.

Under these regulations, covered entities will be required to pay an initial payment of $5 billion over 10 years, with $500 million starting on March 1, 2027, to the California Plastic Pollution Mitigation Fund. Extended Producer Fees would start on July 1, 2027.

Additionally, members of the PRO and the community of Independent Producers are required to comply with annual reporting requirements for covered materials, including all source reduction baseline reports, starting on July 1, 2026.

For these reasons, we believe that CalRecyle should exercise its regulatory authority and encourage the Department to grant an extension to the start of collection for the proposed fund and Extended Producer fee timelines in alignment with future guidance from the Department towards the end of 2027.

Response to I-61-5

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42053, 42060, and 42064, and no change is necessary to the implementation of the Act. PRC section 42053(b) provides that the PRO must charge its producers fees during the first two years of operation and during the preparation of the PRO plan, and PRC

section 42064(e)(1) provides that producers' annual environmental mitigation surcharge payments must commence in the 2027 calendar year. The proposed regulations providing for the payment of producers' fees, including section 18980.6.7, are consistent with these statutory requirements and timelines. Therefore, no change to the proposed regulations is necessary.

Comment I-61-6

Conclusion

We appreciate the opportunity to provide comments specific to our industry. We look forward to achieving the spirit of SB 54 through the collective efforts of stakeholders in the food industry as we work towards the shared goal of increased recycling rates for product packaging, while also being as delicate as possible with new costs and obligations for the statewide restaurant community.

Response to I-61-6

Comment rejected. No response specific to the commenter's submission is necessary. This closing paragraph summarizes the commenter's recommendations, to which CalRecycle has responded separately.

I-62: Anna Ferrera

Comment I-62-1

Dear Director Heller:

On behalf of Wine Institute, a public policy advocacy organization representing over 1,000 wineries and affiliated organizations in California, I appreciate the opportunity to provide comments on the draft final regulatory language to implement the SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act (Act), posted by CalRecycle on August 22, 2025.

The Act establishes an extended producer responsibility (EPR) program focused on reducing plastic but also impacts all product packaging in California, with certain exceptions, to meet a 100% recyclable or compostable goal for single use packaging and single use food service ware by 2032. SB 54 leaves much of the administration and guidance of the EPR program to the Professional Responsibility Organization (PRO), which is the Circular Action Alliance (CAA) selected by CalRecycle to administer the program.

Our winemakers create an agriculture-based product that has been manufactured and exported globally for generations. California is the fourth largest wine producer in the world. Our wine industry makes a significant contribution to the nation by providing quality jobs, bolstering economies through hospitality, taxes and tourism and enhancing communities through environmental stewardship and sustainable farming practices. In

California, wineries employ 422,000 people, paying $25.9 billion in wages annually, $7.9 billion in taxes annually, and generating $73 billion in economic activity in the state.

Last year, our wineries committed to a circular economy and began entering the California Beverage Container Recycling Program (Bottle Bill). Over 4,000 wineries registered and are moving forward to comply with recycling beverage containers in a significant step forward to further the state's recycling goals. New Bottle Bill program regulatory language per SB 1013 (Atkins, Chapter 610, Statutes of 2022), is now also moving forward this month.

California wineries are in the unique position of potentially entering two state programs focused on a circular economy, with recycling and source reduction goals, deadlines, and fees at a time when our industry is also grappling with the impacts of tariffs on wine export markets and sales, inflation and historically high production costs. This burdensome duplication raises costs, disrupts operations, and undermines the competitiveness of California wines and wine grape growers in both domestic and international markets.

Response to I-62-1

CalRecycle rejects this comment because it does not set forth any objection to the proposed regulations but rather acknowledges that certain businesses are subject to another statute in addition to those implemented by these regulations. To the extent the commenter meant to assert that the proposed regulations inappropriately interpret the statute, CalRecycle rejects that assertion for the reasons stated in response to comment O-91-5.

Comment I-62-2

Wine Institute requests that the SB 54 proposed program language revert to CalRecycle's previous interpretation to exclude secondary and tertiary packaging with CRV beverage containers in ARTICLE 2:

Exemption for Secondary and Tertiary Packaging for Wine Products
ARTICLE 2: Covered Material and Covered Material Categories
Section 18980.2. Categorically Excluded Materials

The current proposed final regulatory language considers CRV beverage containers excluded from the SB 54's EPR program. However, packaging that keeps these products safe and secure, is not. Secondary and tertiary packaging in commercial and industrial operations, according to the current language, are considered covered materials to be accounted for under the program. This was a change from the May 2025 version that excluded CRV beverage container packaging as well as the beverage containers.

SB 54 was enacted with exemptions and categorical exclusions that the Legislature placed in various parts of the statute such as food and agriculture and medical goods, along with CRV containers. Wine Institute aligns itself with CalChamber's comments

with regard to excluding CRV beverage container secondary and tertiary packaging, we agree specifically that:

- When the Legislature drafted SB 54 and specified what was *not* a "covered material", it *exempted* in PRC § 42041(e)(2)(A)-(G)) all of the packaging associated with that category, which the Department correctly assessed includes secondary and tertiary packaging associated with the primary regulated good.
- Legislature's recent expansion of the Bottle Bill to include wine and distilled spirits through SB 1013 (Atkins, 2022) was the product of years of debate over how best to handle the unique packaging streams associated with these industries. **Industry stakeholders agreed to participate because the CRV program would manage their packaging without subjecting them to fragmented or overlapping requirements from multiple state programs.** This legislative compromise underscores that the Bottle Bill is not merely about bottles and cans, but rather about ensuring an integrated and streamlined regulatory framework for all beverage packaging.
- Reading SB 54's beverage container exclusion narrowly would create direct conflict by forcing producers to comply with overlapping and inconsistent mandates under both the Bottle Bill and SB 54.
- When taken with the other exemptions in Public Resources Code section 42041(e)(2), the "beverage container" exclusion **should be understood to function consistently with its statutory neighbors** where the exclusion of what is not "covered material" applies broadly across all tiers of packaging associated with "not covered material" category..

We strongly agree with CalChamber's analysis that "it would be inconsistent with the statutory structure for one exclusion in the same series to be treated as vessel-only, while the rest sweep in the full packaging system." It is more likely that the Legislature intended the beverage container exclusion to cover the full packaging chain associated with CRV products and that a contrary reading would make the CRV provision the sole outlier in the section.

The term "beverage container" should be properly understood as the whole packaging system associated with CRV-regulated products, ***thereby preserving consistency in the exclusions section of SB 54****. It is contrary to the statute to now force wineries who voluntarily integrated into the Bottle Bill under SB 1013 with SB 54 compliance on secondary and tertiary packaging associated with the beverage containers.*

Recommendation: Cal Recycle's May 2025 draft regulation was correct in treating all tertiary and secondary packaging associated with CRV beverages as "not covered material." The current proposed final regulation should **revert to this interpretation and exclude secondary and tertiary packaging associated with the Bottle Bill in ARTICLE 2: Covered Material and Covered Material Categories Section 18980.2. Categorically Excluded Materials.**

Response to I-62-2

CalRecycle rejects this comment for the reasons stated in response to comment O-91-5. As explained in greater detail in that response, the contrasting wording of the so-called "statutory neighbors" supports the conclusion opposite the one advanced by the commenter.

Comment I-62-3

Other areas of significant concern by Wine Institute:

Uniqueness of Wine Product Packaging

SB 54 requires producers to meet certain source reduction deadlines for packaging, but the **primary packaging for wine is often purchased and used to contain products a year or two or more in advance of sale.** That may make it difficult to determine source reduction or use of recyclable materials over time.

Recommendation: Wine Institute would appreciate language that takes into account the unique packaging processes that occur with wine products.

Response to I-62-3

Comment rejected. No change to the proposed regulations is necessary to accommodate the concern over source reduction determinations because packaging that has not yet been sold, distributed, or discarded (and thus counted as "offered for sale," as described in section 18980.1(a)(17)(G)) is not assessed for purposes of source reduction. Regarding challenges specific to wine packaging for meeting the recyclability requirement, Public Resources code section 42060(a)(3) provides relief for "unique challenges" and is addressed in section 18980.2.4 of the proposed regulations, so no revisions in response to this comment are necessary.

Comment I-62-4

Producer Compliance - ARTICLE 5: Requirements for Producers Section 18980.5.

“(b) Pursuant to subdivision (b) of section 42051 of the Public Resources Code, each producer shall, within 30 days after the effective date of this chapter, apply to become a participant of an approved PRO or apply to be an Independent Producer subject to the requirements of section 18980.5.1.”

“(d) Each producer that applies to become a participant of an approved PRO pursuant to subdivision (b) of this section shall, at the time of its application, submit to the PRO that producer’s supply data for calendar year 2023. For purposes of this subdivision, “supply data” means the information described in section 18980.10.2.”

We agree with the comments of the Agricultural Coalition that CalRecycle and the PRO should allow for a good faith phase-in plan for the submission of 2023 data upon initial registration to the PRO. Requiring complete data for 2023 could be problematic as the

types of data may or may not have existed during this timeframe. Allowing producers to provide available data with a gradual phase-in process over subsequent years will incentivize more participation into the registration process and would be a more realistic, workable solution for producers.

Recommendation: Given the delay in promulgating the proposed final SB 54 EPR language, Wine Institute is concerned that the timing requirements in 18980.5 (d) are unrealistic for producers/participants pursuant to subdivision (b) of that section. Producers should be given an appropriate amount of time to gather and submit their supply data for calendar year 2023 rather than needing to supply that data at the time of application.

Response to I-62-4

CalRecycle rejects this comment as a uniform requirement and timeline for submitting supply data for the calendar year 2023 for each producer that applies to become a participant of an approved PRO is necessary to ensure that a PRO receives all relevant data as soon as possible to ensure its compliance with the Act, including those under section 42057 of the PRC, and section 18980.9 of the proposed regulations. This requirement and timeline are also necessary to ensure the PRO can review all relevant information prior to its decision to approve a producer to become a participant in its plan. The commenter's concern that this requirement hypothetically "could be" problematic as the types of data may or may not have existed during this timeframe" is outweighed by the need to ensure that a PRO has all relevant data to ensure compliance with the Act as described above. Further, CalRecycle also rejects this comment as the commenter does not articulate with specificity any undue burden or alternative timeline that would be universally applicable to all producers balancing the aforementioned PRO requirements for the data which is further clarified in section 18980.10.2 of the proposed regulations.

Comment I-62-5

“Exemptions” require EPR program registration and fees
Exemptions for Materials with Documented High Recycling Rates, Unique Challenges, and Small Producers from the EPR packaging program must still register and pay fees.

-Materials with Documented High Recycling Rates: **Exemptions for Specific Material with Demonstrated Recycling Rates** - Section 18980.2.3. Specific packaging or food service ware collected through established alternative programs (outside of standard curbside collection) and consistently achieving high recycling rates (e.g., 65% for 2024-2026, 70% thereafter) may be eligible for an exemption.

“(2) **The person shall also be considered a producer for purposes of the registration** requirements provided in section 18980.10, regardless of whether the Department approves the exemption.”

-Unique Challenges: Exemptions for Certain Covered Materials – Section 18980.2.4. **Only a PRO may present and justify these cases that allow for an exemption** and must clearly and convincingly establish that compliance with the Act is impractical due to challenges unique to the covered material or related circumstances.

-Small Producers: Section 18980.5.2.: Producers with gross sales within California under $1 million in the most recent calendar year may apply for an exemption. The application is subject to approval and “applicants” **must register as producers** before they are considered exempt.

These fees and accounting obligations will surely add to the costs of our products to consumers.

Recommendation: Entities exempted under the program should not be required to register as a producer, pay fees, or be subject to enforcement penalties. They are exempt. These entities could be allowed to simply self-certify and then be exempted entirely from the program.

Response to I-62-5

Comment rejected. Allowing entities to "simply self-certify" and then have no obligations whatsoever under the law would result in an enormous loophole and risk the failure of the program established under the statute entirely.

Regarding section 18980.2.3, producer registration is required because CalRecycle otherwise could not reasonably enforce the requirements of Public Resources Code section 42041(e)(2)(H). That provision's use of the term "producer" reflects that reality. However, the commenter is incorrect that such entities are subject to the same fees and "enforcement penalties" as producers generally. The packaging and food service ware at issue would, by definition, not be "covered material."

The same analysis applies to the exemption for "small producers" under section 18980.5.2. They are still "producers" but are excused from the obligations, including those that apply to fees that producers participating in PRO plans must pay, that apply to producers with respect to covered material of which they otherwise would be producers. But, without any registration requirement, CalRecycle could not implement the exemption.

Regarding section 18980.2.4, there Legislature's word choice makes clear that there is no exemption for producers, nor are the "exempted" materials considered no longer "covered material." Section 42060(a)(3)(A) unambiguously states that "covered material" is exempt, so the covered material itself need not meet any requirements of the law, but that provision provides no relief to the producers, nor does it require any materials to be no longer considered "covered material." Under any other interpretation, the granting of exemptions would significantly undermine the statute's purpose; each granted exemption would result in more covered material disposed of in landfills, less funding for local jurisdictions' collection and recycling programs for handling covered material, more covered material depressing plastic recycling rates, and greater likelihood

that covered material would fail to meet the statutory requirements to be considered recyclable. Moreover, if exemptions under section 42060(a)(3)(A) carried that risk, CalRecycle would be unable to grant nearly as many exemptions as it might under the current interpretation, severely undercutting apparent purpose of the commenter's request.

Comment I-62-6

Scarcity of Materials with High Recycling Rates

Wineries are seeking these high recycling rate materials but often they are scarce or simply not available.

- Will there be an investment in developing these materials from EPR funds?
- What will be the recourse if entities cannot meet the goals due to scarcity of product?

Response to I-62-6

Comment rejected. No substantive response is required because the comment raises general concerns without stating any specific recommendation or explanation of its objections to the proposed regulations. To the extent this comment poses questions to CalRecycle, as opposed to making any recommendation or objection that is specifically directed at CalRecycle's proposed regulations, no response is required.

Comment I-62-7

List of De Minimus Material Exclusion - Section 18980.2.2.(b)(ii) and (2)(C) Exclusion of Certain Types of Packaging

This section may exclude labels, adhesives, and other small components of wine bottles or boxes that wineries will need to have more clarity on such as corks and capsules.

PRO may designate components as de minimus:
"(3) The PRO or an Independent Producer may request that the Department deem certain components or groups of components to be of de minimis weight or volume."

CalRecycle must publish a list of such de minimus components:
"(4) The Department **shall publish on its website a list of its components and groups of components**, whether proposed in requests submitted pursuant to paragraph (3), alleged to be of de minimis weight or volume in response to a notice of violation, or otherwise identified by the Department, **that it has determined to be of de minimis weight or volume."**

Wine corks, capsules or other small components may be considered de minimus.

<u>Recommendation: We request that CalRecycle and CAA allow postponement of this data collection until final decisions on de minimis exclusions are made to avoid collection of data that will not be needed for future reporting.</u>

Response to I-62-7

Comment rejected. The commenter refers to "data collection" without explanation. If the commenter intended to suggest that certain components can be disregarded until initial determinations concerning application of the de minimis exclusion are made, CalRecycle declines to do so. First, it is not reasonably possible to identify which components should effectively be granted an exclusion before the exclusion can actually be applied using reported information. While the commenter describes components that it be treated in that manner, no method is presented for how that determination could be made generally, and the components identified may, in any event, be parts of beverage containers and therefore are not covered material (see Public Resources Code section 42041(e)(2)(E)). Also, the expected timing of the effectiveness of the proposed regulations relative to the likely approval of any producer responsibility plan allows sufficient time for information to be available concerning what components will initially be considered de minimis, but there is no date certain by which CalRecycle can reliably predict when that will occur. Lastly, no determinations concerning the de minimis exclusion will be "final decisions," as they will be subject to reevaluation.

Comment I-62-8

Registration Deadlines in Statute vs. those set by the PRO - ARTICLE 5: Requirements for Producers - Section 18980.5. Producer Compliance

SB 54 statute states that producers must register within 30 days of the official enactment of the regulations or upon becoming a producer (for entities established before January 1, 2027), or within six months for those becoming producers on or after that date.

“(a) Within 30 days of the effective date of this chapter each producer shall register with the Department pursuant to subdivision (a) of section 18980.10. Entities that become producers after 30 days after the effective date of this chapter but prior to January 1, 2027, shall register within 30 days of becoming a producer.”

SB 54 requires that the PRO deliver a detailed report outlining plastic covered material data from the 2023 calendar year to CalRecycle by July 1, 2026. The program must be fully operational by January 1, 2027.

CAA set a deadline of September 5, 2025, for producer registration and posted this on their website. This is not in statute, however, and proposed regulatory language is not final.

Recommendation: Both of these deadlines, given the delay and Governor’s request for the re-review of these proposed regulations, appear unrealistic and more time should be provided in order for participants to gather and submit accurate information.

Response to I-62-8

CalRecycle rejects this comment for the reasons stated in I-62-4. Further, CalRecycle also rejects the portion of the comment regarding CAA setting a deadline for producer registration as this is outside the scope of CalRecycle's current statutory authority as well as the proposed regulations.

Comment I-62-9

Penalties for Non-Compliance by PRO - Section 18980.13.2
Participants may be penalized if actions taken by PRO on their behalf causes their noncompliance.

"Any entity, such as a PRO, producer, local jurisdiction, recycling service provider, retailer, or wholesaler, not in compliance with the Act or this chapter is subject to penalties pursuant to subdivision (a) of section 42081 of the Public Resources Code. If a PRO acting on behalf of its participants causes participants to be in violation of the Act or this chapter, such participants shall not be exempt from penalties on the grounds that their noncompliance was caused by the PRO's conduct ."

- What is the legal basis for this language that may cause a participant (who must rely on a PRO's submissions and program compliance) to be penalized by CalRecycle for a PRO's actions/non-compliance?

Recommendation: This section should be reconsidered.

Early Fees - Section 18980.6.7.(a)
Relevant Language: Prior to approval of an initial plan and for the two years following that approval, a PRO shall charge all participant producers a fee based on specific items set forth in subdivision (b) of section 42053 of the Public Resources Code including estimated costs of implementing the plan, the needs assessment, and reimbursement to CalRecycle for administration, implementation, and enforcement.

The PRO/CAA requested and collected input only from those that had already registered as producers regarding their proposed calculation for early fees. For those who do not yet know their status as producers - input on early fees was not considered.

Recommendation: Regulations should be approved and promulgated so that all potential participants may provide input on early fees.

Response to I-62-9

CalRecycle rejects this comment. To the extent this comment poses questions to CalRecycle, as opposed to making any recommendation or objection that is specifically directed at CalRecycle's proposed regulations, no response is required. To the extent this comment recommends reconsideration of section 18980.13.2(a), see the response to comment I-60-4. To the extent this comment

recommends the approval and promulgation of the proposed regulations so that potential participants may provide input on fees under section 18980.6.7(a) of the proposed regulations, CalRecycle is currently following the rulemaking process to adopt the proposed regulations, including by complying with all necessary timeframes and opportunities for public participation. The commenter is welcome to contact the producer responsibility organization directly if it would like to provide input on the assignment of fees under section 18980.6.7(a) prior to the adoption of regulations.

Comment I-62-10

Governance by PRO

Wine Institute highlights our general concern about the unique governance structure and authority CalRecycle grants to the PRO under this packaging EPR program and potential for anti-competitive behavior. We strongly believe that CalRecycle must exercise extraordinary and consistent oversight and transparency in this matter and provide a process for stakeholders to provide timely and direct input to the Department on PRO actions/decisions.

Response to I-62-10

Comment rejected. The comment does not address any particular provision in the proposed regulations and only generally asserts discomfort with the EPR model.

Comment I-62-11

Food Safety

We appreciate that the new draft recognizes the statutory language in SB 54 requiring that the implementation of the program that does not create conflicts with food safety and other requirements under Federal law and guidelines. Will ensure that California's food supply chain is adequately protected, minimizes organic waste and remains affordable..

We agree with the comments of the Agriculture Coalition that enhancing recycling and achieving circularity cannot and should not expose Californians to increased risks jeopardizing food safety or adding to food waste and higher prices.

Response to I-62-11

Comment rejected. No substantive response is required because the comment raises general concerns without stating any specific recommendation or explanation of its objections to the proposed regulations.

I-63: Emily Rooney

Comment I-63-1

On behalf of the undersigned organizations, we submit these comments regarding CalReycle's recent draft regulatory text for the Plastic Pollution Prevention and Packaging Producer Responsibility Act (SB 54). Collectively, we represent a broad coalition of food and agricultural associations, whose members may be subject to this regulation. We thank CalRecycle for their continued work to address concerns regarding affordability and costs associated with compliance with SB 54, however, we continue to remain concerned about overall implementation of the regulation. We look forward to working with you throughout this process.

Response to I-63-1

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment I-63-2

Section 18980.1(a)(17)(B). Definition of "Product that Uses Covered Materials"

We support CalRecycle's recent addition in this section highlighting that empty packaging materials are not considered single use plastic or covered materials for the purposes of this regulation. Empty packaging may or may not enter the commerce stream in the state of California and therefore should not be considered under compliance until it is purchased, filled and sold, by the producer for the user or consumer, into the supply chain in California.

Response to I-63-2

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment I-63-3

Section 18980.1.1. Producer Identification

In Section (c), we propose the following language be added for clarity (suggested new language in italics):

"(c) For covered material other than food service ware *and those identified in section 42041(e)(2) and (w)(4) of the Public Resources Code,* the producer shall be determined in accordance with this subdivision."

Response to I-63-3

Comment rejected. The proposed additional language would be superfluous and would incorrectly state that the packaging described in Public Resources Code section 42041(e)(2) is "covered material."

Comment I-63-4

ARTICLE 2: Covered Material and Covered Material Categories
Section 18980.2. Categorically Excluded Materials

The coalition remains supportive of the categorical exclusions for food and agriculture products that are under certain state and federal guidance or regulations. Issues such as protecting human and environmental health through food safety practices, and the prevention of the spread of pests and diseases are paramount when providing food and agricultural products (and their packaging) for consumers.

In Section 18980.2(2)(A), we propose the following language be added for clarity and specificity (suggested new language in italics):

Any entity that has determined that packaging is not covered material pursuant to paragraph (2) of subdivision (a) shall notify the Department and provide both a specification for the packaging or packaging component and the associated product(s) along with a summary of the basis for its determination. The basis shall identify the specific provision of this Chapter that causes a conflict, cite the conflicting federal *and/or state* regulations, rules, or guidelines, *applicable to food and agriculture* and explain why no reasonably possible alternative packaging or packaging component is available. The Department shall maintain on its website a publicly available electronic database of each such determination that includes the entity name, the specification for the packaging and the associated product(s), and the status of any review by the Department of such determination.

At this time, there are not economically viable alternatives available to plastic packaging for many food and agricultural products throughout the supply chain and pursuing a change in the packaging will result in an increase in food prices and food waste. Some commodities are cooked or pasteurized within the package to properly sterilize the food and reduce the chances of contamination and spread of food borne illnesses. This method keeps the product and inside of the package completely pristine and shelf-stable until the package is opened.

Pursuing a change in packaging is a multi-step process that involves identification of materials and testing of the prototype for biological and structural stability. For shelf-stable foods, the testing spans twelve months at minimum. The food used for the testing process must be discarded. It is routine protocol that products that are in the experimental process for packaging testing and validation cannot be sold for human or animal consumption therefore resulting in excessive food waste.

Packaging changes could also require new machinery upgrades and/or entirely new equipment, since packaging lines are specifically designed by material type and package size. If new machinery must be purchased, a single food processing machine can cost $30 million to $100 million. In many cases, these costs are unsustainable for agricultural businesses and will lead to business closure or relocation out of the state. In rare cases, where an agricultural business can sustain this cost increase it will be

passed through the supply chain to the consumer. None of this includes the actual costs into research and development for new packaging or the costs for implementing the regulation.

In an effort to transition to other packaging alternatives, millions of dollars will be spent throughout the food supply chain, increasing food prices, and generating excessive food waste. For these reasons and many others, it is critical that CalRecycle maintain a workable “Categorical Exclusion,” that provides an option for potential producers that do not have a “reasonable” alternative to prevent negative impacts to the food and agricultural supply.

Response to I-63-4

Comment partially rejected and partially accepted. CalRecycle rejects the specific changes the commenter suggests. The only proposed change is the addition of the phrases "and/or state" and "applicable to food and agriculture." Referring to state regulations is improper because the statutory provision (Public Resources Code section 42060(b)) implemented in the proposed regulation at issue does not concern any state law. To the extent state law presents compliance challenges, exemptions under Public Resources Code section 42060(a)(3) (which also allow phase-in plans) and (a)(4) are adequate to address the commenter's concerns. Regarding the second proposed phrase, CalRecycle declines to add it because it would be redundant. The proposed regulation at issue expressly only concerns food and agricultural commodities.

CalRecycle accepts this comment, however, to the extent it asserts that section 18980.2(a)(2) was unclear or potentially overbroad. See CalRecycle's response to comment I-19-1, explaining the revisions responsive to this and similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

Comment I-63-5

Section 18980.2(a)(2)(A). Categorical Exclusion Reporting and Disclosures

Our coalition is concerned about Section 18980.2.(a)(2)(A) and its requirement of CalRecycle to publish, on a publicly available electronic database, the entity name and product specifications, of producers seeking exclusions based on conflicting regulations. While CalRecycle is mandated to withhold from the public information that may be identified as a trade secret, this is not sufficient assurance that information about producer products will not be released to the public and potential competitors. It is highly likely these entities could become a target for litigation or public shaming. Entities should not be exposed to targeting by the public or competitors for determining a product falls within the categorical exclusion for any reason.

In Section 18980.2(a)(2)(A), we propose the following language be added for clarity (proposed additions in italics and deletions in bold strikethrough):

“(A) The Department shall maintain on its website a publicly available electronic database of each such determination that includes the entity name, *a general description of* ~~**the specification for**~~ the packaging and the associated product(s), and the status of any review by the Department of such determination

Response to I-63-5

CalRecycle partially accepts and partially rejects this comment as described in CalRecycle's response to comments I-60-2 which contains the same recommendation. See, also, CalRecycle's response to comment I-63-7 regarding "litigation or public shaming."

Comment I-63-6

Section 18980.2.(a)(2)(B). Determination of Non-Qualification

The coalition supports CalRecycle’s overall approach to enforcement including engaging state agencies such as the California Department of Food and Agriculture (CDFA) and California Department of Public Health (CDPH) throughout the process. However, it is likely that entities that are found out of compliance for packaging or components may not be able to ensure compliance within 180 days. If there are further requirements to transition safely to alternative compliance options such as additional research or machinery replacement, this can take much longer than the allotted 180 days. We urge CalRecycle to consider alternative compliance pathways for businesses working in a good faith effort to transition out of plastic packaging.

Response to I-63-6

Comment partially rejected and partially accepted. CalRecycle rejects the comments general objection to the 180-day period established in the proposed regulation, as explained in response to comment O-64-3[AB46.1][DZ46.2]. Moreover, the regulations ameliorate the commenter's concern regarding 180 days by requiring notice from the Department that packaging may not be eligible for the exclusion addressed in section 18980.2(a)(2) at least 120 days before that 180-day period can begin. Lastly, the commenter offers only the vague suggestion that CalRecycle "consider alternative compliance pathways for businesses working in a good faith effort to transition out of plastic packaging." The statute and the proposed regulations already address such pathways via exemptions under Public Resources Code section 42060(a)(3) (which expressly authorizes phase-in plans) and (4) and corrective action plans under section 42081(b) (which allow avoidance of penalties while a producer resolves compliance problems).

CalRecycle accepts this comment, however, to the extent it suggests that the proposed regulations should reduce the potential for businesses to have to change their packaging within 180 days of a Department determination to begin with. The regulation has been revised to more clearly establish a process to prevent unmeritorious claims from being added to the database described in the

regulation (in new subparagraph (D)), thereby reducing the likelihood the a business will rely on such claims only to have the Department deem the claim improper and thus subject to the 180-day period.

Comment I-63-7

Sections 18980.2.2. Exclusion for Certain Types of Packaging

For the purposes of this section, CalRecycle determines that packaging used for the storage of certain products over five years is not considered covered materials. We recommend changing this threshold to one year for consistency with reporting to the Producer Responsibility Organization (PRO). This one change could create more consistency and efficiency within the reporting and compliance process.

Regarding public disclosures of de minimis, we hold the same concerns as the previous section requiring disclosures in Section 18980.2.(a)(2)(A) Categorical Exclusion Reporting and Disclosures. The coalition is concerned that public disclosures will expose the business community to legal actions and other nuisance issues.

Response to I-63-7

Comment rejected. The commenter refers to a "threshold" and requests that it be changed to one year, an apparent reference to the five-year maximum period for how frequently CalRecycle will reconsider its applications of the statutory de minimis provision. CalRecycle declines to make that change because a period of just one year is insufficient for producers to have the certainty necessary for it to rely on the exclusion in the first place. The commenter's assertion that CalRecycle reconsidering its determinations as frequently as one year "could create more consistency and efficiency" contradicts this commonsense accommodation of producers' reasonable operational needs. Regarding the potential for "legal actions and other nuisance issues" and "litigation or public shaming" (the phrase used in comment I-63-5, to which this comment refers) based on disclosure of information to the public, CalRecycle rejects that basis for not requiring disclosures. The proposed regulations incorporate the basic legal protections for trade secrets under the Public Records Act. No support is given for why those protections are "not sufficient," and the risk of "litigation or public shaming" is not sufficient to render information a trade secret. The Legislature decided that basic information regarding the characteristics of packaging must be disclosed to CalRecycle, and nothing in the statute or otherwise suggests that the protections of the Public Records Act for legitimate trade secrets (i.e., information that derives value from its secrecy and is reasonably maintained as a secret) are weaker than in other contexts in which they apply. If the commenter's assertion that public disclosure of information would subject it to harm, then such information is likely to constitute legitimate secrets protected under trade secret law. To the extent that information may subject businesses to legal actions or "nuisance issues' if released, such a risk is an ordinary risk of conducting business, not a circumstance that, by itself, renders the information a trade secret, and it is incumbent upon those choosing to do business in California to adjust its practices to comply with applicable law.

Comment I-63-8

Section 18980.2.4. Exemptions for Certain Covered Materials

This coalition appreciates the Department's recognition of the need for exemptions of certain covered materials. However, we remain concerned about the language contained in the updated draft regulatory text suggesting exemptions last for only two years. The draft language and rulemaking processes have not substantiated any reason for this deadline which suggests a lack of specific reasoning for the two-year period. In most cases, two years will not allow sufficient time to develop alternative packaging, given the length of time to identify and test new packaging materials and subsequently obtain and install new packaging equipment. No covered material category is the same and may require reconsideration at different intervals. Thus, we strongly recommend exemption timelines be considered on a case-by-case basis that evaluates the compliance challenges with products in the exempted covered material category.

Additionally, the coalition believes that if certain packaging types are exempt, they should not be required to pay fees. By determining that a certain package is exempt, the PRO is concluding that it is necessary in some capacity and therefore it should not be subject to any of the regulatory costs associated with this process.

Response to I-63-8

Comment rejected. The commenters' concern over the two-year period is unfounded. As the commenters' themselves concede—"two years will not allow sufficient time," but only in "most cases," not all—there likely will be some cases where that period is sufficient time. And, when that period is not sufficient, section 18980.2.4(h) avoids unnecessary burden by establishing a streamlined process for extending the exemption period. Moreover, section 18980.2.4(g) provides that CalRecycle will grant extensions for up to five years when it determines the circumstances justify such a duration. These provisions generously accommodate the commenters' concerns over the duration of exemptions.

Regarding the proposal that producers should not be required to pay fees related to packaging types that are exempt, CalRecycle rejects that proposal for three reasons. First, the statute unambiguously provides that exemptions do not render packaging no longer "covered material," and that the exemptions apply to compliance by the covered material themselves, not producers' obligations with respect to their covered materials. Second, packaging that is exempt contributes to the end-of-life management costs and other impacts of waste from single-use materials just as non-exempt covered materials do. In fact, their effects are actually greater because, by definition, they cannot be recycled or composted but may still fall into a covered material category that qualifies as recyclable or compostable and thus must be collected by local jurisdictions and recycling service providers. Excusing producers from their share of responsibility over the end-of-life management of those materials is directly counter to the purpose of the statute, as they would effectively shift all their responsibility for paying for the management of covered materials onto local jurisdictions, recycling service

providers, and other producers. Third, and relatedly, if those responsible for putting exempt materials into the marketplace (and thus, eventually, into the waste stream) are excused from paying for the impacts of those materials, the strain on program funding would militate against granting any exemptions to begin with.

Comment I-63-9

Section 18980.2.4. (4)(f)(2)(D): Alternative Phase-in Plans

The coalition supports allowing CalRecycle to approve alternative phase-in plans for businesses that require additional time to transition to compliance. This allows for greater flexibility for the regulated entity and CalRecycle to come to mutually agreeable, workable solutions in a timeframe that works for all parties involved.

Response to I-63-9

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process.

Comment I-63-10

Section 18980.2.5. Covered Material Category List Updates

Additional clarity is still needed with regards to the timeline in which the Department can receive and review new information for updates to the Covered Material Category (CMC) List as outlined in the revisions in Section 18980.2.5 (a) and (b).

Specifically, Section 18980.2.5(a) dictates conflicting timelines and procedures for the department to follow in updating the CMC List. Furthermore, this section does not recognize the need for regular updates throughout the calendar year to address the needs of businesses in making purchasing decisions. We urge CalRecycle to update the CMC List on a quarterly basis to accommodate updated recycling data and purchasing decisions to ensure the proper management of covered materials at the start and end of their useful life.

To provide more clarity for the Department and producers we suggest the following streamlined updates to Section 1890.2.5(a) (proposed additions in italics and deletions in bold strikethrough):

“18980.2.5 “(a) The Department shall review and, if necessary, update the CMC list *quarterly to make relevant changes* ~~**within the applicable timeframe specified by**~~ *in accordance with* subdivisions (e) or (f) of sections 42061 ~~**or subdivision (a) of sections 42092**~~ of the Public Resources Code.”

The current rate of CMC List updates has already fallen short of providing the needed clarification for producers, end-markets, and municipal sorting centers.

These recommended changes to the draft regulatory text recognize the need for more consistent updates to the CMC List. As covered materials change as a result of the Act,

annual updates will fall short of what producers, suppliers, and end-use markets need to make management and planning decisions to remain compliant and achieve the highest rate of recyclability.

Response to I-63-10

CalRecycle rejects the comment. Subdivisions (e) and (f) of sections 42061 of the PRC and subdivision (a) of sections 42082 of the PRC have their own subject matter and a requirement for an update related to that subject matter. Ignoring the requirements of sections 42082 of the PRC is inappropriate. The process set forth by regulation to review and, if necessary, update the list is completely consonant with the requirement to update the list "at least" within or "no less than" particular timeframes and no change is required. CalRecycle also rejects the suggestion that the list be reviewed and updated quarterly. A commitment to quarterly review would significantly truncate the time needed to obtain longitudinal information and to analyze that information. The regulations do not restrict CalRecycle from revising the CMC list more frequently than the statutory minimum when appropriate for the circumstances, and thus no change is required.

Comment I-63-11

Section 18980.2.6.(a). Covered Material Category List Recommendations

We urge CalRecycle to combine aseptic cartons (Category ID PF15P) and gable-top cartons (Category ID PF5P) into a single CMC.

Gable-top and aseptic cartons are widely recognized and managed within the recycling industry under a single material category (including in the EPR systems in Oregon and Colorado and on the draft list in Maine). These cartons are baled, marketed, and sold together at Material Recovery Facilities (MRFs) in California and across the country. The industry does not differentiate between gable-top and aseptic cartons when preparing bales for end markets. In fact, Recycled Materials Association's (formerly ISRI) specifications for the Grade 52 bale, keeps gable top and aseptic cartons together. The U.S. EPA, in its waste characterization studies, also keeps aseptic and gable-top cartons together in the same category. This practice reflects the reality of the recycling industry, where both types of cartons are processed and marketed together.

CalRecycle's SB 343 MCS Report issued in April 2025 found that the difference in acceptance in recycling programs between the two types of cartons is negligible and programs that stated in the past that they manage them differently in all likelihood no longer do (i.e., any implication that they are collected, sorted, or marketed separately from each other is based on outdated information). Additionally, the MCS Report found that large volume transfer and processing facilities (LVTPFs) sort both types of cartons at the same percentage for recycling and into the same output stream.

Maintaining this unnecessary distinction between the two types of cartons increases the cost to California consumers, the PRO, and CalRecycle by requiring additional

composition study sorting, additional data collection, calculation of two instead of one recycling rates, and separate cost allocation to each carton type.

We urge CalRecycle to align with industry wide recycling practices and group aseptic and gable-top cartons together into a single Covered Material Category.

Response to I-63-11

Comment rejected. The comment does not recommend a change to the proposed regulations or raise an objection to the procedures followed by CalRecycle in the rulemaking process. Rather, the comment urges changes to a study published by CalRecycle. Accordingly, no response is required.
To the extent the commenter intended to urge changes to the covered material categories list published by CalRecycle pursuant to Public Resources Code section 42061, that suggestion also concerns a publication separate from these proposed regulations, not the proposed regulations themselves.

Comment I-63-12

ARTICLE 3: Evaluations of Covered Material and Covered Material Categories Section 18980.3.4. Independent Third-Party Validation of Postconsumer Recycled Content
Shifting packaging away from plastic will require substantial effort and resources. Requirements of the act should be inclusive of all alternatives to plastics. Agricultural waste is a well-established waste stream with multiple alternative uses for its byproducts. Many are used in packaging or container components already. To accommodate for the use of agricultural byproducts in alternative packaging we recommend the following language be included in the Act.

In Section 18980.3.4(a)., we propose the following language be added (proposed additions in italics):
“(a) A PRO shall not apply the source reduction credit based on incorporation of postconsumer recycled content *or substitution of virgin petroleum-based plastic with plant agricultural waste,* as described in section 42057(a)(2)(B)(i) of the Public Resources Code, unless the alternative compliance formula described for doing so has been proposed and approved as part of a PRO’s plan in accordance with this section.”

Response to I-63-12

Comment rejected. The suggested addition is nonsensical because it would state that "substitution of virgin petroleum-based plastic with plant agricultural waste" is one of the bases for the source reduction credit permitted under Public Resources Code section 42057(a)(2)(B)(i). The only basis permitted by that statutory provision is the incorporation of postconsumer recycled content. To the extent the commenter intended to propose that CalRecycle expand the statute so that agricultural waste could be used in the alternative compliance formula described in section 42357(a)(2)(B)(i), CalRecycle rejects that proposal because such a change can only be made through legislation.

Comment I-63-13

ARTICLE 5: Requirements for Producers
Section 18980.5. Producer Compliance

We continue to urge flexibility for producers in registering with the PRO for the first time, then what is required in subsection (a) and (d) of Section 1890.5. This regulation is extremely complex and may be unclear for certain entities that may or may not be producers as required by the Act. Requiring producers to register with a PRO 30 days after the publishing of the Act may not leave enough time for an entity to fully understand how the requirements apply to their operation. This would result in a burdensome submission of data to the PRO and Department that would be unnecessary. This is especially concerning as it requires sensitive data be submitted by private companies to the PRO which is operated by a non-governmental agency.

The Department should provide additional resources and technical assistance for California businesses to determine whether they must comply with the Act. Additionally, the PRO should be granted more flexibility to onboard new producers at a cadence workable for both the PRO and potential producer to ensure accuracy in submitted data.

Due to the uniqueness of this regulation, we recommend CalRecycle and the PRO allow for a good faith phase-in plan for the submission of 2023 data upon initial registration to the PRO. Requiring complete data for 2023 could be problematic as the types of data may or may not have existed during this timeframe. Allowing producers to provide available data with a gradual phase-in process over subsequent years will incentivize more participation into the registration process and would be a more realistic, workable solution for producers.

Response to I-63-13

CalRecycle rejects this comment for the reasons as stated in I-62-4 and I-62-8.

Comment I-63-14

Section 18980.5.2. Exemptions for Small Producers

This coalition would like to raise concerns regarding the exemptions for small producers outlined in the Act. Producers with gross sales within California under $1 million in the most recent calendar year may apply for an exemption. The application is subject to approval and “applicants” must register as producers before they are considered exempt. These fees and accounting obligations will surely add to the costs of our products to consumers. Entities exempted under the program should not be required to register as a producer, pay fees, or be subject to enforcement penalties. They are exempt. These entities could be allowed to simply self-certify and then be exempted entirely from the program.

Response to I-63-14

CalRecycle rejects this comment as it would undermine CalRecycle's statutory obligation to "establish a process" for the exemption to apply; simply allowing

self-certification would remove any process, and it would not allow the Department to ensure that statutory requirements are being met. Further, the regulations have already been revised from the initial drafts to lessen the burden on small producer applicants by only requiring small producers to establish that their sales were lower than the $1,000,000 threshold stated in PRC section 42060(a)(5) and provide basic information about the business as well as registration information. This balances the requirements for small businesses while allowing the Department to ensure that statutory obligations are being met. Finally, there is nothing in the regulations implying that a small producer meeting the statutory and regulatory requirements would be subject to paying any fees pay or enforcement penalties, and thus no further response is needed regarding this portion of the comment.

Comment I-63-15

ARTICLE 9: Source Reduction Baseline Report and Annual Reports
Section 18980.9. Source Reduction Baseline Report
Given the substantial delay in an approved final regulation, which subsequently delays the development of a plan from the PRO, our coalition is recommending changes to Article 9 Sections 18980.9. to accommodate for the delays.

Additionally, the current source reduction baseline report language may create confusion, as it could be interpreted to require individual producers to submit reports to the department even when they are members of a PRO. We recommend clarifying the draft regulation to be consistent with the statute (PRC 420579 (c)).

To provide more stability and accurate data for the Department and PRO we suggest the following updates to Section 18980.9(a) and Section 18980.9(c) (proposed additions in italics and deletions in bold strikethrough):

“18980.9 “(a) On or before July 1, ~~**2026**~~ *2027*, all reporting entities shall submit a source reduction baseline report to the Department. The source reduction baseline report shall be submitted electronically, and at minimum, include the total amount of plastic covered material, by weight and number of plastic components, for which ~~**they were**~~ *the reporting entity was the producer or, for a PRO, for which its participant producers* were the producers in the 2023 calendar year. The weight of plastic covered material shall be measured in accordance with paragraph (15) of subdivision (a) of section 18980.1.”

“(c) The Department shall use the information reported pursuant to this section to update the source reduction baseline pursuant to subdivision (b) of section 42057 of the Public Resources Code by November 1, ~~**2026**~~ *2027*.

Response to I-63-15

CalRecycle rejects this comment as the date of July 1, 2026 is necessary to ensure the statutory requirements are sufficiently met, including section 42051(b) of the PRC. Section 42051(b) requires that upon approval of a plan or commencing January 1, 2027, whichever is sooner, a producer shall not sell,

offer for sale, import, or distribute covered materials in the state unless that producer is covered by a PRO plan or is approved by CalRecycle as an Independent Producer. Therefore, by no later than January 1, 2027, producers should be complying with the Act and regulations. Thus, requiring the source reduction baseline report to be submitted to CalRecycle on or before July 1, 2026 gives the Department six months after the latest possible statutory date. This provides a balance by allowing adequate time for all reporting entities to gather the necessary information for the report, while also ensuring CalRecycle receives the information as expeditiously as possible to make any necessary updates to the source reduction baseline. Further, the July 1, 2026 date also aligns with the annual reporting dates including section 18980.6.5(a) of the proposed regulations, which should make for more efficient reporting. As this regulation is necessary for implementation of the act and aligns with statutory requirements while striking a balance between both adequate time for the reporting entities and adequate time for the Department, no change is required as it would undermine the above.

Lastly, the commenter's concern that the current wording regarding how reporting entities submit data "may create confusion" is without merit as this subsection does the opposite by clearly requiring electronic submission of source reduction baseline reports to the Department which establishes a consistent, uniform standard and format of submission to avoid any confusion, and a reporting entities interaction with the PRO and their method of data submission is outside the scope of this regulation, and thus no change is necessary. See also response to O-41-4 and 0-48-5.

Comment I-63-16

ARTICLE 10: Registration and Data Reporting Requirements Section 18980.10.2. Data Report Contents

We recognize that CalRecycle must establish a baseline for the 25% reduction using 2023 as the reference year, which necessitates requiring producers to submit their 2023 supply data.

Section 18980.10.2 details the data that producers must report, including the total weight of material sold, distributed, or imported in or into the state; the total number of plastic components sold, distributed, or imported in or into the state; the total weight of material disposed of; and the total weight of material recycled.

This proposed regulation requires a level of detail that may exceed the comprehensive record-keeping practices traditionally maintained by many producers, whose existing systems were not designed to track data for this regulatory purpose and will require significant refinement. While producers are committed to meeting these requirements, we respectfully request that the regulation include "good faith" language acknowledging the challenges of this initial reporting period. Specifically, producers are being asked to retrospectively compile data spanning three years, which will often necessitate

estimates derived through various sources, rather than data tracked through systems specifically designed for this reporting purpose.

We recommend adding a Section 18980.10.2(e) and propose the following language be included (proposed additions in italics):

(e) All data reported pursuant to this chapter shall be reported to the best of the producer's ability. Reporting errors for years 2023, 2024, and 2025 will not be subject to penalties if errors were made using a reasonable basis and disclosed in good faith.

Response to I-63-16

Comment rejected. The commenter requests that CalRecycle essentially create new carveouts that are not consistent with the statutory requirements, including the reporting required in section 42057 of the PRC, as well as the enforcement sections 42080 through 42081 of the PRC. The Department both declines and does not have the requisite authority to create the requested general and vague additional regulatory provision that would essentially exempt or shield reporting entities from penalties for reporting errors based on "good-faith" estimates and "errors were made using a reasonable basis", which again are vague and ambiguous to render it essentially unenforceable, and also exceeds the Departments statutory authority and undermines statutory text as referenced above. Lastly, it is worth noting that the Department did reduce the burden on reporting entities in previous versions of proposed regulations by requiring reporting to be in annual increments rather than monthly increments to find a balance between the statutory requirements, information needed by the department, and requirements of reporting entities. Thus, the department rejects this comment.

Comment I-63-17

Reporting Guidance:

Our coalition also wishes to raise concerns with the "Covered Material Categories Reporting Guidance" issued by CalRecycle on September 2, 2025, and CAA's related draft reporting instructions. We have identified several challenges that create unnecessary burdens and duplicate work compared to reporting structures already implemented in Oregon and Colorado.

First, CalRecycle's guidance instructs producers to treat adhesives or coatings containing polymers as plastic components. While CAA is proposing to rely on the de minimis exclusion [PRC Section 42041(s)(4)(A)] in statute for adhesives used in cardboard boxes and coatings on paperboard or metal cans, these exclusions will not be approved by CalRecycle until after the regulations are finalized. Collecting data now on the plastic content of adhesives and coatings is both labor-intensive and premature, since these materials are likely to be excluded. We request that CalRecycle and CAA allow postponement of this data collection until final decisions on de minimis exclusions are made to avoid collection of data that will not be needed for future reporting.

Second, we are concerned with the broad interpretation of “plastic component” to include items that will never be separately collected or recycled, such as adhesives or tape on cardboard boxes or tin/steel bimetal can lids. Tracking such components separately is impractical, does not contribute to measurable recycling outcomes, and represents wasted effort. The guidance requires detachable components to be reported separately, even if made of the same material and recycled through the same stream. For example, reporting can lids separately from can bodies diverges from reporting practices in Oregon and Colorado; these states instructed producers to report the entire packaging material as one item weight. While separate reporting may make sense when detachable components are made of different materials, identical components that are recycled together should be reported in aggregate.

For these reasons, we strongly encourage CalRecycle to revise its reporting guidance to avoid duplicative data collection and to harmonize requirements with other state programs. Doing so will ease compliance and reduce unnecessary costs.

Response to I-63-17

CalRecycle rejects this comment because it does not concern the proposed regulations themselves. It concerns a document that CalRecycle published separately from these proposed regulations. That document is related to the covered material categories list, which is another publication that is not part of these regulations.

Comment I-63-18

Plastic Pollution Mitigation Fund:

Lastly, our coalition underscores that strong public–private partnerships will be essential to meeting the demands of compliance under SB 54. We encourage the Department, in collaboration with other state agencies, to allocate resources for research and development of practical packaging alternatives that also meet federal and state requirements for preventing the spread of pests and disease. Investment from the Plastic Pollution Mitigation Fund, as established in statute, can play a critical role in accelerating the transition away from plastic packaging while safeguarding public health and protecting California’s food and agricultural systems. Given the scope of change required, the statutory timelines cannot realistically be achieved without robust collaboration between the public and private sectors. Strategic use of the Plastic Pollution Mitigation Fund will help producers comply with the Act while advancing its environmental goals and more rapidly reducing plastic pollution in California’s communities, beaches, and waterways.

Thank you for your consideration of these comments. We look forward to working with the Department and the PRO throughout the duration of this process.

Response to I-63-18

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including PRC sections 42060 and 42064, and no

change is necessary to the implementation of the Act. This comment recommends collaboration between CalRecycle and other state agencies to allocate resources from the California Plastic Pollution Mitigation Fund for the research and development of packaging alternatives. However, the allocation of such funds is not within CalRecycle's statutory authority. Sections 42064(j) and (k) of the Public Resources Code provide that the environmental mitigation funds will only be allocated upon appropriation by the Legislature, and CalRecycle has no authority to depart from this requirement. Therefore, no change to the proposed regulations is necessary or appropriate.

I-64: Laila Sharpe

Comment I-64-1

My name is Laila Sharpe and I work with Environment California as the Clean Air and Water Intern. On behalf of Environment California, I urge CalRecycle to strengthen the regulations under SB 54 so that only real recycling technologies are allowed in our state. This is our opportunity to make California a national leader in real solutions to plastic pollution; by not allowing loopholes and false solutions to undermine the intent of SB 54. Allowing chemical recycling is worse than creating new plastics in many ways. It is similar to plastic incineration that releases toxic chemicals into our air and water. These facilities are often built in low-income neighborhoods and communities of color, adding to the environmental injustices that residents already face everyday. I grew up in the Southeastern part of San Diego, where pollution became normalized and communities like mine were often overlooked when it came to environmental protection. During heat waves and wild fires, the air would hang low and thick with smoke. By the age of sixteen, I was having migraines at least twice a week during wildfire season. My family just accepted it as normal and no one and no community should have to accept that in their home. Far too long families like mine have lived with the consequences of weak environmental policy. Policies like SB 54 are supposed to protect them from that kind of harm, not make it worse. I am asking CalRecycle to keep SB 54 strong and Governor Newsom to not approve anything that fails to represent the best interest of California residents. Ban chemical recycling. Hold producers accountable. And ensure the final regulations truly reduce plastic at the source, not shift the burden back onto communities already breathing air pollution. We have the chance to protect public health, clean air, and the environment across California. Please do not let weak regulations take that away. Thank you for your time and consideration.

Response to I-64-1

CalRecycle rejects this comment's suggestion that "chemical recycling" be banned outright in the regulations. A complete ban on any technology could have been accomplished through straightforward, specific language that required prohibition based solely on the type of technology at issue. Instead, the Legislature chose to word statute in a way that requires consideration of hazardous waste generation, not merely consideration of the type of technology.

I-65: Julie Beer

Comment I-65-1

Hello. I am commenting on SB54, the Plastic Pollution Prevention Act. Please don't weaken this bill. Plastic pollution presents a serious health problem when ingested by ocean inhabitants and by people. Nanoparticles of plastic travel through our bloodstream and cause harm to our bodies . Thank you for protecting us.

Response to I-65-1

Comment rejected. No substantive response is required because the comment raises general concerns without stating any specific recommendation or explanation of its objections to the proposed regulations.

I-66: G M

Comment I-66-1

Twine should not be considered a compostable material. It gets tangled in trammel screens and other equipment.

Waxed cardboard should not be considered compostable and should never be labeled that way. Workers move quickly and don't examine every box. If you tell them some are compostable, they will all end up in the compost. Petroleum-based wax does not belong in our soil.

Bioplastics should never be considered compostable. They take too long to break down, create harmful microplastics in soil, and are very confusing to consumers. They also contaminate recyclable plastics. This also goes for poly-coated paper, particularly foodware. I work at events and consumers cannot tell the difference between a poly-coated plate and one that is fiber-only. They throw it all in the compost, leading to plastic particles in soil. Only uncoated fiber-based materials should be allowed for foodware.

Plastic cups should not be considered recyclable. After visiting many MRFs, I have never seen them baled; I do not think they are actually being recycled. They are often dirty, coated in smoothies, boba drinks, sweetened coffee beverages, milk shakes... They belong in the trash, are one of the most confusing items to consumers, and come with other plastics that are not recyclable (lids, stir sticks, straws). Also, by lying to consumers and policy makers by saying cups are recyclable, there is little incentive to move away from single-use and to the much more resource-conserving reusable cups. Reusables create green jobs and innovation. Single-use cups just end up in the landfill.

Section 18980.3.3(5) of the draft SB 54 regulations makes no sense! It says an item is designed to be associated with the recovery of desirable organic waste "if it is desirable

organic waste itself or is marketed, labeled, or otherwise sold or distributed in a manner that directs or otherwise causes users of the item to use and discard it with desirable organic waste." Being associated with organic waste does not transmit the magical property of being compostable! We see this with all foodware and food packaging. Consumers think if it touches food it somehow becomes compost! There are also no such things as magic words! Being labeled "compostable" does not make it so! Wow, fix this nonsense!

Chemical recycling is NOT recycling. Keep that toxic waste out of California and out of SB 54.

Regarding packaging that is "necessary to comply with rules, guidance, or other standards issued by the [USDA] or [FDA] ... to prevent microbial contamination or to maintain the safety or structural integrity of packaging...." These exclusions should only apply when "it is not reasonably possible to use other packaging or packaging components..." and should require providing a valid reason to the Department including the conflicting federal regulation and explanation as to why no possible alternative packaging can be utilized. The Department should also review exclusion requests and maintain a public list of determinations.

To simplify and encourage innovation, materials excluded under section 18980.2(a)(2) should be limited to 2-5 years, just as exemptions are.

The current draft says that a "covered material is considered included in a local jurisdiction or recycling service provider's collection and recycling program if the local jurisdiction or recycling service provider collects the covered material and transfers it to responsible end markets directly or to intermediate supply chain entities." This makes it difficult to attribute violations to the correct party, muddying the distinction of where the enforceability of a jurisdiction for a violation of this requirement ends and the point at which that responsibility transfers to a recycling service provider or an intermediate supply chain entity. Jurisdictions need clear guidance on what's expected for compliance and how compliance will be determined.

Reporting and compliance review for SB 54 should be incorporated into existing Electronic Annual Report (EAR) system run by CalRecycle to simplify reporting for jurisdictions.

Response to I-66-1

Comment partially accepted and partially rejected. CalRecycle accepts this comment to the extent it asserts that the proposed regulations would have allowed businesses to submit to CalRecycle plainly insufficient or invalid claims that packaging should not be considered "covered material." Section 18980.2(a)(2) has been revised to include a robust procedure to prevent such claims and to require notices to justify claims with respect to objective factual criteria. These revisions implement the commenter's suggestion that submissions be reviewed by CalRecycle and required to include an "explanation

as to why no possible alternative packaging can be utilized." The revisions also describe in greater detail how CalRecycle will maintain the public database (i.e., "a public list") of exclusion claims and the effect of such claims appearing in the database.

Regarding the compostability or recyclability of the particular materials and items mentioned, the commenter proposes no revisions to the regulations, so no specific response is necessary. In any event, the purpose of the regulations is to establish how compostability and recyclability will be determined, not to codify any particular determinations. Regarding section 18980.3.3(c)(5), the commenter appears to misread that provision as concerning an independently sufficient condition for when items are considered eligible to be labeled "compostable"; nothing in the proposed regulations or statute suggest that. The commenter appears to take issue with the requirement that items must be "associated with [the recovery] of organic waste," but that requirement is established in statute (Public Resources Code section 42357(g)1)(E), not the proposed regulations.

Regarding chemical recycling, CalRecycle rejects the implied recommendation that the regulations ban chemical recycling, for the reason stated in response to comment O-62-1.

Regarding the proposal to limit exclusions under 18980.2(a)(2) to between two and five years, CalRecycle rejects that proposal because it would restrict CalRecycle's ability to determine that an exclusion was improperly claimed. See, also, CalRecycle's response to comment O-90-3.

Regarding the quoted text from section 18980.11(b), no change is necessary because the regulation is clear on its face and describes with particularity the compliance obligations of local jurisdictions and their recycling service providers. The sentence at issue identifies a discrete act and a particular moment: the transfer of collected material to a responsible end market or to an intermediate supply chain entity. The commenter also incorrectly states that responsibility for fulfilling the requirements of Public Resources Code section 42060.5 could transfer from the local jurisdiction to any entity outside its recycling program. There is no responsibility established by that section other than the one placed on local jurisdictions and recycling service providers operating a collection and recycling program. That responsibility cannot transfer to intermediate supply chain entities.

Regarding use of the existing Electronic Annual Report system, no regulation is necessary to establish the technical details of the electronic system that CalRecycle will use to facilitate reporting, so no revision is appropriate in response to the commenter's suggestion.

I-67: Dara Farnoush

Comment I-67-1

My name is Dara Farnoush, and I am a student at UC Davis.· I also am the president of the Surfrider chapter at Davis and the -- and I sit on the board of the CALPIRG students chapter.

In my comments today, I'd like to focus on the allowance of chemical recycling and the fact that it will cause a need for new virgin plastics instead of actually recycling the plastic.

Through both my classes and my cleanups, I've come to learn just how much plastic goes into our environment.· I think this statistic was mentioned earlier, but about a dump truck's worth of plastic gets dumped into the ocean every 45 seconds.

Plus, nearly half of all plastics that are produced are meant to be used just once.· After that, they're thrown away and they end up -- and they show up everywhere.· From the soil at the bottom of the ocean to every single person's brain and bloodstream.

I was visiting Big Bear Lake with my family. And while we were hiking along the edge of the lake, we -- my dad mentioned how beautiful the nature is and how lovely the view is.· And we couldn't tell that there was a whole town across the street when we looked out over the lake.

I pointed out a plastic bottle and a chip bag that were floating by the edge of the lake.· For me, they ruined the view, but I was quickly able to put them out of my head, because I'm used to seeing plastic on beach cleanups and hikes that I've done throughout the last couple years.

My dad, on the other hand, couldn't put it out of his head.· During the rest of our lap, he kept noticing the plastic trash all around the lake and the trail.· And I felt horrible that I shattered his rose-colored glasses.· But it definitely showed both of us how much work there needs to be made to clean up our environment and clean up plastics from our lifestyles.

Chemical recycling doesn't actually solve any of these problems, since it just incinerates the plastic.· And on top of not reducing our need for new plastics to be created, it creates toxic pollutants that harm our environment and threaten public health.

Plus, current regulations have a lot of sweeping exemptions.· Which means that a lot more plastic is being sent to landfills or discarded into our environment than is necessary.· So I'm asking CalRecycle to strengthen the regulations so that only real recycling technologies are allowed in California, not chemical recycling.

Response to I-67-1

CalRecycle rejects this comment's suggestion that "chemical recycling" be banned outright in the regulations. A complete ban on any technology could have been accomplished through straightforward language establishing a prohibition based solely on the type of technology. Instead, the Legislature chose to word statute in a way that requires consideration of hazardous waste generation, not mere consideration of the type of technology. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42041(aa) and 42060, and the recommended change is not necessary to the implementation of the Act.

Comment I-67-2

On top of that, I'm asking CalRecycle to not allow for broad exclusions for packaging of over-the-counter drugs and food or ag products.· But instead to institute an exemption process so that not only those who need it are exempted.· These changes will lead to more real recycling and therefore, less plastic in our parks, waterways, and landfills.· And it will create less demand for new plastics to be produced. Thank you.

Response to I-67-2

CalRecycle partially accepts and partially rejects this comment. CalRecycle rejects this comment with respect to over-the-counter drugs for the reasons stated in response to comment O-49-1. For the reasons stated in response to comment I-59-2, CalRecycle rejects the comment to the extent it requests an exemption process similar to the ones available pursuant to Public Resources Code section 42060(a)(3) and (4) (see section 18980.2.4 of the proposed regulations). CalRecycle also rejects the comment to the extent it suggests there should be no exclusion for food or agricultural goods packaging, for the reasons stated in response to comment I-19-1. CalRecycle accepts this comment with regard to food and agricultural packaging, however, to the extent it alleges that section 18980.2(a)(2) was unclear in scope or effect, was insufficiently clear regarding what renders it "not reasonably possible" to resolve conflicts with federal laws, or would have been overbroad in effect due to the potential for the exclusion to be applied despite the conflicts being avoidable. See CalRecycle's response to comment I-19-1, explaining the revisions responsive to this and similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

B-1: Dean Eldrenkamp (Dean Eldrenkamp)

Comment B-1-1

The regulation indicates "(d) Each producer that applies to become a participant of an approved PRO pursuant to subdivision (b) of this section shall, at the time of its

application, submit to the PRO that producer's supply data for calendar year 2023. For purposes of this subdivision, "supply data" means the information described in section 18980.10.2."

Calender Year 2023 data is 2 years old. Obtaining this data brings problems. Other existing EPR state reporting uses 2024 data. The CA plan should align and be updated and use of the more current 2024 data. This will save manufactures vast amounts of time and improve the accuracy of reported data.

Response to B-1-1

CalRecycle rejects this comment for the reasons stated in I-62-4 and I-62-8. Further, the commenter does not specify how the 2023 data will be problematic, and merely aligning with other EPR programs, which are unique and distinct to SB 54, does not provide a reasonable basis for a regulatory change.

B-2: Ahava River cards coloring books (Christina DiMari)

Comment B-2-1

Hello,
I am reaching out to ask a question.

I have a very small company that sells some of our greeting cards wholesale to stores. Each card is wrapped in a protective plastic art sleeve.

I am trying to figure out if that is now not allowed.

Can you help or call to discuss?

Response to B-2-1

Comment rejected. The comment does not address the proposed regulations themselves, suggest changes to them, or raise objections related to the rulemaking process. Instead, the comment requests that CalRecycle provide assistance with a specific compliance question directly to the commenter. Accordingly , no response is required. Moreover, even if this comment could be construed to raise an objection or recommend revisions relevant to the circumstances the commenter describes, no such revisions are warranted. The definition of "packaging" in statute (Public Resources Code section 42041(s)) is sufficiently clear on its face, and regulations are not required to address, nor could they feasibly address, every example good specifically.

B-3: Indiana Botanic Gardens INC (Konstantina Sotiroglou)

Comment B-3-1

I’m writing on behalf of Indiana Botanic Gardens INC regarding the SB 54 packaging producer requirements. Our California gross sales are under $1,000,000 across all channels (direct-to-consumer, marketplaces, and wholesale), and we intend to claim thesmall-producer exemption.
Could you please confirm where and how we should submit the exemption?
Specifically:
1. Should we file the exemption through CalRecycle’s producer registration portal, or via email to this inbox?
2. If the portal is required, could you please provide the exact link and any step-by-step guidance (e.g., “register as a producer → select small-producer exemption”)?
3. Are there any specific forms or templates you require for the attestation?
4. What supporting documentation should be included (e.g., CA gross sales summary by channel), and in what file format?
5. What is the effective period of the exemption and the renewal cadence?
6. For the $1,000,000 threshold, should we calculate based on all California gross sales (across all channels), or only sales associated with covered packaging materials?
For your convenience, we can attach:
Cover letter attestation (company letterhead)
California Gross Sales Worksheet (by channel), with totals clearly shown
We appreciate your guidance so we can proceed correctly and on time. Please let us know
if there is any additional information you need from us.

Response to B-3-1

Comment partially rejected and partially accepted. CalRecycle rejects this comment to the extent it was intended to request response to compliance and application questions specific to the commenter rather than to suggest changes to the proposed regulations or raise objections related to the rulemaking process. Because such questions are not objections or recommendations concerning the proposed regulations, no response is required in the context of this rulemaking.

However, to the extent the commenter's questions were intended to identify portions of the proposed regulations that require greater clarity, CalRecycle partially accepts it. Regarding how to file an exemption request, CalRecycle accepts the comment and has revised 18980.5.2(a) to explain that notices from small producers must be submitted via an online portal that CalRecycle will establish. Regarding the request for an "exact link," CalRecycle declines to include a link in the regulations themselves because codifying such ministerial details is unnecessary; no regulation is needed for CalRecycle to establish the specific URL used for accessing the portal. Regarding "specific forms or templates," no change the regulations are required because on online portal necessarily provides such detail, and 18980.5.2(a) now makes clear that such a portal will be provided. Codifying forms (i.e., including forms themselves in

regulations) that CalRecycle will provide via that portal is not necessary. Regarding the required "supporting documentation," 18980.5.2(a) appropriately leaves that to the discretion of submitters. Prescribing specific documentation would be unnecessarily rigid and would not respect the fact that the best evidence of sales might not be exactly the same for all small businesses. Regarding the file format, the proposed regulation resolves the commenter's question by explaining that use of CalRecycle's online portal, rather than solely discrete files, will be required, and codifying the exact technical details of such an online portal in regulations is not required. Regarding the effective period and renewals, that detail is made clear in 18980.5.2(b), which states when exemptions become effective and their duration, and 18980.5.2(c), which explains the renewal process. Regarding the $1,000,000 threshold, 18980.5.2(c) is sufficiently clear because it includes no limitation of gross sales to those associated with covered materials. The requirement, as clearly stated, relates to "gross sales in the state."

B-4: Vermont Hard Cider Company, LLC (Sue Citron)

Comment B-4-1

As a beverage manufacturer in Vermont, we are reviewing the reporting requirements under CA SB 54. We produce hard cider in cans, bottles and kegs and also co-pack a small amount of beer. We are not currently producing our spirit-based RTD beverages but we maintain our Out of State Spirit Shipper License. Our cider products are imported into CA via our CA distributors so our distributors report those shipments. We only report on beer produced under our Out of State Beer Manufacturer Certificate. All of our products are labeled with CA CRV. According to Public Resources Code 42041, beverage containers subject to CA Beverage Container Recycling and Liter Reduction Act are exempt. Would the cardboard packaging that hold a six or twelve pack of cans or bottles we produce also be exempt?

Response to B-4-1

Comment rejected. The comment does not address the regulations themselves, suggest changes to them, or raise objections related to the rulemaking process. Instead, the comment requests that CalRecycle provide assistance with a specific compliance question directly to the commenter. Accordingly , no response is required. Moreover, even if this comment could be construed to raise an objection or recommend revisions relevant to the circumstances the commenter describes, no such revisions are warranted. The definition of "packaging" in statute (Public Resources Code section 42041(s)) is sufficiently clear on its face, and regulations are not required to address, nor could they feasibly address, every example good specifically. Lastly, the regulations already include a provision offering clarity regarding application of the exclusion for beverage containers: section 18980.2(c) explains that that exclusion (Public Resources Code section 42041(e)(2)(E)) applies the definitions found in the California Beverage Container Recycling and Litter Reduction Act.

B-5: Coleto Brands (Darren Robling)

Comment B-5-1

Can Expanded Polyethylene (EPE) be added to the Covered Material Classification List and noted as to whether it is recyclable or not in California. It is a common material used in electronics packaging, along with Expanded Polystyrene (EPS or styrofoam) which is on the CMCL and noted as not recyclable. Should EPE be listed in the same code as EPS?

Response to B-5-1

Comment rejected. The comment concerns the Covered Material List that CalRecycle published, not the proposed regulations. Accordingly, no response is required here.

B-6: Ingevity (Brian Pontious)

Comment B-6-1

Ingevity is a world leader in polycaprolactone technology with 50 years of innovation and a long history of helping compounders and converters produce safer and higher-performing certified compostable plastics. Our company has actively advocated worldwide to increase access to organics recycling and offer solutions to regulators and legislators looking to protect and preserve our environment.

Ingevity appreciates the opportunity to comment on CalRecycle's proposed regulations for the implementation of SB 54.

Article 2- Covered Material and Covered Material Categories

Ingevity fully supports the revised language in § 18980.2(a)(2), which offers a clear and reasonable pathway for products to be exempted from being considered a covered material if they cannot comply with the program due to conflicts with federal law.

Specifically, Ingevity appreciates CalRecycle's newly proposed language in § 18980.2(a)(2)(A) which will bring transparency and fairness to this process of companies requesting exemptions. If companies seek to exempt certain products from being covered material, they need to justify that request to the department and clarify that no alternative that could meet the requirements of SB 54 is available. This will prevent misleading activity and ensure all companies are playing by the same fair rules. We also support creating a public database of these exemptions so that companies investing in innovative packaging can target those products and invest in creating sustainable alternatives that can meet the requirements of SB 54.

Ingevity was firmly opposed to the language proposed in these relevant sections during the last release of informally proposed text and appreciates CalRecycle listening to the concerns of stakeholders and making the proper adjustments.

Ingevity would like clarity on how exemption requests may be reconsidered. For example, if an alternative product becomes available, what is the process for removing a company's exemption for a certain product? Would a process for reconsideration of an exemption be covered by the language in18980.2(a)(2)(B)?

Response to B-6-1

Comment partially accepted and partially rejected. The comment does not recommend a change to the text of the proposed regulation, so no substantive response is required. However, to the extent the commenter's questions were intended to request that the proposed regulation itself provide "clarity on how exemption requests may be reconsidered," CalRecycle accepts the comment and has revised 18980.2(a)(2) accordingly. In particular, text was added to make clearer how CalRecycle and interested parties must evaluate whether avoiding the conflict is "not reasonably possible." Subparagraph (D) now more directly explains the effect of CalRecycle adding information about exclusion claims to the database it will maintain. Also, subparagraphs (C) through (F) of the revised regulation also more clearly explain the procedure for CalRecycle's receipt and reconsideration of notices of exclusion claims, the effect of duplicative or overlapping notices, and that the criteria provided applies to CalRecycle's consideration of notices submitted to it concerning the exclusion, as described in the revised text in subparagraphs (D) and (E).

Comment B-6-2

Article 2- Section 18980.2.1. Exclusion of Reusable and Refillable Packaging and Food Service Ware

Ingevity continues to oppose the substantial removal of language in §18980.2.1. affecting reuseable products. The new regulations leave reuseable products generally unregulated and susceptible to abuse. § 42041 within SB 54 loosely defines "reuseable" and leaves much to the interpretation of CalRecycle. By deleting provisions regulating the marketing and durability of reusable products, we fear companies will take advantage of the lack of clarity surrounding what is and what is not truly reuseable and "resin dump" into many single use products resulting in them being considered "reuseable" and landfilled instead of paying fees and being recycled or composted within the state. California faced this issue with plastic bags and we advise the removed criteria defining reusable products be added back to avoid creating the same "loophole" for packaging.

Solution: *We recommend reinstating the previous proposed regulations governing reuseable products in this section.*

Response to B-6-2

CalRecycle rejects this comment because it does not set forth any recommended change. The currently proposed regulations are the first regulations proposed in this rulemaking; there are no "previous proposed regulations" that are part of this rulemaking. In particular, the commenter does not identify how they propose to address the so-called "resin dump" issue, nor does the commenter explain how that practice would necessarily result in items satisfying the statutory reusability criteria. To the extent the commenter intended to suggest that regulations directly regulate items that satisfy the criteria in Public Resources Code section 42041(af), other than setting forth interpretations of those criteria, CalRecycle rejects that suggestion because such items are unambiguously not within the definition of "covered material." To the extent the commenter intended to suggest that the regulations impose a requirement on how many times a consumer-refilled item must be used for it to be considered "reusable," CalRecycle rejects that comment because 42041(af)(2) makes no reference to such a requirement, which would be practically impossible to assess, in any event. The only reasonable interpretation of section 42041(af)(2) is that the Legislature intended the robust requirements for consumer-refilled items to naturally result in sufficient reuse of the items, thereby avoiding the negative outcomes about which the commenter is concerned.

Comment B-6-3

Article-2 Section 18980.2.5. Covered Material Category List Updates

Ingevity continues to oppose the proposed changes in § 18980.2.5(b). While CalRecycle is only mandated to update the list annually, the department should update it as needed when new information is provided to the department. This change to the language will make the agency less responsive and delay California's efforts to ensure more products are put on the covered material categories list, collected, and recycled/composted.

Solution: *We recommend reinstating the language in* §18980.2.5(b).

Response to B-6-3

CalRecycle rejects the comment. The commenter recommends "reinstating the language" in section 18980.2.5(b). However, no language to "reinstate" is provided. Moreover, subdivision (a) explains when the list will be reviewed, with the potential consequence being that the list might be updated. Subdivision (b) of the proposed regulation explains the standard by which CalRecycle will decide, after that preceding review, if the list should be updated. The commenter appears to assume that the proposed regulation limits when CalRecycle may review and update the CMC list. That is incorrect: CalRecycle can update the list any time if determines that a change is warranted. Also, subdivision (f) expressly addresses the commenter's concern over updates "when new information is provided to the department"; that subdivision explains that CalRecycle will consider information submitted to it by April 1 and information submitted later, if

time permits, for purposes of updating the list in that year.
To the extent that this might be understood as seeking a requirement for a more frequent review of the CMC list, the comment is rejected for the following reasons. A binding commitment to review the list more frequently would significantly truncate the time needed to obtain longitudinal information and to analyze that information appropriately without the guarantee that review and changes are warranted.

Comment B-6-4

Article 3-Section 18980.3.3. Eligibility for Being Labeled "Compostable"

Ingevity strongly supports CalRecycle's newly proposed deletion of "desirable organic waste" in 18980.3.3(b)(5)(A). This language was repetitive and already applied appropriately in statute through Chapter 5.7

Response to B-6-4

Comment rejected. CalRecycle cannot locate the regulatory provision described by the commenter. In any event, the comment expresses support for the proposed regulation and does not propose any changes or raise any objection, so no response is required.

Comment B-6-5

Article 4- Responsible End Market Criteria - § 18980.4(a)(4)(B) and § 18980.4(a)(4)(C)

Ingevity continues to oppose the language in § 18980.4(a)(4)(B). While we appreciate that CalRecycle has now defined "biologically decompose" it does not alleviate our previously stated concerns nor the potential for market distortion. We previously requested CalRecycle to remove the term "biologically decompose" from § 18980.4(a)(4)(B) and for the language to be amended to recognize overs as a standard part of the composting process which are typically disposed of and sent to the landfill.

Similar to how some residuals in the recycling stream may be landfilled to sort out contamination, it is possible certified compostable products might be caught as overs along with other natural products like food waste and contamination from conventional plastic products. Rather than recognize this process for all products, CalRecycle has created § 18980.4(a)(4)(C) for paper and fiber products, which creates an unacceptable exemption and allows the overs of paper and fiber products to be landfilled, while language in § 18980.4(a)(4)(B) explicitly restricts an entity processing certified compostable plastics from disposing of undecomposed material. All certified compostable products, regardless of material type or material origin, should be meeting the same requirements as they are processed in an identical manner at the same responsible end market.

All certified compostable products, regardless of whether they contain plastic or not, should have to meet the same responsible end market requirements as they are all designed and certified to disintegrate and biodegrade in industrial compost facilities.

This proposed section would create an unfair advantage for paper and fiber products while possibly prohibiting any composter in California from being considered a responsible end market if they accept certified compostable plastic products. Finally, even if there was a reason to provide a special exemption for paper and fiber products, there is no reasonable way for composters to screen their overs and determine what items have plastic in them and what items do not have plastic in them. It may not be obvious which fiber or paper-based products contain barrier coatings which can contain natural or synthetic resins.

Solution: *We are requesting minor edits to 18980.4.(3)(B) as illustrated below to ensure your intent is accurately recorded and interpreted properly:*

(B)For items partially or wholly constituting plastic, any covered material or intentionally included in the process used to generate a recycled organic product must ~~fully~~ biologically decompose and be processed in a manner consistent with the management of other feedstocks to produce a marketable product which complies with standards found in sections 17868.2, 17868.3 and 17868.3.1 of Article 7 of Chapter 3.1 of Division 7 of Title 14 of the California Code of Regulations or in sections 17896.59, 17896.60, and 17896.61 of Article 6 of Chapter 3.2 of Division 7 of Title 14 of the California Code of Regulations, as applicable. ~~The entity must neither dispose the undecomposed material nor send it to another entity that subsequently disposes it, and the entity must ensure that it fully biologically decomposes, through additional processes conducted either by the entity or by subsequent entities to which the material is transferred. Covered material and derivative material inadvertently included in the process that remain undecomposed shall be considered incompatible materials and are subject to paragraph (3) of subdivision (a).~~

Response to B-6-5

CalRecycle rejects this comment. The proposed regulations are consistent with the provisions of the Act, including PRC sections 42041(aa), 42041(ad) and 42060, and no change is necessary to the implementation of the Act. PRC section 42041(aa) provides that, to constitute recycling under the Act, covered material must be sent to a responsible end market. PRC section 42041(ad) defines a responsible end market as a materials market in which the recycling of materials is conducted in a way that benefits the environment and minimizes risks to public health and worker health and safety. PRC section 42041(ad) further authorizes CalRecycle to adopt regulations to identify responsible end markets and to establish criteria regarding benefits to the environment and minimizing risks to public health and worker health and safety. Sections 18980.4(a)(4)(B) and (C) of the proposed regulations implement these provisions by specifying how responsible end markets may be identified according to the covered materials they accept. Sections 18980.4(a)(4)(B) and (C) appropriately

set different standards for the identification of responsible end markets because the respective covered materials—i.e., covered material partially or wholly comprising plastic (18980.4(a)(4)(B)) and covered material comprising fiber or paper substrates (without a plastic component) or wholly derived from natural resources (18980.4(a)(4)(C))—pose different risks under the factors specified in PRC section 42041(ad). Specifically, the inclusion of non-plastic covered materials in the process used to generate a recycled organic product inherently presents different risks to the environment and public health than the inclusion of covered materials that partially or wholly comprise plastic in such process. PRC 42041(ad) explicitly authorizes CalRecycle to consider risks to the environment and public health that are posed by end market operations; because end market operations for the applicable covered materials present different risks, different standards for the identification of responsible end markets are necessary and appropriate.

Furthermore, to the extent this comment suggests section 18980.4(a)(4)(B) creates an unreasonable standard, no change is necessary. PRC section 42051.1(c)(2) establishes that a PRO is responsible for describing in its plan how it will support and achieve the collection, processing, recycling, composting, and the development of responsible end markets for covered materials to meet the requirements of the Act. The PRO is therefore responsible for describing in its plan how it will support and achieve any upgrades, including, for instance, technological or infrastructure upgrades, that may be necessary to enable covered materials to achieve recycling or composting requirements under the Act. To the extent further additional investment may be necessary to achieve these upgrades, the PRO may account for such investment in its plan under, for instance, PRC sections 42051.1(i)(3)(G) or (I) or PRC section 42051.1(j)(1)(F). Finally, to the extent this comment is concerned with overs in the composting process, no change is necessary. The biological decomposition requirements in sections 18980.4(a)(4)(B) and (C)—and the prohibition against disposal of undecomposed materials—are explicitly limited to materials that are intentionally included in the process used to generate a recycled organic product. Instead, materials that are inadvertently included in the process and that remain undecomposed must be treated as incompatible materials consistent with section 18980.4(a)(3). Therefore, an adequate process already exists under section 18980.4(a)(4)(B) and (C) for any unintentional overs in the composting process, and no change is necessary.

Comment B-6-6

Article 6- Section 18980.6.7. Eco-modulated Fee and Fee Schedule

Ingevity continues to strongly oppose the proposed language changes in §18980.6.7(a) and §18980.6.7(b). Delaying eco-modulation incentives will directly harm companies who made critical investments in their production facilities and supply chains to produce products that were expected to be sold at competitive prices due to eco-modulation incentives. Eco-modulation incentives for certified compostable products were

specifically put within statute as compostable products often cost more to produce compared to conventional products and these incentives were designed to help level the playing field. Delaying eco-modulation incentives will restrict the innovation currently taking place to bring sustainable solutions to the market quickly.

Solution: We strongly recommend removing the two-year delay.

Response to B-6-6

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42051.1, 42053, and 42060, and no change is necessary to the implementation of the Act. PRC section 42053(b) provides that a PRO shall determine producer fees based on the considerations specified in that section "[d]uring the first two years of operation and during the preparation of the plan[.]" Sections 18980.6.7(a) and (b) of the proposed regulations implement this provision by providing that, prior to the approval of a PRO plan and for two years following that approval, a PRO must charge its producers fees pursuant to PRC section 42053(b). Sections 18980.6.7(a) and (b) therefore do not impose an additional delay to eco-modulated fees beyond that which is required by statute; rather, they merely specify the timeline that is established in PRC section 42053(b). This timeline is necessary to ensure the PRO has sufficient data to support the allocation of eco-modulated fees before it must begin charging producers eco-modulated fees. Moreover, section 18980.6.7(c) of the proposed regulations permits the PRO to begin charging producers eco-modulated fees at any time following approval of the plan if the PRO determines it has sufficient data to support eco-modulated fees. Therefore, the current language of section 18980.6.7 appropriately balances the statutory requirement of PRC section 42053(b) and the practical realities of eco-modulated fees based on producer data with the opportunity and flexibility to charge eco-modulated fees at the earliest available opportunity. No further change is necessary.

Comment B-6-7

Article 11- Section 18980.11. Requirements for Local Jurisdictions and Recycling Service

Ingevity continues to oppose the proposed underlined language in §18980.11(b). We support CalRecycle seeking to clarify that local jurisdictions are not required to setup responsible end markets on their own. However, we remain concerned that this new language will be interpreted as a blanket exemption for local jurisdictions rather than being seen as criteria that can be used to request an exemption. We agree that it is the PRO's responsibility to work with local jurisdictions to create responsible end markets and local jurisdictions need clarity to ensure they will not be victim to any unnecessary enforcement action.

As interpreted, the proposed language would fundamentally change the foundation of how SB 54 works, contradict the stated goals of the program, and harm California's

circular economy efforts. SB 54 tasks local jurisdictions to work with the Producer Responsibility Organization (PRO) to ensure all material that is considered recyclable or compostable is collected and processed at a responsible end market. There should be no reason that a local jurisdiction does not have access to a responsible end market as the PRO will be tasked with working with each local jurisdiction in their local conditions to fund these services even if it requires building new facilities or investing in infrastructure to haul covered materials outside of certain communities.

Solution: We are requesting a minor amendment to ensure your intent is properly captured in the newly proposed language below:

(b) Covered material is considered included in a local jurisdiction or recycling service provider's collection and recycling program if the local jurisdiction or recycling service provider collects the covered material and directs it to recycling at responsible end markets, either by transferring it to responsible end markets directly or to intermediate supply chain entities. The local jurisdiction or recycling service provider shall not be required to establish the availability of a responsible end market to ultimately recycle the covered material. However, the absence of responsible end markets shall be deemed a local condition, circumstance, or challenge for grounds of applying for an extension or exemption in processes detailed in ~~rendering inclusion of the covered material in the program impracticable for purposes of~~ subdivision (b) of section 42060.5 of the Public Resources Code and paragraph (4) of subdivision (c) of section 18980.11.1 of this chapter.

If you have any questions regarding Ingevity's position, or need additional input, please contact me at Michael.Tschantz@ingevity.com

Response to B-6-7

CalRecycle rejects this comment for the reasons stated in response to comment B-48-9.

B-7: Janine M Chicourrat (Janine M Chicourrat)

Comment B-7-1

As the premier environmentally conscious hotel in Monterey County-and one of the top 10 eco hotels in the country ranked by USA Today-the Portola Hotel & Spa is deeply invested in eliminating single-use plastic across our hotel and spa facilities. In support of independently owned California businesses like ours, we urge you to ensure that the final regulations to implement California's landmark Plastic Pollution Prevention and Packaging Producer Responsibility Act (SB 54) are strong-ensuring plastic packaging and foodware intended to be covered by the law are not excluded in the source reduction and recycling mandates and dangerous chemical recycling remains prohibited as required by the law.

The Portola Hotel & Spa successfully provides a luxury experience for our guests; offering a variety of environmentally conscious amenities and features while reducing our carbon footprint. Strong implementation of SB 54 will further enable the Portola Hotel & Spa, and other hotels across the state, to reduce single-use plastic across operations and guest experiences by ensuring that plastic producers are financially responsible for managing their waste and that businesses like ours aren't left shouldering the cost. Additionally, the strong goals of SB 54 should drive innovation to make available more alternatives to single-use plastic on a faster and more economical timeline making endeavors for hotels to go plastic free more viable.

We thank you for your commitment to tackling the plastics crisis in California by signing SB 54 and urge you to fully uphold the goals of the law.

Response to B-7-1

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment I-19-1 and I-25-1.

B-8: CornNext (Melissa Fox)

Comment B-8-1

Executive Summary

CornNext Corporation respectfully submits these comments on the California Department of Resources Recycling and Recovery's (CalRecycle) draft regulations implementing SB 54, the Plastic Pollution Prevention and Packaging Producer Responsibility Act. We urge CalRecycle to adopt revised definitions for "biodegradable" and "compostable" packaging materials within SB 54's Extended Producer Responsibility framework that properly distinguish between natural-source, non-polymeric agricultural products and industrially-synthesized bio-plastics.

Our core recommendation is the establishment of a tiered classification system for covered packaging materials under SB 54 that recognizes the fundamental differences between materials preserving original agricultural biochemistry versus those requiring synthetic polymer creation, supporting both the Act's environmental goals and coordination with federal organic agriculture standards.

Response to B-8-1

Comment rejected. No response to this portion of the commenter's submission is necessary because the recommendation it mentions has been addressed in response to other portions of the submission setting forth that recommendation in greater detail.

Comment B-8-2

About CornNext Corporation

CornNext is a leading manufacturer of packaging materials derived directly from corn starch and other agricultural byproducts. Our products represent true agricultural circularity, converting farm waste streams into functional packaging through minimal processing that maintains the natural biodegradability of the source materials. We are committed to supporting California's environmental goals while maintaining the integrity of agricultural and organic systems.

Response to B-8-2

Comment rejected. No response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process. To the extent other portions of the submission do suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment B-8-3

I. Current Regulatory Framework Limitations
Insufficient Distinction Between Natural and Synthetic Materials

The current draft regulations rely primarily on ASTM Standards D6400 and D6868 for compostability determinations, treating all materials that meet these technical specifications equally regardless of their origin or manufacturing process. This approach fails to recognize the fundamental environmental and agricultural differences between:
1. **Naturally-derived materials** that undergo minimal physical processing (corn starch molding, fiber formation)
2. **Synthetic bio-plastics** requiring industrial fermentation, chemical synthesis, and polymer creation (PLA, PHA, etc.)

Misalignment with USDA Organic Standards
California's current framework creates regulatory inconsistency with federal organic agriculture standards. The USDA National Organic Program (NOP) severely restricts synthetic materials in compost feedstocks, allowing only newspapers as synthetic inputs. Yet California's regulations would classify synthetic bio-plastics as equivalent to natural agricultural materials for compostability purposes, potentially compromising organic agricultural systems.

Response to B-8-3

Comment rejected. CalRecycle cannot fully parse this comment because it does not explain how the proposed regulations do what the commenter alleges ("rely primarily on ASTM Standards D6400 and D6868 for compostability determinations..."), nor does it identify any proposed regulation that the commenter recommends be changed. The proposed regulations make no reference to ASTM standards D6400 or D6868, and the commenter does not explain how the proposed regulations "classify" materials in any particular way. In any event, the commenter is incorrect as a matter of law that synthetic materials may be treated the same as non-synthetic materials for purposes of

determining compostability or that "California's current framework" is inconsistent with federal agriculture standards. As acknowledged in section 18980.3.3(a) of the proposed regulations, Public Resources Code section 42357(g)(1)(B) applies to compostability and incorporates the National Organic Program limitations on synthetic inputs. To the extent the commenter's objection is that Public Resources Code section 42357 also includes the requirement that materials satisfy the ASTM standards referenced, CalRecycle rejects that objection because it concerns statutory requirements that cannot be modified via regulation.

Comment B-8-4

II. Proposed Tiered Classification System for SB 54 Packaging Materials
Tier 1: Natural-Source, Non-Polymeric Compostable Materials
Definition: Materials derived directly from agricultural crops, crop residues, or agricultural processing byproducts through physical transformation processes that involve no chemical modification of the starch backbone, no polymerization, and no creation of new synthetic polymers.
Characteristics:
• Source materials: Unmodified corn starch, wheat straw, bagasse, cotton fibers, wood fibers
• Processing: Physical molding, heating, fiber formation, pressing, or shaping without chemical alteration of molecular structure
• No synthetic polymer creation, industrial fermentation, or chemical synthesis of new compounds
• Biodegrades readily under varied environmental conditions
• Maintains original agricultural biochemistry
Regulatory Treatment:
• Expedited approval for "compostable" labeling under SB 54
• Presumptively compatible with organic composting principles, subject to NOP guidance and local facility policies
• Standard ASTM testing requirements (D6400/D6868)
• Priority consideration for EPR fee reductions or credits
• Clear feedstock labeling requirements for downstream transparency

Tier 2: Bio-Synthetic Compostable Materials
Definition: Materials derived from renewable biological feedstocks but requiring industrial processes including fermentation, chemical synthesis, polymer creation, or other substantial molecular transformation that alters the original agricultural biochemistry.
Characteristics:
• Source materials: Corn (processed into PLA), sugarcane (processed into PHA), etc.
• Processing: Industrial fermentation, chemical synthesis, polymer engineering, molecular modification
• Requires specific industrial composting conditions for optimal degradation
• Subject to enhanced testing requirements due to synthetic polymer characteristics
Regulatory Treatment:

• Enhanced testing requirements including mandatory microplastics residue assessment
• Polymer-specific molecular degradation verification (sub-2mm particle analysis plus analytical identification)
• Soil biodegradation testing (ISO 17556) and ecotoxicity/plant growth assessment
• Evidence-based eco-modulation in EPR fee structures
• Comprehensive feedstock labeling for informed facility and farmer selection

Response to B-8-4

Comment rejected. This comment provides background for the proposals set forth later in this submission, in comments B-8-6 through B-8-8. To the extent this comment requires a response, CalRecycle has provided it via its responses to comments B-8-6 through B-8-8.

Comment B-8-5

III. Technical and Environmental Justifications
Biodegradation Performance Differences

Natural-source, non-polymeric materials demonstrate superior biodegradation characteristics:
1. **Broader Environmental Compatibility:** Corn starch-based materials with unmodified molecular structure biodegrade effectively across varying temperature, moisture, and microbial conditions, unlike synthetic bio-plastics requiring specific industrial composting parameters.
2. **Enhanced Molecular Breakdown:** Materials preserving original agricultural biochemistry decompose to their constituent agricultural compounds, supporting soil health. However, we recommend mandatory microplastics residue assessment and polymer-specific molecular degradation verification for bio-synthetic materials to ensure complete breakdown below detection thresholds.
3. **Infrastructure Independence:** Natural-source materials compost successfully in municipal, industrial, and appropriate home composting systems, reducing California's dependence on specialized industrial composting infrastructure under SB 54's waste diversion goals.

Agricultural System Coordination
The National Organic Coalition and numerous organic farmers have explicitly opposed inclusion of synthetic compostable packaging in organic compost systems. Rather than substituting SB 54 standards for existing organic regulations, we recommend coordination between CalRecycle and USDA National Organic Program policies to ensure complementary rather than conflicting frameworks for compostable packaging materials.

Microplastic Assessment and Testing Protocol Enhancement
Current ASTM testing protocols require enhancement for bio-synthetic materials. ASTM standards consider materials "biodegraded" if they pass through a 2mm sieve, but this only confirms particle size reduction, not molecular decomposition. We recommend CalRecycle require mandatory microplastics residue assessment using analytical

methods capable of detecting and identifying particles below 2mm thresholds, combined with polymer-specific molecular degradation verification to ensure complete breakdown rather than fragmentation.

Response to B-8-5

Comment rejected. This comment provides background for the proposals set forth later in this submission, in comments B-8-6 through B-8-8. To the extent this comment requires a response, CalRecycle has provided it via its responses to comments B-8-6 through B-8-8.

Comment B-8-6

IV. Specific Regulatory Recommendations
1. Revised Definitions
§ [X].1 Natural-Source, Non-Polymeric Compostable Material
"A packaging material covered under SB 54 that is derived directly from agricultural crops, crop processing residues, or other naturally occurring organic matter through physical transformation processes that involve no chemical modification of the starch backbone, no polymerization, and no creation of new synthetic polymers. Processing may include molding, heating, fiber formation, pressing, or shaping that preserves the original agricultural biochemistry and biodegradability characteristics of the source material."

Response to B-8-6

Comment rejected. The commenter proposes a definition of the term "Natural-source, non-polymeric compostable material." As the commenter explains in comment B-18-17, the purpose of the definition is to fit into a proposed "tiered classification system that properly distinguishes between natural-source, non-polymeric and bio-synthetic compostable packaging materials." As explained in response to the other portions of the commenter's submission, however, that classification system ignores the framework mandated by statute and attempts to address matters outside the scope of the statute and these proposed regulations. Accordingly, defining this term is unnecessary and would not serve any valid purpose.

Comment B-8-7

§ [X].2 Bio-Synthetic Compostable Material
"A material derived from renewable biological feedstocks but requiring industrial processes including fermentation, chemical synthesis, polymer creation, or other substantial molecular transformation that alters the natural biodegradability characteristics of the source material."

Response to B-8-7

Comment rejected. The commenter proposes a definition of the term "Bio-Synthetic Compostable Material." As the commenter explains in comment B-18-17, the purpose of the definition is to fit into a proposed "tiered classification

system that properly distinguishes between natural-source, non-polymeric and bio-synthetic compostable packaging materials." Here and in other comments, the commenter fails to explain clearly how that framework relates to the statute, however. The commenter may have intended to suggest that the definition of materials as "Bio-Synthetic Compostable Material" or "Natural-Source, Non-Polymeric Compostable Material" (with a definition proposed in comment B-8-6) be used to determine whether materials should be considered compliant with the compostability requirement of Public Resources Code section 42050(b). That approach would be unlawful; the statute requires compliance with that provision to be assessed with respect to the requirements set forth in Public Resources Code sections 42355 through 42358.5.

Comment B-8-8

2. Enhanced Testing Protocols for Bio-Synthetic Materials

• **Mandatory microplastics residue assessment** using analytical methods capable of detecting and identifying particles below 2mm thresholds
• **Polymer-specific molecular degradation verification** beyond particle size reduction, including analytical identification of breakdown products
• **Soil biodegradation testing** according to ISO 17556 or equivalent standards
• **Ecotoxicity and plant growth assessment** for agricultural application compatibility
• **Long-term persistence testing** in various environmental conditions

Response to B-8-8

Comment rejected. This portion of the commenter's submission, which overall proposes a "tiered classification system that properly distinguishes between natural-source, non-polymeric and bio-synthetic compostable packaging materials," sets forth "testing protocols" for materials fitting the definition proposed in comment B-8-7. As explained in response to that comment, however, that framework does not appear to relate to the requirements of statute and the mandate of these proposed regulations. The commenter may propose the testing protocols for the purpose of determining whether the sale of certain materials is lawful or whether the materials comply with Public Resources Code section 42050(b). The testing protocols have no relation to any statutory provision, however, and the statute does not authorize CalRecycle to impose a sales restriction based on criteria other than those specifically identified for applying the recyclability and "eligible for being labeled 'compostable'" requirements. The commenter may instead have intended to propose testing protocols as required methods that composters must use to be considered "responsible end markets." CalRecycle declines to adopt those protocols because they are directed at the characteristics of the recycled organic product and are more precise than can be justified under statute, which requires processes to output products (including compost) "that meet the quality standards necessary to be used in the marketplace." Because that is the overall requirement, statute requires the more flexible approach described in section 18980.4(a)(4)(C).

Comment B-8-9

3. Feedstock Labeling and Data Transparency Requirements

• **Clear feedstock identification:** Compost facilities must clearly label whether feedstock includes Tier 1, Tier 2, or mixed material sources
• **Data transparency:** Public reporting of feedstock composition to enable informed choices by farmers and end-users
• **Facility disclosure:** Composting operations must maintain records of material sources and make information available to agricultural customers
• **Chain of custody:** Documentation requirements for traceability from packaging producer to compost end-user

Response to B-8-9

Comment rejected. CalRecycle rejects this comment because it relates to a framework for classifying materials that, as explained in response to comments B-8-7 and B-8-8, is either irrelevant to or inconsistent with statute. To the extent the commenter proposes "labeling and data transparency requirements" as requirements for composters to be considered "responsible end markets," CalRecycle rejects that proposal for the reasons explained in response to comment B-8-8. The labeling and transparency requirements would serve potential marketplace needs for the sale of recycled organic product produced by composters; those needs to not concern whether the composters' operations meet the statutory definition of "responsible end markets." That definition concerns how the recycling and recovery of materials affects the environment and health and safety, not the marketplace for materials after they are a finished recycled product. While the "chain of custody" requirement is relevant to evaluating the recycling of covered materials, the proposed regulations already impose such a requirement (18980.4(a)(2)). For these reasons and those set forth in response to the other portions of this submission, no change is necessary.

Comment B-8-10

4. EPR Eco-Modulation Implementation

• **Fee reductions or credits for Tier 1 materials:** Given lower infrastructure dependency and broader composting compatibility, CalRecycle should implement preferential EPR fee treatment for natural-source, non-polymeric materials
• **Evidence-based eco-modulation for Tier 2:** Bio-synthetic materials should face eco-modulated fees based on documented infrastructure requirements, processing complexity, and environmental impact assessments
• **Infrastructure incentives:** Prioritize development of composting infrastructure compatible with both material tiers while recognizing differential processing needs
• **Market development support:** Facilitate creation of premium markets for agricultural-grade compost produced from clearly identified feedstock sources

Response to B-8-10

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42051.1, 42053, and 42060, and no change is necessary to the implementation of the Act. PRC section 42053(a) makes clear that the PRO is responsible for establishing and developing a producer fee schedule that includes producer fees that are adjusted using malus fees or credits based on the factors specified in PRC section 42053(e). Section 18980.6.7(b) and (f) implement these requirements by clarifying the eco-modulation requirement for producer fees. The relevant statutory and regulatory provisions, including PRC section 42053(d) and section 18980.6.7(f) of the proposed regulations, already require the PRO to ensure that eco-modulated fees reflect the relative ease with which specific covered materials are recycled or composted, which necessarily incorporates considerations of material composition and the applicable recycling infrastructure. Therefore, section 18980.6.7 of the proposed regulations already incorporates the considerations of this comment while preserving the PRO's discretion to develop and establish the producer fee schedule in a manner consistent with PRC section 42053. No further change is necessary.

Comment B-8-11

V. Environmental Justice and Economic Considerations
Supporting True Agricultural Circularity
California's EPR program should prioritize materials that genuinely support agricultural circularity rather than creating new waste streams. Corn-based materials represent authentic agricultural recycling, converting crop residues and processing byproducts into functional packaging that returns nutrients to agricultural systems upon composting.
Farmer Economic Protection
Many organic and sustainable farmers have invested significantly in compost-based soil management systems. Protecting the integrity of these systems by distinguishing natural from synthetic compostable materials safeguards farmer investments and maintains consumer confidence in organic agricultural products.
Supply Chain Transparency
Natural materials offer superior supply chain transparency and traceability compared to synthetic bio-plastics requiring complex industrial processing. This transparency supports California's environmental justice goals by enabling communities to understand and evaluate the materials entering their local composting and agricultural systems.

Response to B-8-11

Comment rejected. The commenter describes three issues and asserts that they should be priorities in the "EPR program." First, first the commenter states that the program should "prioritize" certain materials. CalRecycle does not have authority under the statute to select certain materials and "prioritize" them, and the commenter does not explain what it would mean to do so. Instead, the statute necessarily considers any material compliant if the material satisfies the requirements of Public Resources Code section 42050. Second, the commenter

states that "compost-based soil management systems" should be "safeguard[ed]" by "[p]rotecting the integrity of those systems." This proposal, while potentially addressing important public policy issues, is vague and does not appear relevant to implementing any statutory provision. Third, the commenter asserts that "[n]atural materials offer superior supply chain transparency and traceability." Regardless of whether that is true, this assertion is not a recommendation of any change to the proposed regulatory text, so no further response is required.

Comment B-8-12

VI. Implementation Timeline and Stakeholder Engagement
Proposed Implementation Schedule
• **Phase 1 (2026):** Implement tiered classification system for new product registrations under SB 54, with safe-harbor provisions for products currently in development or pilot programs
• **Phase 2 (2027):** Apply enhanced testing requirements to bio-synthetic materials, with transition period for existing certified products
• **Phase 3 (2028):** Full integration with feedstock labeling and data transparency requirements
• **Phase 4 (2029-2030):** Comprehensive evaluation and system optimization, maintaining grandfathering provisions for compliant products

Response to B-8-12

Comment rejected. This comment relates to implementation of the framework described in earlier portions in the commenter's submission. As explained in response to those earlier portions, the various elements of that framework are either irrelevant to or inconsistent with the statute and the mandate that the proposed regulations implement and enforce it. Accordingly, CalRecycle rejects this comment for the reasons provided in response to comments B-8-1 through B-8-11.

Comment B-8-13

Transition and Safe-Harbor Provisions
To avoid cliff-edge compliance impacts, CalRecycle should establish:
• **18-month transition period** for products currently certified under existing standards
• **Pilot program protections** for innovative materials undergoing testing or development
• **Good faith compliance safe-harbor** for producers making reasonable efforts to meet new requirements
• **Technical assistance programs** to support smaller producers in achieving compliance

Response to B-8-13

Comment rejected. This comment relates to implementation of the framework described in earlier portions in the commenter's submission. As explained in

response to those earlier portions, the various elements of that framework are either irrelevant to or inconsistent with the statute and the mandate that the proposed regulations implement and enforce it. Accordingly, CalRecycle rejects this comment for the reasons provided in response to comments B-8-1 through B-8-12.

Comment B-8-14

Stakeholder Collaboration Framework
CornNext recommends CalRecycle establish a **Natural Materials Working Group** including:
• Agricultural producers and organic farming representatives
• Natural material manufacturers
• Compost facility operators
• Environmental justice organizations
• Academic researchers specializing in biodegradation science

Response to B-8-14

Comment rejected. CalRecycle rejects this comment for the same reasons set forth in response to comment B-8-13. The "compliance" that this comment refers to does not implement any compliance requirement set forth in statute but rather relates to the framework, described elsewhere in the commenter's submission, that does not have any legitimate place in the proposed regulations.

Comment B-8-15

VII. Legal and Regulatory Consistency
Federal Alignment and Biobased Content Leadership
Our proposed approach aligns California's EPR regulations with existing federal frameworks:
• **USDA National Organic Program:** Coordinates with (rather than substitutes for) existing restrictions on synthetic materials in organic compost systems
• **FDA Food Contact Standards:** Recognizes different safety profiles for natural vs. synthetic materials
• **ASTM International Standards:** Builds upon existing testing while addressing identified limitations through enhanced protocols
USDA Biobased Product Recognition: We note that USDA recently announced a new product category for "Disposable Drinking Straws," requiring a minimum 69% biobased content under the BioPreferred Program. CornNext's CornNext-17 product line, at 98% biobased content, significantly exceeds this federal threshold, demonstrating our leadership in the emerging federal classification system. This federal recognition underscores the importance of CalRecycle adopting definitions that properly distinguish truly natural, agricultural-source materials from industrially synthesized bio-plastics, even when both may qualify as "biobased" under federal standards.
Interstate Commerce Considerations
The tiered system protects California's regulatory authority while facilitating interstate commerce by providing clear, science-based classifications that other states can adopt or recognize through reciprocity agreements.

Response to B-8-15

Comment rejected. CalRecycle rejects this comment for the same reasons set forth in response to comment B-8-13. The comment refers to legal programs and concepts with respect to the framework discussed elsewhere in the commenter's submission, but that framework mostly irrelevant to the statute and has no legitimate place in the proposed regulations, as explained in response to the other portions of the commenter's submission.

Comment B-8-16

VIII. Conclusion and Call to Action

California has the opportunity to lead the nation in developing truly sustainable packaging standards within its EPR framework that support both SB 54's environmental goals and agricultural system integrity. By implementing a tiered classification system that properly distinguishes between natural-source, non-polymeric and bio-synthetic compostable packaging materials, CalRecycle can ensure that SB 54 achieves its waste reduction and recycling objectives while coordinating effectively with federal organic agriculture standards.

CornNext urges CalRecycle to:

1. **Adopt the proposed tiered classification system** for biodegradable and compostable packaging materials under SB 54

2. **Implement enhanced testing requirements** for bio-synthetic materials including mandatory microplastics residue assessment and polymer-specific molecular degradation verification

3. **Establish feedstock labeling and data transparency requirements to** enable informed facility and farmer choices

4. **Coordinate with USDA organic standards** to ensure complementary rather than conflicting frameworks

5. **Implement EPR fee reductions or credits for Tier 1 materials** given their lower infrastructure dependency and broader compatibility

6. **Provide transition and safe-harbor provisions** to avoid cliff-edge compliance impacts for existing products and pilot programs

We appreciate CalRecycle's commitment to comprehensive stakeholder engagement and look forward to working collaboratively to implement these essential improvements to California's groundbreaking environmental legislation.

Response to B-8-16

Comment rejected. No response to this portion of the commenter's submission is necessary because it lists the recommendations discussed in greater detail in earlier portions of the submission. CalRecycle has addressed those recommendations in response to those earlier portions, so no further response is necessary here.

B-9: Buoy, LLC (Adrian Colesberry)

Comment B-9-1

My name is Adrian Colesberry. I am the CEO and co-founder of Buoy, a California LLC that buys recycled plastics from Envision in Chino and makes reusable water bottles, coffee cups and food containers in one of our third party manufacturers in Oxnard or Tracy, www.buoy.eco.

The bill does not provide for demand and innovation around using recycled plastics. When discussing this law with the National Stewardship Action Council, I thought that Buoy would be considered a responsible end market, but that does not seem to be what the term means. In the definition in 42041 (ad) and throughout the bill, a lot is said about setting up responsible end markets, but these all seem like MRFs or PRFs, assuring that the supply of recycled plastic is converted responsibly to usable resin.

But supply does not create demand. What is the plan to create demand? If there were enough demand for recovered resin, much of this law would not be needed. (A law is not needed to tell people to recycle metal. Industries fall in place to do this because metal recycling is profitable.) Demand for anything, plastic included, would pull the supply chain into place. Virgin resin is going to be cheap for a long time. It is one of the few things in the world that the US makes cheaply, and Chinese resin has a downwards effect on the price also. For there to be a market for all the recycled plastic that this bill aims to create, demand and innovation must be cultivated and possibly subsidized. You are certainly following Europe and the closures of recycling plants. The plants and investments created by this bill will also blow away in the wind if no one lines up to buy it. It is my suspicion that the intent is to send these materials out of state, per California's usual strategy.

Re. 42041 (ad) The last sentence is too vague. No human activity is a benefit to the environment, not building a house, not driving down the street, and the only way to minimize risk in any human activity is to not engage in it entirely. The lack of attention to demand combined with this vague wording sets up California to do what it historically prefers to do with anything that anyone can interpret as even slightly negative, which is shove it outside the borders of California. This is not responsible in any way. I've run Pharma plants and departments in California for decades. I know there are state laws on the books already, probably among the strongest in the world, that regulate industrial activities and employee safety. There is no reason to give this legislation vague authority over those already very rugged laws.

Response to B-9-1

CalRecycle rejects this comment. To the extent this comment recommends revising the proposed regulations to redefine responsible end markets to address the need to create demand for recycled plastic, no change is necessary. See the response to comment O-56-10. Moreover, demand for recycled plastic is already encouraged elsewhere in the Act, including, for instance, PRC sections 42053(e)(1) and 42057(a)(2)(B)(i). To the extent this comment argues that the criteria concerning environmental benefits in PRC section 42041(ad) is too vague, no change is necessary or appropriate. Because that language comes directly from the text of PRC section 42041(ad), CalRecycle has no authority to revise that language. However, section 18980.4(a) of the proposed regulations implements the language of PRC section 42041(ad) by clarifying the criteria that must be satisfied for an end market to be identified as a responsible end market. The proposed regulations are consistent with the relevant statutory provisions, including PRC sections 42041(aa), 42041(ad), and 42060, and no change is necessary to the implementation of the Act.

B-10: IKEA of Sweden, Inter IKEA Group (Anders Persson)

Comment B-10-1

Dear Director Heller,

At IKEA, we have an ambition to transition towards a circular business model, and we believe well-designed EPR programs can help increase recycling. We write to express our appreciation for CalRecycle's commitment to developing these draft regulations in a thorough and collaborative process with external stakeholders to implement SB 54 and create a more circular economy in California.

We have identified one primary area below related to the draft regulation's *Covered Material and Covered Material Categories* section that could be improved to ensure the state's recycling system is adequately funded by all participating producers.

Response to B-10-1

Comment rejected. No response to this portion of the commenter's submission is necessary because the issues to which it allude have been addressed in response to other portions of the submission.

Comment B-10-2

Section 18980.2. Categorically Excluded Materials

To comply with federal requirements established by USDA and FDA, the proposed regulation creates an exemption for "packaging or packaging components used by a

food or agricultural commodity (without regard to its origin) if it is not reasonably possible to use other packaging or packaging components."

However, any exempted food and agricultural packaging will likely still flow into the same recycling waste stream as covered materials, especially for examples where the same packaging type is used for both exempt and non-exempt material categories and when primary sortation is done by the consumer. As a result, recycling facilities and haulers will still need to collect, sort, and process these exempt materials. At the same time, the Circular Action Alliance (CAA) will be responsible for covering these costs—even though the producers of exempt packaging sold in California are not required to pay fees to CAA.

To ensure the producer responsibility organization (PRO) and the recycling system are adequately funded, we recommend CalRecycle work with CAA to develop a formula that accounts for categorically exempt materials entering the recycling stream. This would ensure the CAA only pays for the processing and recycling of covered material categories.

Thank you for your commitment to implementing SB 54 and helping create a more sustainable and circular future for the residents and businesses of California.

Response to B-10-2

CalRecycle rejects this comment because it does not recommend any revision to the proposed regulation. Instead, it proposes a course of action that the commenter recommends CalRecycle and CAA undertake to address effects of "categorically exempt materials" expected to be in waste streams.

B-11: The Procter & Gamble Company (Julie Froelicher)

Comment B-11-1

Dear Director Heller:

The Procter & Gamble Company (“P&G1”) would like to submit the following recommendations for the permanent draft regulations for SB 54, the Plastic Pollution Prevention and Packaging Producer Responsibility Act, published on August 22, 2025 (“Formal Proposed Regulations”). As the world’s largest consumer goods company, we have a concerted interest that the SB 54 program drives maximum sustainability benefits while ensuring affordability and availability for all Californians; protecting health and safety of California consumers; enabling federal regulatory compliance; and providing continued opportunity for innovation and product quality in California. Importantly, P&G fully supports Governor Newsom’s direction to the Department that the Formal Proposed Regulations “ensure California’s bold recycling law can achieve its goal of cutting plastic pollution and is implemented fairly — minimizing costs for…working families as much as possible.”2 We recognize the progress the Department has made with the Formal Proposed Regulations toward this goal from

earlier informal draft versions but believe significant further changes are needed to fully realize the Governor's vision for cost-effective SB 54 implementation for California consumers.

P&G continues to have significant concerns about the ability to implement the Formal Proposed Regulations in a way that is cost-effective and safe for consumers. We highlight below necessary changes that are needed in the Formal Proposed Regulations. The following summarizes the critical issues with the current SB 54 Draft Regulation that we discuss at length in this comment letter and require modification of the Formal Proposed Regulations to serve the best interests of the consumers of California:

- **OTC Drug Exclusion** – exclude all FDA-regulated OTC drugs from SB 54 requirements to keep these products available and affordable to California consumers.

- **Detachable Components** – align with the APR Design Guides to recognize that caps reattached to a larger package are a recyclable unit and to reinforce a favorable consumer recycling behavior.

- **Source Reduction Compliance Measurement Period** – allow producers to demonstrate source reduction reporting for January 1, 2027, 2030, and 2032 using the measurement period of the respective calendar years of 2027, 2030, and 2032.

- **Source Reduction Adjustment Factor** – allow the PRO to incorporate an adjustment factor for product sales growth over time in the program plan.

- **Measurement of PCR Credit for Source Reduction** – remove the 2023 baseline year so as not to penalize producers who voluntarily adopted sustainability measures and incorporated PCR decades ago.

- **Physical Recycling** – recognize physical recycling technology as an acceptable responsible end market technology, in addition to mechanical recycling, to broaden the potential applications for recycled plastic and promote continued

circularity in similar types of applications. This will help reduce the amount of plastic that is downcycled.

- **Malus Fees for Covered Materials Containing Prop 65 Materials above Established Exposure Levels** – recognize the OEHHA-established exposure levels for Prop 65 materials.

_____

1 The Procter & Gamble Company serves nearly five billion people around the world with its brands. The Company has one of the strongest portfolios of trusted, quality, leadership brands, including Always®, Ambi Pur®, Ariel®, Bounty®, Charmin®, Crest®, Dawn®, Downy®, Fairy®, Febreze®, Gain®, Gillette®, Head & Shoulders®, Lenor®, Olay®, Oral-B®, Pampers®, Pantene®, SK-II®, Tide®, Vicks®, and Whisper®. The P&G community includes operations in approximately 70 countries worldwide. Please visit http://www.pg.com for the latest news and in-depth information about P&G and its brands. 2 Kamisher, Eliyahu. “Newsom Orders Redo of California’s Landmark Anti-Plastic Rules, Citing Cost.” Bloomberg. 7 March, 2025.

Response to B-11-1

Comment rejected. No response to this portion of the commenter's submission is necessary because the issues raised in it have been addressed in response to other portions of the submission discussing the same issues.

Comment B-11-2

For convenience, we have also attached relevant sections of the Formal Proposed Regulations with P&G’s specific proposed edits in Appendix 2.

Additionally, we highlight at the end of our letter a few improvements in the Formal Proposed Regulations that are critical to be maintained:

•**Refillable/Reusable Design and Labeling Requirements** – The deletion of overly burdensome and uniform design and labeling requirements of refillable/reusable packaging enables more effective design and labeling.

•**Minimum Duration of Exemptions** – The two-year minimum duration for an approved exemption provides much needed certainty to producers and should be maintained. *Additionally, we urge the Department to urgently provide guidance on the exemption application process to allow producers to start preparing applications for critical materials, such as mono-material flexible films, which are necessary to safely and hygienically deliver staple products*

•**Corrective Action Plans** – The additional clarity that CalRecycle has the authority to enter into a Corrective Action Plan to resolve violations on any terms the parties mutually agree is critical to enable sufficient flexibility for practical implementation solutions.

Response to B-11-2

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment B-11-3

NECESSARY CHANGES IN FORMAL PROPOSED REGULATIONS

P&G urges the Department to incorporate the following changes, as described, in the Formal Proposed Regulations to ensure regulatory implementation is feasible, achieves the actual intended outcomes, complies with the law, is cost-effective and safe for consumers, and ensures product availability in California.

OTC Drug Exclusion (Section 18980.2(a)(6))

Paragraph (6) of subdivision (a) provides an exclusion for over the counter (OTC) drugs. **This exclusion is supported by the text of the law and should be preserved in the Formal Proposed Regulations,** as these Medical Products must meet stringent Food & Drug Administration (FDA) requirements that limit the ability to use certain packaging materials, to source reduce packaging or to consider reusable packaging. OTC drugs face the same regulatory scrutiny and unique compliance challenges that prescription drugs do, and it is appropriate to exclude them.

However, this OTC drug exclusion is unnecessarily narrowed by subparagraphs (A) and (B) the plain reading of which limits the OTC drug exclusion to exclude cosmetics and soaps that are considered OTC drugs solely because of sunscreen active ingredients. (Note, there is a potential alternative interpretation of this section that would limit the OTC drug exclusion to only medicines by removing OTC drugs that also make cosmetic claims, are soap, or contain sunscreen active ingredients. If no other changes are made, we strongly urge the Department to revise this section to remove the potential for this alternative interpretation.)

All FDA-regulated OTC drugs (i.e., all OTC products that display a "Drug Facts" panel on packaging) are medical products under 21 U.S.C. 321(g) and are excluded by the plain language of the SB 54 statute. As such, all OTC drugs should be exempt from SB 54 requirements without exception. The fact that some OTC drugs also provide secondary benefits (e.g., cosmetic, cleaning, or sunscreen) does not change the fact that they are OTC drugs and are considered medical products under 21 U.S.C. 321(g). These products provide consumers with important health benefits to which, without an exclusion, consumers may lose access or must buy multiple products, using more packaging, to receive the same benefits. The Department must adhere to the statutory language and not use the regulations to narrow the statutory exemption.

Rationale: There is a significant risk that if required to comply with the stringent SB 54 source reduction requirements, many OTC health and oral care product SKUs (assuming the alternative interpretation) may be eliminated in California, especially in smaller sizes. This would severely impact consumer access to essential anti-dandruff OTC shampoos and OTC oral care solutions, exacerbating health care challenges for low-income California consumers. Over 31% of Californians are considered "near poor" or live below the poverty line, affecting approximately 12 million people3.For example, P&G's Oral Care research tells us that households that make less than $35K/year buy smaller toothpaste sizes than other higher income households, indicating a pattern to buy smaller size packages to manage costs. Without application of the OTC drug exclusion to all OTC drug products, regardless of their secondary benefits, manufacturers will be forced to eliminate or upsize many of the affordable oral health products and medicated shampoos upon which these Californians rely.

Furthermore, all OTC regulated products must meet stringent FDA criteria for active levels/concentration throughout the product shelf life, whether a medication or application such as mouthwash or toothpaste. Significant lightweighting of these packages cannot meet requirements for moisture/vapor transmission, resulting in changes in active levels that would fall outside the OTC drug requirements to which all OTC drugs are subject. Traditional methods of reducing plastic for liquids, such as compaction through concentration, are also not available due to active level requirements. This, combined with the Consumer Product Safety Commission's Poison Prevention Packaging Act (PPPA) requirements of Child Resistant Closures (where required), creates untenable challenges in meeting reduction targets for FDA-regulated OTC products.

Without including all products that are regulated as OTC drugs by the FDA (those which are required to include a "Drug Facts" panel on their packaging) in the medical products exclusion (21 U.S.C. 321(g)) as required SB 54 statute, manufacturers will be forced to eliminate or upsize many affordable product options or separate consumer benefits into multiple product offerings. For example, most toothpaste provides an anti-cavity benefit by containing fluoride and is regulated by the FDA because it makes a claim about preventing cavities. P&G's Crest® toothpastes provide additional benefits consumers value – like protection from sensitivity, fresh breath and whiter teeth – in addition to cavity prevention. If the potential alternative interpretation of the current OTC drug exclusion was adopted, it could lead manufacturers to separate the exact same toothpaste formula into two consumer products, one that makes claims about whitening teeth and freshening breath and one that makes claims only about anti-cavity benefits. The toothpaste that makes only anti-cavity claims would be excluded under the Formal Proposed Regulations as an OTC drug that is not also a cosmetic, even though it also provides the same whitening or freshening benefits.

Similarly, if the potential alternative interpretation is adopted, manufacturers of medicated shampoos like Head & Shoulders®, which combine a cleaning benefit with a drug benefit in preventing dandruff, or Olay® skincare products that have moisturizing benefits and skin cancer protection with an SPF ingredient, could be forced to separate

these “all in one” products” into two separate products, one regulated solely as an OTC drug but not a soap/cosmetic, and one regulated only as a soap/cosmetic; one excluded from the SB 54 regulations and one not. Consumers will be disadvantaged by having to pay more to purchase more products to obtain the same benefits from what was once a single product. Some consumers may also choose to not purchase multiple products and miss out on important health benefits that these “all in one” products provide.

_____

3 Poverty in California - Public Policy Institute of California.

Response to B-11-3

CalRecycle rejects this comment. As stated in greater detail in the Initial Statement of Reasons, inclusion of three distinct terms to describe the excluded packaging ("medical products," "devices," and "prescription drugs") establishes that the Legislature intended to exclude medical goods other than just prescription drugs and "devices" (a defined term under the Federal Food, Drug, and Cosmetic Act). There would have been no reason to identify prescription drugs, and not drugs generally, if the exclusion applied to all drugs. Accordingly, the term "medical products" must be given a meaning that does not encompass all drugs, and the most reasonable one aligns with the term's common, colloquial understanding: that products that serve cosmetic purposes are not considered "medical products," but items that serve only medical purposes are. The commenter's preferred interpretation would render the statute's express limitation of exempted drugs to "prescription" ones meaningless; doing so would violate long-standing principles of statutory interpretation.

Comment B-11-4

Detachable Components – Actual Recycling Rates and Recyclability (Section 18980.1. and Section 18980.3.)

Additional language was added to subparagraph (ii) of subparagraph (C) of paragraph (4) of subdivision (a) of Section 18980.1 to specify that a “detachable component” is defined by certain characteristics “regardless of whether the component is discarded attached to the other components.” This additional language is directly contrary to the Association of Plastic Recyclers (APR) Design Guide, which recommends leaving plastic caps on bottles and containers when recycling.

APR’s Design Guide recommends caps be attached to packaging prior to disposal because it dramatically improves recovery of these materials in the recycling stream; if caps were separated prior to disposal, they are much more likely to be lost in the sortation process. When caps are attached, material recovery facilities process and recover the caps along with the bottles, eventually sorting out and recovering differing material types where necessary through additional processing steps. The cap material is typically recyclable high-density polyethylene (HDPE) or polypropylene (PP) plastic, for which recycling collection and processing technology has improved, so reattaching caps to bottles prior to disposal optimizes recovery.

Additionally, when recycling is made easier, participation in recycling programs goes up. P&G placed a large-scale consumer study (September 2025) to understand existing consumer habits when recycling, specific to behaviors of recycling packages consisting of a bottle and cap. The quantitative study included a sample of 2,000 US nationally representative consumers including 196 California consumers. Consumers were exposed to a stimulus defining the survey topic space showing a variety of packaging/brands across laundry, cleaning, beauty, and beverage containers consisting of plastic bottles with lids to set proper context. The study clearly demonstrates that both in California and the United States in general, consumers consistently replace caps on packages prior to recycling:

- 82.4% of California consumers indicate they recycle packaging with caps reattached to bottles.
- 77.2% of total US consumers indicate they recycle packaging with caps reattached to bottles.

Net, the clear consumer habit is to recycle bottles with caps attached, which is not a surprise given it prevents any remaining product flow/odors, reduces number of items in their bin, and matches years of recycling instruction communication from organizations such as APR and How2Recycle.

Taking a position contrary to the APR Design Guide, as the Formal Proposed Regulations do, negatively impacts both the calculation of actual recycling rates for components and the recyclability determination for components in a way that does not match current recycling practices.

For the calculation of actual recycling rates for components, under the Formal Proposed Regulations a recycling rate is calculated using the covered material category applicable to each component standing on its own, regardless of whether the component is designed to be reattached to the primary packaging. The APR Design Guides instruct components to be reattached, and current material recovery facilities process the packaging as a whole and sort it into a single recycling stream. Understanding this guidance, a single recycling rate should be calculated for the covered material category applicable to component and the packaging to which it is reattached. **P&G proposes adding language to Section 18980.1. and Section 18980.3.2. to ensure that such components are properly considered together with the packaging to which they are designed to be reattached prior to disposal.**

For recyclability determinations for components, under the Formal Proposed Regulations components that are less than 2 inches by 2 inches in size may not be considered recyclable due to their small size and current processing limitations with material recovery facilities. However, these same components are actually recyclable when designed to be reattached to the larger recyclable packaging, pursuant to APR Design Guides. To ensure the correct recyclability determination of components that are

intended to be reattached to a recyclable packaging, **P&G proposes adding language to Section 18980.1 to ensure that such components are properly considered together with the packaging to which they are designed to be reattached prior to disposal.**

To illustrate these points, consider that a laundry detergent bottle often has a screw cap that is also used as a dosing mechanism. The bottle is typically made of HDPE plastic, and the cap is typically made of PP plastic to avoid leaks and spills, as PP provides a significantly better seal than alternative material types and offers superior durability for packaging that may be dropped. Under APR Design Guides, the PP cap should be reattached to the HDPE bottle prior to disposal. Material recovery facilities collect the bottle with the cap attached and process the entire package (cap and bottle) as part of the HDPE recycling stream, and compatible with the end markets of the HDPE recycling stream. In this instance, the entire package *should* be classified as a whole package under the HDPE material classification category, despite the dosing cap being made of PP, because the entire package is actually recycled with the HDPE material stream. The Formal Proposed Regulations do not recognize this APR Design Guide approach that is used by material recovery facilities and instead requires that producers classify the PP cap under a separate PP material classification category for purposes of determining whether the cap is recyclable and whether the cap material meets the required actual recycling rates. This has the perverse practical result of banning these PP caps, which today are recycled with the HDPE bottles at high rates, if the separate PP material category does not achieve the required 30% recycling rate by January 1, 2028, which we anticipate it will not.

P&G's proposed changes would ensure that the Proposed Regulations align with the APR Design Guides and actual practices of material recovery facilities. This alignment requires evaluation of components in conjunction with primary packaging. It would also ensure that a packaging component that is fully recyclable and actually recycled in practice is considered recyclable and uses an accurate recycling rate under SB 54. **Together, these changes to the Formal Proposed Regulations will optimize and simplify consumer participation and maximize the amount of plastic material that will be recovered through the recycling process.**

For a full discussion of how plastic components are recycled with plastic packaging, please see APR's Discussion Brief, shared with their permission, in Appendix 1.

Response to B-11-4

Regarding detachable components, CalRecycle rejects the suggested change for the reasons stated in response to comment O-39-5 and O-41-3.

Regarding the calculation of recycling rates for components, CalRecycle rejectes this comment. The commenter fails to explain why a component's covered material categories should be disregarded for purposes of the recycling rate calculation because the "Design Guides instruct components to be reattached."

For one, the usefulness of that instruction is dubious, as it relates to consumer behavior. Furthermore, if that instruction were effective, the result would be that the component has the same recycling rate of the components to which it is attached. No explanation is provided for why the components should, in effect, be disregarded based on the potential that they may be reattached prior to disposal. The commenter is describing an outcome more appropriately framed around the components being of a de minimis weight or volume, as described in section 18980.2.2(b).

Comment B-11-5

Compliance Measurement Period for Source Reduction (Section 18980.9.1.)

Neither SB 54 nor the Formal Proposed Regulations specify the reporting period to be used for measuring compliance against the source reduction requirements. It is imperative that producers know now when compliance will be measured to know what they must do to comply. **P&G proposes adding language to paragraph (2) of subdivision (d) to specify that source reduction requirements that are required as of January 1, 2027, 2030, and 2032, are based on producer source reduction reporting using the measurement period of the respective calendar years of 2027, 2030, and 2032.**

Rationale: Material usage data from the respective calendar years of 2027, 2030, and 2032 will be most reflective of what is on the market and the source reduction that has been achieved by January 1st of the respective reporting year. Should producers need to report material usage data from a time period any earlier than calendar year 2027, it would be impossible. For example, if usage data from calendar year 2026 is required to prove compliance with the January 1, 2027 source reduction date, this would mean that P&G and other producers would need to comply with SB 54's source reduction requirements by January 1, 2026, long before the approval of a PRO plan that is required to allocate the source reduction requirements among the various producers and presumably around the same time the regulations specifying the details of the PRO-level source reduction requirements are finalized.

P&G and other producers do not and will not have the information necessary to implement source reduction compliance any earlier than calendar year 2027. We currently have less than 3 months until January 2026, do not yet have finalized regulations, finalized CMC material description guidance, or an approved PRO plan, and require a much longer lead time to develop, test, and implement packaging changes. While P&G has been researching potential alternative packaging designs since SB 54 was passed, it is impossible for P&G to implement any changes until the regulations and related guidance are finalized given that changes to the draft regulations and CMC material description guidance have significant impacts on P&G's potential approaches to compliance, as we have already witnessed with certain changes made in recent months. Potentially, the only way for producers to comply with the January 1, 2027, source reduction requirement that would propose a material usage data time period earlier than calendar year 2027 would be for producers to cease selling

products in California for some period of time in 2026, which is not in the best interests of California's consumers nor its affected businesses within the state.

Response to B-11-5

CalRecycle rejects this comment for the reasons stated in I-63-15, B-27-2, O-48-5, and O-41-4.

Comment B-11-6

Source Reduction Adjustments, including for Sales Growth (Section 18980.8.3.)

The wholesale deletion of Section 18980.8.3 removes the PRO's express ability to utilize important, common sense adjustment factors in the development of its source reduction plan. The deleted section included adjustment factors for fluctuations in economic conditions and the change in number of producers participating in the PRO plan. **Paragraph (a) of this section should be restored, and P&G proposes adding a third common sense adjustment factor for the PRO to incorporate into its source reduction plan: adjustments for product sales growth over time.**

Rationale: The adjustment factors in the deleted text protect against arbitrary shifts in economic conditions or the number of producers participating in the PRO plan. For example, without these adjustment factors, an economic decline that results in lower consumer consumption in a reporting year may result in the PRO achieving its source reduction targets without any producer changes to packaging.

P&G's proposal to add a third adjustment factor to account for product sales growth over time allows the PRO to incorporate producer reporting of sales adjusted material usage into its source reduction plan to normalize for business growth. Without such an adjustment factor, the Formal Proposed Regulations penalize sales growth by disproportionately forcing producers with growing sales to reduce more plastic usage to compensate for additional products sold. An adjustment for sales growth ensures that a large, steadily growing company like P&G, which may be doing

everything possible to source reduce its packaging for individual products, is not subject to anticompetitive standards that require P&G to meet more rigorous requirements than a company with stagnant or declining sales, potentially requiring growing companies to cease or even reverse their sales growth in California to meet absolute source reduction requirements. A sales growth adjustment decouples growth from plastic usage long-term, thereby enabling fair and robust competition among businesses in California and allowing businesses whose innovation is rewarded by California's consumers to grow in the California market by focusing on source reduction by product sold versus absolute source reduction.

Response to B-11-6

Comment rejected. The commenter references "[p]aragraph (a) of this sections" and "deleted text," but the currently proposed regulations are the only regulations relevant to this rulemaking. Without including that paragraph for CalRecycle to consider, there is no alternative text for CalRecycle to consider. Nevertheless, CalRecycle understands the commenter to propose some method for the PRO's plan to allow reduction in its source reduction burden where that burden would be greater, in terms of absolute reduction, due to increases in sales of covered materials. CalRecycle declines to make such a change because it would be unnecessary and contrary to statute, which contemplates no adjustment to the requirement stated in Public Resources Code section 42057(a). Moreover, the statute does not preclude the PRO plan from having provisions accommodating the growth experienced by individual businesses, and section already has multiple provisions accounting for the problem the commenter describes. Section 42057(f)(2) requires the PRO to give credit to producers that achieved reductions from 2013 to 2022. Section 42057(g) requires the PRO to penalize producers that add new covered material to optimize their packaging; in other words, when a producer expands its usage of covered (due to business growth or otherwise), statute clearly intended that the producer would face an enhanced burden. Lastly, 42057(h) is expressly directed at "ensur[ing] source reductions achieved by January 1, 2032, are not lost after [that date] while still allowing for businesses to grow." To that end, CalRecycle is authorized, beginning in 2040, to impose new requirements to ensure that the source reduction requirement of section (as established in 42057(a)) will be met. These provisions reflect a clear intent for the PRO not to have flexibility to alter how the PRO's overall source reduction will be evaluated (i.e., neither the goal nor the calculation of source reduction can be adjusted). To the extent increases in sales put satisfaction of the source reduction requirement at risk, statute clearly puts the burden on the PRO to account for that risk.

Comment B-11-7

Measurement of PCR Credit for Source Reduction (Section 18980.3.4.)

SB 54 specifies that the PRO may apply for a source reduction credit up to 8% through an alternative compliance formula that offers source reduction credit "on a sliding scale based on the ratio of virgin plastic to postconsumer recycled content plastic to producers who incorporate postconsumer recycled content into plastic covered material." Paragraph (1) of subdivision (b) of Section 18980.3.4 of the Formal Proposed Regulations requires that the PRO measure the increase in absolute amount of postconsumer recycled content (PCR) used versus a 2023 baseline. **P&G proposes revisions to this paragraph to remove the 2023 baseline.**

Rationale: Although SB 54 requires CalRecycle to determine a 2023 baseline for purposes of measuring overall source reduction, nothing in SB 54 requires CalRecycle to adopt a 2023 baseline for purposes of determining this credit. Many producers began incorporating PCR into packaging decades ago and had already achieved significant amounts of PCR usage by 2023. For example, P&G has averaged 28% PCR use in our North America laundry HDPE packaging for the past 20 years. Measuring producers' absolute volume increase of PCR based on a 2023 baseline does not recognize, and in fact penalizes, the proactive sustainability efforts of producers who voluntarily took early action to incorporate PCR into plastic packaging prior to 2023. Necessarily, due to PCR already incorporated prior to 2023, the ability to incorporate more is limited.

Response to B-11-7

Comment rejected. The commenter's proposal is incompatible with the plain meaning of Public Resources Code sections 42041(aj) and 42057(a) and (b), which unambiguously establish that source reduction must be assessed against the amount of plastic covered material created relative to the amount created in 2023. The commenter proposes that the "alternative compliance formula" described in 42057(a)(2)(B)(i) be allowed to credit actions taken before 2023 as source reduction since to 2023. Nothing in statute suggests that CalRecycle has the authority to give the alternative compliance formula such an incongruous effect.

Comment B-11-8

Physical Recycling (Section 18980.4.1.)

P&G strongly urges the Department to restore recognition of physical recycling technology as an acceptable responsible end market technology, in addition to mechanical recycling. The Department recognized physical recycling in earlier versions of the draft regulations. Rationale: Physical recycling enables a method to clean plastic and remove contaminants from the recycling stream in a manner that also results in significantly reduced greenhouse gas emissions compared to virgin resin. Physical processes are not chemical recycling because they maintain "plastic to plastic" recycling, as they do not chemically alter the plastic polymers or break chemical bonds but rather remove both intentionally and unintentionally added materials to vastly improve the quality of recycled plastics and produce a high-quality post-consumer

recyclate (PCR). The chart below published by the Nova Institute4 provides a clear visual of where physical recycling (see “Dissolution Physical Process”) resides in the spectrum of recycling processes. Physical processes can also be operated in tandem with mechanical processes to vastly improve the quality of output. This broadens the potential applications for recycled plastic and promotes continued circularity in similar types of applications, helping to reduce the amount of plastic that is downcycled. Physical recycling processes do not result in significant hazardous waste production.

Response to B-11-8

CalRecycle rejects this comment, which suggests that "physical recycling" should be considered on par with mechanical recycling for purposes of Public Resources Code section 42041(aa)(5), as applied in section 18980.4.1(d) of the proposed regulations. CalRecycle declines to make that change because "physical recycling" is still a developing, "advanced recycling" technique and necessarily involves the use of chemical solvents. It is therefore fundamentally distinct from mechanical recycling in terms of environmental risks.

Comment B-11-9

Malus Fees for Covered Materials Containing Prop 65 Chemicals above Established Exposure Levels (Section 18980.6.7.)

P&G recommends adding language in paragraph (i) to restrict any Prop 65-listed chemicals in packaging that are present at levels that would expose consumers above the respective exposure levels (No Significant Risk Levels-NSRLs/Maximum Allowable Dose Levels-MADLs) established by the Office of Environmental Health Hazard Assessment (OEHHA).

Rationale: Prop 65 is an exposure-based statute that does not restrict chemicals solely based on presence at any level. Instead, Prop 65 establishes “safe harbor” levels that determine acceptable exposure limits for chemicals without significant health risks over a lifetime of exposure (NSRLs and MADLs). As written, the Formal Proposed Regulations are not in alignment with the Prop 65 statute, regulations, and guidance provided by OEHHA. This creates a fundamental inconsistency between the two agencies and disregards the work OEHHA has done to establish meaningful risk-based “safe harbor” limits. Current testing and compliance systems are not set up to measure and report Prop 65-listed chemicals at trace levels well below those established by OEHHA. Requiring the establishment of a new level of trace contaminant monitoring imposes significant costs, while such trace levels do not present any significant risk to consumer health. It also negatively impacts circularity by unduly restricting the amount of recycled content that could be incorporated into packaging, again for no benefit.

4 https://renewable-carbon.eu/news/advanced-recycling-on-the-rise-rapid-growth-in-capacitiesat-global-and-european-level/

Response to B-11-9

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42053 and 42060, and the recommended change is not necessary to the implementation or enforcement of the Act. PRC section 42053(e)(4) requires a PRO to adjust its participant producer fees based on the presence of hazardous material as identified by the Office of Environmental Health Hazard Assessment (OEHHA), the Department of Toxic Substances Control, or CalRecycle. Section 18980.6.7(i) of the proposed regulations implements this statutory requirement by requiring a PRO to charge a malus fee to producers who use covered material that contains a chemical listed on the list established pursuant to section 25249.8 of the Health and Safety Code. That list, which is also known as the Prop. 65 list, is administered by the OEHHA and represents a list of chemicals that are known to the state to cause cancer or reproductive toxicity at certain levels. While Prop. 65 may recognize safe harbor levels in the context of that program, PRC section 42053(e)(4) does not include such nuance; rather, the adjustment of producer fees pursuant to that section is based on the mere presence of certain materials. Section 18980.6.7(i) of the proposed regulations is consistent with the purpose of PRC section 42053(e), with the definition of "malus fee" in PRC section 42041(o), and with the broader purpose of the Act because it establishes a low threshold for malus fees that is designed to reflect the environmental or public health impacts of covered material and to discourage the use of covered material that has such negative impacts. However, section 18980.6.7(i) of the proposed regulations only provides that a PRO must charge a malus fee to producers who use such covered material; it does not specify the fee amount that must be charged. A PRO is therefore welcome to consider exposure levels or any other relevant factor when deciding on the appropriate fee to charge a participant producer. The PRO is best suited to assess the appropriate malus fee to charge under section 18980.6.7(i) because it will have the organizational ability to communicate with the relevant producer and it will have ready access to any pertinent information. Specifically, because the environmental or public health risks presented by covered materials in which hazardous materials are present may be affected by many factors, including the quantity of covered materials containing such hazardous materials or the treatment of those covered materials in the recycling process, the PRO is best suited to determine an appropriate malus fee after the presence threshold has been established. Section 18980.6.7(i) therefore strikes an appropriate balance between discouraging the use of covered materials that might present certain environmental or public health risks while maintaining adequate flexibility for a PRO to tailor its participant producer fees based on the specific harms presented by a given covered material.

Comment B-11-10

IMPROVEMENTS IN FORMAL PROPOSED REGULATIONS

P&G urges the Department to preserve the following critical provisions in the Formal Proposed Regulations that address the practicality of the program, while protecting health and safety of California consumers and providing for continued opportunity for

innovation. These improvements address issues that P&G believes are critical to the cost-effective and safe implementation of SB 54.

Refillable/Reusable Design and Labeling Requirement Deletion (Section 18980.2.1.)

The deletion of paragraphs (4) and (5) of subdivision (a) remove from the Formal Proposed Regulations arbitrary and overly burdensome requirements. **It is critical to preserve the deletion of these paragraphs**, as they would have applied uniform requirements to the design and labeling of reusable/refillable packaging despite significant differences in packaging types and purposes across consumer product categories.

Rationale: There are tens of thousands of product packages that are covered by SB 54, each with their own unique purpose and usage. For a refillable/reusable package to be successfully adopted by consumers, its design and marketing must be consumer-led and consumer focused. Consumers have different expectations across different types of product packaging, and producers must have the flexibility to be able to meet these varying expectations. Producers are best positioned to analyze and choose the most effective communication and labeling to convey that a package should be utilized multiple times. For durability, different types of products are used and refilled at varying frequencies. Overly prescriptive and uniform durability requirements do not consider the variability of product packaging usage and can have the unintended consequence of requiring producers to use more plastic than necessary to meet the arbitrary requirements that do not reflect real world conditions.

Minimum Duration of Exemptions (Section 18980.2.4.)

The revisions to subdivision (g) change the minimum duration for an approved exemption from one year to two years, providing a longer period of certainty for producers who may use the material that is granted an exemption. **This revision provides greater certainty to producers and should be preserved.**

We strongly encourage the Department to provide guidance to producers on the exemption application process as early as possible to give producers direction and allow time to generate the supporting data necessary to substantiate exemption applications. Producers will submit exemption applications for review (via the PRO) as soon as the Formal Proposed Regulations are finalized for critical materials that are unlikely to meet the 2028 recyclability rate, have unique challenges, are needed to protect safety or consumer health and hygiene, and where no viable alternatives exist. A prime example is mono-material flexible films for essential health and hygiene products like diapers, baby wipes, toilet tissue and paper towels, which require the highest standards of protection at an affordable cost. Alternate packaging has unique challenges including higher contamination (insects, foreign material) and moisture permeation (diapers become less absorbent), which lead to compromised performance, health and safety issues for consumers, and a higher cost and environmental impact. P&G and other producers are working with external partnerships, such as CalFlex, to develop the needed recycling infrastructure in California for these

mono-material flexible films and other critical materials. We simply need more time to develop this infrastructure and will need to rely upon exemptions for these critical materials to help bridge the gap to compliance. The need for exemptions will be plentiful, as very few plastic materials will meet the aggressive 30% recyclability rate by 2028, and it will take time for the PRO to educate consumers and change consumer recycling habits. Producers need this direction from the Department to ensure exemption applications can be swiftly processed and approved for uninterrupted business operations to meet consumer demand for their daily-use products while producers and the PRO work toward compliance.

Rationale: This change provides necessary certainty to producers about the continued availability of an exemption for critical packaging materials. Making packaging changes and finding replacement materials can take substantial time and planning to ensure the viability, safety, and consumer acceptance for new packaging materials, often across a broad range of product categories. Our experience at P&G is that finding and qualifying new replacement packaging materials, when possible, can take as long as two to five years, so producers need as much certainty as possible on whether a material will be available for use in California. Without this certainty, producers may be forced to remove products, including consumer staples, from the California marketplace while they find and qualify replacement packaging.

Corrective Action Plans (Section 18980.13.1(a))

This section clarifies that CalRecycle has the authority to enter into a Corrective Action Plan (CAP) agreement with a producer to resolve violations on any terms the parties mutually deem appropriate and that CalRecycle is not required to issue financial penalties.

Rationale: CalRecycle is not limited in their authority to pursue a CAP as a standalone compliance mechanism. This provides the Department more flexibility to prioritize compliance as part of its enforcement policy and work with producers who are doing everything within their power to achieve this shared goal.

***

While not part of the Formal Proposed Regulations, P&G would like to use this opportunity to thank the Department for the reclassification of single-sided, polycoated paperboard into the 25_PF 10P Covered Material Category (CMC) in the September 2 publication of the updated CMC Guidance. We were extremely pleased to see this development after discussing this classification issue with you and your staff in our August 26 meeting in Sacramento and believe this removes an obstacle for packaging innovation and allows P&G to make an important step forward in SB 54 compliance in California. Thank you for your attention to this reclassification.

Please contact me if you have any questions about the content of P&G's recommendations or would like more information about the practical impact on producers and California consumers. Thank you for incorporating P&G's recommendations into your efforts on the Formal Proposed Regulations.

Sincerely,
Julie Froelicher
Senior Director, Global Product Stewardship
The Procter & Gamble Company
1 P&G Plaza
Cincinnati, OH 45202
Froelicher.jm@pg.com

Response to B-11-10

Comment rejected. No response to this portion of the commenter's submission is necessary because the issues raised in it have been addressed in response to other portions of the submission discussing the same issues. Regarding the encouragement that CalRecycle provide "guidance" concerning application processes, that encouragement is not a proposed change to the regulations and does not require further response. No regulation is required for CalRecycle to provide the requested guidance.

Comment B-11-11

Appendix 1

APR Brief on Detachable Components
APR DISCUSSION BRIEF

HOW PLASTIC COMPONENTS ARE RECYCLED WITH PLASTIC PACKAGING & REQUESTED CHANGES TO SB54 DETACHABLE COMPONENT DEFINITION

The Association of Plastic Recyclers (APR) represents over 80% of the processing capacity for post-consumer plastic packaging in North America. Our members include the businesses that recycle most of the PET, HDPE, LDPE, and PP plastic packaging after it has been collected by California's curbside and CRV recycling programs. This includes five California-based processors (reclaimers) of post-consumer recycled plastics, as well as dozens of California-based businesses throughout the value chain of plastics recycling.

APR has spent 30 years working with recyclers, producers, and the entire supply chain to design plastic packaging, including plastic packaging components, to be compatible with recycling processes. When components are designed to be recyclable and recycled, we can create a system where residents can simply put the entire plastic package into the recycling bin and the entire package--including attached plastic components--can be effectively sorted and recycled by MRFs and plastic reclaimers. As the voice of plastic recyclers, APR is focused on how the SB 54 requirements can effectively and efficiently drive higher recycling rates for plastic packaging to reduce plastic pollution. Unfortunately, APR is deeply concerned that the proposed definition of detachable components under the SB 54 revised rules (released August 2025) will treat all components as distinct parts, and not as part of the base packaging. This will lead to lower recycling rates. **APR requests CalRecycle amend the definition of detachable**

component to recognize that some plastic components are best recycled as part of the base packaging and should be categorized as part of the base packaging. This includes differentiating when the component is routinely removed by the consumer and routinely re-attached by the consumer prior to recycling.

PROBLEM:
If all plastic components are put in separate EPR fee categories than the base plastic packaging, this will
• Conflict with design standards and best practices
• Lower recycling rates
• Distort the producer fees
• Create more consumer confusion
• Promote poor design choices
Examples of plastic components on plastic packaging The following table identifies common examples of how plastic components are used by consumers and how the consumer may recycle these components. The components in the green rows are commonly recycled today as part of the base packaging. In other cases, components are more likely to be recycled separately from the base packaging. There are still some cases in which it is unclear if there is sufficient data to know how consumers are recycling these components.
Examples of plastic components on plastic packaging and how they are commonly recycled by the consumer*
The above examples illustrate that there are many common plastic packaging components that are recycled today along with the base packaging. **It is critical that the Covered Material Categories reflect how consumers are actually recycling the products.** This is why the definition of detachable components must differentiate when components are attached or re-attached by the consumer for recycling.

CONCERN 1: CONTRADICTS BEST PRACTICES OF DESIGNING COMPONENTS TO BE RECYCLABLE WITH ENTIRE PACKAGE
Plastic components can and should be designed to be recyclable when attached or reattached to the base packaging. CalRecycle already recognizes the importance of product design for plastic packaging in SB 54. Further, SB 343 (Allen, Chapter 507, Statues of 2021) specifically references the APR Design® Guide as the tool to address how components affect the recyclability of plastic products:

PRC 42355.51: *"(3)A product or packaging shall not be considered recyclable in the state unless the product or packaging meets all of the following criteria, as applicable: (A) For plastic packaging, the plastic packaging is designed to not include any components, inks, adhesives, or labels that prevent the recyclability of the packaging according to the APR Design® Guide published by the Association of Plastic Recyclers…"*

Statute requires producers to be compliant with the APR Design® Guide because the Design® Guide evaluates components as part of the entire packaging. See the diagram below to demonstrate how the APR Design® Guide assesses all the product design

features including components, inks, colors, sizes, additives, and more. This means it would be contradictory for CalRecycle to use the current definition of detachable components because it would classify all components as distinct parts when best practices look at these components as part of the base packaging. **This current definition is at odds with the leading design standards already recognized in California law.** The definition of detachable component must recognize that some components are successfully recyclable and recycled as part of the base packaging.

CONCERN 2: LOWERS RECYCLING RATES

In addition to the examples in the chart on page two, here are two common ways plastic components can be effectively recycled as part of the plastic product when properly designed for recyclability.

Example 1: Caps on plastic bottles. APR's model bale specs have endorsed caps on bottles since 2011. APR Design standards ensure that the caps can either be separated from bottles during the recycling process and recovered for recycling (e.g., caps on PET bottles), or are sufficiently compatible with the main bottle packaging (e.g., caps on HDPE bottles). Please see more information on caps in the plastics recycling process here. Data shows that California consumers are in fact putting caps back on the bottles. In 2025, the PET Recycling Corporation of California (PRCC) conducted a bale sort that found that over 78% of bottles collected through the CRV program had the cap attached, and 57% of bottles processed at MRFs had caps on bottles prior to baling.1

Example 2: Design-compatible pumps and sprayers. Pumps and sprayers often contain a small metal spring that is very problematic to sort out during the plastic recycling process. APR's Design Guide recommends plastic-only pumps and sprays, and there are over 60 variations of APR approved designs for sprayers and pumps that a company can use to ensure the entire container and pump/sprayer are fully recyclable. Proper design eliminates the need for the consumer to remove any pump or sprayer, and instead, allows the consumer to simply put the entire container in the recycling bin. Plastic recyclers can then fully recycle the container and pump, leading to higher recycling rates.

CONCERN 3: DISTORTS EPR FEES

The statute requires the PRO to set fees that reflect the *"Costs to collect, sort, avoid or remove contamination, aggregate, and transport the covered material into defined streams to support the viable responsible end markets for the remanufacturing of the covered material…."* This means producer fees, as based on the Covered Material Categories (CMCs), are required to reflect the actual costs of recycling and should reflect how plastic components are currently managed. For example, plastic caps on PET plastic bottles are collected and recycled today as part of the PET bottles. The costs collect and sort PET bottles are based on recycling all of the components together as a single unit. Similarly, the plastic reclaimers' costs to recycle a bale of PET bottles include the routine operational steps of separating the caps for recycling, along with any other non-PET "floatable" material. To base the EPR fees on the actual costs, the PRO must consider how products are actually recycled, which means differentiating between

components that are attached or re-attached for recycling. **Treating attached and re-attached components as part of the entire packaging unit is the most accurate reflection of the actual recycling costs of managing these components based on how they are recycled today.**

CONCERN 4: INCREASES CONSUMER CONFUSION

When all the attached or re-attached plastic components are designed to be recyclable with the product, recycling is easier for California residents. One of the overarching principles of SB 54 is to streamline, standardize, and simplify plastics recycling for residents to increase participation. This means **moving toward a future where there is less onus on the resident to intentionally remove any plastic components prior to recycling.** The role of the resident is to simply put the plastic package into the recycling bin, and then, with proper packaging design, the full product can be effectively recycled into new products. If components are all considered separately, then it may lead to more cases of when the resident is instructed to remove parts for recycling. This moves in a contrary direction to the statute goals. Components that are already recyclable when attached or re-attached should be incentivized, not treated the same as components that must be removed and recycled or disposed separately. There are too many nuances around how components are handled by consumers and how they flow in the recycling to simply set one baseline for all materials. **APR strongly recommends CalRecycle differentiate between component types in its definition and CMC guidance and incentivize those that can be recycled as part of the base package.**

CONCERN 5: PROMOTES POOR DESIGN CHOICES

APR anticipates several significant problems caused by charging EPR fees based on separate components with two examples provided here:

Scenario 1: Counting separate components may result in larger lids that use more plastic

If a producer must consider the screw-on lid as a separate and distinct component, then the producer may need to design the lid to be recycled separately from the container. Since smaller format plastics are more challenging to recycle, the producer would be incentivized to make the lid larger so it could be more effectively sorted by the MRFs. For example, a plastic jar lid (e.g., peanut butter jar) could be expanded to 3” or 4” width, or increased in height to 3” or more, to increase recyclability as a standalone component. This change in lid size will increase the amount of plastic being used in product design, which is contrary to the statutory goals.

Scenario 2: Moving to metal caps will result in less recycling. If the plastic cap is considered a separate category and has a different fee than the plastic container, then producers will look for ways to reduce their fees on the cap itself. Because metal typically has lower EPR fees than plastics, producers would have a financial incentive to move toward metal caps. While this might *sound* like a good way to reduce the number of plastic components, it has many unintended consequences. Metal components are the number one contaminant on PET containers. Small pieces of metal are extremely problematic in the plastic recycling system because they are extremely challenging to separate and degrade the quality of the recycled content. If more companies move to metal caps, it will have several negative impacts, including less recycled plastic and

lower quality of recycled content. In addition, small metal caps are challenging to recycle because of their size and because they contain a plastic lining on the inside of the cap. By contrast, plastic caps are recyclable today on bottles. Moving toward more plastic-lined metal caps would be a huge step backward and would create more problems rather than solve problems.

Moving forward
APR recognizes that one of the goals of SB 54 is to reduce plastic waste from small components, and the subsequent need to quantify the number and types of plastic components. However, the goal to count all components should not undermine recycling efforts, and we believe there is a way for the state to set the definitions to both quantify the number of components and ensure components are effectively recyclable and recycled.
APR requests CalRecycle amend the definition of detachable component to recognize that some plastic components are best recycled as part of the base packaging and should be categorized as part of the base packaging.

Response to B-11-11

CalRecycle rejects this comment for the reasons stated in response to comment O-39-5.

Comment B-11-12

Appendix 2

P&G Proposed Edits to Formal Proposed Draft Regulations

Proposed revisions shown in red font.

OTC Drug Exclusion (Section 18980.2(a)(6))

Section 18980.2. Categorically Excluded Materials
(a) The following are not covered material:

[…]

(6) Packaging for medical products. “Medical products” means products that are “drugs,” as defined pursuant to paragraph (5), that do not require a prescription. ~~and satisfy at least one of the following criteria:~~
~~(A) They are neither “cosmetics,” as defined in subsection (i) of section 321 of Title 21 of the United States Code, nor “soap,” as defined in section 701.20 of Title 21 of the Code of Federal Regulations.~~

~~(B) They are not a drug solely by virtue of containing a “sunscreen active ingredient,” as defined in section 352.3 of Title 21 of the Code of Federal Regulations~~.

Explanatory note: This edit excludes only products that have a Drug Facts panel, per the definition of medical products (21 U.S.C. § 321(g)) included in SB 54 statute. This does not exclude cosmetics that are not OTC drugs because pure cosmetics do not have a Drug Facts panel. Pure cosmetics that are not drugs remain in scope.

Detachable Components – Actual Recycling Rates and Recyclability (Section 18980.1 and Section 18980.3)

Section 18980.1. Definitions

[…]

(4) "Component" and related terms are defined as follows:

(A) "Component," with respect to covered material, means a covered material item that has no physically distinct subparts, or a piece or subpart of a covered material item, if the piece or subpart is distinct with respect to its composition or function or is otherwise physically distinct from other pieces or subparts. "Item" is defined in paragraph (12).
(B) For purposes of categorizing components into covered material categories, each detachable component shall be considered individually and not necessarily categorized in the same category as the components from which it was detached, unless such component is designed to be reattached before disposal.

(C) A "detachable component" is one that may be completely detached from all other components or material, is not designed to be reattached before disposal, and is either of the following:

(i) A component designed such that it may be readily detached by consumers or during or after collection without the use of tools, substances, or non-manual processes. A component shall not be considered designed to be detached merely because it may be detached from all other components or materials during processing.

(ii) Typically or necessarily detached through ordinary usage by the consumer and is not designed to be reattached before being discarded~~, regardless of whether the component is discarded attached to the other components~~.

(D) A "non-detachable component" is a component that is not detachable, as defined in subparagraph (C).

(E) The term "separable and distinct material component," as stated in the definition of "packaging" in subdivision (s) of section 42041 of the Public Resources Code, means a component, as defined in this subdivision, that is not the good being packaged but rather is the covered material serving the functions of packaging, as set forth in that definition.

Section 18980.3.2. Methodology for Recycling Rate Determination

[...]

(d) Recycling rate shall be calculated for each covered material category, except as established in subdivisions (f) and (g).

(1) For covered material components that are not detachable components, a single recycling rate shall be calculated for the covered material category applicable to the item comprising those components rather than calculating a recycling rate for each component.

(2) For covered material components that are detachable components, a recycling rate shall be calculated using the covered material category applicable to each detachable component.

(3) If the Department determines that a recycling rate can be calculated for a group of components representing more than one covered material category and that a recycling rate cannot be calculated separately for a covered material category in such group, then the recycling rate of the group shall be used for each covered material category in the group for which an individual recycling rate cannot be calculated.

Compliance Measurement Period for Source Reduction (Section 18980.9.1)

Section 18980.9.1. Annual Reports

[...]

(d) For the PRO, the annual report shall additionally include:
(1) In the second phase of the annual report, as described in subdivision (c) of section 18980.6.5, fee schedule amendments pursuant to subdivision (e) of section 42053 of the Public Resources Code as a result of adjustments, including calculations for malus fees or credits.

(2) In its first phase of the annual report, as described in subdivision (b) of section 18980.6.5, the following information with respect to source reduction that is required by January 1 of 2027, 2030, and 2032, under subdivision (a) of section 42057 of the Public Resources Code:

(A) Percentage of reduction across all participant producers achieved during the applicable calendar year 2027, 2030, or 2032, respectively, based on producer source reduction reporting pertaining to calendar year 2027, 2030, or 2032, to determine the PRO's compliance with its source reduction plan and the requirements of subdivision (a) of section 42057 of the Public Resources Code.

(B) A qualitative assessment of the successes and challenges achieving source reduction goals, delineated by plastic covered material category, which ranks the relative frequency of use of each source reduction strategy.

(C) A quantitative assessment of source reduction achieved through reuse and refill strategies. The assessment shall assess the percentage of reduction in new material produced, detailing the reduction in the number and weight of plastic components through shifting to reusable or refillable packaging or food service ware and elimination of plastic components.

(D) Source reduction percentage by weight achieved through an alternative compliance formula pursuant to subclause (i) of subparagraph (B) of paragraph (2) of subdivision (a) of section 42057 of the Public Resources Code and approved by the Department as part of the PRO's plan.

Source Reduction Adjustments, including for Sales Growth (Section 18980.8.3)

Section 18980.8.3. Source Reduction Adjustments

(a) Subject to the limitations of this section, a source reduction plan developed pursuant to subdivision (f) of section 42057 of the Public Resources Code may utilize adjustment factors and methods to account for fluctuations in economic conditions and the increase or decrease in the number of producers participating in the PRO plan and must utilize adjustment factors and methods to allow producer reporting of material usage to be adjusted by units of sale to normalize for business growth over time, in each case for determining whether the PRO has met its source reduction obligation relative to the baseline established by the Department under subdivision (b) of section 42057 of the Public Resources Code.

Measurement of PCR Credit for Source Reduction (Section 18980.3.4)

Section 18980.3.4. Independent Third-Party Validation for Postconsumer Recycled Content

[...]

(b) The Department shall approve an alternative compliance formula as part of a PRO's plan only if the plan establishes the following:

(1) That the formula will accurately and reliably assess the reduction, by weight, in the use of virgin plastic through incorporation of postconsumer recycled content. To measure source reduction, it will ~~compare~~ measure the amount of postconsumer recycled content, by weight, used ~~to the amount used~~ in the ~~2023~~ relevant reporting calendar year and count such amount as the amount of virgin plastic that was source

reduced. The plan shall include a detailed description of the formula, including all assumptions, estimates, and supporting information.

Physical Recycling (Section 18980.4.1)

Section 18980.4.1. End Market Identification

[...]

(d) A PRO or Independent Producer shall identify in its plan any recycling technology that was not a type of mechanical or physical recycling technology in use within the United States of America as of the effective date of the Act. Facilities employing such technology must not produce significant amounts of hazardous waste as defined in paragraph (1).

(1) For purposes of paragraph 5 of subdivision (aa) of section 42041 of the Public Resources Code, "significant amounts of hazardous waste" means hazardous waste as defined in Title 40 of the Code of Federal Regulations Section 261.3 that presents a substantial risk of harm to public health, or of contamination of the environment.

(A) Mechanical and physical recycling technologies that were in use within the United States of America as of the effective date of the Act do not produce significant amounts of hazardous waste for the purposes of the Act and this chapter.

(B) The production and management of hazardous waste that is handled and disposed of in compliance with an applicable permit does not present a substantial risk of harm to public health or of contamination of the environment, for purposes of the Act and this chapter. Minor technical violations or minor deviations from permit conditions that do not result in, or are not reasonably likely to lead to, actual environmental harm or harm to public health shall not, by themselves, be considered noncompliance for purposes of this section.

(2) A facility's use of a technology that is not a type of mechanical or physical recycling technology in use within the United States of America as of the effective date of the Act shall not be considered recycling for the covered material processed using it unless the facility operates in a manner consistent with ISO 59014:2024.

Malus Fees for Covered Materials Containing Prop 65 Chemicals above Established Exposure Levels (Section 18980.6.7.)

Section 18980.6.7. Eco-Modulated Fee and Fee Schedule

[...]

(i) Pursuant to paragraph (4) of subdivision (e) of section 42053 of the Public Resources Code, a PRO shall charge a malus fee to producers who use covered material that

contains a chemical listed on the list established pursuant to section 25249.8 of the Health and Safety Code at levels that would expose consumers above the respective exposure levels (No Significant Risk Levels/Maximum Allowable Dose Levels) and via the route of exposure of concern established by the Office of Environmental Health Hazard Assessment.

Response to B-11-12

Comment rejected. This comment sets forth the proposed changes that correspond to the preceding portions of the commenter's submission. Each proposed change has been addressed in response to those preceding portions.

B-12: John Caturano GGC / On Behalf of: Plastic Forming Enterprises LLC (John Caturano)

Comment B-12-1

Comment on SB 54 Draft Regulations – ISO/IEC 17025 Accreditation for Third-Party Recyclable Packaging Testing
To ensure credibility and consistency in the data used to implement SB 54, it is strongly recommended that all testing—whether for compostable or recyclable packaging materials—be conducted by independent third-party laboratories accredited to ISO/IEC 17025. As California moves toward ambitious regulatory expectations, validation through credible, science-driven data, by trusted independent third-parties is essential.

While the current draft regulations appropriately reference ISO/IEC 17025 accreditation for compostable materials and recyclability packaging testing, there is not yet a requirement to use a third-party testing facility. This creates a critical gap in technical verification and data reliability.

Independent third-party ISO/IEC 17025 accreditation ensures that laboratories maintain robust quality systems, calibration traceability, and the plastics expertise necessary to generate credible data for end-market determinations. That said, not all testing methods for determining recyclability will fall within a laboratory's ISO/IEC 17025 scope. To ensure the production of reliable data, those conducting the testing should remain independent from the product being assessed. This change will help prevent self-serving or unverified recyclability claims, reinforce SB 54's data-driven framework, and support transparent, technically sound decision-making aligned with California's circular economy goals.

Response to B-12-1

Comment rejected. The commenter's request is that "those conducting the testing should remain independent from the product being assessed." The proposed regulation, however, already guarantees such independence. See section 18981(b)(1) and (2).

B-13: RJ Schinner Co., Inc (Joseph Siekierski)

Comment B-13-1

Dear Sirs/Madams:

By this letter, R.J. Schinner Co., Inc. ("Schinner") is responding to the request from the California Department of Resources Recycling and Recovery ("CalRecycle") for public comments on the proposed SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act (the "Act") Permanent Regulations. Schinner is a wholesale redistribution company serving the foodservice, lodging, grocery, janitorial supply, and office supply markets, and distributes products into the state of California. Because its business operations are potentially subject to the Act, Schinner has an interest in CalRecycle's rulemaking activities associated with the Act.

Accordingly, Schinner submits the following comments:

> **Response to B-13-1**
>
> Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it only references the commenter's recommendations; it does not set those recommendations forth. To the extent the issues raised require responses, CalRecycle has addressed them in response to other portions of the submission discussing the issues in detail.

Comment B-13-2

1. The term "purchaser" is used in the Act at section 42041(w)(5) and in the proposed regulations at section 18980.2.1(a)(4)(B). This term should be defined in section 18980.1. For example, it is unclear whether a "purchaser" is the same as other terms used, such as "end user," "consumer," or any other entity in the supply chain that may purchase a product (such as a "retailer" or "wholesaler"). Given the complex nature of distribution in supply chains, it is very important that the language used in the regulations is precise and recognizes that products often end up being "purchased" by an entity that does not use the product (or dispose of the packaging), but instead sells that product to another person or entity—and the location of that subsequent transaction may be unknown to the entity that first sells the product into the state.

> **Response to B-13-2**
>
> Comment rejected. The term "purchaser" has obvious, plain meaning (one who purchases) and is only used in an explanatory parenthetical listing examples of how items can be purchased. Moreover, the context makes clear that the "consumer" or "end user" at issue is the person (whether natural person or an entity) that uses the items that might be refilled or reused. Lastly, because the context is the application of the reuse/refill criteria in Public Resources Code section 42041(af), it is immaterial that the supply chain might involve intermediate transactions by entities that might not know the precise fate of the

items they purchase or sell. In every event, the criteria for whether those items are reusable or refillable are applied in context of their use and reuse/refill.

Comment B-13-3

2. The term "consumer" should similarly be defined within 18980.1 and differentiated from the terms "purchaser," "user," and "end user." The term "consumer" is defined in 18980.2.1(a)(1)(B), but the application of the definition is limited to that subdivision.

Response to B-13-3

CalRecycle rejects this comment for the reasons stated in response to comment B-13-2.

Comment B-13-4

3. The terms "user" and "end user" should be defined within 18980.1 and differentiated from the terms "purchaser" and "consumer." To the extent that "user" and "end user" are meant to refer to the same thing, only one of those terms should be used.

Response to B-13-4

CalRecycle rejects this comment for the reasons stated in response to comment B-13-2.

Comment B-13-5

4. The term "covered product" is used in the Act at section 42041(w)(2). The definition of "product" at section 18980.1(a)(18) should clarify whether it also applies to the use of the term "covered product."

Response to B-13-5

Comment rejected. The commenter erroneously asserts that secion 42041(w)(2) uses the term "covered product" and, on that basis, requests that the regulation provides clarity regarding it. While the first-enacted version of 42041(w)(2) used that term, it was removed in subsequent legislation, so no change is warranted.

Comment B-13-6

5. Sections 18980.6(b) and (c) allow the PRO to dismiss or refuse producer participation. These provisions are an improper delegation of CalRecycle's authority to a private entity. A producer's inability to participate in a PRO, due either to PRO dismissal or refusal, effectively prohibits the producer from lawfully selling or distributing products in the state of California, with no reasonable alternatives available to comply with the law and no recourse through administrative hearing or judicial review. As the agency imbued with authority to implement the Act, CalRecycle alone should adjudicate, through a transparent process, whether a producer is permitted to participate in the program and sell or distribute products in or into California. The PRO should not have the authority to refuse or dismiss producer participation.

Response to B-13-6

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, and no further change is necessary to the implementation or enforcement of the Act. PRC section 42051(b)(1) provides that a producer cannot sell, offer for sale, import, or distribute covered materials in the state on or after January 1, 2027, unless the producer "is approved to participate in the plan of a PRO that is approved by [CalRecycle.]" PRC section 42051(b)(1) does not require CalRecycle to determine when producers are approved for participation in the PRO's plan. Sections 18980.6(b) and (c) of the proposed regulations implement this requirement by establishing a heightened standard for when a PRO will be allowed to dismiss or refuse to accept a producer from participating in its plan. As described in those sections, the heightened standard includes requirements for good cause based on substantial noncompliance and good faith effort by the PRO to resolve the good cause. Consistent with Article 13 of these proposed regulations, any failure by a PRO to comply with this heightened standard will constitute a violation by the PRO and may subject the PRO to penalties. Furthermore, pursuant to PRC section 42051(d), the PRO will be required to notify CalRecycle within 30 calendar days of the date a producer no longer participates in the PRO's approved plan. CalRecycle will also have the opportunity to demand records and conduct inspections as it deems necessary to determine a PRO's compliance with the requirements of sections 18980.6(b) and (c). Therefore, the proposed regulations already provide CalRecycle with sufficient opportunity to oversee and enforce the PRO's dismissal or refusal of participant producers. Moreover, even if a PRO properly dismisses or refuses to accept a participant producer, that producer will have the opportunity to comply with the Act as an Independent Producer, consistent with PRC section 42051(b)(2) and section 18980.5.1 of the proposed regulations. Finally, nothing in the Act or these proposed regulations purports to affect or eliminate any opportunity for judicial review that might be available to a producer under the law. As such, no change is necessary.

Comment B-13-7

6. Section 18980.6.1 provides that the PRO shall prepare and submit a producer responsibility plan on or before either April 1, 2026, or June 15, 2026 (under certain conditions). Upon submission, the plan will then be subject to review and public comment prior to approval; this comment and approval process will likely take several months, in the very least. The contents of this plan will provide producers with critical details about CAA's process and fee schedule, as prescribed in section 18980.6.7. However, California's approved PRO, Circular Action Alliance ("CAA"), is requiring producers to register, report supply data, and pay early fees prior to the existence of even a draft plan—let alone an approved plan. Without the information to be contained in this plan, producers cannot make informed decisions about whether to participate in the PRO, and yet they are being forced to do so by the requirements imposed by CAA. CAA should not be permitted require producers to submit supply data and fees prior to the approval of its producer responsibility plan. All producer compliance dates should be postponed until after CalRecycle has approved the PRO's plan.

Response to B-13-7

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42051.1, 42053, and 42060, and the recommended changes are not necessary to the implementation of the Act. First, to the extent this comment recommends the postponement of PRO-initiated compliance deadlines, no response is necessary because such recommendations do not suggest changes to the proposed regulations or raise objections related to the rulemaking process. Rather, these recommendations concern deadlines that have been established by CAA, not CalRecycle, outside of the rulemaking process. Second, to the extent this comment recommends postponing the requirement for producers to pay fees to the PRO prior to the approval of its producer responsibility plan, no change is necessary or appropriate for the reasons specified in response to comment B-35-4. Finally, to the extent this comment recommends postponing the requirement for producers to report supply data to the PRO prior to the approval of its producer responsibility plan, no change is necessary or appropriate. Consistent with the overall statutory framework and its authority under the Act, the initial PRO plan must be based on producer supply data. This requirement is inherent in the relevant statutory provisions, including, among others, PRC sections 42051.1(d), (h), and (j), which require producer supply data to reasonably inform initial determinations concerning producer fees, source reduction data, and the budget. If a producer declines to provide the PRO with supply data, or if a producer discontinues its participation in a PRO following approval of the PRO's plan, the producer can apply to comply with the requirements of the Act as an Independent Producer under PRC section 42051(b)(2) and section 18980.5.1 of the proposed regulations. Therefore, the proposed regulations already strike an appropriate balance between ensuring the PRO is able to receive all information necessary to develop its initial plan and providing producers with opportunities to decline to provide the PRO with supply data or participate in the PRO's plan if desired.

Comment B-13-8

7. Section 18980.6.4 does not provide for public comment on amendments to the PRO's producer responsibility plan. This is in contrast to section 18980.6.3, pertaining to plan updates, which does allow for public comment. Section 18980.6.4 should be revised to allow for public comment in order to be consistent with the Act. Section 42051.2(e)(1) of the Act provides that the process for amendments to the producer responsibility plan should be the same as for the updated plan.

Response to B-13-8

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42051.2, 42060, and 42063, and the suggested change is not necessary to the implementation of the Act. PRC section 42051.2(e) only requires the PRO to make specified proposed

plan amendments available for review by the advisory board and CalRecycle; it does not require the PRO to make such proposed plan amendments available for public review or comment. Section 18980.6.4(b) of the proposed regulations implements this provision by specifying that a PRO must include a summary of all comments received from the advisory board and identify revisions, if any, made in response to the comments. Furthermore, consistent with PRC section 42051.2(e), section 18980.6.4(c) of the proposed regulations establishes a process and standards by which CalRecycle will review advisory board comments as summarized by the PRO and determine whether the PRO has properly considered and incorporated such comments into its proposed plan amendments. No further change is necessary to implement the requirements concerning comments on proposed plan amendments as set forth in PRC section 42051.2(e).

Comment B-13-9

8. Section 18980.6.5 requires the PRO to prepare and submit Annual Reports, and notes that the first report should be submitted no later than July 1 of each year after CalRecycle has approved a PRO Plan. However, given the ambiguity around the anticipated timing of CAA's approved PRO Plan, it is unclear when the PRO's plan will be approved. The timing of the Annual Report therefore should not be tied to the approval of the PRO plan, especially if the PRO is permitted to collect fees from producers in advance of the plan's approval. The PRO should be required to submit Annual Reports to CalRecycle detailing its use of finances beginning in its first year of operation—or, in the very least, in the year it begins collecting fees from producers.

Response to B-13-9

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42051.2, 42051.3, 42060, and 42063, and no change is necessary to the implementation of the Act. PRC section 42051.3(a) requires a PRO to annually submit to CalRecycle an annual report and budget that describes how the PRO is implementing the approved plan. Section 18980.6.5 of the proposed regulations implements this provision by providing that this annual report requirement will commence in the year after the plan has been approved or conditionally approved. This interpretation is necessary and reasonable because the plan must first be approved before the PRO can describe how it is "implementing the approved plan," as required by PRC section 42051.3(a). Following the plan's approval, the PRO will be required to submit annual reports that detail its use of finances, as required by PRC section 42051.3 and 18980.6.5 of the proposed regulations. No further change is necessary.

Comment B-13-10

9. Section 18980.6.5 does not allow for public review and comment of the PRO's Annual Report. The opportunity for public comment is crucial and should be added to this section. Moreover, the Annual Report must be unredacted in order to achieve complete transparency regarding the PRO's fee setting and expenditure of funds.

Response to B-13-10

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42051.3, 42060, and 42063, and no changes are necessary to the implementation of the Act. PRC sections 42051.3 and 42063 establish the process and requirements governing the submission and approval of a PRO's annual report. In contrast to statutory provisions governing the submission and approval of a PRO's plan and plan updates (PRC section 42051.2), which do provide an opportunity for public comment prior to CalRecycle's approval, PRC sections 42051.3 and 42063 do not establish any requirement for public comment on proposed annual reports before CalRecycle's approval. Section 18980.6.5 of the proposed regulations implements PRC sections 42051.3 and 42063 by adding further specificity to the process and requirements governing the submission and approval of a PRO's annual report without adding any public comment requirement. No further change is necessary to give effect to PRC sections 42051.3 and 42063. Moreover, to the extent this comment recommends requiring that the annual report be unredacted to achieve complete transparency, no change to the proposed regulations is necessary. Nothing in the Act or proposed regulations provides that an annual report submitted to CalRecycle may be redacted or will lack complete transparency. Rather, PRC section 42063(c) requires CalRecycle to withhold certain producer-specific financial, production, or sales data included in an approved annual report from being released to the public. That section provides that approved annual reports are public records, except that financial, production, or sales data reported to the department by the PRO is not a public record for purposes of the California Public Records Act (Division 10 (commencing with Section 7920.000) of Title 1 of the Government Code) and shall not be open to public inspection. Therefore, the proposed regulations are consistent with the Act's requirements and limitations concerning the transparency of annual reports.

Comment B-13-11

10. Section 18980.6.6(b) should not permit the PRO to redact financial information. Complete, transparent financial data is critical for meaningful oversight by both producers and CalRecycle.

Response to B-13-11

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42060 and 42063, and no change is necessary to the implementation of the Act. Section 18980.6.6(b) of the proposed regulations does not purport to permit the PRO to redact financial information from documents it submits to CalRecycle. Rather, it instructs the PRO to identify to CalRecycle any portions of its document submittals that should be withheld from disclosure to the public because such portions contain producer-specific financial, production, or sales data. This is necessary for

consistency with the requirement for CalRecycle to withhold from public inspection such information, as set forth in PRC section 42063(c). Therefore, no further change is necessary or appropriate.

Comment B-13-12

11. Section 18980.6.7(c) permits the PRO to switch from collection of "early fees" to collection of supply-based fees if it determines that it has "sufficient data" to do so. The regulations should clarify more specifically what is meant by "sufficient data" and how the sufficiency of data should be measured.

Response to B-13-12

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42051.1, 42053, and 42060, and no change is necessary to the implementation of the Act. PRC section 42053(a) makes clear that the PRO is responsible for establishing and developing a producer fee schedule according to the timeline established in PRC section 42053(b). PRC section 42053(b) provides that, during the first two years of operation and during the preparation of the PRO plan, the PRO will base the producer fee schedule on estimated costs of implementing the plan, operating costs, the cost of completing the needs assessment, and the costs to reimburse the department. PRC section 42053(b) further provides that, in the third year and beyond, the PRO must base the producer fee schedule on the factors specified in PRC 42053(c), including fees that are adjusted using malus fees or credits. Section 18980.6.7(c) of the proposed regulations implements this timeline by clarifying that the PRO may establish a producer fee schedule reflecting eco-modulated fees any time following approval of the initial plan if the PRO determines it has sufficient data to do so. The timelines in PRC section 42053(b) and sections 18980.6.7(a) and (b) of the proposed regulations are designed to protect against the assessment of eco-modulated fees before the PRO has sufficient data to establish such eco-modulated fees. PRC section 18980.6.7(c) provides that, once sufficient data exists, and after approval of the initial plan, the PRO may begin charging eco-modulated fees as part of the estimated costs of implementing the plan under PRC section 42053(b). Because the PRO is given the responsibility and discretion to develop and establish eco-modulated fees under PRC section 42053, section 18980.6.7(c) appropriately extends the PRO the opportunity to determine when it has sufficient producer data to establish such eco-modulated fees. Therefore, section 18980.6.7(c) is consistent with the producer fee framework established in PRC section 42053 and no further change is necessary.

Comment B-13-13

12. Section 18980.6.8(e) requires access to records within ten (10) calendar days. This is overly burdensome for many businesses, which often rely on a small team to collect and maintain this data. The time permitted for access to records should be extended to thirty (30) calendar days.

Response to B-13-13

CalRecycle rejects this comment. CalRecycle rejects this comment to the extent it recommends changing "10 calendar days" to "30 calendar days" because such change is not necessary to the implementation or enforcement of the Act and would cause undue delay to CalRecycle's ability to carry out its investigative functions and verify compliance with the Act. The proposed regulations are consistent with the requirements set forth in the Act, including in sections 42051.1 and 42060 of the Public Resources Code. Section 42051.1(m) already requires all records to be maintained such that they are reasonably accessible to CalRecycle upon request. Consistent with the record maintenance protocol of section 42051.1(m) and section 18980.6.8(d) of the proposed regulations, ten calendar days provides an entity with sufficient time to assemble and provide CalRecycle with the requested records that are already being maintained.

Comment B-13-14

13. PROs should not be permitted to require binding arbitration as the sole method of dispute resolution with producers. The regulations should address this point specifically. In section 18980.8.(h), for example, the regulations outline an approved dispute resolution process as between the PRO and local jurisdictions and recycling services providers, and further note as follows in Section 18980.8(h)(6): "Nothing in this subdivision shall be construed as empowering the PRO or Independent Producers to require local jurisdictions or recycling service provides to submit any matter to mediation or arbitration." A similar provision is necessary to govern the resolution of disputes between the PRO and producers. CalRecycle should prohibit CAA from requiring producers, through CAA's non-negotiable participant producer agreements, to be subject to binding arbitration with no possibility of judicial review as the sole means of dispute resolution.

Response to B-13-14

Comment rejected. PRC section 42060(a) requires CalRecycle to "adopt regulations necessary to implement and enforce this chapter[.]" The proposed regulations fulfill that mandate through the provision cited by the commenter, section 18980.8(h) of the proposed regulations, which implements the requirements of section 42051.1(g) of the Act concerning the resolution of cost disputes between a PRO and a local jurisdiction or a recycling service provider. Even in that context, the PRO is not given any authority to require any party to submit to binding arbitration. Also, no parallel provision exists in the statute or the proposed regulations concerning disputes between a PRO and producer. As such, no further changes to the proposed regulations are necessary to the implementation or enforcement of the Act.

Comment B-13-15

14. Pursuant to sections 18980.1(a)(22)(C) and 18980.10.1(b), producers that are members of a PRO (and therefore are not Independent Producers) may choose not to submit reports to the PRO and instead submit reports directly to CalRecycle. However,

the process for this option is not further elaborated beyond two brief references. The regulations should either provide more detail about how this option would be effectuated or direct the PRO to develop a process within its plan. Moreover, producers should be privy to the details of this option before being forced to submit supply data and fees to a PRO.

Response to B-13-15

Comment rejected. A regulation is not required for establishing every ministerial detail of how a report may be submitted directly to CalRecycle. And, in any event, section 18980.10.1 establishes both substantive and procedural requirements relating to report submissions and unambiguously establishes that its requirements apply to reporting entities. Also, section 18980.1(a)(22)(C) clearly states that a producer becomes a "reporting entity" merely by not providing data to the PRO. At that point, the procedures set forth in 18980.10.1 apply to the producer directly. Lastly, no change is required to ensure that, as the commenter suggests should be required, a PRO plan establish a process for producers to "effectuate" the option of submitting reports directly to CalRecycle. The PRO already has the general obligation under Public Resources Code section 42051.1(m) to implement measures to ensure that producers comply with the Act, including by maintaining records demonstrating such compliance. A PRO cannot fulfill that obligation unless it establishes procedures for producers to submit data to it or notify it that they are complying by reporting directly to CalRecycle.

Comment B-13-16

15. Section 18980.13(a) does not indicate that notice will be given to an entity prior to entry for an inspection. Reasonable notice should be included in this provision.

Thank you for the opportunity to submit these comments on the Act's proposed regulations.

Response to B-13-16

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act. PRC section 42080(a) authorizes CalRecycle to conduct investigations, including through inspections and audits, to determine whether entities are complying with the Act. Section 18980.13(a) of the proposed regulations implements this statutory provision by specifying the nature and methods of such investigations. While notice is not required by PRC section 42080(a), CalRecycle may give notice prior to entry for an inspection where appropriate. Additionally, PRC 42081(a) already provides for an adequate period of notice before any penalties begin accruing with respect to a violation of the Act. Therefore, no further change to the proposed regulations is necessary.

B-14: Repurpose, Inc. (Lauren Gropper)

Comment B-14-1

I'm writing as the Founder & CEO of Repurpose, a California C-Corp with headquarters in Los Angeles, California. We have 25 employees and have been in business for 15 years. We manufacture and distribute compostable household goods through 15,000 retailers nationwide including Costco, Target, Amazon, Kroger and Albertsons. California's proposed law will have a significant negative impact on our Company, raising costs and harming markets nationwide, as well as hurting consumers that want clearly labeled sustainable products and packaging.
Repurpose is not new to sustainability, it's in our DNA.
For over a decade, we've:

Designed PFAS-free, non-toxic, certified compostable products across multiple household categories.

Substituted petroleum-based single-use plastics with clean, plant-based materials.

Advocated for consumer transparency and the elimination of greenwashing in the marketplace.

Built a strong internal data foundation to classify, measure, and verify packaging components across our entire product catalog.

Our actions are already aligned with the core intent of SB 54: reduce plastic pollution, improve end-of-life outcomes, and shift responsibility upstream to producers. Though the SB 54 regulations are not yet finalized, Repurpose has proactively:

Completed a full packaging audit: Every SKU's packaging material, weight, recyclability/compostability, and labeling has been tracked and mapped.

Maintained PFAS-free product design: Our commitment to safe materials positions us to comply not only with SB 54 but with global regulatory trends.

Built a scalable compliance framework: We've begun working with tech partners to streamline Extended Producer Responsibility (EPR) data reporting and cost modeling across jurisdictions.

Engaged early in rulemaking: Repurpose has reviewed and submitted feedback on draft regulations, tracking shifts that affect compostables in particular.

Below please find our comprehensive comments:

Response to B-14-1

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it only references the commenter's recommendations; it doesn't set those recommendations forth. To the extent the issues raised require responses, CalRecycle has addressed them in response to other portions of the submission discussing the issues in detail.

Comment B-14-2

Section 18980.1 — Definitions

At Repurpose, we appreciate the revisions CalRecycle has made to the definitions of "alternative collection" and "food service ware." The inclusion of mail-back and extended logistics programs under "alternative collection" is a positive and realistic recognition of how forward-thinking companies are working to expand access to responsible disposal pathways. Likewise, including food-associated items like cup sleeves under "food service ware" shows a more complete understanding of real-world usage and disposal behavior.

However, we strongly urge CalRecycle to further revise the definition of "plastics or polymers" and create a standalone definition for "polymers." These two terms are not interchangeable — yet without a clear distinction, the proposed regulations unintentionally widen the exemption outlined in PRC 42356.1(d), which was meant to be narrowly applied.

As a company that designs certified compostable products using responsible materials — including trace polymers that meet ASTM D6400 and D6868 — we know firsthand how rigorous these standards are. Compostable polymers are carefully tested to ensure biodegradation, safe disintegration, and non-toxic breakdown. To lump these in with conventional plastics undermines the science, misleads consumers, and threatens the integrity of the entire system — from field to soil.

If CalRecycle does not address this definition, it will create a loophole that penalizes responsible brands and invites confusion, greenwashing, and contamination in composting streams. We recommend the adoption of ASTM D883's definition of "polymer" and that the term "plastics or polymers" in this regulation be amended to reference this.

Response to B-14-2

CalRecycle rejects the commenter's suggestion, which is vague because it states that the regulation should incorporate "ASTM D883's definition of 'polymer'" but does not provide that definition nor explain why it is more appropriate than the definition provided in 18980.1(a)(16). Moreover, the commenter implies that proposed regulation treats the words "plastic" and "polymer" as interchangeable, but that is not correct. Section 18980.1(a)(16) does not purport to define each term separately. Rather, it interprets the entire phrase "plastic or polymers," as that phrase is used in Public Resources Code section 42356.1(d). In doing so, CalRecycle reasonably understands the Legislature's intent in using the word "plastic" as a reference to items made

entirely of plastic because that is the ordinary, layperson use of that term. In contrast, in including the technical word "polymer," it used a word that does not have a commonly understood meaning among consumers (i.e., lay persons), so it must be interpreted in light of the context in which it appears. In that context, the Legislature could not have intended to refer to all polymers, which would include molecules that make up fiber; that result would be absurd because the exemption under section 42356.1(d) is for fiber products to begin with; fiber products would be disqualified for their own exemption. Accordingly, CalRecycle reasonably understands the Legislature's to have intended the entire phrase "plastic or polymers" to capture both "plastic" in its common, layperson's sense and plastic molecules that may not necessarily be noticeable by consumers but fall within the definition of "plastic." Because the Legislature specifically included a definition of that term in SB 54, incorporating it here is appropriate because it ensures a consistent, statute-wide application of the definition of "plastic," consistency that the commenter's suggested change would disrupt.

The commenter's position also appears to be nonsensical. While it is difficult to discern that position without the benefit of the definition the commenter desires, it appears to be that "plastic or polymers" should be interpreted more narrowly by construing "polymers" not to include what the commenter refers to as "compostable polymers" that "are carefully tested to ensure biodegradation" (i.e., the regulations should not "lump [compostable polymers] in with conventional plastics"). At the same time, the commenter objects that the proposed regulations unduly "widen the exemption outlined in Public Resources Code 42356.1(d)." But narrowing the definition of "plastic and polymers" would not narrow the exemption under Public Resources Code section 42356.1(d). Instead, that change would expand the exemption by restricting the range materials that can be said to "incorporate plastic or polymers" (and thus would be ineligible for the exemption). If the commenter's assertion is instead that "polymers that meet ASTM D6400 and D6868" should be considered eligible for the exemption, that position is also patently nonsensical. It would mean that complying with the strictures of Public Resources Code section 42357 would make materials eligible for an exemption from them.

Lastly, concern over non-plastic polymers incorporated into wood (or other non-plastic fiber) food service ware items is misplaced because those items are, by definition, not covered material. And, with respect to any covered material, if items contain any synthetic polymers, with very limited exception, they would fail to satisfy the requirement in public Resources Code section 42357(g)(1)(B) (requiring materials to be allowable inputs under the National Organic Program).

Comment B-14-3

Section 18980.2.2 — Exclusion of Certain Types of Packaging

We support the clarification requiring brands to explain why no reasonable packaging alternative exists when seeking categorical exclusion. Innovation thrives under clear

incentives, and there are already compostable substitutes for many materials currently excluded. This change encourages continued movement toward safer, smarter design — which aligns with the intent of SB 54.

That said, we are deeply concerned with the proposed "de minimis" exclusion as it relates to compostables. In composting, even the smallest non-compostable component — by weight or volume — can persist as a contaminant. The real test is not what we can see or measure in a pile, but what happens under controlled lab conditions: biodegradation, disintegration, and toxicity.
ASTM D6400 and D6868 already give us the framework. Any allowance for "de minimis" components should only apply if the full product still meets these standards. Otherwise, we risk allowing products into the market that break down incompletely or introduce harmful residues into the soil. We urge CalRecycle to either remove compostables from the "de minimis" language or require full product compliance with ASTM standards in these cases.

Response to B-14-3

Comment rejected. The commenter requests special treatment for allegedly "compostable" components. The comment provides no evaluation of the criteria established in 18980.2.2(b) to explain why they would not be sufficient—that is, why they would not, as written, preclude the components of concern from qualifying as de minimis. The criteria—in particular, subparagraphs (A), (C), (D), and (E) of paragraph (2)—address the commenter's concerns. Moreover, nothing in the proposed regulations or the statutory de minimis exclusion affects application of California laws concerning labeling. Regardless of whether materials are considered "covered material" under CalRecycle application of the statute implemented by the proposed regulations, there is no "de minimis" exclusion for product labeling under Public Resources Code section 42357.

Comment B-14-4

Section 18980.4 — Responsible End Market Criteria

Repurpose is aligned with the principle that responsible end markets must benefit the environment and minimize risks to human and environmental health. Unfortunately, the current treatment of fiber and paper products in Section 18980.4(a)(4)(B) and (C) undermines that goal.

The proposed language doesn't require full biodegradation for these materials, despite SB 54's clear guidance. That's a problem — especially since some fiber and paper products contain synthetic polymers. If plastics must meet strict breakdown criteria, so should these.
We strongly recommend removing these provisions unless they are revised to require full degradation, consistent with ASTM D6400 and D6868. Anything less creates a dangerous inconsistency, and a missed opportunity to build a truly circular system.

We also support the use of ASTM D8618 and D8619 for evaluating composting facilities and recommend requiring these facilities to demonstrate — via field testing — the ability to process certified compostable products responsibly.

Response to B-14-4

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42041(aa), 42041(ad), and 42060, and the recommended changes are not necessary to the implementation or enforcement of the Act. The different standards in sections 18980.4(a)(4)(B) and (C) of the proposed regulations are appropriate and reasonable for the reasons specified in response to comment B-6-5. Moreover, the commenter's concern about the application of these standards in the context of synthetic polymers is misplaced for the reasons provided in response to comment B-14-2 elsewhere in this submission. To the extent this comment argues that the current standard in section 18980.4(a)(4)(B) is inadequate, see the response to comment O-75-12. To the extent this comment argues that the current standard in section 18980.4(a)(4)(C) is inadequate, no change is necessary. The standard of section 18980.4(a)(4)(C)—requiring biological decomposition and processing in a manner to produce a marketable product that complies with applicable standards—is reasonable, appropriate, clear, and consistent with CalRecycle's authority under PRC section 42041(ad). Moreover, as noted in the Final Statement of Reasons, this standard is necessary to ensure that all composting responsible end markets are subject to uniform requirements and produce compost that meets the quality standards necessary to be used in the marketplace. The recommended standard of full degradation is not necessary because fiber and paper fragments are not contaminants in the composting process and, even if they fail to fully decompose during processing, they are organic materials that continue to biodegrade after processing without presenting uncertain environmental and health risks. For similar reasons, and for the further reasons identified in response to comment O-83-5, the recommendation to incorporate ASTM standards for evaluating composting facilities and to require composting facilities to demonstrate, through field testing, the responsible processing of covered materials is not necessary. Both section 18980.4(a)(4)(B) and (C) already require facilities to process applicable materials in a manner consistent with the standards set forth in those sections and further require the resulting recycled organic product to meet standards necessary to be sold into the marketplace. No further demonstration is necessary to ensure facilities covered under sections 18980.4(a)(4)(B) and (C) process materials in a manner that is responsible and sufficient to satisfy the requirement under 18980.4(a)(4), consistent with PRC section 42041(ad).

Comment B-14-5

Section 18980.11.1 — Exemptions for Local Jurisdictions and Providers

We support the language requiring jurisdictions to demonstrate specific limitations before seeking exemptions. However, we encourage CalRecycle to require these

entities to issue an RFP before concluding that compliance isn't feasible. Technology and infrastructure are evolving fast — and assumptions about feasibility can often be disproven with the right partners.

Importantly, jurisdictions should not be allowed to exempt only certain compostable materials. Certified compostable products are tested under the same standardized conditions. Selective exemption introduces inconsistency and confusion that puts the entire category at risk.

Response to B-14-5

CalRecycle rejects this comment for the reasons provided in response to comment O-83-6. Furthermore, Public Resources Code section 42060(b) expressly requires CalRecycle to grant extensions when a recycling service provider establishes that compliance with section 42060.5(a) is not practicable for a specific identified covered material because of specific local conditions, circumstances, or challenges. Also, while the issuance of an "RFP" (presumably, a request for proposals relevant to fulfilling the requirements of Public Resources Code section 42060.5(a)) might be a useful tool in some cases to establish that compliance is not practicable, it would not be necessary in every instance, and in some instances it could be obviously futile. Imposing a blanket requirement for all applications would therefore create an undue and wasteful burden.

The commenter also requests that CalRecycle forbid exemptions from applying only to "certain compostable materials" because "[c]ertified compostable products are tested under the same standardized conditions." But there is no current requirement that a product labeled "compostable" be certified. Moreover, the commenter's implied assertion—that an exemption for certain materials necessarily is justified for others—need not be addressed in the proposed regulations because the merits of exemption requests, including the scope of granted exemptions, are necessarily a case-by-case matter. Lastly, local jurisdictions and recycling service providers are best suited for determining the necessary scope of exemptions they request, and Public Resources Code section 42060.5(a) only authorizes exemptions for covered material cannot that the local jurisdiction or recycling service provider cannot included in their collection and recycling programs.

Comment B-14-6

Accreditation Requirements for Third-Party Certification Entities
We support the adoption of ISO 17065 for compostability certifiers. It's a high bar, and that's a good thing. But it's not common today — which means time is needed for certifiers and manufacturers to adjust.

We support BPI's recommendation for a phased approach:

By Jan 1, 2028: Certifiers must be ISO 17065 accredited with testing from ISO 17025 labs or labs audited to that standard.

By Jan 1, 2031: All certificates for covered compostable products must reflect ISO 17065 accreditation.

CalRecycle must address this timeline explicitly to comply with the Administrative Procedures Act and ensure fair implementation.

Response to B-14-6

CalRecycle rejects this comment for the reasons provided in response to comment B-36-8.

Comment B-14-7

Finally, we reiterate the need to prohibit conflicts of interest, particularly ownership stakes in testing labs or composting facilities by certifying bodies. As of now, there is at least one national organization operating with potential conflicts in this space. Without strict and enforceable separation between certification, testing, and processing entities, the credibility of compostable labeling is compromised.

In conclusion, Repurpose is committed to creating products that are safe, circular, and scientifically sound. SB 54 has the potential to be a model for the nation but only if the details match the intent. We urge CalRecycle to uphold the spirit of the law by ensuring clarity, accountability, and scientific rigor across all definitions, exclusions, and end-market criteria.

Response to B-14-7

Comment rejected. The commenter requests that the proposed regulations prohibit conflicts of interest. Section 18981(b)(1) and (2) of the proposed regulations establishes that prohibition.

B-15: United States Bakery (Randi Wells)

Comment B-15-1

By this letter, United States Bakery ("U.S. Bakery") is responding to the request from the California Department of Resources Recycling and Recovery ("CalRecycle") for public comments on the proposed SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act (the "Act") Permanent Regulations. U.S. Bakery is a manufacturer of baked goods based in Oregon and supplies its products into the state of California. Because its business operations are potentially subject to the Act, U.S. Bakery has an interest in CalRecycle's rulemaking activities associated with the Act.

Accordingly, U.S. Bakery submits the following comments:

The term "purchaser" is used in the Act at section 42041(w)(5) and in the proposed regulations at section 18980.2.1(a)(4)(B). This term should be defined in section

18980.1. For example, it is unclear whether a "purchaser" is the same as other terms used, such as "end user," "consumer," or any other entity in the supply chain that may purchase a product (such as a "wholesaler"). Given the complex nature of supply chains, it is very important that the language used in the regulations is precise and recognizes that products often end up being "purchased" by an entity that does not use the product (or dispose of the packaging), but instead sells that product to another person or entity—and that subsequent transaction may be unknown to the original manufacturer or the entity that first sells the product into the state.

Response to B-15-1

CalRecycle rejects this comment for the reasons stated in response to comment B-13-2.

Comment B-15-2

The term "consumer" should similarly be defined within 18980.1 and differentiated from the terms "purchaser," "user," and "end user." The term "consumer" is defined in 18980.2.1(a)(1)(B), but the application of the definition is limited to that subdivision.

The terms "user" and "end user" should be defined within 18980.1 and differentiated from the terms "purchaser" and "consumer." To the extent that "user" and "end user" are meant to refer to the same thing, only one of those terms should be used.

Response to B-15-2

CalRecycle rejects this comment for the reasons stated in response to comment B-13-2.

Comment B-15-3

The term "covered product" is used in the Act at section 42041(w)(2). The definition of "product" at section 18980.1(a)(18) should clarify whether it also applies to the use of the term "covered product."

Response to B-15-3

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment B-13-5, which is substantively the same as this comment.

Comment B-15-4

In establishing the producer determination, the Act at section 42041(w)(1) states that, as pertaining to a licensee, "the licensee of the brand" is a producer (if other criteria are also met). However, the wording in the regulations at section 18980.1.1(c)(1) is different: it provides that a producer is a person in the state who manufactures goods and either owns the brand or "is licensed to manufacture the goods." This inconsistency in wording between the Act to the regulations is confusing. Section 18980.1.1(c)(1) further states that "the licensee must have the legal right to use the brand or trademark on the goods in connection with manufacturing the goods and be entitled to be the only

person with such right in the state or in a subregion of the state." The inconsistency is further complicated by the inclusion of a different subsection, 18980.1.1(c)(3), which separately assigns the producer responsibility to "a licensee of the designated brand or trademark." Is CalRecycle intending to expand the scope of what it means to be a licensee with the language in (c)(1) and (c)(3)? If so, that intent should be clearly stated and explained in the regulations. If not, CalRecycle should use wording that is consistent with the statute.

Section 18980.1.1(c) should explain how the producer obligation applies in the context of white labeling and contract manufacturing. Under Oregon's analogous extended producer responsibility law, the regulations clarify that the person who is directing the manufacturing is the producer. Therefore, if Company A contracts with Manufacturer B (located in California) to produce widgets in covered material using Company A's brand name, Company A would be the producer, not Manufacturer B. The same should be true in California: contract manufacturers should not bear the producer obligation for products sold by the company that owns the brand and directs the manufacturing.

Response to B-15-4

Comment rejected. The language in 18980.1.1(c)(1) is not inconsistent with Public Resources Code section 42041(w)(1); rather, the former explains what it means to be a "licensee of the brand or trademark" for purposes of the latter. The commenter apparently reads Public Resources Code section 42041(w)(1) as requiring a "licensee of the brand" to be a producer, even if the relevant license has nothing to do with manufacturing; that interpretation ignores the context of 42041(w)(1). Regarding section 18980.1.1(c)(3), there is no inconsistency there, either, nor does that provision "expand the scope of what it means to be a licensee." Rather, (c)(3) addresses the scenario where no producer can be identified pursuant to (c)(1) and (2), which would occur, for example, if neither the manufacturer nor the brand owner is in the state. In that scenario, no producer can be identified pursuant to Public Resources Code section 42041(w)(1), and no producer other than a licensee can be identified pursuant to 42041)(w)(2).

Regarding white labeling and contract manufacturing, no change is required because the proposed regulations fully address those scenarios, and the commenter does not explain how they would not do so. The commenter's only proposal is that California law should produce the same result as Oregon's law does for the hypothetical situation the commenter describes. That is not a valid analysis; California law is as stated in Public Resources Code section 42041(w), which may not necessarily produce the same results as Oregon's law.

Comment B-15-5

Sections 18980.6(b) and (c) allow the PRO to dismiss or refuse producer participation. These provisions are an improper delegation of CalRecycle's authority to a private entity. A producer's inability to participate in a PRO, due either to PRO dismissal or refusal, effectively prohibits the producer from lawfully selling products in the state of California, with no reasonable alternatives available to comply with the law and no

recourse through administrative hearing or judicial review. As the agency imbued with authority to implement the Act, CalRecycle alone should adjudicate, through a transparent process, whether a producer is permitted to participate in the program and sell or distribute products in or into California. The PRO should not have the authority to refuse or dismiss producer participation.

Response to B-15-5

CalRecycle rejects this comment. See the response to comment B-13-6.

Comment B-15-6

Section 18980.6.1 provides that the PRO shall prepare and submit a producer responsibility plan on or before either April 1, 2026, or June 15, 2026 (under certain conditions). Upon submission, the plan will then be subject to review and public comment prior to approval; this comment and approval process will likely take several months, in the very least. The contents of this plan will provide producers with critical details about CAA's process and fee schedule, as prescribed in section 18980.6.7. However, California's approved PRO, Circular Action Alliance ("CAA"), is requiring producers to register, report supply data, and pay early fees prior to the existence of even a draft plan—let alone an approved plan. Without the information to be contained in this plan, producers cannot make informed decisions about whether to participate in the PRO, and yet they are being forced to do so by the requirements imposed by CAA. CAA should not be permitted require producers to submit supply data and fees prior to the approval of its producer responsibility plan. All producer compliance dates should be postponed until after CalRecycle has approved the PRO's plan.

Response to B-15-6

CalRecycle rejects this comment. See the response to comment B-13-7.

Comment B-15-7

Section 18980.6.4 does not provide for public comment on amendments to the PRO's producer responsibility plan. This is in contrast to section 18980.6.3, pertaining to plan updates, which does allow for public comment. Section 18980.6.4 should be revised to allow for public comment in order to be consistent with the Act. Section 42051.2(e)(1) of the Act provides that the process for amendments to the producer responsibility plan should be the same as for the updated plan.

Response to B-15-7

CalRecycle rejects this comment. See the response to comment B-13-8.

Comment B-15-8

Section 18980.6.5 requires the PRO to prepare and submit Annual Reports, and notes that the first report should be submitted no later than July 1 of each year after CalRecycle has approved a PRO Plan. However, given the ambiguity around the anticipated timing of CAA's approved PRO Plan, it is unclear when the PRO's plan will

be approved. The timing of the Annual Report therefore should not be tied to the approval of the PRO plan, especially if the PRO is permitted to collect fees from producers in advance of the plan's approval. The PRO should be required to submit Annual Reports to CalRecycle detailing its use of finances beginning in its first year of operation—or, in the very least, in the year it begins collecting fees from producers.

Response to B-15-8

CalRecycle rejects this comment. See the response to comment B-13-9.

Comment B-15-9

Section 18980.6.5 does not allow for public review and comment of the PRO's Annual Report. The opportunity for public comment is crucial and should be added to this section. Moreover, the Annual Report must be unredacted in order to achieve complete transparency regarding the PRO's fee setting and expenditure of funds.

Response to B-15-9

CalRecycle rejects this comment. See the response to comment B-13-10.

Comment B-15-10

Section 18980.6.6(b) should not permit the PRO to redact financial information. Complete, transparent financial data is critical for meaningful oversight by both producers and CalRecycle.

Response to B-15-10

CalRecycle rejects this comment. See the response to comment B-13-11.

Comment B-15-11

Section 18980.6.7(c) permits the PRO to switch from collection of "early fees" to collection of supply-based fees if it determines that it has "sufficient data" to do so. The regulations should clarify more specifically what is meant by "sufficient data" and how the sufficiency of data should be measured.

Response to B-15-11

CalRecycle rejects this comment. See the response to comment B-13-12.

Comment B-15-12

Section 18980.6.8(e) requires access to records within ten (10) calendar days. This is overly burdensome for many businesses, which often rely on a small team to collect and maintain this data. The time permitted for access to records should be extended to thirty (30) calendar days.

Response to B-15-12

CalRecycle rejects this comment. CalRecycle rejects this comment to the extent it recommends changing "10 calendar days" to "30 calendar days" because such change is not necessary to the implementation or enforcement of the Act and would cause undue delay to CalRecycle's ability to carry out its investigative functions and verify compliance with the Act. The proposed regulations are consistent with the requirements set forth in the Act, including in sections 42051.1 and 42060 of the Public Resources Code. Section 42051.1(m) already requires all records to be maintained such that they are reasonably accessible to CalRecycle upon request. Consistent with the record maintenance protocol of section 42051.1(m) and section 18980.6.8(d) of the proposed regulations, ten calendar days provides an entity with sufficient time to assemble and provide CalRecycle with the requested records that are already being maintained.

Comment B-15-13

PROs should not be permitted to require binding arbitration as the sole method of dispute resolution with producers. The regulations should address this point specifically. In section 18980.8.(h), for example, the regulations outline an approved dispute resolution process as between the PRO and local jurisdictions and recycling services providers, and further note as follows in Section 18980.8(h)(6): "Nothing in this subdivision shall be construed as empowering the PRO or Independent Producers to require local jurisdictions or recycling service provides to submit any matter to mediation or arbitration." A similar provision is necessary to govern the resolution of disputes between the PRO and producers. CalRecycle should prohibit CAA from requiring producers, through CAA's non-negotiable participant producer agreements, to be subject to binding arbitration with no possibility of judicial review as the sole means of dispute resolution.

Response to B-15-13

CalRecycle rejects this comment for the reasons stated in responses to comments B-13-14 and O-56-4.

Comment B-15-14

Pursuant to sections 18980.1(a)(22)(C) and 18980.10.1(b), producers that are members of a PRO (and therefore are not Independent Producers) may choose not to submit reports to the PRO and instead submit reports directly to CalRecycle. However, the process for this option is not further elaborated beyond two brief references. The regulations should either provide more detail about how this option would be effectuated or direct the PRO to develop a process within its plan. Moreover, producers should be privy to the details of this option before being forced to submit supply data and fees to a PRO.

Response to B-15-14

CalRecycle rejects this comment for the reasons stated in response to comment B-13-15, which is identical to this comment.

Comment B-15-15

Section 18980.13(a) does not indicate that notice will be given to an entity prior to entry for an inspection. Reasonable notice should be included in this provision.
Thank you for the opportunity to submit these comments on the Act's proposed regulations.

Response to B-15-15

CalRecycle rejects this comment. See the response to comment B-13-16.

B-16: TekniPlex (Wouter Geurts)

Comment B-16-1

Feedback Submission to CalRecycle SB54 Draft Regulation Consultation
Submitted by: TekniPlex
Contact: wouter.geurts@tekni-plex.com
Date: October 7, 2025
Subject: Comments and Questions on SB54 Draft Regulations

1. Clarification on Reporting Obligations for Empty Packaging Shipments
TekniPlex manufactures and ships empty single-use packaging (e.g., yogurt containers) into California, which are later filled and marketed by food packers or brand owners. We seek clarification on the following:
Question:
Are we, as the manufacturer and importer of empty primary packaging into California, required to report the secondary and tertiary packaging used for the shipment and transportation of these empty items under SB54? Or is the reporting obligation limited to the brand owner who introduces the filled product to the California market?
We understand that once filled, the brand owner assumes responsibility for the primary and associated packaging. However, our concern lies with the reporting obligations for the packaging used during the initial shipment of empty containers into the state.

Response to B-16-1

Comment rejected. The comment does not set forth proposed revisions to the proposed regulations. Rather, the commenter requests that CalRecycle issue a specific determination as to commenter's obligations under the statute. To the extent the commenter requests that the proposed regulations establish that packaging is not covered material where the packaged goods are "empty primary packaging," CalRecycle rejects that proposal because nothing in statute affords special treatment to such goods. Unless the statute provides otherwise (e.g., Public Resources Code section 42041(e)(2)), the good packaged irrelevant, and its packaging is "covered material" if it is single-use.

Comment B-16-2

2. Timeline and Transparency on Fee Schedules

Question:

Could CalRecycle provide clarity on when the official SB54 fee schedules will be published? Additionally, will any preliminary fee ranges or methodology details be made available to assist producers in forecasting the financial impact of compliance?

This information is critical for budgeting and strategic planning. We have understood there will not be a direct link between 2023 submission now and fees, and much more between 2025 reporting in 2026.

Response to B-16-2

CalRecycle rejects this comment. To the extent this comment poses questions to CalRecycle, as opposed to making any recommendation or objection that is specifically directed at CalRecycle's proposed regulations, no response is required. To the extent this comment appears to recommend the revision of section 18980.6.7 of the proposed regulations to offer additional clarification as to the timeline for fee schedules, the proposed regulations are consistent with the requirements of the Act, including in PRC sections 42051.1, 42053, and 42060, and no change is necessary to the implementation of the Act. PRC section 42053(a) makes clear that the PRO is responsible for establishing and developing a producer fee schedule, and PRC section 42053(b) establishes the timeline according to which producers will be charged fees. Sections 18980.6.7(a) and (b) of the proposed regulations implement these provisions by further specifying the relevant timelines. Consistent with the statutory intent expressed in PRC section 42053, the PRO is responsible for determining when it will inform producers of the applicable fees that will be charged pursuant to that section. Therefore, no further change to the proposed regulations is necessary.

Comment B-16-3

3. Producer Identification for Embossed or Trademarked Foodservice Ware
TekniPlex manufactures foodservice ware that may bear logos or trademarks of downstream brand owners or may be generic with only our company's identifier.
Questions:
a. If we manufacture plastic foodservice ware customized with logos of brand owners (e.g., food chain restaurants) and ship them to their distributors in California, who is considered the "producer" under SB54 TekniPlex, the distributor, or the brand/franchisee using the customized ware?
b. If we manufacture and sell generic foodservice ware (with no private branding, only our company logo embossed discreetly), and these are sold by distributors to restaurants and hotels in California, are we considered the "producer" under SB54, or does the reporting obligation fall on the distributor? How to avoid dubble reporting? We suggest to add samples in the files

Response to B-16-3

Comment rejected. The comment does not set forth proposed revisions to the proposed regulations. Rather, the commenter requests that CalRecycle issue a specific determination as to commenter's obligations under the statute. The commenter also suggests that CalRecycle "add samples in the files," which CalRecycle interprets as asking that CalRecycle include example applications of the regulations in the rulemaking file. No regulation is necessary, however, for CalRecycle to publish helpful examples outside the formal rulemaking process.

Comment B-16-4

4. Request for Inclusion of Guidance Examples
Recommendation:
We recommend that CalRecycle and the Circular Action Alliance (CAA) include a concrete example in official guidance showing a case where both the packaging manufacturer's logo and the final brand owner's logo appear on the same foodservice ware item.
This would help clarify producer responsibility, avoid double reporting, and support consistent volume reduction calculations.

Response to B-16-4

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it does not recommend changes to the proposed regulatory text. The commenter requests CalRecycle provide concrete examples as guidance. Not regulation is required for CalRecycle or CAA to as publishing additional resources, such as FAQs or demonstrative examples, regarding the final regulations

Comment B-16-5

5. Reporting Requirements for Expanded Polystyrene (EPS/PS Foam) Products
Question:
Based on CalRecycle's August 2025 notice cite turn1search8, EPS foodservice ware is banned from sale, distribution, or import into California effective January 1, 2025, due to failure to meet the 25% recycling rate threshold.
Given this ban, can CalRecycle confirm whether legacy EPS/PS volumes from 2023 are fully exempt from SB54 reporting requirements? Specifically, since these products can no longer be sold and fees cannot be passed through to customers, should producers exclude these volumes from their compliance reporting?
We attach the relevant CalRecycle communication for reference and request explicit confirmation on this exemption. 6) In other systems e.g. Europe, B2B packaging is typically dealth with by means of other PROs and other reporting systems. We feel misalignment on reportint secondary and tertiary packaging with what is needed for packaging items - e.g. reporting pallets, straps, reporting tape (in meters?), wrap film, .. for which many can be reused.

Response to B-16-5

Comment rejected. The comment does not address the proposed regulations themselves, suggest changes to the proposed regulations, or raise objections related to the rulemaking process. Instead, the comment requests that CalRecycle address specific compliance questions. Accordingly, no response is required. Moreover, even if this comment could be construed to raise an objection or recommend revisions relevant to the issues raised, the commenter's questions rest on a misreading of statutory language that does not require interpretation, so they can be answered by application of the proposed regulations as written. In particular, the commenter is incorrect that Public Resources Code section 42057(i) is an outright ban on EPS; rather, it only restricts producers. If producers choose to violate that restriction by, for example, selling EPS food service ware in the state, article 13 of the proposed regulations thoroughly addresses violations of the Act and would apply. Lastly, nothing in that article or any other provision suggests any other outcome or that the food service ware at issue would not be covered material and thus exempt from obligations related to covered material.[AB69.1]

Regarding "B2B packaging," the commenter does not propose any change to the regulations but may have intended to suggest that the proposed regulations should exempt business-to-business packages from compliance obligations. CalRecycle rejects that suggestion for the reasons provided in response to comment O-38-1. Regarding secondary and tertiary packaging, CalRecycle cannot discern what the change the commenter proposes, especially with respect to packaging components that the commenter alleges can be "reused." To the extent the commenter intended to suggest that secondary and tertiary packaging be exempted or treated differently than primary packaging, CalRecycle also rejects that suggestion for the reasons provided in response to comment O-38-1.

This response does not address the communication that the commenter references as an attachment to the comment because no such attachment was submitted.

B-17: Waste Connections (Christina Pestoni)

Comment B-17-1

We appreciate the time and effort staff has dedicated to evaluating and responding to the Governor’s directive regarding affordability and operational readiness in the proposed regulations. Our feedback remains largely consistent with the positions outlined in our previous correspondence, submitted on May 8, November 4, December 17, 2024, and June 3, 2025.

We are actively collaborating with Circular Action Alliance, contributing to CalRecycle's Needs Assessments, and responding to information requests to support the development of the Producer Responsibility Plan.

In this letter we are reaffirming our concerns over several items currently in SB 54:

1. **There is a need to clarify the definition of Alternative Collection.**
2. **Refillable packaging with putrescible residue is solid waste.**

We are also proposing a discussion for clarifying language to be added to SB 54, the upcoming PRO plan, or both, to ensure there are no franchise violations during the collection of CMC materials, whether by alternative collection or curbside collection.

***

1) There is a need to clarify the definition of Alternative Collection.

We stand in alignment with solid waste industry experts in expressing concern over the current definition of "Alternative Collection":

Article 1 Definitions 18980.1
(2) "Alternative Collection" means a program that collects covered materials, regardless of whether the covered material is discarded or considered solid waste and regardless of the manner and location of collection, and is not "curbside collection" as defined in subdivision (g) of section 42041 PRC, because it is not conducted by a local jurisdiction or recycling or composting service provider under contract with a local jurisdiction".

The three primary concerns we have are:

a. As it stands, the definition unfairly restricts recycling service providers from offering alternative collection programs if they are under contract with local government. Many recycling providers operate programs outside the scope of their municipal agreements. These recycling programs often share infrastructure and collection mechanisms with other services, but they are distinct and independently operated. Therefore, the current definition of "Alternative Collection" does not accurately reflect the realities of how these services are provided and should be revised to allow for greater flexibility and fairness.

b. We find the addition of the words "discarded" and "solid waste" problematic and recommend that CalRecycle strike the reference to "discarded" and "solid waste" from the definition of "alternative collection."

Inclusion of the words "discarded" and "solid waste" in the regulatory text introduces unnecessary confusion by invoking concepts from solid waste law that CalRecycle has expressly said are not relevant to the definition. Removing this word will align the

regulatory text with the stated purpose of the subsection and provide clearer guidance for implementation.

In the Initial Statement of Reason (ISOR), CalRecycle' s reasoning explains that the purpose of this subsection is to define "alternative collection" in contrast to the broader definition of "curbside collection" under the Act, and to ensure that no program conducted by or on behalf of local jurisdictions can be considered "alternative collection." The reasoning further states that whether a program is considered "alternative collection" cannot depend on whether the material has been discarded or is solid waste, because those concepts are not relevant to whether non-curbside programs successfully recover covered material and whether such recovery constitutes recycling under Public Resources Code section 42041(aa)(1).

Please consider this modified definition:

"Alternative Collection" means a program that collects covered materials, regardless of the manner and location of collection, and is not "curbside collection," as defined in subdivision (g) of section 42041 of the Public Resources Code, because it is not conducted by a local jurisdiction or by a recycling or composting service provider under contract with a local jurisdiction .Alternative Collection does not mean a Recycling Service Provider is precluded from the opportunity to provide an Alternative Collection Program outside of its local contract.

Response to B-17-1

CalRecycle rejects the commenter's proposed change for multiple reasons. First, the commenter's assertion that the definition of "alternative collection programs" restricts recycling service providers in any way. The definition clarifies a merely semantic issue: In the context of the regulations, "alternative collection programs" refers to all programs not conducted by local jurisdictions or under contract with one. That clarification, on its own, does not imply any restriction on recycling service provider's substantive rights. Second, the definition uses the terms "discarded" and "solid waste" to codify the exact clarification that the commenter claims is appropriate: The reference to those concepts from "solid waste law" only serves to make clear that those concepts are not relevant to whether a program is "alternative collection."

Comment B-17-2

2) Refillable packaging with putrescible residue is solid waste.
There remains a concern putrescible waste will be collected by a nonfranchised hauler in the process of collecting or exchanging refillable/reusable packaging, thereby violating existing franchise agreements and potentially creating public safety concerns.

For clarity we recommend the following language be added to Article 11:

Nothing in this chapter authorizes the collection of reusable or refillable packaging from a residence or business when the packaging contains putrescible residues or other solid

waste materials subject to an exclusive franchise agreement of a local jurisdiction. Any program to recover such items shall be coordinated with, and performed by or under the authorization of, the franchised solid waste service provider for that service area.

In closing, we would like to add a comment regarding the upcoming PRO plan and CMC materials collection. After the PRO plan/CMC list is formally approved and adopted, any companies or jurisdictions collecting CMC materials will no longer be allowed to charge for those collection services. Any program costs for materials collected on the CMC list must in turn be covered by the PRO whether they are collected by alternative collection or curbside collection. To that end, there needs to be a process by which payment/contracting for this collection both takes place and is scrutinized by the jurisdiction and franchise hauler to reach mutual agreement there are no violations of franchise rights. In our discussions with CAA, they agreed to contact the jurisdiction and franchise hauler before engaging in such discussions with third party companies offering these services. For clarity, we would like this process formalized either in SB 54, the PRO plan, or both.

Thank you for considering these ongoing concerns, which could disrupt existing franchise agreements and solid waste systems. We welcome the opportunity to discuss these further and clarify our position.

Response to B-17-2

CalRecycle rejects the commenter's proposed addition to Article 11 because nothing in the statute or the proposed regulations purports to supersede other laws with respect to the rights of the parties under an exclusive franchise agreement or the application of any laws concerning local solid waste collection. Nor does statute affect whether recycling service providers' rights under such agreements necessarily give them the right to control alternative collection programs, which, by definition, are programs not operated by local jurisdictions or under contract with them.

Regarding the purported agreement that the commenter has entered into with "CAA" concerning the process for paying for collection and scrutinizing that collection, that agreement is not law and is not appropriate for incorporating into regulations. Instead, the proposed regulations place appropriate requirements on how the PRO's plan must address payments of costs and disputes over them. See section 18980.8(g) and (h).

See, also CalRecycle's response to comment O-47-2 regarding effects on franchise agreements.

B-18: AMP Robotics Corporation (Paula Soos)

Comment B-18-1

On behalf of AMP, I appreciate the opportunity to submit these comments addressing the proposed regulatory text under SB 54. AMP strongly supports the intent of SB 54 to shift responsibility for collection, recycling, and residual management of covered materials to producers. We offer the following recommendations focused specifically on ensuring that recovery of recyclable materials from municipal solid waste ("MSW") streams (e.g., at transfer stations, material recovery facilities ("MRFs"), mixed waste processing facilities ("MWPF"), and other "post-collection" locations) are explicitly included in and credited under the program.

AMP pairs high-performance recovery with continuous material characterization and real-time facility data. While diversion from landfills to recycling is our primary objective, the resulting insights give communities, states, and PROs powerful tools for understanding composition, shaping long-term EPR and sustainability strategies, and measuring success.
Below, our comments are organized by relevant regulation sections for CalRecycle's consideration.

Section 18980.1 (Definitions) Clarify "alternative collection" and eligibility of materials recovered from MSW

AMP supports crediting covered materials recovered through the sortation of MSW toward producer recycling obligations. The definition of "alternative collection" "a program that collects covered materials regardless of whether the covered material is discarded or considered solid waste and is not 'curbside collection'" is critical for enabling the recovery of covered materials from MSW prior to the permanent disposal -- and loss of that material in landfills.
To eliminate ambiguity and ensure that quantities recovered from MSW count toward producer obligations recognized by the program, we recommend adding:
"For purposes of producer compliance obligations, quantities of covered materials recovered through alternative collection from MSW streams (e.g., at transfer stations, MRFs, mixed waste processing facilities, or other post-collection sortation locations) shall count fully toward the recycling obligations of producers.

Section 18980.11 (Producer Responsibility Organization Plan Funding Requirements) Ensure "increases" include MSW sortation and allow incentive weighting

The metric of "collection/sorting increases" is key to driving investment and performance in recycling programs. We support CalRecycle's inclusion of a mechanism to reward or credit increases in collection and sorting throughput. However, the rule should explicitly confirm that such credit is available when the increased volumes of new recyclables (e.g., via increased collection) are derived from MSW sortation or recovery efforts at any point in the system (e.g., transfer stations, MRFs, mixed waste processing facilities).

Incentives to improve the recovered volume of recyclables should be designed to encourage new methods of recovery in addition to traditional methods.
We recommend adding:
"For purposes of determining increases in collection and sorting, the Department shall authorize incentive weighting for covered materials recovered through the sorting of MSW, advanced mixed waste processing, or other innovative technologies, consistent with collection and sorting of curbside streams. Such weighting may include temporary bonus multipliers (e.g., 1.2) during the first compliance period to encourage early adoption and scaling of advanced technologies."

Section 18980.3.2 (Methodology for Recycling Rate Determination) Recognize covered materials collected using advanced MSW sortation in determination of collection/sorting baseline

The PRO or Independent Producer must calculate an estimated recycling rate and report it to the department using either prescribed methodologies or an approved alternative. To accurately include the contributions of covered materials collected from the sortation of MSW, the unique nature of materials recovery from large volumes of MSW as opposed to the smaller volumes collected curbside should be taken into account. The value of recovering covered materials from MSW destined for landfills should be captured and quantified in a manner that does not discourage such additionality. Facilities processing MSW (including transfer stations, MRFs, and MWPFs) can produce substantially higher volumes of net new, high quality recyclables at substantially lower cost by accessing far greater volumes of recyclables (nationally, over 75% of all recyclables are found in MSW). However, these facilities also process a greater breadth of materials than some downstream recyclers, which could lead to a lower total recovery rate than would be expected in a MRF processing single-stream materials. Recovery rate guidelines should take this dynamic into account by incentivizing high performance standards and net new covered tons without inadvertently penalizing effective programs such as MWPFs that recover recyclables from waste streams otherwise destined for California's landfills and lost from the circular economy.

We recommend adding:
PROs must accurately account for covered materials recovered from MSW in their estimated recycling rates and reports, modifying the sources of data and methodology as necessary to prevent unintentional bias.

Section 18980.11 (PRO Plan Funding) - Support investment in MSW sortation infrastructure
In the PRO plan funding and compensation requirements, it is essential that PROs allocate funding to support MSW sortation infrastructure (transfer stations, MRFs, MWRF, AI sorting, etc.)
We recommend adding:
"PROs shall allocate funding to eligible recycling service providers, including material recovery facilities, transfer stations, or mixed waste processors that recover covered

materials from MSW. Eligible facilities must comply with program material quality, reporting, and verification requirements. Recovery of covered materials from MSW shall be treated as additive to, not substitutive of, compliance from conventional collection."

Section 18980.11 (PRO Plan Funding) - Incentive Weighting for Advanced MSW Recovery Options

The largest concentration of recyclable material remains in MSW streams that are landfilled. To optimize recovery of these materials, the EPR program should prioritize and incentivize deployment of innovative, high-volume sortation technologies capable of recovering recyclables from MSW.

Advanced technologies that also advance other SB 54 objectives -- such as adaptability to new covered materials, recovery of difficult-to-sort items, and the ability to conduct pre- and post-stream audits -- should be eligible for additional incentive funding.

We recommend adding:

To accelerate recovery of recyclables currently landfilled in MSW, the EPR program should establish an additional incentive payment (e.g., 1.5x multiplier) for innovative technologies that demonstrate recovery of greater than 70 percent of recyclable materials from MSW. Recovering these discarded recyclables will substantially and cost-effectively increase overall recycling rates beyond those achievable through traditional collection systems.

The program should also apply comparable incentive weighting for technologies that support EPR compliance by sorting difficult-to-recover material (e.g., films, foils, drink carriers, flexible packaging), newly covered materials, and technologies capable of conducting pre-and post-collection waste audits.

Section 18980.3 (Evaluations of covered Material and Covered Material Categories) - Apply uniform standards for recovered materials

We support uniform standards such that all recovered covered materials whether originating from curbside, drop-off, or MSW sortation are held to the same quality requirements.

We Recommend Adding:

"Recovered covered materials, whether originating from curbside/primary collection or alternative collection (including MSW sortation), shall be subject to the same material quality, contamination thresholds, verification, and reporting requirements."

This ensures program integrity and consistency.

Section 18980.11.2 (Exemption for Rural Counties and Rural Jurisdictions) Require MSW sortation for covered materials in rural counties and rural jurisdictions granted an exemption from the program

The proposed rules provide rural counties, rural jurisdictions, and recycling service providers an opportunity to apply for an exemption from program requirements. Mixed waste processing facilities ("MWPFs") can produce substantially higher volumes of net new recyclables at substantially lower cost by accessing the 76% of all recyclables in MSW, all without requiring new collection schemes, which are often challenging in small or rural regions.

AMP suggests that in those situations where the local jurisdiction or recycling service provider determines that local conditions render compliance impractical, the use of advanced MSW sortation should be required as a means to recover significant volumes of covered materials until circumstances change.

We recommend adding:

"When a rural county, rural jurisdiction, or rural recycling service provider applies for and is granted an exemption from program compliance, the Department shall require the implementation of advanced MSW sortation to recover covered materials prior to landfill."

Conclusion
We believe these modifications and clarifications will strengthen SB 54 implementation, driving the recovery of larger volumes of covered materials and preventing the permanent loss of those materials through landfill disposal. These recommendations will also keep California at the forefront of new technology, critical as the waste sector is transformed and improved through automation and AI-technologies. Further, acting on these comments will enable California to achieve increases in recycling today by creating a flexible pathway for new, cutting edge technologies to advance and decarbonize the state's solid waste infrastructure.
Thank you for the opportunity to comment. We welcome follow-up questions and discussions with CalRecycle staff around our comments and welcome the opportunity to partner in refining these provisions before final adoption.

Response to B-18-1
CalRecycle rejects the commenter's proposed changes for multiple reasons.

First, regarding the definition of "alternative collection," the proposed additional sentence is unnecessary and would not serve any clarification purpose. The proposed regulation provides a definition of "alternative collection" to clarify a semantic issue: Anything that is not within the definition of "curbside collection" is necessarily "alternative collection," as those terms are used in the proposed regulations. Nothing in the definition purports to affect whether recovery "through alternative collection from MW streams" would "count fully toward the recycling obligations of producers."
Second, regarding "section 18980.11," CalRecycle cannot respond in substance because it cannot discern which provision of the proposed regulation to which the suggestion is directed. Section 18980.11 is not, as the commenter states, titled "Producer Responsibility Organization Plan Funding Requirements," nor is any other section of the proposed regulations.
Third, regarding section 18980.3, no change is appropriate because that section concerns the standards for recyclability, which statute requires to rely solely on the criteria in Public Resources Code section 42355.51(d). Neither those criteria nor this section itself concerns the establishment of standards for recovered materials' "material quality, contamination thresholds, verification, and reporting

requirements." Nor does any other section within Article 3 do concern those issues. More generally, the statute does not authorize CalRecycle to generally regulate the quality of recovered covered materials. Rather, the statute limits "recycling" to materials processed at end markets that qualify as "responsible end markets," and nothing in the proposed regulations suggests that verification and reporting requirements might vary based on how materials were recovered. Lastly, regarding the proposed addition to 18980.11.1, that proposal is rejected because CalRecycle does not have authority under the statute to require any particular recovery means. Rather, local jurisdictions and recycling service providers must include covered material categories when doing so is practicable, which may, depending on the circumstances, encompass the means described by the commenter.

B-19: Sonoco (Scott Byrne)

Comment B-19-1

As a top ten domestic recycler and as one of the country's largest consumers of recovered paper, Sonoco appreciates the challenges faced by today's recycling systems. Sonoco also supports pursuing the best environmental outcomes for packaging while reducing material sent to landfill. We appreciate the ability to comment on the SB 54 Publication of Producer Reporting Guidance Documents and Covered Material Categories Updates and welcome further engagement with CalRecycle staff. In the following sections please find general comments from Sonoco as well as specific information for the broader paper categories, particularly for polycoated paper. By providing this information, Sonoco seeks to help California achieve their goal of increasing the recycling of packaging material.

General Comments

We acknowledge that each state and region have unique processes, infrastructure, and markets that could lead to unique determinations for the recyclability of various materials. We also recognize the benefit to consumers and to companies when working towards harmonization of recyclable materials.

We are pleased to see the update to the covered material categories (CMC) in the CalRecycle reporting guidance covered material categories update from September 2025:

• **25_PF17P*** Paper and Fiber / Multi-Material Laminate / Paperboard with a Plastic Coating/Lining

o New category with material that was previously in 24_PF7P Paper and Fiber / MultiMaterial Laminate / Other Forms w/ plastic component

For clarity, we suggest that CalRecycle update the categories 25_PF10P, 25_PF11P, and

25_PF12P to read: " All forms w/ plastic component, excluding those falling into category

25_PF17P* ". This is in order to clarify that packaging in the format of paperboard with a plastic coating/lining, such as Sonoco's rigid paper container, is considered in the

25_PF17P* category rather than mistakenly being categorized as either the 25_PF10P, 25_PF11P, or 25_PF12P categories.

Poly-coated paper is used across packaging, shipping, and food-service applications. It provides mechanical durability, resistance to water and grease, low mass, and can be engineered as rigid or flexible constructions. The substrate is predominantly paper, a renewable fiber, and the package can be recyclable where collection programs and mills accept it. Moisture and grease barriers are achieved with coatings such as polyethylene or polylactic acid, with other chemistries selected to meet specific performance requirements. Manufacturers continue to introduce barrier innovations that target improved environmental profiles. Because the material is primarily paper with established recovery markets, many poly-coated formats can be processed with other coated papers, including magazines, catalogs, and advertising mailers, where local acceptance exists. Our paper mills have publicly committed to accepting and recycling various forms of polycoated paper, including rigid paper containers and paper cups. As CalRecycle continues to update determinations of recyclability or compostability under PRC section 42061(e) of the SB54 regulations, we request that CalRecycle consider the significant evidence that polycoated paper meets the thresholds required to be considered readily recyclable in California.

Poly Coated Paper Alliance (PCPA) Recyclability Findings

Sonoco is a member of the Poly Coated Paper Alliance (PCPA), a collaborative industry platform working to achieve widespread collection and recycling of poly coated paper products. PCPA membership represents every step in the supply chain from collection and sorting, to pulping, mills, converters, packaging manufacturers, and brands. PCPA conducts ongoing research and collects data to document the existing flow and recovery of poly coated paper products. These include:

- **RFID Testing:** PCPA completed radio-frequency identification (RFID) testing at a materials recovery facility (MRF) equipped with a fiber optical sorter. On average, 74% of the polycoated paper packaging materials were correctly sorted into appropriate marketable bales.
- **Sortation Study:** PCPA completed a sortation test following the Association of Plastic Recyclers (APR) two dimensional/three dimensional (2d3d) sorting potential protocol. 92% of poly coated paper package formats tested were captured in the appropriate marketable bales.
- **Repulpability Test:** Utilizing the FBA/AF&PA part 1 repulpability testing protocol, PCPA tested 20 polycoated paper packages, and all packaging formats achieved fiber yields greater than 61%, with some reaching as high as 84.4%.
- **Bale Audit:** PCPA completed bale audits which included bales from Maine, Massachusetts, California, Ohio, and Oregon. The analysis found no significant difference in the composition of bales from communities or material recovery facilities (MRFs) that explicitly accept polycoated paper packaging materials compared to those that do not. Additionally, the presence of food residue was not inherently higher on polycoated paper packaging, even though it is comprised of many food service and food contact categories.

We encourage CalRecycle staff to engage directly with the PCPA on this topic and for any clarification on the above studies.

Summary

As an operator of 100% recycled paper mills, residential MRFs and a packaging converter, Sonoco is committed to advancing the recycling of all packaging formats and ensuring that the California stewardship program for packaging achieves its stated goals. We believe a well-developed CMC will have a substantial positive impact on the success of California's EPR program for packaging. Polycoated paper should be considered readily recyclable. We look forward to answering any questions you may have regarding Sonoco's experience in the industry and paper cans and other fiber-based packages fit into the future of California's recycling program. Please feel free to reach out to me at scott.byrne@sonoco.com with any questions.

Response to B-19-1

Comment rejected because does not raise an objection or propose changes to the regulatory text. At most, the comment vaguely references objections or proposals that appear later in the submission. To the extent later portions of the commenter's submission require substantive responses, CalRecycle has provided responses to those portions.

B-20: Syensqo (Ian Choiniere)

Comment B-20-1

Syensqo is a global leader in advanced materials and specialty chemicals. Our tailor-made range of products and constantly evolving research offers everyday sustainable market-based solutions for next-generation transportation, resource efficiency, consumer goods, healthcare, and industrial production to accommodate U.S. consumers' needs. Syensqo, through its predecessors, has been connecting people and scientific minds for 160 years. Innovation is at our core and part of our DNA. In the United States, Syensqo employs nearly 4,800 people working in nearly 40 sites across 20 states, including California.

Syensqo is a member of the Coalition for Protein Packaging ("CPP"), which represents producers, distributors, and supply chain partners committed to ensuring safe, sustainable, and affordable protein products for California consumers.

We are writing to express our support for the categorical exclusions provided in Section 18980.2(a)(2) of the draft regulations, which recognize packaging for food subject to regulations, rules, or guidelines for food issued by the FDA and USDA as outside the scope of covered material where no feasible alternative exists.

Support for USDA/FDA Exclusions

- Food Safety and Public Health: FDA and USDA issued regulations, rules and guidelines are not optional, and optimized packaging is critical to preventing microbial contamination, maintaining freshness, and ensuring consumer health. Aligning SB 54 with these standards avoids conflicts between federal and state regulations while ensuring Californians have safe access to protein products.

- Food Security: Protein is an essential nutritional component for California families. The regulatory exclusions help safeguard supply chains and prevent disruptions that could compromise affordability and accessibility of these products.
- Regulatory Certainty: By recognizing federal mandates, CalRecycle provides necessary clarity for producers who must comply with both federal and state law. This reduces compliance risk and allows members to focus on reducing unnecessary packaging elsewhere in their operations.

Conclusion
Syensqo strongly supports CalRecycle's recognition of the unique role of food packaging in maintaining compliance with FDA and USDA regulations, rules, or guidelines in protecting food safety and security. We urge CalRecycle to preserve these categorical exclusions in the final regulations. This approach strikes the right balance between advancing the goals of SB 54 and maintaining California's commitment to public health and nutrition.

Response to B-20-1

Comment rejected. The comment must be rejected, and no response is required, because the comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

B-21: Ross Neely (Ross Neely)

Comment B-21-1

Kemira appreciates the opportunity to provide comments on the proposed regulations implementing California's Plastic Pollution Prevention and Packaging Producer Responsibility Act (SB 54). Kemira is a global leader in sustainable chemical solutions for water treatment and packaging. In North America, we work closely with municipalities, industrial partners, and packaging producers to deliver technologies that enable safer water, support circular packaging systems, and reduce reliance on non-sustainable solutions. We strongly support California's leadership in advancing circular economy goals and addressing plastic pollution. SB 54 represents a significant step forward in shifting toward systems that emphasize reduction, recyclability, compostability, and sustainability. Our comments below are intended to ensure that the program successfully achieves these objectives while also supporting innovation.

Support for SB 54 Goals

Kemira is aligned with the core objectives of SB 54, including the reduction of single-use packaging, the expansion of recyclable and compostable materials, and the transition toward safer, more sustainable alternatives. Our solutions directly support these goals. For example, Kemira develops barrier and coating chemistries that allow for more recyclable and compostable paper and fiber-based products. Kemira's expertise enables these materials to replace traditional fossil-based plastic by providing the

essential properties and functionalities they need—such as strength, water and oil resistance, and protection to ensure safe and hygienic use in food packaging. Kemira urges CalRecycle to ensure that SB 54 recognizes and incentivizes the use of **truly sustainable, nonfossil derived barrier technologies by clearly distinguishing them from traditional fossil-based plastic** in both definitions and compliance requirements. This is critical to achieving the law's circular economy goals while accelerating innovation.

Response to B-21-1

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it only references the commenter's recommendations; it doesn't set those recommendations forth. To the extent the issues raised require responses, CalRecycle has addressed them in response to other portions of the submission discussing the issues in detail.

Comment B-21-2

Concern: Classification of Innovative Materials

Our broader concern is the treatment of innovative packaging materials—**particularly compostable bioplastics that are inherently biodegradable such as polyhydroxyalkanoates (PHAs) and polyhydroxybutyrate (PHB)**—as well as other next-generation barrier chemistries that are designed to replace traditional fossil-based plastics with more sustainable alternatives. **Including these materials in "problematic" or "non-preferred" categories without a rigorous scientific basis or a full end-of-life assessment would be a missed opportunity.**

PHAs and PHB, as part of the broader category of biodegradable and compostable bioplastics, are inherently compostable and biodegradable, offering a sustainable alternative to traditional fossil-based plastics. In fact, these materials are produced via a fermentation process wherein microorganisms produce and utilize PHAs and PHB as a carbon reserve which is an inherent part of their lifecycle. **Due to this evolutionary feature, PHAs and PHB are broadly biodegradable in nature where microorganisms are present and active such as in home and industrial composting.** Misclassification would discourage adoption of these technologies, undermine investment in sustainable solutions, and send the wrong signal to the market at a time when alternatives to traditional fossil-based, non-degradable plastics are urgently needed. Because California is the largest market in the United States, the way the state classifies emerging materials will shape how other state-level extended producer responsibility (EPR) programs and future federal frameworks develop. This gives California a unique opportunity to lead in fostering innovation and accelerating the adoption of new product technologies that can help end plastic pollution. By taking this approach, next-generation solutions would be encouraged and position the state as a model for sustainable packaging policy, while premature or inaccurate classification would risk cementing incumbent products and hindering the very innovation needed to achieve SB 54's goals.

Kemira urges CalRecycle to ensure that classifications are based on transparent, science-driven criteria, including peer-reviewed lifecycle assessments and realistic end-of-life scenarios. SB 54 should establish clear criteria for compostability and recyclability that reflect real-world conditions and are informed by both scientific and industry expertise. These criteria are essential to ensure that innovative materials are not penalized if they deliver superior environmental performance compared to traditional fossil-based plastics.

California should also actively incentivize the development and adoption of next-generation, non-fossil derived barrier materials that are compostable, recyclable, and have minimal environmental impact. This could include fast-track approval processes, reduced compliance fees, or preferential recognition in reporting requirements for packaging that incorporates such alternatives. **As currently written, SB 54 treats bioplastics such as PHA and PLA the same as traditional fossil-based plastics**, subjecting them to the same requirements and fees as fossil-based plastics despite their compostable nature. Kemira recommends a differentiated approach for biobased, compostable materials that meet rigorous environmental standards, ensuring that such solutions are not discouraged by disproportionate regulatory burdens.

Finally, we encourage CalRecycle to establish a transparent, science-based review process for evaluating new materials. This should allow producers to submit data on environmental safety, compostability, and recyclability, with clear timelines and criteria for regulatory decisions. Such a system would provide predictability, encourage responsible innovation, and help ensure that truly sustainable materials can enter the market without unnecessary delays.

Partnership with California

Kemira is committed to being a constructive partner in California's journey toward a circular economy. We are prepared to share technical expertise on sustainable barriers and packaging chemistries, provide data and lifecycle assessments for innovative materials, and participate in stakeholder workshops and advisory panels to support science-based decision making.

Closing

We commend CalRecycle and the State of California for their leadership on this critical issue and appreciate the opportunity to provide comments. By ensuring that SB 54 is implemented with a strong foundation in science and flexibility for innovation, California can continue to set the national standard for sustainable packaging. Kemira welcomes further dialogue and collaboration with regulators, industry partners, and stakeholders to advance the goals of SB 54.

Response to B-21-2

Comment rejected. The comment offers only the nonspecific recommendation to "ensure that classifications are based on transparent, science-driven criteria . . . that reflect real-world conditions and are informed by both scientific industry and expertise." Even if the commenter proposed any particular criteria on which

CalRecycle would base determinations (instead of only suggesting the processes for how to arrive at those criteria), no change to the proposed regulations would be appropriate in response to this comment because the statute codifies the criteria that CalRecyle must apply. The regulations are legally required to apply the criteria in Public Resources Code section 42355.51(d)(2) through (6) (for recyclability) and 42357 (and surrounding sections, for compostability). Moreover, the commenter erroneously suggests that a problem with the proposed regulations is that certain materials alleged to be "compostable bio[plastics" are categorized as "problematic" or "non-preferred." The proposed regulations contain no provision referring to materials as "problematic," and the reference to "preferred" concerns recyclability in context of the design guide described in Public Resources Code section 42053(d)(2), not compostability.

B-22: Sinclair Systems International LLC (Scott Howarth)

Comment B-22-1

Sinclair is one of the largest manufacturers in the world of produce labels (also known as “price look up” or PLU stickers). These produce labels are a critical part of bringing produce to market for farmers, allowing traceability and branding on individual fruits and vegetables that would otherwise need additional packaging. Sinclair’s North American headquarters are based in Fresno, California where we have 94 employees. Sinclair sells billions of labels annually to California farmers / fruit packers for use on citrus, stonefruit, avocados, kiwifruit, tomatoes, and onions. These little stickers enable California farmers to sell their fresh produce in California, the rest of the US and around the world.

Conventional plastic produce labels cannot be recycled and contaminate compost, as they are small and challenging to screen out. This has led countries like France, New Zealand, and others to require compostable produce labels. Sinclair rose to the challenge and developed a compostable produce sticker. This innovative sticker is a minimal packaging solution able to label at high speeds meeting food safety and all performance requirements to make it through the fresh produce supply chain - from farm to retail to your home. It also meets global standards for safely breaking down into usable compost after it has completed its job at retail point of sale.

We recognize and support Senate Bill 54’s goal to make all covered products and packaging in California reusable, recyclable, or compostable by 2032. The initial rulemaking updated the CMC list that does not properly recognize the requirements established by AB1201; therefore, we believe further changes must ensure intent of SB54 so that compostables like our compostable produce sticker are supported as compliant covered materials alongside recyclables and reusables.

Response to B-22-1

Comment rejected. No response to this portion of the commenter's submission is necessary because it does not state any recommended changes or raise any objections with particularity; rather, it refers to the proposals and objections raised in greater detail in subsequent portions of the submission. CalRecycle has responded to those proposals and objections in response to those subsequent portions.

Comment B-22-2

CalRecycle has failed to define ‘polymer’ as described in AB 1201. As a result, noncompostable products filled with untested and unknown components might evade requirements for testing and certification, putting the integrity of soil in California at risk. As remedy, we’ve requested the definition of “polymer” in ASTM D883 be included in this regulation to reflect both the intent and the language in existing statute

Response to B-22-2

CalRecycle rejects this comment for the reasons provided in response to comment B-14-2.

Comment B-22-3

Responsible End Markets

- Because all compostable materials are tested to the same ASTM standards based on the same conditions, we argue that treating plastic and paper/fiber differently not only betrays the science and how compostables are defined under California law (primarily AB 1201), but it also suggests that it's 'ok' to allow certain products to persist in finished compost piles based on the origin of their materials, not their end of life or certification.
- We recommend highlighting environmental risks associated with immature and unstable compost piles filled with unprocessed products.
- As a substitute requirement to ensure end markets are responsible, we ask CalRecycle to employ the newly published ASTM test methods to ensure facilities are providing optimal conditions for our covered materials.

Response to B-22-3

CalRecycle rejects this comment. To the extent this comment suggests that end markets for materials under section 18980.4(a)(4)(B) of the proposed regulations should be held to the same standard as end markets for materials under section 18980.4(a)(4)(C), see the response to comment B-6-5. To the extent this comment recommends highlighting environmental risks associated with immature and unstable compost piles filled with unprocessed products, no change is necessary. Consistent with PRC section 42041(ad), sections 18980.4(a)(4)(B) and (C) already provide for the biological decomposition of covered materials into recycled organic product meeting standards necessary to

be sold into the marketplace. Moreover, under section 18980.4(a)(4)(B) of the proposed regulations, any covered material inadvertently included in the process that remains undecomposed is considered an incompatible material and must be handled in a manner consistent with section 18980.4(a)(3). Therefore, the proposed regulations already provide for the sufficient decomposition and processing of covered materials into recycled organic product in a manner that is consistent with the Act and protective of the environment. See also the responses to comments O-75-12 and O-83-5. Additionally, to the extent this comment recommends application of ASTM test methods, see the response to comment O-83-5. No change is necessary.

Comment B-22-4

Sinclair is a proud California company that believes in the principles of SB54 and with these proposed changes it offers a level play field for all certified compostable packaging products and removes confusion by referring to recognized ASTM standards

Response to B-22-4

Comment rejected. No response specific to the commenter's submission is necessary. This closing paragraph summarizes the commenter's recommendations, to which CalRecycle has responded separately.

B-23: Alliance for Automotive Innovation (Emily Jones)

Comment B-23-1

CalRecycle has issued a Notice of Action for implementation of SB 54 “Plastic Pollution Prevention and Packaging Producer Responsibility Act Regulations.” The Alliance for Automotive Innovation (Auto Innovators) appreciates the opportunity to provide comments on this next step in California’s implementation of its extended producer responsibility (EPR) program. Our members will be significantly impacted by these regulations, and our comments reflect our commitment to a continued constructive dialogue with CalRecycle staff.

Auto Innovators represents the auto manufacturing sector, including automakers that produce and sell around 95% of the new light-duty vehicles in the United States. Our mission is to work with policymakers to realize a future of cleaner, safer, and smarter personal transportation and to work together on policies that further these goals, increase U.S. competitiveness, and ensure sustainable, well-paying jobs for citizens throughout the country. Millions of packaged auto parts are transported across the country and across the globe in order to repair and maintain the vehicles that our members sell; therefore, EPR programs have a substantial impact on automakers.

We appreciate that CalRecycle has refined this second iteration of proposed regulations to reduce some of requirements and resultant burdens and costs outlined in the May 2024 SB 54 proposed regulations.3 However, we are concerned that in some cases the

current proposal creates a program that actually extends the reach of the program beyond plastics reaching consumers – the stated intent of the Act.4 Our comments here reflect the basis for our concerns and recommendations to further reduce burden both for CalRecycle and impacted industry sectors.

Response to B-23-1

Comment rejected. No response to this portion of the commenter's submission is necessary because it does not suggest a specific change to the proposed regulations, does not raise an objection concerning the rulemaking process, and to the extent the comment is mainly introductory and references other portions of the submission which have suggested changes, CalRecycle has responded to those portions separately.

Comment B-23-2

Key Definitions Needing Clarity

We have specific concerns regarding CalRecycle's proposed definitions for "consumer" and "distribution" and the implications that they have for business-to-business distribution.

The term "consumer" means the end user of an item, or the last person in the supply chain who acquires and uses an item. For example, a retailer that obtains and uses a covered material item in its business operations, without selling or otherwise further distributing the item, is the consumer of the item.

"Distribution" and "distribute," as used in the Act and this chapter, mean the act of transferring products to another person within the supply chain or to the end user of the products, and "import" means the act of bringing products from outside the state into the state for purposes of sale or distribution…5

We request that both of these definitions specifically exclude or exempt business-to-business operations. Including business-to-business operations such as pallet wrap, protective films, and replacement parts as covered activities substantially increases administrative burden and distracts from efforts to reduce single-use packaging. Many companies are already working towards this in business-to-business operations, including by introducing reusable materials and replacing plastic wrap with more sustainable alternatives where possible. For example, Minnesota has recognized this and has defined covered products so that it excludes materials that a producer distributes to another producer and are not further distributed to a person other than the commercial or business entity that first received the product.6

Additionally, defining "consumer" in a way that clarifies that a consumer is a person who purchases goods for personal use would add needed clarity and meet the intent of the Act.

Response to B-23-2

CalRecycle rejects this comment for the reasons provided in response to comments O-38-1. Also, the justification for the proposed change--that business-to-business operations are already reducing "single-use packaging" and introducing "reusable materials"--is nonsensical. One express function of the statute is to establish what constitutes "reusable" packaging, as opposed to "single-use" packaging, to begin with. See, also, CalRecycle's response to comment O-40-1.

Comment B-23-3

Exemption for Business-to-Business Distribution

In keeping with the intent of the Act and to ensure a workable program, we request that CalRecycle expressly exempt business-to-business operations. In addition to other exemptions in the proposed regulations, such as the hazardous materials exemption,7 we believe that an exemption such as that cited above for Minnesota would be in keeping with the need to identify plastics reaching consumers. We see no constraints regarding the legislation that would prohibit this type of exemption.

Response to B-23-3

CalRecycle rejects this comment. The purpose of section 18980.2.2 is to address the exclusions created by sections 42041(e)(2)(F) and 42041(s)(4)(A) of the PRC, which do not contain the exclusion that the commenter seeks for business-to-business materials. Unlike the packaging used to contain hazardous products pursuant to section 42041(e)(2)(C) and (D) which was cited by the commenter, there is no business-to-business categorical exclusion under the Act. With regard to the Act's application to business-to-business products, please see the response to comment O-38-1. Taking into account the foregoing, there is no need to change the proposed regulations.

Comment B-23-4

Concerns with Proposed Fee Calculations

SB54 stipulates that a fee will be imposed on participants but does not specify how that fee should be collected, giving CalRecycle leeway in how fees should be calculated.

The plan shall include a fee for participants of the [producer responsibility organization] PRO consistent with the provisions of Section 42053, set forth the calculation of the fee, and describe the process through which the PRO will collect the fee from producers that are participants of the PRO’s approved plan.8

In the draft regulations CalRecycle proposes that the fee be calculated using the following guidelines in the statute:

A PRO shall structure the fee schedule required pursuant to subdivision (a), delineated by covered material category and based on the following factors: (1) The costs to

ensure each covered material category meets the requirements of this chapter. Covered material that is easier and less expensive to recycle or compost or that is designed to be recycled into a similar covered material or a material that is easier to be composted shall be subject to lower fees. The costs may include all of the following: (A) Costs to develop and sustain viable responsible end markets for each covered material category. (B) Costs to collect, sort, avoid or remove contamination, aggregate, and transport the covered material into defined streams to support the viable responsible end markets for the remanufacturing of the covered material either through curbside collection or other means.9

Our further understanding is that fees will be calculated based on the number of plastic components and the weight of plastic covered materials. We would recommend that CalRecycle include additional factors that would make this process more equitable and workable. For example, we recommend CalRecycle consider allowing more simplified/averaged reporting (e.g., an industry calculator),10 exempting specific components (especially smaller items such as replacement parts), and items that are more difficult to report such as plastic inks and adhesives.

Response to B-23-4

CalRecycle rejects this comment. The current regulations regarding fee calculation are consistent with statute, including section 42053(c) of the PRC, and the commenter's general suggestions do not identify any specific text that is needed to further comply with statute. Further, the general suggestion to create additional exemptions not only lacks the specificity to require a response, but it also conflicts with statute and exceeds CalRecycle's rulemaking authority.

Comment B-23-5

Compliance Deadlines

We are concerned that the proposed regulations do not extend the compliance deadlines even though key components of the program have yet to be developed. Significant guidance needs to be developed to clarify the requirements that “covered material offered for sale, distributed, or imported in or into the state on or after January 1, 2032, is recyclable or compostable,” “that plastic covered material offered for sale, distributed, or imported in or into the state meets specified recycling rates,” and that “not less than 65% of plastic covered material to be recycled on and after January 1, 2032.”11 This timing issue holds true for the exemption process outlined in the proposed regulations. It is not clear what form that process will take nor how long it will take. Until such guidance and the specifications that CalRecycle will require are developed, it will be challenging for producers to request an exemption or for covered items to move to acceptable alternatives.

Response to B-23-5

CalRecycle rejects this comment, which offers the vague suggestion that the proposed regulations should "extend the compliance deadlines." The commenter suggests no particular extension, and, in any event, no provision in statute allows

CalRecycle to change the cited compliance dates (January 1, 2032, for Public Resources Code section 42050(b) and (c)). With regard to the timing of exemptions, no change is necessary because the regulations clearly state the standards by which CalRecycle will evaluate exemption requests, and those exemptions will be valid for at least two years, providing ample lead time for producers to request exemptions before their compliance obligations take effect.

Comment B-23-6

Conclusion

Again, we appreciate this opportunity to provide constructive comment and recommendations for making this program more workable and less burdensome for both CalRecycle and impacted industry sectors. We strongly recommend that CalRecyle include a business-to-business exemption that would be a practical approach to implementation. We see this as going hand in hand with tightening up the definitions identified above. We also have concerns with the fee calculation approach and would recommend that CalRecycle convene a group of impacted industries to provide real world approaches that would be more effective. And finally, given the delays in the development of this proposal, we urge reconsideration of the compliance dates.

Response to B-23-6

Comment rejected. Regarding the request for a "business-to-business exemption," CalRecycle rejects that proposal for the reasons stated in response to comment O-38-1 and because the statute does not grant CalRecycle general authority to create new exemptions. Regarding the "fee calculation approach," the commenter does not offer any revision for CalRecycle to consider. Instead, the commenter only recommends that CalRecycle further confer with "impacted industries"; that is not a proposed change to the regulatory text for CalRecycle to consider, so no specific response to that recommendation is necessary. Regarding "reconsideration of the compliance dates," the commenter again fails to specify what changes to the proposed regulations they would consider appropriate. In any event, the statute does not grant CalRecycle general authority to change the compliance dates set in statute, so no change is appropriate.

B-24: g2 revolution, LLC (Michael Sangobanwo, PE)

Comment B-24-1

On behalf of g2 revolution, LLC (“g2”), we appreciate the opportunity to comment on CalRecycle’s proposed regulations (“Proposed Regulations”) implementing the Plastic Pollution Prevention and Packaging Producer Responsibility Act, Pub. Res. Code § 42040 et seq. (“SB 54” or “the Act”). g2 is a specialty recycling solutions company dedicated to developing innovative, environmentally responsible strategies for our customers. For over fifteen years, we have supported customers nationwide with material management, reverse-logistics, take-back, and specialty recycling program,

resulting in the successful diversion of roughly twenty-five million pounds of difficult to-recycle consumer and commercial materials, such as multilayer film, flexible packaging, retail hard goods, and regulated product returns, from landfills to higher-value recovery pathways each year. We share California's commitment to advancing a circular economy by reducing plastic pollution and improving end-of-life outcomes for packaging, paper, and food-service ware.

While we are aligned with the State's policy goals, we have serious reservations about CalRecycle's Proposed Regulations as currently drafted. The framework for Extended Producer Responsibility ("EPR") outlined in the Proposed Regulations is unnecessarily complex and imposes disproportionate compliance burdens that risk stifling, rather than encouraging, the innovative recovery solutions that SB 54 was designed to foster. Especially worrisome, the Proposed Regulations also delegate broad programmatic authority to non-regulatory thirdparties, yet lack meaningful safeguards for public oversight, transparency, or due-process, thereby risking both inequitable cost allocation and diminished accountability. In addition, several key definitions, requirements, and procedural mechanisms appear to conflict with established federal and state environmental law principles, and could inadvertently disrupt existing, highly effective take-back and recycling infrastructures that already deliver substantial diversion, data transparency, and environmental benefits.

Accordingly, we respectfully submit the following comments to assist CalRecycle in refining the Proposed Regulations so that the final rule set will support rather than undermine proven recycling solutions. We believe the changes discussed below will also help maximize the Act's potential to achieve California's ambitious circular economy objectives.

Response to B-24-1

Comment rejected. No response to this portion of the commenter's submission is necessary because the issues raised in it have been addressed in response to other portions of the submission discussing the same issues.

Comment B-24-2

I. Overview of g2: Transforming Recycling and Sustainability for Businesses.
g2 is a mission-driven company committed to "Changing the Way the World Recycles®."1 Since our founding in 2008, we have specialized in providing innovative, compliant recycling and sustainability solutions for businesses across a diverse range of industries—including office food and coffee service, retail, healthcare, beauty, and electronics. Our reputation is built on tackling the unique challenges of managing and disposing of hard-to-recycle materials. While some material recovery facilities may manage greater overall volumes, g2's expertise is focused on the most difficult-to-recycle items—materials that would otherwise be destined for landfill without our intervention.

Our core services encompass the safe collection, management, and recycling of consumer chemical products and their packaging; comprehensive management of

product recalls and returns; creative Second Life® repurposing solutions; and robust material data collection and reporting. We proudly partner with more than two dozen national retail chains and numerous commercial and industrial businesses, ensuring the safe and responsible end-of-life management of products such as hair and body care items, household cleaners, and detergents—addressing both packaging and any residual chemicals.

Our capabilities extend to managing damaged, expired, and returned products, where we evaluate the most environmentally and socially responsible disposition options, including donation, industrial reuse, and, when appropriate, waste-to-energy conversion. Every engagement begins with a thorough assessment of each customer's operations and material streams, allowing us to design a customized collection and logistics program. Materials are transported from the customer's site to one of g2's advanced processing facilities, where they are sorted and managed using the best available methods.

At g2, we are dedicated to finding beneficial, cost-effective solutions that minimize landfill use to the greatest extent possible. Whenever feasible, we reuse or repurpose materials collected from our customers' businesses. For example, after separating consumer products like soaps, detergents, and cleaners from their packaging, we transform the remaining products into g2branded remixed items such as industrial floor washes and commercial deodorizers. Packaging materials, including cardstock and clamshell plastics, are recovered for recycling. We also consolidate returned consumer products and collaborate with downstream processors to reclaim valuable chemicals and materials. As an illustration, nail polish returned to retail stores can be aggregated, processed, and incorporated into formulated alkyd paints for commercial use.

Transparency and accountability are fundamental to our operations. We regularly undergo independent third-party audits of our materials management and recycling processes to ensure the highest standards. Our facilities have achieved GreenCircle Certified Zero Waste to Landfill status, demonstrating our success in diverting 100% of audited waste streams away from landfills. Beyond compliance, we are recognized leaders in sustainable innovation, continually exploring and implementing new methods to reuse or recycle materials that cannot be donated or processed through traditional systems. This ongoing commitment ensures we deliver the most responsible and forward-thinking solutions for our customers and the environment. Our work also directly supports California's environmental priorities, including the State's EPR policies aimed at reducing waste, improving recycling rates, and ensuring the responsible management of products at end-of-life.

Response to B-24-2

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment B-24-3

II. CalRecycle's Proposed Regulations Unlawfully Delegate Essential Regulatory Authority to a Private Entity.

A foundational element of California's EPR program under SB 54 is the option for producers to satisfy their EPR compliance obligations by forming a Producer Responsibility Organization ("PRO").2 SB 54 envisions a PRO as being a nonprofit entity that is established by producers to function as their collective representative and liaison with CalRecycle for all matters related to EPR compliance. In this capacity, the PRO is responsible for developing, coordinating, and implementing an approved stewardship plan that details how its member producers will meet the State's EPR requirements.3 PROs therefore play a central role in the administration of EPR, streamlining compliance for individual producers by managing key functions such as registration, reporting, fee assessment and payment, and the effective execution of recycling and source reduction programs. Beyond these core responsibilities, PROs are also charged with advancing community outreach, supporting the development of sustainable solutions, and investing in technologies that improve collection and management systems to foster a circular economy. But, importantly, the statutory role of a PRO is that of a coordinator and facilitator—not a regulator, enforcer, decision-maker, or auditor. The PRO's mandate is to organize and support producer compliance, ensuring that the collective efforts of its members align with SB 54's objectives and regulatory requirements, while leaving enforcement and oversight functions to CalRecycle and other designated authorities.4

CalRecycle's Proposed Regulations substantially broaden the authority of PROs beyond the original intent of SB 54, effectively positioning them as the architects and overseers of California's recycling system. Under the Proposed Regulations, PROs are empowered to monitor and refer noncompliant producers to CalRecycle for enforcement action,5 and direct the development and implementation of recycling solutions and source reduction solutions in the state.6 PROs are also granted independent authority to determine how materials are categorized, processed, and recycled within the system.7 The Proposed Regulations further allow PROs to determine which materials qualify for exemptions, control the flow of materials through the recycling system, and influence the adoption of new recycling technologies and infrastructure.8 Moreover, PROs are tasked with establishing standards for "responsible end markets" and are required to conduct annual, independent third-party audits of these end markets and recycling service providers that handle EPR-covered materials.9 PROs can then use these standards to determine where and when to provide financial support to recycling service providers and other entities to drive system improvements.10

This regulatory framework fundamentally shifts primary responsibility for assessing both producer and recycling service provider compliance with EPR requirements from CalRecycle to PROs. By doing so, CalRecycle's Proposed Regulations delegate critical regulatory functions, including the interpretation of statutory and regulatory provisions, the determination of exemptions, and the approval of responsible end markets, to private organizations that lack the direct public oversight, transparency, and

accountability inherent to governmental agencies.11 This transfer of authority constitutes an improper delegation of core administrative and oversight responsibilities that, under SB 54, are intended to remain with CalRecycle. Many of the contemplated requirements are also unnecessary and duplicative because recycling service providers are already subject to a comprehensive set of federal and state laws governing material management, handling, transportation, and disposal. The Proposed Regulations, therefore, layer on additional—and arguably redundant—oversight and compliance obligations for these entities, without clear statutory authorization or demonstrated necessity under SB 54. This approach risks creating regulatory confusion and inefficiency, while undermining the clear lines of accountability that are essential for effective program administration.

The expanded authority granted to PROs to approve and oversee service providers designated as “responsible end markets,” gives PROs broad access to sensitive information and substantial authority over these providers. This delegation of authority and oversight raises a separate and particularly significant concern over the Proposed Regulations’ absence of meaningful accountability mechanisms for PRO administration. There is no clearly defined process for service providers to challenge or appeal a PRO’s determinations, nor are there sufficient safeguards to protect confidential business information or trade secrets, such as proprietary recycling technologies. Additionally, the Proposed Regulations do not explicitly assign CalRecycle any role in monitoring or ensuring that PRO interactions with recycling service providers are conducted transparently and fairly. The absence of procedural safeguards and oversight provisions raises substantial concerns about due process, transparency, and the appropriate allocation of regulatory authority within California’s EPR framework. Without clear avenues for recourse or independent review, service providers may be exposed to arbitrary or inconsistent decisionmaking by PROs, ultimately undermining the integrity and effectiveness of the program.

To ensure consistency with the intent of SB 54 and maintain regulatory integrity, we respectfully urge CalRecycle to reassess the scope of authority granted to PROs. CalRecycle should retain ultimate decision-making authority over all regulatory matters, including material exemptions and responsible end market designations. Additionally, the regulatory framework should establish a clear, formal grievance and appeals process that allows recyclers, service providers, and other affected stakeholders to challenge PRO decisions or raise concerns about PRO conduct directly with CalRecycle.

Response to B-24-3

Comment rejected. This comment advocates for two changes to the proposed regulations. First, it proposes that CalRecycle establish a "challenge or appeal" process, which the commenter links to issues of confidentiality. CalRecycle declines to adopt a "challenge or appeal" process for the reasons provided in response to comment O-38-1. Moreover, neither statute nor the proposed regulations conceive of a PRO having "authority over" any end markets. Rather, the PRO has the burden of establishing that there are responsible end markets

available to process covered material; only processing at such end markets may be considered "recycling." No end market incurs any legal obligation under the statute or regulations. Regarding confidentiality, Public Resources Code sections 42060(a)(2)(E) and 42080(e) protects confidentiality of information obtained by CalRecycle, and responsible end markets and the PRO may establish their own non-disclosure agreements.
This comment also broadly asserts that CalRecycle "should retain ultimate decision-making authority over all regulatory matters, including material exemptions and responsible end market designation." However, nothing in the proposed regulations suggest CalRecycle will relinquish its authority over any regulatory matter. The statute (Pub. Resources Code sections 42080 and 42081) unambiguously authorizes CalRecycle to impose penalties when any person violates their statutory obligations, and Article 13 of the proposed regulations detail how CalRecycle will carry out its enforcement role.

Comment B-24-4

III. CalRecycle's Proposed Regulations Set Burdensome Expectations for Exempt Materials

SB 54 was enacted to address the environmental and public health impacts of postconsumer single-use plastic packaging and food service ware.12 The statute expressly defines "covered material" to include "single-use packaging that is routinely recycled, disposed of, or discarded after use, and is not typically refilled or reused by the producer." This definition was carefully crafted to exclude certain types of packaging from SB 54's requirements and to provide clear pathways for materials to be exempted.13 Both the statutory language and legislative history make clear that SB 54's EPR obligations were intended to focus on single-use packaging and food service ware primarily encountered in the consumer context—where end-of-life management is deficient due to infrastructure gaps or consumer behavior. In contrast, materials excluded or exempted from coverage were not meant to be subject to the same rigorous management or EPR fees, as other effective stewardship or waste management controls are already in place for these materials.

Despite this intent, CalRecycle's Proposed Regulations establish an unnecessarily restrictive and burdensome process for verifying categorically excluded materials and seeking exemptions from EPR requirements. The regulations impose a multi-step notice, review, and determination process for managing such materials, regardless of whether exclusion is dictated by statute, regulation, safety concerns, compliance challenges, conflicts with federal law, or the existence of well established, high-performing end markets. For example, packaging or components used for federally regulated products—excluded from the definition of "covered material" under SB 54—are subject to an exemption notice, CalRecycle review, and a determination of eligibility before they can be managed as excluded or exempt for EPR purposes.14 The Proposed Regulations similarly require notification and review for reusable and refillable packaging, medical and drug device packaging, durable packaging, and de minimis components, with determinations published and re-evaluated at prescribed

intervals.15 Critically, only a PRO or approved Independent Producer may submit exemption applications, and each request must include extensive justifications, comprehensive supporting data, and, where applicable, a detailed compliance plan for phasing the material into the program over time.16 Exemptions are not permanent and are subject to ongoing review and renewal, imposing a continuing compliance burden on materials that may already be effectively managed through other environmental programs or stewardship models.17

This approach is fundamentally inconsistent with SB 54. The statute was designed to exempt or exclude certain materials to avoid burdening producers with unnecessary obligations, duplicative management efforts, or excessive fees. By imposing a regulatory process on excluded and exempt materials, the Proposed Regulations effectively extend EPR obligations beyond the intent and purpose of SB 54. In doing so, the Proposed Regulations fail to consider the unintended consequences of attempting to manage all materials under EPR, irrespective of their type, existing regulation under other frameworks, or successful management under existing take-back or stewardship programs. These potential consequences include (i) producers discontinuing participation in effective stewardship programs due to increased EPR-related costs, and (ii) incentives to reroute materials into other environmental programs (e.g., hazardous substance and waste regimes) to avoid EPR assessments. The Proposed Regulations also fail to address how exemptions should be applied for materials currently managed through successfully established mechanisms such as take-back programs, reverse logistics, or product return and recall systems, creating a significant gap in regulatory clarity for common and effective industry practices.

The process established in the Proposed Regulations for managing excluded and exempt materials goes well beyond what SB 54 envisioned. SB 54 expressly distinguishes between materials excluded from the definition of “covered material” and those eligible for exemption and does not contemplate the imposition of additional regulatory hurdles for these categories. By requiring extensive documentation, review, and ongoing compliance for excluded and exempt materials, the Proposed Regulations create an unreasonable regulatory burden that will increase the administrative complexity of EPR compliance programs and drive-up costs for California businesses and consumers. In particular, the Proposed Regulations place significant and undue burdens on non-producer entities—such as recyclers and service providers—by obligating them to conduct detailed analyses, prepare comprehensive data reports, and disclose proprietary business information to third parties, often without adequate safeguards or confidentiality protections. These requirements are not only excessive, but also unnecessary, as the status of excluded or exempt materials could be demonstrated through producer records subject to audit or review by CalRecycle. This alternative approach would reduce regulatory and administrative burdens while still ensuring compliance and oversight.

To address these issues, CalRecycle should revise all relevant regulatory definitions in the Proposed Regulations to align more closely with the intent of SB 54 and to enhance regulatory clarity. Specifically, the regulations should:

 Avoid imposing unnecessary requirements on the management of excluded or exempt materials;
 Clearly address the treatment of materials already managed through alternative, industryled collection, and recovery systems;
 Ensure that exempt or excluded materials are not subject to ongoing, duplicative compliance obligations; and
 Refrain from requiring unreasonable data reporting or disclosure from service providers, particularly when such requirements could compromise proprietary or confidential business information.

Absent these revisions, the Proposed Regulations risk overcomplicating the EPR framework, increasing administrative burdens, and deterring participation by recycling and logistics providers—outcomes that would undermine the core objectives of SB 54.

Response to B-24-4

Comment rejected. The commenter requests sweeping changes for all exemption and exclusion provisions in the proposed regulations. The commenter, however, raises objections to all requirements, identifying none that it considers "unnecessary." CalRecycle has only imposed reasonably necessary requirements, as explained further in the Initial Statement of Reasons and Final Statement of Reasons for all provisions relating to exclusions and exemptions. The commenter is also incorrect that the proposed regulations do not address materials already managed through alternative, industryled [sic] collection, and recovery systems." The Legislature adopted various exclusions specifically aimed to accommodate those circumstances (e.g., Public Resources Code sections 42041(e)(2)(A) through (H), 42041(s)(4), and 42060(a)(3) and (4)) and, for multiple of them, expressly provided a role for CalRecycle in administering them. CalRecycle has imposed burdens on producers seeking to avail themselves of those accommodations where mandated and where reasonably necessary to achieve the purpose of the statute. It is not, as the commenter asserts, "fundamentally inconsistent" with the statute for producers to have "compliance obligations" to avail themselves of benefits afforded them under statute; to argue otherwise is to say that producers should not have to show that they comply with the law, so that CalRecycle would have to blindly trust those claiming to do so. Regarding the concern over confidential business information, there is no indication in statute that the Public Records Act's protections do not fully protect confidential business information, and the commenter does not support its suggestion to the contrary. See, also, CalRecycle's response to comment I-63-7. In any event, the commenter's suggestion that CalRecycle "[r]efrain from unreasonable data reporting or disclosure" cannot be implemented because, as also noted above with respect to "unnecessary requirements," the commenter does not suggest what it would consider "reasonable" data reporting and disclosures; instead, the commenter offers the unreasonable request that CalRecycle instead rely on its authority to "audit or review" records. That suggestion offloads all responsibility for demonstrating compliance with the law

from producers onto CalRecycle. There is no suggestion in statute that the Legislature intended to limit producers' responsibilities in such a drastic way.

To the extent the commenter's third suggestion concerns the exclusion of food and agricultural packaging from the definition of "covered material" described in section 18980.2(a)(2), CalRecycle also rejects that suggestion because there are no compliance obligations placed on packaging excluded from that definition.

Comment B-24-5

IV. CalRecycle's Proposed Regulations Are Likely to Deter Participation by Out-of-State Recyclers and Service Providers.

CalRecycle's Proposed Regulations establish new, highly stringent, and often duplicative environmental, health, and transparency standards for entities designated as "responsible end markets."18 Under the proposed framework, the PRO is charged with identifying, supporting, and reporting on these end markets, and service providers or recyclers must demonstrate compliance with these standards to the PRO in order to receive and process covered materials under California's EPR program.19 While CalRecycle's intent with these requirements may be to promote accountability and sustainability in the end-use of recycled materials, the practical and economic implications are significant—particularly for innovative recyclers and out-of-state partners.

Many existing service providers, recyclers, and facilities that would qualify as end markets, including those located outside California, are already subject to a comprehensive array of environmental, health, and safety regulations. These include federal statutes such as the Resource Conservation and Recovery Act ("RCRA"), as well as state and municipal laws governing solid waste management. In addition, many of these providers already participate in rigorous third party auditing and verification programs. Imposing additional California-specific requirements, particularly those that duplicate or exceed the standards of other jurisdictions, may present significant compliance challenges for these entities. Service providers, recyclers, and processing facilities are unlikely to have a compelling incentive to modify their operations solely to satisfy a PRO's expectations or to meet narrowly tailored regulatory definitions that apply only in California, especially when such changes introduce new administrative burdens without delivering a corresponding market benefit.

For example, an innovative end market in Wisconsin that uses novel technology to break down plastics for use in construction aggregate—delivering measurable circular economy and environmental benefits—would have little reason to implement additional California-specific reporting or operational requirements that do not substantively improve recycling processes or material outcomes. Under CalRecycle's Proposed Regulations, such end markets could be excluded from participation—not because of any deficiency in environmental performance, but due to the rigidity and duplicative nature of the regulatory framework. This approach risks discouraging participation by high-performing end markets and undermining the broader goals of advancing a circular economy and maximizing environmental benefits.

CalRecycle's Proposed Regulations also appear to grant the PRO broad discretion in determining which end markets to support or prioritize for investment. Having PRO oversight of end markets raises concerns that PROs could, even inadvertently, influence the success of recycling technologies or markets based on factors wholly unrelated to environmental performance or innovation. These same determinations may also affect the ability of producers or recyclers to secure material exemptions, potentially discouraging investment in novel recycling pathways that could meaningfully advance circularity.

To address these concerns, we respectfully recommend the following:
 Incorporate Flexibility for Out-of-State End Markets: CalRecycle should recognize reputable end markets outside California that meet equivalent environmental standards under their own jurisdictions, without requiring full compliance with California-specific rules. CalRecycle should also avoid imposing unnecessary or duplicative oversight of end markets through its EPR program. It should not, for example, be CalRecycle or the PRO's responsibility under SB 54 to verify an out-of-state end market's compliance with their state's laws or permits.
 Clarify and Limit the PRO's Gatekeeping Role: The PRO's authority in designating responsible end markets should be clearly defined and subject to CalRecycle oversight, ensuring that innovative or alternative recycling solutions are not excluded due to procedural or administrative barriers. The PRO further should not be responsible for independently setting environmental, health, or safety standards that end-markets are required to comply with.
 Ensure Independence in Responsible End Market Decisions: Decisions regarding an entity's designation as a responsible end market should rest with CalRecycle and not be contingent on whether a PRO has endorsed a particular end market or technology.

Absent these adjustments, the "responsible end markets" framework risks becoming a barrier to innovation and interstate collaboration, undermining the effectiveness of California's EPR program and discouraging the development and adoption of viable circular economy solutions.

Response to B-24-5

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42041(ad), 42051.1, and 42060, and the recommended change is not necessary to the implementation or enforcement of the Act. First, to the extent this comment recommends incorporating flexibility for out-of-state end markets, such flexibility is already incorporated. The proposed regulations, particularly section 18980.4(a)(1), already require applicable entities to operate in compliance with all permitting, licensing, and other clearances under all applicable local, sub-national, national, and international laws. Therefore, rather than impose California standards on out-of-state entities, section 18980.4(a)(1) merely requires those entities to comply with relevant laws applicable in their own jurisdictions. To the extent this comment suggests it should not be CalRecycle's or the PRO's responsibility to

verify an out-of-state end market's compliance with their state's laws or permits, the proposed regulations are consistent with PRC section 42041(ad). That provision authorizes CalRecycle to adopt regulations to identify responsible end markets and to establish criteria regarding benefits to the environment and minimizing risks to public health and worker health and safety; to the extent one such criterion is the entity's compliance with all applicable laws, it is well within CalRecycle's authority under the Act to verify satisfaction of that criterion. Second, to the extent this comment recommends clarifying and limiting the PRO's gatekeeping role with respect to responsible end markets, no further clarification is necessary. The proposed regulations already provide CalRecycle with sufficient oversight in the designation of responsible end markets. For example, section 18980.4.1(a) of the proposed regulations requires a PRO to include in its plan the method by which it will identify responsible end markets, and those plans are subject to CalRecycle's review and approval. Moreover, section 18980.4.1(c) of the proposed regulations requires a PRO to maintain all necessary records to verify responsible end markets and produce such records to CalRecycle upon request, and section 18980.4.2 requires annual compliance audits of responsible end markets and subjects such audits to CalRecycle review (see, e.g., sections 18980.4.2(b) through (d)). Therefore, CalRecycle already has a significant role in overseeing the designation of responsible end markets under the proposed regulations and the PRO's gatekeeping role is sufficiently limited. Finally, to the extent this comment recommends ensuring CalRecycle's independence in making a decision regarding an entity's designation as a responsible end market, no change is necessary. Section 18980.4.2(e) of the proposed regulations clearly provides that CalRecycle has an independent role in determining whether an end market continues to meet the requirements to be considered a responsible end market. Moreover, a PRO's demonstrations of new technologies are subject to review and approval by CalRecycle, including under sections 18980.4.1(d)(5) and (6) of the proposed regulations. To the extent CalRecycle requires additional information to make an independent determination outside of the information already provided by a PRO, sections 18980.4.1(c) and 18980.4.2(d) provide CalRecycle with authority to request the necessary information. Therefore, the proposed regulations already allow for the authorities and outcomes recommended by this comment and no change is necessary.

Comment B-24-6

V. CalRecycle’s Proposed Regulations Should Have Definitions and Requirements That Foster Use of the Most Sustainable Materials Management Practices.

As a final matter, we appreciate CalRecycle’s efforts to clarify the distinction between “disposal” and “recycling” in the Proposed Regulations and to ensure that only legitimate recycling activities are credited toward compliance with SB 54. However, we are concerned that an approach centered solely on a binary distinction between “recycling” and “disposal,” without recognizing beneficial use pathways or the most

sustainable management option for a given material, may produce unintended consequences.20

CalRecycle's proposed definition of "disposal," 21 which categorically classifies energy generation, fuel production, and land application as "disposal," appears intended to align with established solid waste frameworks under federal and state law. 22 Yet the composition and risk profile of the covered materials—packaging, food service ware, and paper products that are nonhazardous— warrant a more tailored approach. Applying definitions and incentives designed for hazardous waste to nonhazardous packaging and related materials risks confusion for stakeholders subject to multiple regulatory regimes, creates practical barriers to compliance, and may inadvertently discourage the most responsible and sustainable management approaches for particular materials.

By drawing a strict line between "disposal" and "recycling" without acknowledging beneficial use options, the Proposed Regulations risk disincentivizing effective and environmentally preferable management methods for certain materials and could hinder broader waste reduction and climate objectives. In some cases, materials that are not suitable for mechanical recycling—such as those contaminated with hazardous substances or hard-to-recycle streams like certain plastic films— may be more sustainably managed through conversion to fuel or beneficial land application, particularly where recycling infrastructure is limited. Innovative processes that convert plastic films into diesel-like fuels and other valuable outputs can reduce waste and mitigate environmental risks associated with mismanaged plastics, even if they do not fall within a traditional recycling definition. Excluding such beneficial use pathways from compliance credit or reduced fee eligibility based solely on a restrictive "recycling" definition could penalize producers and service providers that have invested in alternative technologies aligned with SB 54's goals of waste reduction, circularity, and climate risk mitigation.

To better balance regulatory clarity with environmental innovation and real-world materials management, we respectfully recommend that CalRecycle adopt the following adjustments to the EPR framework:

 Recognize and Encourage Beneficial Use Pathways: Create a tiered or supplemental credit structure for material management methods, such as fuel production or beneficial land application, that demonstrably reduce environmental impacts, even if they are not classified as traditional recycling. This structure should include criteria for environmental performance, lifecycle impacts, and end-market integrity to ensure only bona fide beneficial uses qualify.

 Establish a Process for Technological Evolution: Provide clear definitions and evaluation criteria for emerging technologies and innovative practices, along with a periodic review mechanism to update what qualifies as "recycling" or as an eligible beneficial use. This will ensure the regulations remain technology-neutral and adaptive to improvements in performance, traceability, and environmental outcomes.

 Engage Stakeholders: Continue structured engagement with producers, recyclers, local governments, environmental organizations, service providers, and technology providers to ensure that compliance mechanisms are practicable, that measurement and verification are robust, and that the framework does not unintentionally discourage effective material management solutions.

We believe these refinements would support an EPR system that is environmentally sound and operationally feasible, while fostering innovation and enabling multiple, verifiable pathways to manage covered materials responsibly. In doing so, CalRecycle can maintain the integrity of SB 54's recycling objectives, reduce ambiguity for regulated entities, and accelerate progress toward California's broader sustainability goals.

Response to B-24-6

CalRecycle rejects this comment because statute clearly establishes a dichotomy: A material's ultimate end-of-life stage is either "recycling" or "disposal." Public Resources Code section 42041(aa)(2)(E) makes that distinction is unambiguous. With respect to the more specific recommendations, the first two are untenable because, on their face, would require CalRecycle to have authority to change the scope of what is "recycling" under statute. CalRecycle does not have that authority. Regarding the third recommendation, that is not a recommendation for a change in the regulations, but rather is a request that CalRecycle "continue structured engagement" with various stakeholders, so not further response is required.

Comment B-24-7

VI. Conclusion and Recommendations

We strongly support California's commitment to advancing a circular economy and recognize the critical importance of well-designed EPR regulations in achieving the State's ambitious environmental and public health goals. Nevertheless, we are concerned that, as currently drafted, CalRecycle's Proposed Regulations may inadvertently undermine these objectives by introducing unnecessary complexity, delegating broad regulatory authority to private entities without adequate public oversight, and imposing duplicative or conflicting requirements that could disrupt established, high-performing recycling and take-back systems. The proposed framework also risks discouraging participation by innovative recyclers and out-of-state service providers, impeding investment in new technologies, and creating regulatory uncertainty for both producers and service providers.

To address these concerns and ensure the success of SB 54, we respectfully urge CalRecycle to revise the Proposed Regulations to:

1. **Preserve Agency Oversight:** Ensure that ultimate regulatory authority and all key compliance determinations remain with CalRecycle, rather than being delegated to private organizations.

2. **Streamline Exemptions and Compliance:** Simplify and clarify exemption and compliance processes for materials already managed under effective stewardship or alternative programs, reducing unnecessary administrative burdens.

3. **Recognize Diverse End Markets:** Provide flexibility and clear, practical pathways for recognizing responsible end markets both within and outside California, supporting innovation and market development.

4. **Recognize and Encourage Beneficial Use Pathways:** Implement a technology-neutral, tiered framework that, alongside traditional recycling, recognizes verified beneficial-use pathways for management of nonhazardous covered materials (e.g., conversion to fuel or beneficial land application where lifecycle analysis shows superior environmental outcomes), with periodic review to incorporate emerging technologies and ensure EPR requirements do not disincentivize use of the most sustainable management practices for covered materials.

Additionally, we recommend that CalRecycle establish robust procedural safeguards — including transparent grievance and appeals processes—and maintain ongoing, meaningful engagement with all stakeholders to ensure that the final regulations are both operationally feasible and environmentally effective.

We appreciate CalRecycle's efforts to engage stakeholders and to consider these comments. Please do not hesitate to contact us with any questions or to discuss our recommendations in greater detail.

Sincerely,

Michael Sangobanwo, PE, CHMM, CSP.
Environmental Manager

cc: Chris Schlag, Nixon Peabody LLP
Ted Wolff, Nixon Peabody LLP

Response to B-24-7

Comment rejected. No response to this portion of the commenter's submission is necessary because the issues raised in it have been addressed in response to other portions of the submission discussing the same issues.

B-25: North Pacific Paper Company LLC (Jay Simmons)

Comment B-25-1

By this letter, North Pacific Paper Company, LLC ("NORPAC") is responding to the request from the California Department of Resources Recycling and Recovery

("CalRecycle") for public comments on the proposed SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act (the "Act") Permanent Regulations. NORPAC is an end market for paper recycling based in the Pacific Northwest and has historically received a limited volume of materials from California. Because its business operations are potentially subject to the Act, NORPAC has an interest in CalRecycle's rulemaking activities associated with the Act. Accordingly, NORPAC submits the following comments.

Section 18980.4

The Responsible End Market Criteria in Article 4 of the proposed regulations – particularly the requirement for annual compliance audits in section 18980.4.2(a) and annual verification in section 18980.4.2(c) – are overly burdensome and duplicative of existing requirements. NORPAC, like other paper fiber end markets, is already subject to and compliant with a comprehensive and rigorous suite of environmental and safety regulations under federal, state, and local laws. As such, NORPAC is already frequently inspected for air emissions, stormwater and wastewater discharges, emergency response, and hazardous waste management by governmental agencies. Permits and reports can be provided to the PRO upon request to verify a determination that on-site audits for environmental compliance, as well as an annual verification process, are not necessary. The audit requirements currently proposed in these California regulations would place an

unnecessary and costly burden on U.S. end markets, and may further require the improper disclosure of sensitive commercial information.

Moreover, NORPAC is already required to meet transparency requirements through robust independent and internationally recognized third-party programs, including the Forest Stewardship Council, Programme for the Endorsement of Forest Certification/Chain of Custody, and Sustainable Forestry Initiative. These programs utilize audit criteria that are commonly applied in other EPR programs to verify REM status. By providing these certification materials upon request, NORPAC anticipates that the PRO will be able to verify compliance with the REM standards without the need for any additional on-site audit.

These issues, and others, were highlighted in detail by CAA and CAA Oregon in the proposed REM amendment to the Oregon Program Plan, submitted to the Oregon Department of Environmental Quality on August 13, 2025. NORPAC stresses the validity and urgency of these industry concerns, and asks CalRecycle to ensure that the REM verification requirements in Article 4 of the regulations fully integrate these concerns.
Thank you for the opportunity to submit these comments on the Act's proposed regulations.

Response to B-25-1

Comment rejected for the reasons stated in response to comment O-82-55.

B-26: Dan Lett (Dan Lett)

Comment B-26-1

Thank you for the opportunity to provide comments on the proposed regulations implementing California SB 54, the Plastic Pollution Prevention and Packaging Producer Responsibility Act. These comments are supplemental to the oral remarks submitted during the October 7 public meeting.

Bunzl Distribution recognizes CalRecycle for its leadership in advancing packaging sustainability and its continued engagement with stakeholders throughout the rulemaking process. We also value the implementation guidance CalRecycle has provided to help businesses account for materials and components.

As a large distributor of essential business supplies, Bunzl occupies a central position in the supply chain-connecting manufacturers with the businesses that use their products. While we do not control upstream or downstream material specifications, we are well-positioned to influence both ends. Our role enables us to support customers in continuously improving packaging and food service ware with minimal disruption to operations and cost.

The proposed regulations, specifically Section 18980.1.1 , do not fully resolve the practical challenges businesses like ours face in determining which upstream suppliers are considered "in the state" for EPR purposes. While pages 21-22 of the Initial Statement of Reasons provide a reasonable legal justification for the jurisdictional test used for enforcement, the
regulations offer no practical means for businesses to apply that test with confidence in real-world supply chain scenarios.

We work with more than one thousand suppliers to serve customers across California. One challenge we face in complying with California's EPR requirements is the lack of visibility into the jurisdictional status of upstream suppliers. Businesses generally do not share complete location information about their operations with one another, even when they are engaged in long-term commercial relationships. This lack of transparency makes it difficult to determine
which upstream suppliers are considered "in the state" for EPR purposes.

Page 4 of CalRecycle's discussion document related to the May 27, 2025 Informal Rulemaking Workshop indicated that complexity in the producer identification section would be addressed. However, the proposed regulations still lack guidance on the essential "in the state" scoping question. We also note that the Circular Action Alliance has not been able to provide interpretive advice on this issue, further underscoring the need for regulatory clarity.

Given these challenges, we respectfully urge CalRecycle to revise the "in the state" test to make it operationally feasible for businesses. Whether or not the rule is revised, we

also encourage the agency to provide practical tools, clear examples, and decision-making guidance to help regulated entities interpret and comply with the requirements. Specifically, we recommend:

- Developing and maintaining a public, regularly updated registry or database of entities deemed "in the state" for EPR purposes.
- Issuing additional guidance with clear examples, decision trees, or safe harbor provisions to assist businesses in applying the jurisdictional test.
- Considering enforcement leniency or a compliance grace period while interpretive uncertainties remain unresolved.

California's "in the state" producer definition highlights the complexity and variability of EPR compliance across states. We also encourage CalRecycle to maintain flexible regulatory provisions for Producer Responsibility Organizations to support harmonized reporting and fee payment deadlines with other state EPR programs, thereby minimizing the reporting burden on businesses.

Thank you for your thoughtful consideration of these comments and for your continued collaboration with stakeholders to ensure that the final regulations are both effective and practical.

Response to B-26-1

CalRecycle rejects this comment. With regard to the commenter's request that CalRecycle substitute a list of entities that are in the state in lieu of providing the standard by which an entity might be judged to be in the state, the comment is rejected because the purpose of the regulation is to provide rules of general application. With regard to the comment's suggestion that CalRecycle provide interpretive guidance in the manner described in the May 2025 materials or by the exercise of enforcement discretion, the comment is rejected because it does not pertain to the present rulemaking. In its May 2025 discussion document, CalRecycle explained its intention to "publish illustrations (outside this formal rulemaking)."

B-27: Bonduelle Americas (Jessica Adkins)

Comment B-27-1

On behalf of Bonduelle Americas, I am writing to provide comments on the latest regulatory proposal from California's Department of Resources Recycling and Recovery's ("CalRecycle") implementation of the Plastic Pollution Prevention and Packaging Producer Responsibility Act (SB 54). Bonduelle Americas deeply appreciates this opportunity to participate in the regulatory process and share our concerns about

the significant economic and operational impacts this regulation will have on our ability to continue serving California consumers with affordable, healthy, plant-rich food products.

About Bonduelle Americas

Bonduelle Americas is the U.S. business unit of France-based Groupe Bonduelle, a 170-year-old family company and global leader in plant-rich foods. We are proud to be the first fresh produce company in the United States to achieve Certified B Corporation status, reflecting our commitment to environmental stewardship, social responsibility, and sustainable business practices.

Our California Footprint:

• **Major California Operations**: We operate manufacturing and processing facilities in Irwindale and Salinas, California, with significant agricultural operations throughout the state
• **Over 1,300 Employees in Califronia**: A substantial portion of our workforce is based in California, providing good-paying jobs in manufacturing, agriculture operations, quality assurance, and distribution
• **Grower Partnerships**: We work closely with California farmers and agricultural partners, supporting the state's vital agricultural economy
• **Critical Agricultural Infrastructure**: Our Salinas Valley operations are central to California's lettuce and fresh vegetable production, with seasonal operations coordinating between Salinas and Yuma, Arizona

We produce fresh-cut salads, salad bowls, and plant-rich meal solutions under the Bonduelle brand (previously Ready Pac), available in grocery stores and restaurant chains across California and North America. Our mission - to inspire the transition toward a plant-rich diet to contribute to people's well-being and planet health - aligns with California's environmental goals. However, we believe the current regulatory approach requires reconsideration.

Response to B-27-1

Comment rejected. No response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations, does not raise an objection concerning the rulemaking process, and refers to suggested changes or objections set forth in greater detail in other portions of the submission. To the extent other portions of the submission suggest changes or raise objections, CalRecycle has responded to those portions separately. See response to the continuation of this letter: B-27-2.

Comment B-27-2

Key Concerns

Consumer Affordability and Access to Healthy Food

The proposed EPR system will create substantial new costs, extensive packaging redesign expenses, production line retooling, and administrative compliance requirements. These costs will inevitably be reflected in retail prices.
Fresh produce operates on extremely thin margins. When healthy, convenient plant-based foods become significantly more expensive, California families, particularly lower-income households, will reduce consumption. This outcome contradicts both public health objectives and the environmental benefits of plant-based diets that the state seeks to promote.

The Baseline Doesn't Account for Market Growth

The source reduction baseline does not account for factors outside producer control: California's population growth, expanding e-commerce delivery of fresh foods, and increasing consumer demand for convenient, healthy plant-based meals. A static baseline that doesn't adjust for legitimate market growth means producers will face penalties regardless of genuine sustainability efforts.

Recommendations

We respectfully urge CalRecycle to consider a modified approach that achieves environmental goals while maintaining food affordability, safety, and agricultural viability:

1. Explore alternative policy approaches that emphasize voluntary innovation, collaboration, and measurable impact over mandated fees and penalties.
2. If the current regulatory path proceeds:
a. Ensure a comprehensive economic impact analysis is completed to assess potential effects on consumer prices before final implementation
b. Refine the source reduction baseline to reflect real-world factors such as population growth, e-commerce expansion, and the rising demand for healthy, plant-rich foods.

Conclusion

As a Certified B Corporation, Bonduelle Americas is deeply committed to environmental responsibility. We want to work toward solutions that reduce packaging waste. However, we believe the current EPR approach needs significant modification to avoid unintended consequences: higher food costs for California families, potential food safety compromises, and threats to California's agricultural sector.

We respectfully request that CalRecycle reconsider elements of this regulatory framework to ensure it achieves environmental objectives without imposing unsustainable economic burdens on consumers and the food system that serves them.

We remain committed to collaborating on approaches that protect both California's environment and its residents' access to affordable, safe, healthy food.

Thank you for considering our comments.

Response to B-27-2

CalRecycle rejects this comment to the extent it does not specifically identify or propose any changes to regulatory text or raise an objection related to the rulemaking process. To the extent the commenter raises concerns regarding EPR programs in general, this is outside the scope of the current rulemaking process, and no response is needed. Regarding the factors the commenter requests CalRecycle consider when establishing a source reduction baseline, these factors are subjective, vague hypotheticals, and again, no specific proposed changes or additions to regulatory text are provided, nor is there sufficient justification as to why these specific factors are necessary for implementation or enforcement of the Act. Further, statute does not indicate consideration of any such factors mentioned in the comment, nor does the commenter provide any statutory support in their comment. Implementation of these specific factors would exceed the statutory authority and requirements for establishing the source reduction baseline. The regulations already provide that the Department will update the source reduction baseline in future years consistent with the statutory requirements to ensure it best represents available data. For these reasons this comment is rejected.

B-28: Kaneka America Holdings Green Planet Division (Andrew Durant)

Comment B-28-1

Introduction

On behalf of Kaneka America Holdings Green Planet Division ("Green Planet"), I write to comment on CalRecycle's draft regulations to implement SB 54.

About Kaneka Green Planet

Before commenting, I would like to provide some background information on Kaneka and our Green Planet Division. We have worked for decades to develop biodegradable and compostable PHA/PHBH materials that can be made from a variety of sustainable feedstocks to make products and packaging that substitutes for conventional plastics. This long-term investment reflects a long-held view that the proliferation of single use plastics would create problems that needed to be addressed in part by developing substitute products that looked and acted like fossil-based plastics, but which behaved far differently at the end of life.

Over decades, we have developed over 50 different PHBH grades, which can be used as substitutes for the types of plastics that are not recycled today and, most likely, will never be recycled. Products made using our PHBH material can be both home and

industrially compostable and biodegrade completely in all environments without creating persistent microplastics. (See Attachment 1.)

Our PHA feedstocks are now used in a wide range of food contact and other applications around the world for which there are no reuse or reduction alternatives. In April 2024, for example, SONY announced that it would use Green Planet PHBH to replace polystyrene packaging - becoming the first electronics company to convert to a compostable alternative. Polystyrene is required under SB 54 to hit the 50% recycled rate by 2030, which seems tantamount to a ban, and we have developed a compostable alternative that has been validated by one of the largest consumer electronic brands in the world.

Earlier this year, a major Japanese pharmaceutical company adopted our PHA for press through packaging applications. In another first this year, Mizuno and Kaneka announced a joint development agreement to make biodegradable artificial turf blades and turf filler pellets for indoor applications. This demonstrates that PHAs have broad implications for applications in our everyday lives ranging from food and drink contact applications such as straws and food containers to blister packs for over-the-counter medications to the electronics that we buy and the fields we play on.

Both directly and through our memberships in the Biodegradable Products Institute, we have engaged in discussions with CalRecycle and members of the State Assembly and Senate to educate them on the benefits of PHA compostable materials, and to outline our own views on the need for significant investment in the type of composting infrastructure needed to divert food waste from landfills and to thereby significantly reduce one of America's greatest sources of greenhouse gas emissions.

Response to B-28-1

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it only references the commenter's recommendations; it doesn't set forth those recommendations. To the extent the issues raised require responses, CalRecycle has addressed them in response to other portions of the submission discussing the issues in detail. This response does not address the attachment referenced in the comment because no such attachment was submitted.

Comment B-28-2

Comments

SB 54 was enacted in recognition of the failure of current systems and infrastructure to meet California's earlier mandate that 75 percent solid waste be source reduced, recycled or composted by 2020. According to the SB 54 preamble, only 5% of single use plastics are being recycled. SB 54 anticipates raising $5 billion over 10 years through a variable fee structure that will incentivize companies to migrate towards using less and using better materials. These fees will be used to improve the recycling and

composting infrastructure over this ten-year period, beginning in 2027, so that the new stair-step recycling goals set out in SB 54 can be met.

This ambitious mandate must be met with a visionary plan that understands that there will be a transition period between the current composting infrastructure and what will be developed over the next decade as new funding and products come into the compost stream. We strongly believe that the final regulations adopted by CalRecycle must closely follow science and the rigorous standards that flow from it. Just as we have invested decades to develop our resins that are now being used to make compostable products that replace conventional plastics, the final regulations that you adopt must look out over a longer-term horizon and provide time for composters to take advantage of the funds available to them from the fees that SB 54 will collect. As detailed below, we have grave concerns that, in several important and fundamental ways, the draft regulations fail to meet these requirements. These comments are reflective of the submission by BPI which we associate ourselves with.

Response to B-28-2

Comment rejected. No response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations and does not raise an objection concerning the rulemaking process. To the extent other portions of the submission suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment B-28-3

1. In its latest draft CalRecycle has failed to define 'polymer' as described in AB 1201. As a result, non-compostable products filled with untested and unknown components might evade requirements for testing and certification, putting the integrity of soil in California at risk. As remedy, we've requested the definition of "polymer" in ASTM D883 be included in this regulation to reflect both the intent and the language in existing law. It should be noted that the ASTM D883 definition is referenced for the meaning of "polymer" in both ASTM D6400 and ASTM D6868.

Response to B-28-3

CalRecycle rejects this comment for the reasons provided in response to comment B-14-2.

Comment B-28-4

2. We are concerned about the treatment of fiber and paper products in Section 18980.4(a)(4)(B) and (C). As written, the relevant provisions do not require full "biological decomposition" of fiber and paper products. While a "marketable" compost product might ensure proper pathogen reduction, etc., such a threshold does not align with the conditions necessary to allow for product disintegration and biodegradation as established by ASTM standard specifications D6400 and D6868. This is especially true given that the relevant provisions do not exclude fiber and paper products that contain synthetic polymers derived from natural resources. Such polymers, and paper and fiber

products themselves, should be held to the same standards set for plastic products in the relevant section. To the extent that CalRecycle does not change these provisions to require complete degradation of all materials, it will be sanctioning a dangerous practice, causing substantial harm to human health and the environment, and acting contrary to the text and principles of SB54. We request that this section 18980.4(a)(4)(B)-(C) be removed.

Treating plastic and paper/fiber differently, as the draft regulations do, not only betrays science and how compostables are defined under California law (primarily by AB 1201), but it also suggests that it is acceptable to allow certain products to persist in finished compost piles based on the origin of their materials, not their end of life or certification.

We laud CalRecycle for making clear that claims of compostability claims made pursuant to the D5511 standard are misleading and contrary to California law and urge that this be reiterated at every opportunity.

Response to B-28-4

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42041(aa), 42041(ad), and 42060, and the recommended changes are not necessary to the implementation or enforcement of the Act. To the extent this comment suggests that the standard established for end markets that accept fiber or paper covered material in section 18980.4(a)(4)(C) is inadequate and recommends removal of sections 18980.4(a)(4)(B) and (C) from the proposed regulations, see the response to comment B-14-4. To the extent this comment suggests that paper and fiber products should be held to the same standards set for plastic products, no change is necessary. First, sections 18980.4(a)(4)(B) and (C) do not purport to establish standards for materials themselves; rather, they establish standards for end markets that accept such materials. Second, to the extent this comment might suggest that the same standards should apply to end markets that accept plastic, paper, and fiber materials, see the response to comment B-6-5. Finally, to the extent this comment is concerned with how compostable materials are defined under California law, including AB 1201, no change is necessary because sections 18980.4(a)(4)(B) and (C) do not purport to have any effect on whether items are eligible to be labeled "compostable." See the response to comment O-91-8.

Comment B-28-5

3. The Responsible End Market criteria treat plastic and paper products differently by requiring that plastic break down fully while omitting the same requirement for paper, requiring only that paper be processed with other materials. As a substitute requirement to ensure our end markets are responsible, we ask CalRecycle to employ the newly published ASTM test methods (D8618 and D8619) to ensure facilities provide optimal conditions for covered materials.

Response to B-28-5

CalRecycle rejects this comment. See the responses to comments B-6-5, O-75-12, and O-83-5.

Comment B-28-6

4. We are concerned about the exclusions for "de minimis" elements as the language is inappropriate and vague as it relates to compostable products. Unlike recyclable products that can often be deconstructed to remove non-recyclable components, any "size" or "weight" of non-compostable components within covered products, regardless of "weight or volume," can persist as a contaminant in a compost pile. Fortunately, SB 54 references existing California law (Chapter 5.7), including standard specifications such as ASTM D6400 and D6868 that already set pass/fail criteria to prove the performance of compostable items. This includes testing for biodegradation, which is a microscopic process and cannot be measured in a compost facility but rather requires laboratory testing as well as testing for toxicity. ASTM D6400 and D6868 are the appropriate standards, and an element should be considered "de minimis" only if it complies with these standards. We therefore request that all mention of "composting" and "compostable" be removed from this de minimis allowance, and that components small in weight and/or size are adjudicated as part of a whole product, as covered by existing law designed for this purpose. Alternatively, we request that the relevant provisions be revised to clarify that an element be considered "de minimis" only if the whole product still complies with ASTM D6400 and D6868. Without this clarity, the applicable provisions create uncertainty and allow for products to be considered compostable for purposes of the proposed regulations even if they do not meet these strict standards that ensure such products do not cause harm to human health or the environment.

Response to B-28-6

CalRecycle rejects this comment for the reasons provided in response to comment B-14-3.

Comment B-28-7

Closing

As I have stressed in this submission, we believe that policies based on objective standards should guide CalRecycle.

We appreciate the opportunity to provide these comments and stand ready to answer any questions that you may have.

Response to B-28-7

Comment rejected. No response specific to the commenter's submission is necessary. This closing paragraph summarizes the commenter's recommendations, to which CalRecycle has responded separately.

B-29: CR&R Incorporated (Noam Elroi)

Comment B-29-1

On behalf of CR&R Environmental Services, I thank you for the opportunity to comment on CalRecycle's SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act (SB 54) regulatory process. Below are comments on the proposed revisions to the Draft Regulations released August 19, 2025.

Founded in 1963, CR&R is a Southern California-based waste and recycling collection company, serving more than 3 million people and over 25,000 businesses in Orange, Los Angeles, San Bernardino, Imperial, and Riverside counties. CR&R is contracted with approximately 55 local entities to provide waste and recycling services that support compliance with state laws. With over 2,000 employees, many of whom work under a collective bargaining agreement with Teamsters Local 396, CR&R has long been a leader in the development of climate-friendly, closed-loop waste collection and processing. CR&R owns and operate one of the largest Anaerobic Digestion facilities in North America, providing critical services for meeting organics diversion and short-lived climate pollutant reduction requirements of SB 1383 (Lara, 2016) and the waste stream circularity requirements of SB 54 (Allen, 2022).

Response to B-29-1

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it only references the commenter's recommendations; it doesn't set those recommendations forth. To the extent the issues raised require responses, CalRecycle has addressed them in response to other portions of the submission discussing the issues in detail.

Comment B-29-2

1. Financial Precarity from Decreased Revenue and Incomplete Reimbursement

a. **§18980.1 (a)(2)**

The proposed definition of alternative collection risks undermining the existing legal framework around franchise agreements and the exclusive right of franchise haulers to charge generators to collect discarded material (see California Waste Hauler Council's letter dated October 2025). If alternative collection is allowed to interfere with the current stream of material flowing through curbside collection to our Materials Recovery Facility (MRF), it would undermine the entire economic structure upon which our MRF and fleet was financed. Our investments in the very facilities and equipment that will enable SB 54 were financed based on the expected revenue made from selling all the recyclable material we collect. Alternative collection that interferes with or draws material away from our current curbside collection risks decreasing our revenue from material sales. This decreased revenue would have to be made up in garbage collection rates.

To ensure that local collection programs are not disrupted or undermined, alternative collection programs should not be implemented without approval of the relevant recycling service providers and local government.

Response to B-29-2

CalRecycle rejects this comment for the reasons stated in response to comments B-18-1, B-17-2, B-40-2, and B-42-1. Also, to the extent a producer responsibility plan fails to account for the commenter's concerns about effects on rates, such a plan may be subject to rejection because the plans must provide for funding in a manner that "allow[s] local jurisdictions to protect ratepayers from increased costs" (PRC section 42060(a)(1). A PRO's plan will be subject to scrutiny with regard to whether it will fund costs accordingly, and revisions may be required pursuant to section 18980.6.2(a), as well as pursuant to section 42051.1(b)(1), which requires plans to detail how the PRO will implement"[a]ctions and investments . . . in order to meet the requirements of [SB 54]."

See, also CalRecycle's response to comment O-47-2 regarding effects on franchise agreements.

Comment B-29-3

b. **§18980.8(g)(4)**

It is extremely difficult and expensive to secure loans and seed capital debt under the vague guarantee of "reasonable" periods for making determinations of covered costs and issuing reimbursement payments. If recycling service providers are required to begin collection of Covered Material Category (CMC) materials so promptly, more certainty is needed regarding when these costs will be reimbursed so that we can begin the process of securing funding for facility improvements. Reimbursement timelines should be established in regulation.

Response to B-29-3

Comment rejected. The commenter's objection is to the phrase "reasonable periods," but that phrase in section 18980.8(g)(4) is not a "vague guarantee" of when determinations of covered costs will be made. Rather, that provision imposes on the PRO the obligation to establish such a guarantee, thereby addressing the commenter's concern over certainty.

To the extent the commenter intended to object to delaying the establishment of "reasonable periods" until CalRecycle has approved a PRO plan, CalRecycle declines to make any change in response to that objection. The statute contemplates the PRO plan setting forth the details of the process it will use, and, until there is an approved plan, there cannot be any process for the PRO to make determinations of covered costs to begin with. To the extent any local jurisdiction or recycling service provider cannot satisfy its obligation to begin collection of covered material categories due to funding difficulties in the

meantime, the statute provides a remedy (exemptions pursuant to Public Resources Code section 42060.5(b)).
To the extent the commenter intended to object to affording the PRO any discretion to establish "reasonable periods" in its plan, CalRecycle declines to make any change in response to that objection. With input from the advisory board and the public at large, CalRecycle retains discretion to reject any plan that establishes periods for reimbursements that frustrate the purpose of the statute or create undue compliance challenges. The following statutory provisions ensure that the plan is sufficiently detailed and that CalRecycle can require the PRO to address deficiencies related to the reimbursement process:

• PRC section 42051.1(b)(1): Requires the plan to identify "actions and investments that the PRO will implement in order to meet the requirements of this chapter and address the needs and investments identified in the needs assessment."

• PRC section 42051.1(c)(2): Requires the plan to describe "How the PRO will support and achieve, and how the budget will fund, the collection, processing, recycling, or composting of . . . covered materials to meet the requirements of this chapter."

• PRC section 42051.1(g)(1): "The plan shall include a process for determining and paying the costs that will be incurred by local jurisdictions, recycling service providers, alternative collection systems, and others under this chapter[.]"

For a plan to satisfy these requirements, it must address concerns like the one raised by the commenter. In particular, PRC section 42051.1(g)(1) requires the plan to establish a "process for determining and paying the costs," and multiple other statutory provisions firmly establish that the PRO's (or Independent Producer's) statutory obligations include providing funding for local jurisdictions and recycling service providers necessary for that success. (See, for example, PRC sections 42051(b)(2)(B)(ii) and 42051.1(g)(1), and (j)(1)(B).) For a plan to identify how the PRO will meet its statutory obligations—the bedrock requirement established by section 42051.1(b)(1)—payment and other cost-related processes necessarily must ensure that payments are made in a timely manner.

Comment B-29-4

c. **§18980.8(g)(6)**

The establishment of performance-based reimbursement likely only stands to hurt operators and those making the investments that enable circularity. SB 54 clearly states that haulers and local governments are to be fully reimbursed for the costs associated with implementing increased diversion, not that they are to be reimbursed based on their ability to fulfill the ambitions of the Producer Responsibility Organization (PRO).

Payments based on performance could lead to recycling service providers making good faith investments to help achieve the goals of SB 54 and then losing money if the performance-based formula doesn't lead to as much reimbursement as the recycling service provider invested. For example, a recycling service provider could invest in a new sorting line to manage film plastic but, because of the practical difficulties of sorting the material, the shifting markets, or issues with generator compliance, not end up diverting as much material as the PRO wanted. If reimbursement was based on performance, the recycling service provider may be left with the remaining costs. Whereas, if reimbursement was for the entire cost of investments made, the recycling service provider would not run this risk. Performance-based reimbursement should only be an option that recycling service providers and jurisdictions can opt in to, not a structure the PRO can impose.

Response to B-29-4

Comment rejected. Section 18980.3.2(g)(6) unambiguously states that a performance-based approach must be optional. They must be in addition to a claims-based approach described in the preceding paragraphs.

Comment B-29-5

2. Compostability

a. **§18980.3.3, § 18980.4.**

Article 4, § 18980.4 suggests that bioplastics may only be sent to end markets where they completely breakdown. Along with the clarifications in Article 11, §18980.11.1, recent changes seem to suggest that if there are no viable composting end markets that can break down bioplastics in their current system, then recycling service providers can apply for an exemption. CR&R greatly appreciates the flexibility.

We also appreciate the update to the standards for being labeled compostable. The connection to the standards of the National Organics Program (NOP) through the Public Resources Code is very important for the realities of the California compost market. However, we would like to emphasize that products that are not made of NOP-compliant inputs do not have responsible or secure end markets in California, as almost all commercial composting operations adhere to the NOP standards. Even CR&R's state-of-the-art anaerobic digester is incompatible with "compostable" plastics. Further, if our system was somehow modified to break them down, which they currently are not capable of doing, the existing end market for digestate would no longer want the material. End markets are extremely critical to the viability of the materials we produce. This should be considered when giving exemptions for a lack of end markets.

Response to B-29-5

CalRecycle rejects this comment for the reasons stated in response to comment O-47-6.

Comment B-29-6

3. PRO Control of Exemption/Extension Process

a. **§18980.11.1 (d) & (e)**

We appreciate the exemption/extension process that CalRecycle has created in this draft, specifically the sentence that the department shall approve an application if it shows that inclusion of a material in the collection and recycling programs is unpractical. However, we worry about the PRO's apparently outsized role in making these determinations. The PRO obviously has a strong interest in rejecting applications for exemptions/extensions, so the regulation should clearly state that the department is to make its own determination on applications based on the available facts about the current end market and sorting practicalities for a given material.

Response to B-29-6

Comment rejected. No further clarification is necessary because nothing in the proposed regulation purports to give authority to the PRO over the approval or denial of exemption applications, and section 18980.11.1(e) unambiguously states that CalRecycle is the one that approves exemptions, based on the content of applications. The commenter does not explain how they read the text to have the opposite effect.

Comment B-29-7

4. Enforcement

a. **§18980.13 (b), §18980.13.1, PRC §42081 (a)(1)**

The proposed regulations subject recycling service providers to SB 54 enforcement, including penalties of up to $50,000 per day for each covered material category that is not included in a local collection program. We greatly appreciate the work that has been done on the extension and exemption process; nonetheless, the scale of the proposed penalties is extreme – much higher than those included in SB 1383 – and recycling service providers are not the target for responsibility nor enforcement under SB 54. This is in direct conflict with the intention of SB 54 to make recycling service providers and jurisdictions whole for the costs to recycle and compost covered materials.

We recommend that CalRecycle clarify that any fines to recycling service providers would be graduated, meaning that the upper fine amount ($50,000) is the maximum that would be assessed and implemented only after other compliance assistance steps and smaller fines were imposed by the department.

Response to B-29-7

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements set forth in the Act, including in sections 42060, 42060.5, and 42081 of the Public Resources Code, and the recommended change is not

necessary to the implementation or enforcement of the Act. Section 42081(a)(1) provides that CalRecycle may issue a notice of violation to, and impose an administrative civil penalty not to exceed fifty thousand dollars ($50,000) per day per violation on, any entity not in compliance with the Act or any of the regulations adopted to implement the Act. Section 18980.13.2(a) of the proposed regulations implements this statutory provision by specifying that any entity, including a recycling service provider, not in compliance with the Act is subject to penalties pursuant to section 42081(a). However, section 18980.13.2(c) further clarifies that penalty determinations will be made by the CalRecycle director or the director's designee based on evidence presented in hearings conducted pursuant to section 18980.13.4 addressing, at a minimum, the factual factors identified in section 42081(c). Therefore, while section 18980.13.2(a) preserves flexibility for CalRecycle to assess penalties of up to $50,000 per day per violation against a noncompliant recycling service provider consistent with statutory authority, that is a maximum amount and CalRecycle will always make its penalty determinations based on the factual factors and evidence identified in section 18980.13.2(c). The penalties assessed against a noncompliant recycling service provider will necessarily often be far less than the maximum amount of $50,000 per day per violation that is allowed under section 42081(a)(1). No further changes to the proposed regulations are necessary to the implementation or enforcement of the Act.

Comment B-29-8

CR&R has been a pioneer in circular economy waste collection and processing in California for decades and understands the role recycling service providers play in helping local governments and the PRO achieve the goals of SB 54. Again, on behalf of CR&R, I greatly appreciate your consideration of our comments.

Response to B-29-8

Comment rejected. No response specific to the commenter's submission is necessary. This closing paragraph summarizes the commenter's recommendations, to which CalRecycle has responded separately.

B-30: Consumer Technology Association (Ally Peck)

Comment B-30-1

On behalf of the Consumer Technology Association (CTA), we respectfully submit these comments for the implementation of California’s Senate Bill 54: Plastic Pollution Prevention and Packaging Producer Responsibility Act (SB 54). We appreciate the opportunity to offer feedback on the implementation of the law and CalRecycle’s engagement with stakeholders during this process.

CTA is North America’s largest technology trade association. Our members are the world’s leading innovators – from startups to global brands – helping support more than

18 million American jobs. Our member companies have long been recognized for their commitment and leadership in innovation and sustainability, often taking measures to exceed regulatory requirements on environmental design and product stewardship.

Electronics are durable goods and our interests are unique from those associated with the traditional consumer packaged goods that you find at the grocery store. CTA has attached examples of EPS packaging used by the electronics industry, which is necessary for the safe delivery of products.

Response to B-30-1

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it only references the commenter's recommendations; it doesn't set those recommendations forth. To the extent the issues raised require responses, CalRecycle has addressed them in response to other portions of the submission discussing the issues in detail.

Comment B-30-2

Exclusion of Certain Types of Packaging (18980.2.2)

CTA objects to section 18980.2.2(a)(3)(A) regarding the requirement for goods to be covered by an express, written five-year warranty with no exclusion for ordinary wear and tear. This requirement goes outside the scope of the law and is burdensome for manufacturers. A five-year warranty should not be the condition for packaging to be regarded as reusable. Warranty periods are not necessarily tied to product lifespan. **CTA requests that section 18980.2.2(a)(3)(A) be stricken**.

CTA believes that the current scope of “de minimis” is unclear and too narrow. While some polymerbased coatings, adhesives, and inks are assumed to qualify, non-plastic small paper-based components, such as paper lassos or small functional items below 2”x2”, may be excluded from recyclability and therefore deemed non-compliant by 2032. CTA believes that if these components are not explicitly included as a de minimis product, they will be unintentionally banned despite their ability to replace plastic parts and reduce overall plastic use. Additionally, it may trigger producers to use more materials, generating more waste, in order to increase packaging component size.

CTA requests the following provisions:

Section 18980.2.2(b): “Pursuant to subparagraph (A) of paragraph (4) of subdivision (s) of section 42041 of the Public Resources Code, material that is part of, or directly connected to packaging, or that performs a packaging function but is of de minimis weight or volume is not itself packaging for purposes of the Act.”

Section 18980.2.2(b)(1)(B): Modify “independent plastic component” to: “A packaging component, or group of components, that wholly or ~~partially~~ mostly comprises plastic…”

Section 18980.2.2(b)(2)(D): “Designating it as having a de minimis weight or volume enables usage of recyclable, compostable, reusable, or refillable packaging, or enables

the replacement of a plastic component with a functionally equivalent non-plastic material."

Additionally, de minimis could include a clear quantitative target for regulatory certainty. As a reference, de minimis conditions could align with European Packaging and Packaging Waste Regulation, which allow "de minimis" exemptions for "any plastic part representing less than 5 % of the total weight of the whole packaging unit."1

In order to provide better clarify to producers and encourage the transition to more recyclable materials, CTA requests that CalRecycle publish a pre-approved list of common "de minimis" components, including polymer-based adhesives, coatings, varnishes, inks, etc., where such components do not prevent recycling of the whole packaging and meet the other requirements.

These proposals allow CalRecycle to maintain stringent environmental standards while avoiding the unintended elimination of fiber-based alternatives that replace plastic components but fall below current recyclability definitions due to size or form. Additionally, further alignment with SB 343's Material Characterization Study (MCS) categories (e.g., "Other Mixed Paper", that allows for small paper components identifiable as paper and for minor amounts of non-paper materials) helps integrate recycling system realities with regulatory definitions, enhancing clarity and consistency across Californian programs.

Response to B-30-2

CalRecycle rejects this comment. Regarding the warranty described in section 18980.2.2(a)(3)(A), a warranty is described as sufficient but not necessary. Rather, the first sentence of that provision expressly states that the "totality of the circumstances" must be considered.

Regarding the de minimis provisions of 18980.2.2(b), CalRecycle declines to include any components as "explicitly included as a de minimis product." To be considered of de minimis weight or quantity, it is axiomatic that a component must satisfy the burden set forth in statute, which states that de minimis status must be "as determined by the department." Making categorical determinations like the one sought in regulations, as opposed to through a case-specific examination based on a statutory interpretation in regulations, would be contrary to the express language in statute and would be impossible to reverse without the extraordinary effort of undertaking a new formal rulemaking. CalRecycle also rejects the specific textual changes the commenter proposes. Adding the phrase "or that performs a packaging function" to 18980.2.2(b) is unnecessary because any material that "performs a packaging function" is already "part of, or directly connected to packaging"; the proposed text would be redundant. Changing "partially" to "mostly" in 18980.2.2(b)(1)(B) would unlawfully contradict statute: Public Resources Code section 42041(s)(4)(A) prohibits "independent plastic components" from being excluded, and 42041(u) defines "plastic components" as those "made partially or entirely of plastic." Lastly, modifying 18980.2.2(b)(2)(D) as requested would mean that contribution to source

reduction would treat any effects on recycling or composting as irrelevant. Although source reduction is at the top of the hierarchy stated in Public Resources Code section 40051, that does not imply that all items below it should be treated as irrelevant. To the contrary, the presence of recycling and composting in that hierarchy requires that they be considered. Therefore, the de minimis provisions in the proposed regulation accounts for all parts of the hierarchy, including source reduction, which is accounted for in subparagraph (D) (giving consideration to enabling usage of reusable or refillable packaging).
Regarding the proposed quantitative target, CalRecycle declines to adopt a rigid five-percent threshold because considering satisfaction of such a rigid, arbitrary condition as sufficient would have unpredictable, potentially absurd results. Five percent of any component by weight would be a large amount of material for large components and would require ignoring serious problems presented by such amounts. That approach would contradict the traditional meaning of "de minimis": that it encompasses things so small or having so low value that it would be unreasonable or impossible to account for.
Lastly, the proposed regulations already include a process for CalRecycle to do what the commenter requests: publish a list of components that CalRecycle deems to be of de minimis eight or volume. No revision is necessary for CalRecycle to fulfill that request, should CalRecycle find that doing so is possible.

Comment B-30-3

Exemptions for Certain Covered Materials (18980.2.4)

CTA requests that a group of producers, such as a trade association, be able to submit a request for an exemption in order to reduce the burden on CalRecycle to review near identical submissions from a large amount of producers regarding a single type of packaging. CAA is currently the PRO and it's board is only comprised of traditional CPG companies – no durable goods manufacturers that are not retailers have been granted a seat. For this reason, CTA requests trade associations be included so that other industries can appropriately advocate for their self-interests.

CTA requests the that Section 18980.2.4(a) be modified to "~~Only a~~ A PRO, Trade Association or an Independent Producer may submit…"

Additionally, CTA would like to caution CalRecycle from specifying that exemption applications contain granular levels of detail, because it will increase the number of applications that are submitted and thus require more time and effort for CalRecycle to review.

While we agree with the availability of an exemption process, we believe that the current regulations are overly burdensome because they require too much detail from producers to complete the application. **We request that in subsection (c)(4)(A), provisions (iv), (v), (vi), (vii), and (viii) be stricken (pages 3738). We do not believe a producer should be required to propose a detailed phase in plan of the material**

for the which the exemption is being requested and request all references to the phase in plane as outlined in clause (viii) of subparagraph (A) be stricken.

We request that in subsection (c)(4)(B), provisions (ii), (iii), (iv), (v), (vi) (pages 38-40) be stricken. While we agree that the information included in these subsections is important, we do not believe that producers will have access to all this information and be able to properly complete the application, thus this information should be optional.

CTA believes that subsection (f) is repetitive and requests it be stricken (pages 42-43).
If subsection (h) remains, which we request it be stricken, we request that language be included that requires the Department to notify the applicant 120 days prior to the expiration of their exemption that a renewal is required.

Response to B-30-3

Comment rejected. Regarding the first proposal, that a group of producers be able to submit a request for an exemption, CalRecycle declines to make that change for the reasons stated in response to comment B-30-4.

Regarding the general "caution" against granular levels of details, that suggestion is vague and cannot be responded to with particularity. Because of the potentially drastic effect that exemptions may have, requiring significant details to justify any exemption is appropriate. If the justification for an exemption is especially clear and strong, providing the level of detail needed to justify the exemption according to the standards described in 18980.2.4(f) will naturally be less burdensome. Moreover, to the extent a commenter is unable to present information and analysis for any particular factor, they are free to indicate as such and explain that inability. The proposed regulations do not preclude CalRecycle from concluding that an exemption is justified despite the applicant's inability to fully evaluate any one factor.

Regarding the proposal that subsection (c)(4)(A), provisions (iv), (v), (vi), (vii), and (viii) be stricken, CalRecycle declines to make that change for multiple reasons. First of all, a phase-in plan is not required generally; as explained in (c)(4)(A)(viii), no phase-in plan is needed if one would be unfeasible or unnecessary to prevent interference with achievement of the statute's express purpose and core requirements. The commenter offers no explanation (other than that they "do not believe" it should be included) for why this commonsense provision should be deleted. Regarding the other clauses mentioned (clauses (iv), (v), (vi), and (vii)), the commenter asserts, with no explanation, that they require "too much detail." Failing to explain that assertion is brazen considering the stakes of granting exemptions under PRC section 42060(a)(3) and (4). Those exemptions grant producers the right to disregard the core requirements of SB 54: that covered materials be recyclable or compostable and achieve certain recycling rates (PRC section 42050). In other words, the exemptions have the exact opposite effect that statute requires the regulations to achieve

(see PRC section 42060(a)). Given that juxtaposition, the regulations must ensure that exemptions are only available where an application firmly establishes that, on balance, the exemption serves, rather than hinders, the statutory goals stated in PRC section 42060(a). The regulations would fail the basic mandate set forth in PRC section 42060(a) if they were to allow exemptions that are not actually necessary.

Regarding the request that (c)(4)(B), provisions (ii), (iii), (iv), (v), (vi) be stricken, those provisions are, as the commenter concedes, important and relevant. The commenter's objection is not that the information required is irrelevant, but rather that producers may not have access to it, so that the information should not be "part of the application itself." In effect, the commenter asserts that producers should not be required to develop or obtain access to the information necessary to justify receiving the benefit of an exception from state law. But the commenter provides no explanation, and CalRecycle is unaware of any, for why a producer could not do so, nor does the commenter suggest who, if not the producer, is better situated to obtain and present the information that the commenter concedes is important. The core function of the law is to assign responsibility to producers, and the provisions at issue appropriately assign to producers the burden of justifying why CalRecycle should limit that responsibility.

Moreover, for some of the provisions listed by the commenter, it is untrue that the producer would not have access to the required information. The commenter suggests deleting substantially all of section 18980.2.4(c)(4)(B), but those provisions concern the difficulties that the producer itself faces in establishing an alternative collection programs. A producer necessarily either has the required information or is well-situated to acquire or develop it.

Regarding the proposal to strike subdivision (f), that provision is not repetitive of any other provision, and the commenter provides no explanation for its contention otherwise. Notably, it identifies no provisions of which it is repetitive. Regarding subdivision (h), the commenter offhandedly requests that that subdivision be stricken, with no explanation as to why; CalRecycle declines that request because addressing how exemptions could be renewed is a commonsense, necessary element of the exemption process. Regarding the request that applicants be notified that a renewal is required, that provision would unnecessarily burden CalRecycle with a ministerial task; no explanation is given for why applicants would need notification of a deadline of which they were put on notice when the exemption was granted.

Comment B-30-4

Scope of Exemptions (18980.2.7)

CTA appreciates that an entire class of products can apply for an exemption. For reasons outlined in response to Section (18980.2.4), CTA requests that a group of producers, such as a trade association, be able to submit exemption applications on behalf of producers.

Response to B-30-4

Comment rejected. Because it would be impracticable for CalRecycle to evaluate all exemption requests in a reasonably timely manner without some mechanism to facilitate meritorious, non-repetitive applications, section 18980.2.4(a) was added to require applications to be submitted by a PRO on behalf of its participating producers or by an Independent Producer. Considering applications by a trade organization would not provide the same benefit because there would be no assurance that the trade organization adequately represents producers it purports to represent. In contrast, a PRO necessarily represents a large number of producers, and producers are required to join a PRO or be Independent Producers. In effect, the PRO is authorized to fill the role the commenter suggests for groups of producers and trade organizations. Moreover, nothing in the proposed regulations prevents any producer or trade organization from collaborating with a PRO regarding an exemption application.

Comment B-30-5

Recyclability (18980.3)

Across various international and domestic standards and guidelines, there is consistent recognition that fiber-based materials remain classified as paper even when they contain coatings, adhesives, or inks, provided they are predominantly composed of fiber and meet recyclability criteria.

Response to B-30-5

Comment rejected. This comment identifies "international and domestic standards and guidelines" but does not explain why they are a concern, how they relate to the proposed regulations' recyclability provisions, or how the commenter proposes the regulations be revised. To the extent the commenter intended to suggest that certain materials' recyclability should be subject to different standards than those required under Public Resources Code section 42355.51(d), CalRecycle rejects that suggestion because statute expressly requires evaluation of recyclability to apply those standards. To the extent the commenter intended to suggest that certain products should be classified differently than covered material categories lists that CalRecycle has published to date, no response is required because those publications are not part of this rulemaking.

Comment B-30-6

Recyclability of Certain Covered Material Categories Identified by the Department (18980.3.1)

On the topic of recyclability labeling at subsection (c)(4)(B), CTA would like to reiterate previous comments we have made to CalRecycle. The presence of any chasing arrows symbol on an electronics package is for the sole purpose of compliance with legal requirements (including those in foreign countries and territories) and is not a marketing claim. The ban on chasing arrows will create supply chain challenges for any industry

the manufacturers goods on a national or global scale. Most importantly, it will disproportionately affect the electronics industry over any other industry in a negative manner because of the global labeling mandates for batteries and electronic waste. **CTA requests that electronic products and their packaging be exempt from any regulation that limit or ban the use of chasing arrows symbols.**

Additionally, CTA believes that the prohibition on use of recycling symbols required by laws of other countries and the requirement to have PCR content certified by an accredited third-party violates Article 2.1 (Technical Barriers to Trade) by the WTO:

“Members shall ensure that in respect of technical regulations, products imported from the territory of any Member shall be accorded treatment no less favourable than that accorded to like products of national origin and to like products originating in any other country.”

Response to B-30-6

CalRecycle rejects this comment because it does not suggest any specific changes to the proposed regulations or raise issues related to the rulemaking process. To the extent the commenter intended to propose that the regulations expressly state that there is no limit or ban on the use of chasing arrows on particular products, no change is necessary because neither the statute nor the proposed regulations purport to impose such limitations. The commenter's concerns are not relevant to compliance with any provision of SB 54 even if, despite the limitation in PRC section 42355.51(c)(2), some other California law bans the chasing arrows in circumstances where federal law requires it. Section 18980.3.1(c)(4)(B), for example, does not limit or ban the usage of the word "recyclable" or the "chasing arrows" symbol; rather, it requires examination of the effect of deeming that usage lawful because that effect would be directly relevant to the exemption set forth in PRC section 42061(a)(3)(B). Likewise, if covered material fails to satisfy the criteria to be considered "recyclable," it violates PRC section 42050(b) (unless it is compostable), but whether that covered material was labeled using the "chasing arrows" symbol would be irrelevant to that violation.

Comment B-30-7

Methodology for Recycling Rate Determination (18980.3.2)

In order to achieve the required source reduction targets, electronic packaging may increase the number of components in order to substantially decrease the overall weight. For example, electronic products can reduce their packaging material by transitioning from single large block of EPS or molded fiber to four smaller corner pieces, reducing the amount of total material but increasing the components. CTA would like to emphasize that component number is not an accurate measure of total packaging.

CTA agrees with the determination in subsection (c) that the “(r)ecycling rate shall be calculated based on the weight of materials, rather than volume or number.”

CTA also agrees with subsection (d)(1), that a single recycling rate be attributed to all components that are not detachable. However, we would like to emphasize that electronics manufacturers are not tracking metrics based on this level of detail and may not be able to report on the differing levels of nondetachable material components.

Additionally, Section 18980.3.2(d)(2) indicates that recycling rates should be calculated for each detachable component. Currently, manufacturers of electronics are not tracking metrics based on this level of detail. CTA disagrees with this specific methodology. **We request that 18980.3.2(d)(2) be stricken.**

CTA disagrees with subsection (e) that the inability to meet the granular level of reporting required by CalRecycle should automatically be marked as “unreported” and be assumed to not meet the required rates. CalRecycle should create reporting procedures that are achievable based on the current data metrics that companies are tracking. CTA believes this requirement will disproportionately affect small businesses and industries such as the durable goods that require more complex packaging. **We request that 18980.3.2(e) be stricken.**

Response to B-30-7

CalRecycle rejects the recommendation to remove 18980.3.2(d)(2). The commenter's only justification for the request that it be removed is that certain manufacturers currently "are not tracking metrics based on this level of detail." No justification is given with respect to achieving the purposes of the statute, including calculating recycling rates so that the rates accurately reflect the degree to which materials get recycled. CalRecycle also rejects the request that 18980.3.2(e) be removed. The core feature of the statute (and any EPR law) is that producers, through the PRO and otherwise, are responsible for implementing a plan for reducing packaging waste and increasing recycling and composting of packaging. Solving challenges related to reporting the amount of packaging in use is an inherent part of that responsibility.

Comment B-30-8

Third-Party Validation (18980.3.4)

CTA opposes the requirement that an independent third-party certification be needed to verify postconsumer recycled content. We believe that requiring third parties to be approved by the Department will be challenging for global companies that manufacture and package their products outside the United States, especially in countries where English is not a first language.

We ask CalRecycle to provide additional information on how they intend to communicate with international third-party validating entities and not discriminate based on the race, language or location of a supplier of post-consumer recycled content.

For these reasons, CTA believes that a certificate of compliance from suppliers should qualify as meeting the third party certification requirement.

CTA requests that Section 18980.3.4(a) be modified to “(a) A PRO shall not apply the source reduction credit based on incorporation of postconsumer recycled content, as described in section 42057(a)(2)(B)(i) of the Public Resources Code, unless the alternative compliance formula described for doing so has been proposed and approved as part of a PRO’s plan in accordance with this section or a certificate of compliance has been provided from a supplier.”

Response to B-30-8

Comment rejected. The commenter's requests conflicts with the statutory requirement in PRC sections 42053(e)(1) that requires third-party validation entities be approved by CalRecycle. Further, section 42057(a)(2)(B)(i) of the PRC requires third party validation be undertaken by "a third party, such as the Association of Plastic Recyclers, through its APR Postconsumer Resin Certification Program, or a similar third party approved by the department...", reiterating the statutory requirement that a third party must be approved by the department. Allowing a certificate of compliance provided by the supplier would again conflict with statute. Finally, the section 18980.3.4(b) of the proposed regulations implements that third-party validation provision of statute such that a producer responsibility plan (also subject to approval by the department) may rely on the Association of Plastic Recyclers validation program for purposes of section 42057(a)(2)(B)(i) or propose a different third-party validation entity for CalRecycle's approval. As such, the commenter's request to change the proposed regulatory text to authorize use of a certificate of compliance from a supplier conflicts with statute, and as such, no change is appropriate.

Comment B-30-9

Producer Compliance (18980.5)

CTA believes the 30-day timeline for producers to register with CalRecycle, register with the PRO, and report 2023 baseline packaging data, including current CMCs, plastic components and weight is unreasonably short. While CAA and those companies funding CAA may be supportive of this timeline, it is not a timeline that is in the best interest of the entire packaging industry.

This 30-day timeline is unfeasible, especially given the lack of finalized guidance on key concepts such as “plastic components” and “de minimis” classifications. Guidance as to what constitutes a plastic component unit and how to consider their weights will not be available. Producers will be forced to submit rough or exaggerated baseline data without clarity on methodology or definitions. It is also possible that sales data from 2023 will not be readily available at the required level of granularity.

CTA requests that the deadline for submitting 2023 baseline packaging data to be no sooner than 90 days after final guidance is published including:

o The definition and methodology for calculating “plastic components” units and weights.

o The publication of a reference list of components or groups of components that qualify as “de minimis.”

Extending the timeline and clarifying expectations would improve data quality, reduce reporting errors, and enable better environmental tracking. Without this, producers may overreport plastic components (e.g., assuming every adhesive or coating is an individual component), resulting in inflated baselines that complicate source reduction targets. This approach would better align with the law’s goals of meaningful reporting, transparency, and measurable progress toward plastic waste reduction. CTA requests the following update:

Section 18980.5.(d): “Each producer that applies to become a participant of an approved PRO pursuant to subdivision (b) of this section shall, ~~at the time of its application~~, submit to the PRO that producer’s supply data for calendar year 2023, no sooner than 90 days after the effective date of this chapter. For purposes of this subdivision, “supply data” means the information described in section 18980.10.2.”

Response to B-30-9

CalRecycle rejects this comment for the reasons stated in I-62-4, I-62-8, and B-1-1.

Comment B-30-10

NEW SUBSECTION 18980.5(e)

CTA respectfully request that the regulations explicitly include a provision allowing producers to audit the operations and reporting of the Producer Responsibility Organization (PRO) to ensure transparency, accuracy, and compliance with SB 54 requirements. Such audits would provide producers with assurance that collected data, recycling rates, and associated fees are being properly managed and reported. CAA is supposed to be a collective representation of the producers, yet CAA consistently has failed to give producers detailed information on their operating systems. CAA has claimed to consult with CalRecycle on implementing the law, yet has not solicited feedback from their registered producers for information. CTA requests that more CAA be required to provide greater transparency to the producers it represents. Furthermore, the CAA Board is comprised of a limited number of homogeneous producers, unfairly marginalizing the durable goods industry.

Including this provision would enhance accountability, strengthen trust in the program, and support effective implementation of producer responsibility in California

Response to B-30-10

CalRecycle rejects this comment to the extent the commenter's submission concerns proposed changes or additions that are already sufficiently addressed and satisfied throughout both the Act and the proposed regulations, ensuring transparency, third party audits, and the Department's ability to request records, conduct investigations, etc., making the addition unnecessary and duplicative.

Portions addressing the audits, reporting, and investigations include, but are not limited to sections 18980.3(f), 18980.4.2, and 18980.9 of the proposed regulations, as well as section 42080(a) of the PRC which states in relevant part " [t]he department may conduct investigations, including by inspecting operations, facilities, and records of producers and PROs and by performing audits of producers and PROs, to determine whether entities are complying with the requirements of this chapter." Further, no substantive response is required to the portion of the comment addressing the commenter's opinions regarding CAA as this raises general concerns without stating any specific recommendation or explanation of its objections to the proposed regulations. As such, no further response is necessary.

Comment B-30-11

Eco-modulated Fees (18980.6.7)

Section 18980.6.7(i) asserts that a fee will be charged to producers that use CMCs containing a chemical listed under section 25249.8 of the Health and Safety Code, this translates to a chemical listed under Proposition 65 (Prop 65). It would be pertinent for CalRecycle to understand that there are close to 1,000 chemicals listed under Prop 65, and that Prop 65 is an exposure-based not concentration-based law. CTA believes that this requirement is not only unduly burdensome for manufacturers but goes beyond the intent and text of the law. **Therefore, CTA requests this section be stricken from the draft regulations**.

In Section 18980.6.7(j), it is proposed that a credit be given to producers that use renewable materials (not fossil fuel-based plastic). We request that a credit also be applied for the use of recycled content. Using recycled plastic has a better net effect on the Earth's climate than using the materials outlined in subjection (j) "wood, mycelium, algae, or plants such as cotton, corn, sugar cane, or wheat". CTA proposes that life cycle assessment be used to substantiate the environmental benefits of these materials over others and the basis for these credits.

Response to B-30-11

CalRecycle rejects this comment. To the extent this comment recommends striking section 18980.6.7(i) from the proposed regulations, see the response to comment B-11-9. To the extent this comment recommends including a fee credit for the use of recycled content, no change is necessary because such a credit is already established under PRC section 42053(e)(1). Finally, to the extent this comment recommends requiring the use of life cycle assessment to substantiate the environmental benefits of renewable materials as a basis for fee credits, the proposed regulations are consistent with the requirements of the Act and no change is necessary to the implementation of the Act. PRC section 42053(a) makes clear that the PRO is responsible for establishing and developing a producer fee schedule that includes producer fees that are adjusted using malus fees or credits based on the factors specified in PRC section 42053(e). As such, under PRC section 42053(e) and sections 18980.6.7(b), (f), and (j) of the proposed regulations, the PRO retains the discretion to determine and charge

eco-modulated fees in a manner that it deems appropriate so long as it is consistent with the requirements of the Act. No further change is necessary.

Comment B-30-12

Source Reduction Baseline Report and Annual Reports (18980.9)

CTA rejects the revision that all reporting entities submit a source reduction baseline report in 2026 as opposed to 2027. We request that this revision be rejected and the 2027 date be restored.

CTA requests that the source reduction baseline report include only the total amount of plastic covered material by weight and not by number of components. As previously stated in earlier sections, producers are not currently tracking data on this level of granularity and are not required by other EPR laws to report by the number of components. Reporting on number of components will be unduly burdensome for producers.

Additionally, CTA believes that producers will have trouble supplying historical data to supplement the reporting requirement for 2023 as the baseline year.

CTA urges the regulations to acknowledge the significant complexities and ambiguities associated with tertiary packaging in global electronics supply chains. Tertiary packaging—such as pallets, crates, and shipping containers—often passes through multiple tiers of manufacturers, distributors, and retailers, creating uncertainty over which party is responsible for reporting under SB 54. Without clear guidance, there is a risk of double reporting and inconsistent accounting, and producers often lack visibility into when and where portions of the tertiary packaging are ultimately disposed. **We respectfully request that the regulations provide additional guidance on how reporting for tertiary packaging should be conducted, including clear delineation of responsibilities across the supply chain, to ensure accurate reporting, reduce redundancy, and support a practical, enforceable framework for extended producer responsibility.**

Response to B-30-12

To the extent the commenter objects to reporting entities submitting a source reduction baseline report in 2026 as opposed to 2027, CalRecycle rejects this comment for the reasons stated in the response to comments B-27-2, I-63-15, O-48-5, and O-41-4.

Regarding the remainder of the comment, CalRecycle rejects the commenters proposed revision of section 18980.9 to eliminate reporting by number of components as section 42057(a)(1) expressly requires in plain statutory language that producers achieve an aggregate 25 percent reduction "by weight and by number of plastic covered material" by January 1, 2032. Accordingly, the Department is statutorily obligated to collect data "by weight and by number of plastic covered material" to establish the baseline against which reductions will be measured.

Further, CalRecycle provides for flexibility and reasonable accommodations to track individual component counts through estimation methodologies supported by verifiable data sources as already noted in section 18980.9(c)(2) of the proposed regulations which establishes a balance to minimizes burdens while maintaining the integrity of statutory measurement requirements.

Finally, regarding the commenter's concerns on tertiary packaging, for any clarification on tertiary packaging that is not already included in statute, including section 42041(s)(3) of the PRC which establishes that tertiary packaging is within the scope of covered material and Chapter 11.1 and Article 9 of the proposed regulations already provide sufficient comprehensive guidance; however, if additional clarification is required. the Department may provide additional guidance documents to address any legitimate and necessary concerns. As such, no further changes to the regulations are necessary at this time. Please see also responses to B-30-2 and B-30-7 regarding responses to similar comments.

Comment B-30-13

Data Report Contents (18980.10.2)

As we previously stated in earlier sections, CTA believes that reporting should be based only on weight of material and not number of units. Reducing the number of units does not necessarily decrease the total amount of plastic used and thus weight should be the only metric of measurement. Additionally, producers are not currently tracking or required to report on number of units and the requirement to do so would be burdensome. **Thus, CTA requests subsection (a)(1)(B) be stricken.**

Response to B-30-13

CalRecycle rejects this comment for the reasons stated in response to comment B-30-12.

Comment B-30-14

Thank you again for the opportunity to provide these comments for the implementation of California's SB 54: Plastic Pollution Prevention and Packaging Producer Responsibility Act. We would welcome further engagement with CalRecycle. If you have any questions about our above comments, please do not hesitate to contact me at apeck@cta.tech.

Response to B-30-14

CalRecycle rejects this comment, and no response specific to this portion of the commenter's submission is necessary as it does not proposed any changes to the regulations or objections to the rulemaking process. This closing paragraph merely summarizes the commenter's recommendations, to which CalRecycle has responded separately.

B-31: Dow (Sam Gammage)

Comment B-31-1

The Dow Chemical Company ("Dow") appreciates the opportunity provided by the California Department of Resources Recycling and Recovery ("CalRecycle" or the "Department") to submit written comments on the August 22, 2025, Proposed Regulatory Text for **SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act Regulations**. SB 54 imposes minimum content requirements for single-use packaging and plastic food service ware, to be achieved through an extended producer responsibility (EPR) program.

Over the course of multiple iterations of this rulemaking, CalRecycle has prioritized implementation of a program that follows the intent and laws codified in SB 54 while also minimizing costs to consumers. We at Dow believe the May 16, 2025 informal text and August 22, 2025 proposed regulatory text have taken a pragmatic and appropriate approach to doing so.

As noted on the CalRecycle SB 54 webpage: "California's landmark packaging law is the most significant overhaul of California's plastics and packaging recycling policy in history. It goes further than any other state on cutting single-use plastic at the source and represents a giant step toward a more circular economy that is essential to combat climate change."1 We appreciate the work that CalRecycle has done to attempt to implement a program that is implementable by producers and businesses while also considering the potential costs for consumers.

> **Response to B-31-1**
>
> Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment B-31-2

ARTICLE 4: Responsible End Markets

Section 18980.4. Responsible End Market Criteria

In Article 4, Section 18980.4 - Responsible End Market Criteria, Dow appreciates further definition of responsible end markets within the larger circular supply chain. However, the *"point at which a product becomes a feedstock that meets the quality standards necessary to be used in lieu of virgin material"* may occur prior to the creation of a pellet. At Dow/Circulus mechanical recycling facilities, the pelletization does most accurately *become the point at which a product that may be used in lieu of a virgin material.* In the case of non-mechanical recycling, however, plastic feedstocks are converted into a form that can replace virgin fossil fuel feedstocks. Because of this, for non-mechanically recycled plastics, the end market point should be at the place where it

is utilized *in lieu of virgin fossil fuel feedstocks for the creation of new or reconstituted products.*

Response to B-31-2

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including PRC sections 42041(aa), 42041(ad), and 42060, and no change is necessary to the implementation of the Act. Section 18980.4.1(d)(4) of the proposed regulations already provides that, before a non-mechanical technology may be considered recycling under PRC section 42041(aa), any facility using the technology must provide the PRO with a description of the technology and how that technology is consistent with the definition of recycling under PRC section 42041(aa). Because PRC section 42041(aa)(3) provides that covered material must be sent to a responsible end market to be considered recycled, the facility using non-mechanical technology will be required to demonstrate how it is a responsible end market consistent with PRC section 42041(ad). Therefore, the proposed regulations already provide a route for facilities using non-mechanical technologies to be considered a responsible end market so long as they satisfy all the requirements of PRC section 42041(aa) and 42041(ad) and section 18980.4.1(d) of the proposed regulations, and no further change is necessary.

Comment B-31-3

Section 18980.4.1 End Market Identification

In Article 4, Section 18980.4.1 – End Market Identification. The goals of this law cannot be achieved without innovation, both regulatory and scientific. **At Dow, our ambition is to be the most innovative, customer centric, inclusive, and sustainable materials science company in the world.**, as demonstrated by our 127 year history of innovation.

Dow appreciates CalRecycle's thoughtful approach to include new recycling technologies within the framework of this regulation. The pathway allowed for under this section acknowledges that while there are recycling technologies operating at scale today, these landmark policies will also create new opportunities for innovation. As written, this allows for those innovations to be appropriately evaluated and implemented to support achieving the goals of this legislation. In addition, previous versions of the rule included "physical" recycling as a category of recycling that could be considered end markets without further review. Dow recommends that this rule restore and reflect that physical as well as mechanical be recognized as an end market technology. Dow is actively developing innovative plastic dissolution processes to recycle plastics that do not chemically alter or breach chemical bonds and should be accepted alongside traditional mechanical recycling.

Response to B-31-3

CalRecycle rejects this comment. To the extent this comment expresses support for the proposed regulations' approach to new recycling technologies, the comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process. To the extent this comment recommends including language explicitly allowing "physical" recycling along with mechanical recycling, see the response to comment B-11-8.

Comment B-31-4

Section 18980.4.3. End Market Development

Dow appreciates CalRecycle's inclusion of "alternative collection programs" as a category for end market development financial support. Currently, the most effective method of collection for flexible film packaging is through store drop-off sites. Significant investment and research are currently being employed to develop and enhance the collection systems for flexible films and enable a shift towards curbside collection systems and increased consumer participation. We appreciate that these draft regulations recognize both alternative and jurisdictional collection methods in determining recyclability. In addition, we recommend that CalRecycle, at a later time, review current recyclability regulations and laws to identify any challenges or discrepancies in how collection systems and material recovery are accounted for.

Response to B-31-4

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process. As the comment recognizes, the recommended actions for CalRecycle to undertake relate to other recyclability regulations and laws and are therefore outside the scope of this rulemaking.

Comment B-31-5

ARTICLE 6: Requirements for the Producer Responsibility Organization

Section 18980.6.7 Eco-Modulated Fee Schedule

In Article 6, Section 18980.6.7 – Eco-Modulated Fee Schedule, (i) cross references Section 25249.8 of Health and Safety Code to the process for which materials are listed on the Proposition 65 list by The California Office of Environmental Health Hazard Assessment (OEHHA). Dow recommends striking this cross reference to Section 25249.8 of Health and Safety Code and that CalRecycle instead come up with its own process for assessing the malus fee as allowed for in SB 54. Proposition 65 was created with a specific intent to warn consumers of potential exposure to certain listed chemicals. Proposition 65 as adopted did not anticipate or allocate a fee simply for being listed on Prop 65 but only assesses a fee when found in violation of the Prop 65 warning requirements. The allocation of a "malus fee" for being a covered material and

listed on Prop 65 creates a scenario where The State of California may be going beyond their authority as allowed by Proposition 65.

Response to B-31-5

CalRecycle rejects this comment. See the response to comment B-11-9.

Comment B-31-6

ARTICLE 8: Producer Responsibility Plan Requirements

Section 18980.8. Producer Responsibility Plan

In Article 8, Section 18980.8 – Producer Responsibility Plan, similarly to Section 18980.4.1 above designates a pathway and process for which innovative technologies may be approved by the PRO as end market technologies. We appreciate the approach that CalRecycle is taking to ensure that the intent of SB 54 is fulfilled by not just relying on current recycling technologies but to also allows for innovators to have a pathway to help create a more circular economy and meet the goals of SB 54.

Response to B-31-6

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process.

Comment B-31-7

Background & Dow Initiatives

Dow is committed to shifting towards a more circular economy and has taken significant steps (below) towards this effort. We believe that well-designed EPR policies have a significant role to play in this transition. The State of California has an opportunity now to implement just such a policy and support the transition to a more circular economy.

Dow's strategy is to enable a shift to a circular economy for plastics by focusing on resource efficiency and integrating recycled content and renewable feedstocks into its production processes and designing for recyclability. Our goal is to ensure the value of plastic waste is fully utilized to create new, circular plastics that can be used again and again. We are investing in new product technology, value chain partnerships, business models and waste management infrastructure to discover and scale sustainable solutions that extend the useful life of materials and the resources that go into making them. We are using circular economy principles to support the waste hierarchy by rethinking traditional, linear "take-make-dispose" way of doing business to adopt new ways of working that maximize the value and use of our resources.

From the top down, Dow is committed to eliminating plastic pollution and has supported initiatives to do so:

- Dow CEO: My company is a major plastic producer. We must end plastic pollution.
- Dow: We Can't Miss this Opportunity to End Plastic Pollution

Dow has announced ambitious actions to capture the value of plastic waste and to accelerate its investments, partnerships, and projects to produce circular and low-carbon solutions and increasing the use of bio-based and plastic waste derived feedstocks (both from non-mechanical recycling and mechanical recycling).

In addition, we are convening and driving partnerships to collaborate toward solutions around the Globe. Dow is a participant in The Recycling Partnership's CalFFlex Initiative that aims to create pathways for film and flexible packaging compliance with California's SB 54 by improving recycling rates, validating end-market capacity, and generating demand for recycled products for film and flexibles. We are also a founding member of the Alliance to End Plastic Waste and a founding investor in Circulate Capital's $100 million Ocean Fund, and the Closed Loop Circular Plastics Fund in the US. Funding from these organizations has gone toward increasing collection and along with growing new end markets for hard to recycle plastics.

Please let us know if you have any questions.

Response to B-31-7

Comment rejected. No response specific to the commenter's submission is necessary. This closing paragraph summarizes the commenter's recommendations, to which CalRecycle has responded separately.

B-32: BASF (Jeanette Hanna)

Comment B-32-1

Thank you for the opportunity to comment on the August 2025 proposed regulation text for Senate Bill (SB) 54 ("the August 2025 proposed regulation"), as issued by the California Department of Resources Recycling and Recovery ("CalRecycle").
At BASF, we create chemistry for a sustainable future. BASF is a diverse global company that manufactures products and conducts research and development in industries ranging from automotive, electronics, paints and coatings, pharmaceuticals, personal care hygiene, and agricultural products, among a wide range of others. We employ 16,000 employees in North America, including over 250 employees in California located at 9 research and development and manufacturing sites across the state. BASF prides itself on developing innovative solutions to promote a circular and sustainable economy.

The biopolymers business at BASF makes certified compostable and certified soil biodegradable resins, which are raw materials for products sold across the world that help facilitate large-scale organic waste diversion. Collection and composting of organic

waste at scale is essential for California to meet its greenhouse gas (GHG) reduction goals and to offset impacts of climate change via the use of compost, which has been shown to increase water-holding capacity of soils, prevent erosion, and directly sequester carbon.

• **Comments on the new language. [General]**
We would like to acknowledge CalRecycle for conducting an informal rulemaking period earlier this year to address systemic issues from previous drafts in a comprehensive manner. Despite these engagements and improvements, we regret that many of our comments from the past rulemaking periods remain unaddressed, as key parts of the revised draft regulations are not consistent with either the intent or language in the statute with respect to critical issues for organics programs. As a result, in this document, we will revisit our comments previously outlined during the informal rulemaking process in May 2025.

The approach CalRecycle has taken with respect to compostable products and the composting marketplace remains unimplementable and illogical, arbitrarily punishing products containing certified compostable plastics in a manner that is outside the scope of the legislation, while giving a pass to other arbitrarily defined product groups.

We have significant concerns that key parts of the regulations are not based in science, common definitions, nor intent of the law. Furthermore, they undermine the importance of proven performance of certified compostable products by opening the door to toxins and persistent species in compost due to fully removing any scientific performance requirements for fiber-based products. In addition to this approach to fiber products, this regulation as currently drafted will effectively prevent any composter from accepting a certified compostable product containing plastic, even though it has proven performance and demonstrated safety for use in compost. It is not clear why CalRecycle is choosing to open the door to allow products that are untested and unproven to enter the environment, regardless of the level of harm they may cause, but seeks to prohibit participation by those that are fully tested and confirmed to meet statutory requirements.

We again wish to advise that certified compostable products are a critical part of large-scale organic waste diversion programs. Residents and businesses alike need these products to reduce contamination at composting facilities and cleanly and safely divert organics. Consumers need to be assured packaging is designed to ensure food safety and preserve shelf-life to reduce illness and/or food waste in the upstream value chain.

We are hopeful that CalRecycle will take a step back and come to recognize the importance of the role of certified compostable products in SB54 for creating a robust circular economy for organics in California in support of meeting California's climate goals. It is necessary to design a system that takes organics diversion into the future, based on evidence and learning from the past.

Response to B-32-1

For responses to comments in this submission (comment codes beginning "B-32"), see CalRecycle's responses to comments B-34-1 through B-34-9, which are identical to those in this submission.

Comment B-32-2

• **CalRecycle must align the definition of "plastic or polymers" in [18980.1(a)(16)] with correct definitions, because when taken together with [18980.3.3(c)(3)] and [18980.3.3(c)(4)] the result will be a reduction in compost quality and harm to the environment.**

We have made this request through multiple rulemaking periods. It is unfathomable that CalRecycle would intentionally exceed its statutory authority to 1) change the meaning and intent of this language already in statute from AB1201, and 2) fully ignore the meaning of a well-defined and fully understood term.

o We have made a gentle request in previous rulemaking periods to address this, but this has not drawn the attention of CalRecycle, so we will reiterate our comment and urge the agency to modify the regulatory text.

The 61-Day Changes did include a partial definition of "polymer" which was then lost in the First 15-Day changes, and despite our comments, was not remedied in the Second 15-Day Changes, nor in the May 2025 proposed regulation. As a result of not following the proper scientific definition of "polymer", *CalRecycle is opening the door to allow potentially non-biodegradable and harmful materials into compost, and ultimately the open environment, without testing or other evaluation.*

o While we appreciate the attempt to explain this action as described in the Initial Statement of Reasons (ISOR), it is clear there as well, that CalRecycle has a significant error in understanding the meaning of the statute, which, as we explain, is unambiguous.

 The first explanation given by CalRecycle for ignoring the definition of "polymer" is that the exemption relates only to the rate of composting. This is not correct. It is an exemption from having to meet a standard specification which includes requirements for biodegradation, disintegration, ecotoxicity, and control of constituents. The "rate of composting" proposed by CalRecycle in the ISOR is addressed by disintegration only; all of the other criteria are critically important for protecting compost quality and the resulting soil health. The definition of the term "polymer" does not depend the content of ASTM D6400, although it should be noted that the term, "polymer" is explicitly defined that specification.

 The second argument, suggesting that the language in PRC §42356.1(d) is absurd because fiber itself is a polymer, is itself an absurd argument. The phrasing clearly indicates that the basis of the product is fiber and that other polymers are "incorporated". The subsequent argument is therefore fully unfounded. There are many polymers used in products; the only way such an exemption would be valid is if the product could be assured to meet all the requirements of the specification, including

ecotoxicity, biodegradability, and control of constituents, would be if the product was fiber-only.
 It is intended and understood to be an extremely narrow exemption; the specifications for compostable products are critical for ensuring soil health, and therefore, if there are any exemptions, they should be very narrow and only in cases where they are necessary. It would not make sense to exclude a wooden stir stick from being labeled compostable because it does not meet the disintegration requirements in the specification, when it is clear it would also meet the other criteria in the standard specification and composters are already accepting wood in their piles. It is an overreach of CalRecycle to not heed the clear meaning and intent in statute, and to propose the legislature did not intend to include language that safeguards compost quality.

o As we have previously stated, the term "polymer" is a commonly recognized term and can be found in the dictionary. To further explain the etymology of the term, "poly" means "many", and "mer" means "unit/part". A polymer is a molecule made of many repeating units. "Polymers" are not plastics (they are a much broader category of materials), so in the current regulatory definition, it must necessarily follow that CalRecycle has decided that the word "polymers" has no meaning at all, since the regulatory definition is limited to plastics.

It should therefore be noted that a polymer is not necessarily associated with plastics. We use polymers every day in our soaps, shampoos, conditioners, detergents and so on. Polymers used in these applications can be dispersed in water; they cannot be made into plastics. Polymers are also used in a wide range of lubricants, including the type we use every day in our vehicles. These polymers also cannot be made into plastics. Internet searches turn up a number of biological molecules that are polymers, such as DNA, or proteins, etc., none of which can be made into plastics.

While there are some special polymers that can be used to make plastics, it must be noted that this is a very specific subset of the entire class of "polymers".

Based on this overview, we wish to highlight that typically non-plastic , polymers are used in the process for making paper; the polymers used depend on the performance needed in the intended fiber-based product. It is for this reason that it *is very important that composters only accept certified compostable paper products, not just any and all paper products.* Otherwise, composters will be accepting chemicals of all kinds, including not only polymers but other additives that may not break down in a timely manner, and risk introduction of toxic materials into their compost product and ultimately the soil.

o While we have previously argued this is a scientific matter, we will here reframe this topic as simply a matter of recognizing the meaning of a common term in the English language. However, we have to point out that the common usage of this term is based in robust science, and taking any other position directly undermines decades of scientific work and consensus-based standards development. By inventing a definition

for "polymer" which is not correct, CalRecycle undermines and arbitrarily and invalidly modifies existing statute which requires products making a compostability claim to be tested.

o Not only is the definition incorrect, in this instance, CalRecycle has essentially stated that "polymers" is a word with no meaning since "plastics and polymers" shares a definition with "plastics". Even in the statutory text of SB 54, the definition of "plastic" does not equate all polymers to plastics, but rather, denotes that only a specific subset of polymers are examples of "plastics," proving that the intent of the legislation is not to wholly equate these two terms. See PRC §42041(t).

o The consequences of CalRecycle exceeding its authority to either attempt to change existing statute, or set a conflicting requirement under SB54 by not respecting the meaning of a word will create far-reaching and significant challenges in implementing this law.

As we have previously submitted, this incomplete and incorrect definition will result in a serious risk of harm to compost quality by turning a very narrow exemption in Section 18980.3.3(c)(4) to a very broad one, which is not in line with the intent or language of the existing statute in PRC §42356.1(d). Because paper and fiber products can contain a wide range of polymers, it is essential that paper and fiber products be certified compostable to ensure that they biodegrade and disintegrate appropriately in a compost pile, that they will not cause harm to plant growth, and that they will not contain components that are harmful to the environment. We therefore ask that the definition of "polymers" directly references the definition in ASTM D883.

polymer, *n—a substance consisting of molecules characterized by the repetition (neglecting ends, branch junctions and other minor irregularities) of one or more types of monomeric units. (2024)*
We ask that the definition of "polymer" in ASTM D883 is included in this regulation to reflect both the intent and the language in existing statute, Public Resources Code (PRC) §42356.1(d); *it is not within the scope of rulemaking for SB54 to change the definition of "polymers" to "plastics" and create new regulations for statutes resulting from AB1201 or create new regulations under SB54 that conflict with the legislative text.*

It should be noted that the ASTM D883 definition is referenced for the meaning of "polymer" in both ASTM D6400 and ASTM D6868, which are the foundational performance criteria for products labeled compostable in existing statute.

o The intent and language behind the exemption in PRC §42356.1(d) is clear because it was written specifically using the well-known meaning of the word "polymers". It therefore only applies to products like wooden stir sticks or cutlery which are physically carved from wood and do not have any additional polymers added to them. As previously explained, CalRecycle is likely already aware that products made only of wood do not always meet the disintegration requirements of ASTM D6400, like plastic

and paper-based products do, and therefore cannot be certified; it is for this reason that the exemption in PRC §42356.1(d) exists.

We must further point to the fact that the language in PRC §42356.1(d) is effectively the same as exemption language for compostable product labeling in other states, such as Minnesota and Washington . In these states, it is clear that this is a very narrow exemption for a few outlier products; unlike California, these states are not simply giving a free pass on performance and safety to all fiber-based products so long as they do not include plastics.

Considering the proposed language in section 18980.3.3(c)(4), *this incorrect definition for "plastic or polymers" results in allowing any product containing fiber to not be certified or tested, regardless of the non-biodegradable content, the rate of disintegration, or the amount of toxins it contains,* because the proposed definition of "plastic or polymers" in 18980.1(a)(16) only includes plastics. The disclaimer in section 18980.3.3(c)(6) is not sufficient to cover this oversight because it creates an impossible contradiction that would result allowing products that are not tested for performance and safety to be treated as such under SB54, but not in the marketplace. In addition to creating an inequity under SB54, it would increase consumer confusion, which could result
in these products being sent to a composting facility and potentially contaminating the compost.

o As a result of the economic and environmental harm this matter is likely to cause, we similarly object to the references to the definition in section 18980.1(a)(16) in section 18980.3.3, and in particular, as referenced in 18980.3.3(c)(4). Furthermore, it is clearly the intention of CalRecycle to ignore the word "polymer" in 18980.3.3(c)(4)(A)(ii), since it only references that the "substance does not constitute plastic".

o We ask CalRecycle how they justify acting outside the law by not using the proper definition of "polymers", considering the impact it will have on products making false claims and having a free pass to harm the environment. Furthermore, fiber-based products that have demonstrated no evidence of compostability, but are considered compostable due to these regulations, would be expected to receive favorable treatment under the PRO, while contaminating compost piles.

Response to B-32-2

CalRecycle has responded to this comment in its response to comment B-34-2, which is substantively identical to this one.

Comment B-32-3

• **CalRecycle must include the most important criteria for making a compostability claim prior to adding compostable materials to the covered material category (CMC) list. [18980.2.5(d)]**

In this section, CalRecycle is creating an uneven playing field by allowing a product that has not demonstrated that it is compostable to be considered compostable on the CMC list. This would make the CMC list discordant with existing statute that requires a product making a compostability claim to meet certain criteria, including meeting the ASTM standard specifications. And, according to that existing statute, PRC §42357, it would constitute an unlawful compostability claim for the product to be included on the CMC list as compostable.

CalRecycle has not yet named a certifier, as authorized under PRC §42357(g)(1)(A); therefore to be consistent with existing statute, a change in the proposed regulatory language must be made, as we have previously requested.

o Section 18980.2.5(d) states that compostability determinations for the CMC list are based on the "criteria set forth in subdivision (b) of section 18980.3.3. However, the criteria included in section 18980.3.3(b) *alone are not sufficient to determine whether a product can be safely composted* as long as no certifier has been named; such a product is therefore not suitable for inclusion on the CMC list.

o The criteria included in section 18980.3.3(b) are all secondary to the critical performance criteria for a compostable product, namely meeting biodegradation, disintegration, and toxicity requirements that are included in the requirements in section 18980.3.3(a).

We request the language in Section 18980.2.5(d) read:

(d) To update the compostability determinations of the CMC list pursuant to subdivision (e) of section 42061 of the Public Resources Code, the Department shall follow the requirements and apply the criteria set forth in ***subdivisions (a) and (b)*** ~~*subdivision (b)*~~ *of section 18980.3.3 of these regulations.*

Response to B-32-3

For responses to comments in this submission (comment codes beginning "B-32"), see CalRecycle's responses to comments B-34-1 through B-34-9, which are identical to those in this submission.

Comment B-32-4

• **CalRecycle must remove the references to PRC §42357(g)(1)(B) which is not consistent with legislative intent. [18980.3.3(b)] [18980.3.3(c)(2)]**

California statute contains many criteria for making a valid compostability claim. It seems to be the intention of CalRecycle to continue to refer to only one criterion from this longer list in statute that permit a product to be eligible to be labeled compostable.

o The claim in the ISOR that this is the only logical way to "interpret section 42357(b)(1)(B) for the purposes of...section 42050(b) is unfounded, especially since 42357(b)(1)(B) does not exist. There is no justification given in the ISOR to counter that

the legislative text specifically references PRC Chapter 5.7 commencing with PRC §42355; in no way is PRC §42357(g)(1)(B) referenced or implied as a priority criteria in the legislation, and therefore should not be separately called out in the regulations, as the statue directly indicates it is included with all of the other criteria.

o It should be further noted that this particular criterion in PRC §42357(g)(1)(B) related to being allowed in organic compost has no technical merit. The requirement to be allowed in organic compost is arbitrary, and it would be appropriate for CalRecycle to instead reference statute that includes the entire list of criteria for being able to be labeled compostable.

o By choosing one particular criterion, CalRecycle has ignored the clear mandate in SB54 legislative text that the criteria for being eligible to be labeled compostable are established in PRC Chapter 5.7 commencing with PRC §42355.

Section 18980.3.3(b)(1) and (2) of the draft regulatory text creates new criteria which is not consistent with the legislative language in SB54; while some of these are elements are included in PRC Chapter 5.7, beginning with section 42355, it was clear the intent of SB54 was to include products that meet all the criteria in PRC Chapter 5.7 to be eligible to be labeled compostable, not to reproduce specific elements in statute in the regulations, ignoring others.

Section 18980.3.3(b)(1) states that materials must meet the requirements related to the NOP under PRC §42357(g)(1)(B), which is unnecessary, and inconsistent with the legislative language in SB54, which can be found in PRC §42050. The statute in PRC §42050 clearly states that products that meet the requirements in PRC Chapter 5.7 commencing with §42355 are to be included on the covered materials list, which would include the language in 18980.3.3(b). As a result, we find the current proposal that specifies PRC §42357(g)(1)(B) unnecessary and duplicative, and more importantly, it overlooks the other criteria which are established in PRC Chapter 5.7 commencing with §42355, which are relevant and important for materials.

o Section 18980.3.3(b)(2) specifies additional criteria for items, but that criteria is already referenced in 18980.3.3(a), and therefore, is duplicative and irregular to arbitrarily call out individual sections which are included in 18980.3.3(a), when this can simply be directly referenced as it was in the legislation.

It should also be noted that at this time, in section 18980.3.3, *there is no requirement for any products "eligible to be labeled compostable" to be tested or certified,* because CalRecycle has not approved a third-party certifier as indicated in section 18980.3.3(c)(3).

Secondarily, none of the compostable products subject to section 18980.3.3 must meet the testing requirements, because all the requirements listed in this section that are applicable are for the materials in the products rather than the finished products themselves. This is a second significant oversight that would be devastating for both

compost quality and the environment. CalRecycle must ensure finished products are required to meet the performance standards established in ASTM D6400 and ASTM D6868, as specifically directed in PRC 42357(a)(1); otherwise, there is no assurance that they will biodegrade, disintegrate, and be safe for compost. The language in section 18980.3.3(c)(6) is not sufficient to prevent the harm that will result from this regulation which is not consistent with existing statute. Those harms may include: increased confusion in the market from consumers; effective penalties for compostable product producers who do the right thing and certify their products; and ultimately, potential generation of low-quality compost that could damage the environment.

We request the language in Section 18980.3.3(b) read:

(b) The list published by the Department pursuant to subdivision (d) of section 42061 of the Public Resources Code shall identify each covered material category that ***meets the criteria in PRC section 42355-42357.5*** *~~[satisfies both of the following conditions: (1) There are materials within the covered material category that satisfy the requirements set forth in subparagraph (B) or paragraph (1) of subdivision (g) of section 42357 of the PRC. (2)]~~. The covered material category may encompass any ~~covered material that, if used by~~ individual items that* ***meet the requirements to be eligible to be labeled compostable as described in Section 18980.3.3(a)*** *~~[meets the requirements set forth in paragraphs (3) through (5) of subdivision (c), would be eligible to be labeled compostable~~].*

Response to B-32-4

For responses to comments in this submission (comment codes beginning "B-32"), see CalRecycle's responses to comments B-34-1 through B-34-9, which are identical to those in this submission.

Comment B-32-5

• CalRecycle must define a responsible end market for compostables that will allow all covered products equal access. [18980.4(a)(4)(B)], [18980.4(a)4(C)]

We find it highly irregular that requirements for individual items are specified to have different end market requirements. It far exceeds CalRecycle's authority to arbitrarily create different criteria for products that *are processed together* in the *same process* for composters *who run a single process* to compost a broad diversity of products and manufacture the *same compost.*

At the May 27, 2025 workshop, CalRecycle disclosed that this decision was taken because compostable plastic items and paper items have different responsible end markets. This reveals a fundamental lack of understanding of both compostable products and composting by CalRecycle. We ask that if CalRecycle is going to assert such a position, that they must provide the evidence that indicates this is indeed the case and explain why it is the case, as it is absurd on its face.

In general, we support requirements for a composter to demonstrate that they can process the covered materials, but the requirements in 18980.4(a)(4)(B) are impossible for a composter to achieve. First, "biologically decompose" has no scientific definition, so there is no technical criteria a composter could meet to demonstrate they are in compliance with the regulations. Secondly, conversion to carbon dioxide can only be monitored in a closed system, which therefore must take place in a laboratory. We have previously submitted that if a composter makes compost of sufficient quality, then 1) it must meet the regulatory requirements for compost quality in California, and 2) that the composter manages their process such that they make stable and mature compost, in particular as described in ASTM D8618 or ASTM D8619, which define the requirements for stable and mature compost.

Because the language in 18980.4(a)(4)(B) makes it impossible for a composter to comply, it therefore blocks the end market for compostable plastic products, which is arbitrarily defined set of products, and it harms composters who wish to accept compostable plastics, since they would be required to run a process that has to meet not only arbitrary, but unknown, criteria for their finished product.

The ISOR states that certified compostable plastics cannot be a "recycled organic product", presumably because CalRecycle does not believe they are "organic solid wastes"; however, this is not correct. Certified compostable products are organic materials, as they are comprised of carbon, and like all organic materials collected for composting, they are capable of biodegrading by the action of naturally occurring microorganisms in a composting facility, at a rate consistent with other feedstocks and without harmful effects. While current regulations allow composters to have a de-minimis level of persistent plastic contamination, like their fiber-based counterparts, certified compostable materials will also continue to biodegrade over time, ultimately leaving no persistent microplastics.

The language in 18980.4(a)(4)(B) was formerly applied to all covered materials, but in this version of the regulations, a composter who accepts fiber-based products (and an unclear and arbitrary selection of other products) can be a responsible end market, since the resulting compost must only meet a few of the current state regulations for compost quality. While we appreciate this change, we advise that it is woefully insufficient unless it includes criteria for stable and mature compost. Otherwise, the output of the composting facility will not be stable and will only be appropriate for use in limited applications. Furthermore, this section must be properly applied to all covered materials, not an arbitrary subset.

In an analogous case for recycling, it would not be appropriate or proportional for CalRecycle to declare that a responsible end market for one plastic chemistry type has criteria impossible to achieve, and another type of plastic chemistry responsible end market would have a very low performance requirement. Or, perhaps more relevant, would be a case where CalRecycle decided that metal recycling had a low bar to be considered a responsible end market, but plastics recycling was impossible to achieve because there were no defined criteria that could be met to demonstrate compliance.

We ask CalRecycle to explain why it is fair and equitable that a composter who wishes to accept compostable plastics is effectively prohibited from doing so under these regulations, receiving no funding or support for processing them or developing education programs that help residents and businesses divert organic waste.

In addition to creating an unlevel marketspace, Section 18980.4(a)(4)(C) also creates a number of problems related to terminology. First, we have to point to the fact that CalRecycle has grievously erred in not properly including the definition of "polymer"; please see our earlier comments on that definition and the resulting impact as it relates to fiber products.

Secondly, this section also refers to materials made from "natural resources" which, is undefined, and that the references to "mineral origin" or "fossil fuels" are not correct in this context. If terms with no definition or terms with the wrong definition are used throughout the regulations, it is not clear how the resulting EPR program will function, as it will lack a clear and valid framework; market participants will not be clear how they can comply.

We further object to the fact that section 18980.4(a)(4)(C) appears to allow all compostable products except those with fossil content to be included, although, that is incompatible with both the language in this section as well as what is described in Section 18980.4(a)(4)(B). It is also inconsistent with the statutory text in SB54. Most importantly, though, it is well-known that there are certified compostable resins made with fossil sources and there is no reason to exclude a product with proven performance from participating in this EPR program due to an arbitrary and out-of-scope opinion on covered material feedstocks. Indeed, it must be noted that all certified composable products, regardless of the origin of the feedstock, are tested and certified to ensure they are both biodegradable and will not have harmful effects, and they will continue to biodegrade after the composting process is complete, should a very small piece remain at the end of the composting process.8,9,10 Nothing in SB 54 authorizes the inclusion of this discriminatory requirement; and if CalRecycle believes it has the legal authority to impose such a requirement, we specifically ask that they point it out.

Therefore, we ask CalRecycle to adopt the following language for Section 18980.4(a)(4)(B), and to remove newly added Section 18980.4(a)(4)(C) entirely:

~~*[For items partially or wholly constituting plastic, any covered material or derivative material intentionally included in the process used to generate a recycled organic product must fully biologically decompose. The entity must neither dispose the undecomposed material nor send it to another entity that subsequently disposes it, and the entity must ensure that it fully biologically decomposes, through additional processes conducted either by the entity or by subsequent entities to which the material is transferred. Covered material inadvertently included in the process that remain undecomposed shall be considered incompatible materials and are subject to paragraph (3) of subdivision (a).]*~~ ***Any covered material intentionally included in the***

process used to generate a recycle organic product may be processed in a manner consistent with the management of other feedstocks to produce a stable and mature marketable product as described in ASTM D8618 or ASTM D8619, and which complies with the standards found in sections 17868.2, 17868.3, and 17868.3.1 Of Article 7 of Chapter 3.1 of Division 7 of Title 14 of the California Code of Regulations or in sections 17896.59, 17869.60, and 17896.61 of Article 6 of Chapter 3.2 of Division 7 of Title 14 of the California Code of Regulations.

Response to B-32-5

For responses to comments in this submission (comment codes beginning "B-32"), see CalRecycle's responses to comments B-34-1 through B-34-9, which are identical to those in this submission.

Comment B-32-6

• **CalRecycle must make corrections relating to compostables for eco-modulation fees with respect to setting the base fee [18980.6.7(e)] and the adjusted fees, or malus fees [18980.6.7(f)]**

We have asked for this problematic language to be addressed in previous versions because it is statutorily irrelevant, would cause harm to products making legitimate compostability claims, and would increase confusion in the consumer markets. The language being proposed allows arbitrary and unsubstantiated claims.

o In proposed section 18980.6.7(e)(1)(A), the regulatory text states that a PRO shall include a justification of the base rate for a given material, and it is stated that data pertaining to the "biodegradation or disintegration rate of compostable covered materials" is relevant. This provision needs to be removed, as there is no clear statutory directive to include this provision, and in practice, it would set the compostable products industry back over 20 years to a time when these types of invalid and arbitrary relational claims were regularly made.

Nowhere in statute does it indicate that CalRecycle should use "biodegredation or disintegration rate[s] of compostable covered materials" as a metric for setting a base rate for compostable products. We do not see a justification outlined in 42053(d)(1), nor in 42053(d)(2), and subsections (d)(3) and (d)(4) are unrelated. Therefore, we specifically ask CalRecycle to justify the inclusion of this provision in the regulatory text.

In practice, "biodegredation or disintegration rate[s]" are not appropriate metrics; rather, certified compostable products meet pass-fail criteria, and meeting these criteria confirms their performance. The very purpose of the certification is to prevent producers from making arbitrary and unsubstantiated claims about a "degree" of compostability that cannot be compared in a relevant fashion. As iterated above, this section (18980.6.7(e)) references PRC 42053(d) which addresses the ease and cost of composting, based on specifically outlined considerations in subsections (1)(A)(E)); it does not address biodegradation or disintegration rates. It is therefore outside the scope of the statute for CalRecycle to arbitrarily create a forum for making false claims,

as there is no way to scientifically demonstrate any relevant information on this topic for the purposes of setting rates.

Secondly, the sentence in 18980.6.7(e) regarding biodegradation and disintegration rates of compostable covered materials is used in parallel with recycling rates. These are two entirely separate criteria; recycling rates have to do with the volume of material being processed; biodegradation rates and disintegration rates have no bearing on volume or throughput. If CalRecycle is looking for parallel criteria in the composting industry, then we suggest considering the frequency of processing a given compostable item, even though that has no specific relevance for composters.

We wish to make clear that, in practice, ease and cost of composting a product come from a number of factors independent of the product, as noted in PRC 42053(d)(1). These factors include the origin of the organics feedstock stream (residential, industrial, commercial, institutional), the mix of the feedstocks (back of house or front of house), and the contamination that may come along from that location (based on composter ability to provide waste generator feedback and education programs). It should be left to the PRO to determine what criteria best fit the base rates once the needs assessment is complete. In particular, we raise this because education is the responsibility of the PRO. We ask CalRecycle to remove the reference to biodegradation and disintegration rates of compostable covered materials in 18980.6.7(e)(1)(A), as this is clearly out of scope of the statute.

Therefore, we propose the following language for Section 18980.6.7(e)(1)(A):

In setting the base fee rates, a PRO shall include a justification of each rate. The justification shall address each factor specified in subdivision (d) of section 42053 of the Public Resources Code. The justification for fees shall be informed, at a minimum, by the relevant data, if any, in the most recent needs assessment, the most recent material characterization study conducted pursuant to subdivision (a) of section 42061 of the Public Resources Code, source reduction data, data pertaining to recycling rates, and data pertaining to ***frequency of use*** *[~~the biodegradation or disintegration rates~~] of compostable covered materials* ***determined by the needs assessment or other waste audit****.*

o For the same reason, we ask that “data pertaining to biodegradation or disintegration rates of compostable covered materials” be stricken from 18980.6.7(f)(1) related to setting malus fees. This language is not in SB54 nor in any other statute, and CalRecycle should refrain from introducing this provision in the regulations. In particular, in 18980.6.7(f), all the attributes designated for malus fees and credits are related to attributes of products that are not associated with end-of-life performance which is already addressed in the covered material categories. It relates to quantity of material, use, feedstocks, and other attributes of products that can affect environmental impact or help modify consumer behavior and result in higher composting rates (e.g., PRC 42053(e)(5)). We suggest that this section is designed for products that are causing contamination at composting facilities, so capturing the contamination rate is

most relevant for the assigning of malus fees for noncompostable products, as it is well-known this is one of the biggest challenges composters face at this time. Malus fees are intended to be the feedback loop for problematic products, and the end goal is to ensure that composters are successful in their endeavors. Composters do not have a sorting pre-process like recyclers do, so it is especially important that contamination is addressed at the source.

Therefore, we propose the following language for Section 18980.6.7(f)(1):

The justification shall be done by covered material category and shall address each factor specified in subdivision (e) of section 42053 of the Public Resources Code. The justification for malus fees and credits shall be informed, at a minimum, by the relevant date, if any, in the most recent needs assessment, the most recent material characterization study conducted pursuant to subdivision (a) of section 42061 of the Public Resources Code, source reduction data, data pertaining to recycling rates, and data pertaining to ***rate of contamination in composting facilities*** *~~[biodegradation or disintegration rates of compostable covered materials]~~.*

Response to B-32-6

For responses to comments in this submission (comment codes beginning "B-32"), see CalRecycle's responses to comments B-34-1 through B-34-9, which are identical to those in this submission.

Comment B-32-7

• **We request an edit to the definition of "renewable materials". [18980.6.7(j)(1)]**

We again request that CalRecycle use terms with scientific accuracy and in a responsible manner, instead of using undefined terms or terms with clear meaning in a context that does not make sense.

First of all, "renewable materials" should be inclusive of all renewable feedstocks, and it can be simplified to use common terms that are recognized globally, instead of introducing new and undefined terms, such as "natural resource".

It should be noted that "minerals" are not a feedstock for plastics; "minerals" are commonly understood to be inorganic materials, and they would not contain any carbon suitable for making a plastic, which is an organic, carbon-based product. Additionally, "fuels" are not feedstocks for plastics either; fossil resources such as oil and gas are feedstocks. We therefore also ask that the reference to "fuel" be removed. Furthermore, because of limited access to biobased feedstocks, we ask that the requirement to be "wholly derived" be removed. The renewable feedstock content can be readily reported, and therefore, credit should be prorated accordingly. Finally, the meaning of "without resulting in the net depletion of any of the resources" is not clear. Any feedstock used to create a product will be consumed in the manufacturing process. If the idea is to consider rapidly renewable sources, then this should be defined, using terms that are already well-known and understood, such as "renewable"

and “biogenic” as defined in ASTM D6866. It should be noted that these terms are also used in 18980.4(a)

We also want to make clear that the reference to “renewable materials” in PRC §42053(e)(7) is the *feedstock* of the plastic, not the final article which is stated to be *derived* from these feedstocks.

We propose and request adoption of the following:

“Renewable materials” for the purposes of paragraph (7) of subdivision (e) of section 42053 of the Public Resources Code means ***feedstocks*** *[~~materials~~] that are made using* ***renewable or biogenic carbon that is not of fossil origin*** *[~~a natural resource that is not of mineral or fossil fuel origin, without resulting in the net depletion of the resource~~]. Examples of potentially renewable material include those derived from wood, mycelium, algae,* ***animals****, or plants such as cotton, corn, sugar cane, or wheat.*

Response to B-32-7

For responses to comments in this submission (comment codes beginning "B-32"), see CalRecycle's responses to comments B-34-1 through B-34-9, which are identical to those in this submission.

Comment B-32-8

• **We request clarification on renewable carbon credits. [18980.6.7(j)(2)]**

It should also be made clear that credits should be applied according to the percentage of biogenic carbon in the feedstocks of the article. Instead of specifying the source of the feedstocks, which is not relevant to the final article, or could be variable, such as in the case where agricultural waste products are used, producers should present a certification that verifies the biogenic carbon content of the feedstocks.

We ask CalRecycle to adopt the following approach and specific regulatory language for Section 18980.6.7(j)(2):

When awarding a credit to participant producers, the PRO shall ***apply credits according to the percentage of measured or attributed biogenic carbon in the feedstocks, when that percentage is confirmed by a third-party certification*** *[~~in its justification specify the feedstocks used to produce the covered material~~].*

This language will help support a transition to renewable feedstocks by allowing for innovation and create rewards based on merit, not arbitrary claims.

Response to B-32-8

For responses to comments in this submission (comment codes beginning "B-32"), see CalRecycle's responses to comments B-34-1 through B-34-9, which are identical to those in this submission.

Comment B-32-9

• **CalRecycle should update the certification section allowing for sufficient time to come into compliance. [18981(b)]**

We would again request that the certification body is given a reasonable amount of time to come into compliance with the ISO17065 accreditation, and that the associated products have an additional three years to come into compliance, as long as the certification body is already accredited. This is consistent with current three-year product certification cycles, and it will allow producers to comply without causing massive disruption in testing labs for unnecessary repeated testing and recertification. We support the comments submitted by the Biodegradable Products Institute on this technical matter.

We thank you for the opportunity to comment and appreciate your consideration of the changes we have put forth above. We would welcome the opportunity to discuss these topics and others related to the implementation process for SB54.

Response to B-32-9

Comment rejected. No time is needed to allow any entity to "come into compliance with the ISO17065 accreditation" because the requirement for certification does not apply until one year after CalRecycle approves an ISO/IEC 17065-accredited entity in the first place. Moreover, PRC section 42357(g)(1)(A) does not authorize CalRecycle to modify that timeline.

B-33: Freepoint Eco-Systems Holdings LLC (Sid Fowler)

Comment B-33-1

Freepoint Eco-Systems Holdings LLC ("Freepoint") appreciates the opportunity to provide comments on the proposed Plastic Pollution Prevention and Packaging Producer Responsibility Act Permanent Regulations (the "Proposed Rule") published by the California Department of Resources Recycling and Recovery ("CalRecycle") on August 22, 2025. Freepoint develops, constructs, owns and operates facilities in the United States and Europe that use pyrolysis to recycle plastic waste. Freepoint is currently in the planning stages of developing a plastic waste processing and densification facility in Yermo, California, that will produce waste plastic pellets to be used in our pyrolysis process to manufacture pyrolysis oil that can be used in lieu of virgin material for the creation of new products.

Established in 2020, Freepoint's mission is to address the global plastic waste problem by developing innovative solutions to achieve a more sustainable future. Freepoint is developing a series of plastic waste processing and densification facilities that will create recycled plastic pellets for our pyrolysis facilities. In some instances, the pellet production and pyrolysis facilities will be co-located at the same facility, and in other instances, they will be located at separate facilities. In all cases, Freepoint will convert

waste plastic into feedstock that meets the quality standards necessary to be used in lieu of virgin material for the creation of new and reconstituted products. Correspondingly, Freepoint supports the objectives of the Plastic Pollution Prevention and Packaging Producer Responsibility Act (the "Act") and California's goal of minimizing waste. Reaching a waste-free future will require the development of innovative and environmentally beneficial technologies in order to process a broader set of plastic waste types in a technologically feasible and economically productive manner.

Freepoint commends CalRecycle for the important changes made to the Proposed Rule from the proposed regulations issued in 2024. As now drafted, the Proposed Rule achieves significantly better consistency with the Act's statutory language and technology-neutral, outcomes-based framework. While Freepoint generally supports the Proposed Rule, it respectfully submits the following comments regarding the Act's legal framework and the Proposed Rule's implementation. First, Freepoint approves of the Proposed Rule's language regarding new recycling technologies, as this language appropriately complies with the Act's framework. Second, that under the Act, Freepoint's pelletization and pyrolysis facilities should qualify as Responsible End Markets. Third, Freepoint objects to the Proposed Rule's establishment of "Intermediate Supply Chain Entities," as it is inconsistent with the Act. Fourth, that the Act does not mandate the use of any particular accounting method to trace recycled content and calculate recycling yield. Specifically, the Act does not prohibit the use of mass balance accounting, so long as such accounting meets the other accounting requirements set forth in the Proposed Rule. And fifth, that while the Rule does not prohibit mass balance accounting, such a prohibition would violate the Dormant Commerce Clause in the U.S. Constitution.

Response to B-33-1

Comment rejected. No response to this introductory portion of the commenter's submission is necessary because the issues raised in it are discussed in greater detail in the later portions. To the extent those later portions require responses, CalRecycle has provided them

Comment B-33-2

I. Freepoint Approves of the Regulatory Requirements for New Recycling Technologies

Section 18980.4.1(d) of the Proposed Rule establishes criteria governing the inclusion of new recycling technologies in a Producer Responsibility Plan. Freepoint supports this section because it appropriately aligns with the Act and carries out the Act's instruction that CalRecycle provide pathways for new recycling technologies while minimizing the generation of hazardous waste. These provisions complement California's mechanical recycling infrastructure by fostering new approaches that expand and improve material recovery.

Consistent with the Act, the Proposed Rule establishes criteria to exclude only those recycling technologies that produce "significant amounts of hazardous waste."1 The Department appropriately exercised its discretion to interpret that term to mean waste

that "presents a substantial risk of harm to public health, or of contamination of the environment," while recognizing that hazardous waste managed in compliance with applicable permits and state and federal law, including the Resource Conservation and Recovery Act, does not present a substantial risk of harm to public health, or of contamination of the environment, and thus does not constitute "significant amounts."2 This interpretation faithfully implements the statutory directive to encourage technologies that minimize the generation of hazardous waste, not to prohibit any generation altogether.

The Proposed Rule similarly carries out the Act's directives by encouraging development of technologies that reduce greenhouse gas emissions, while reducing environmental and environmental justice impacts, and risks to public health. For example, the Proposed Rule requires non-mechanical recycling technologies to conform to ISO 59014:20243 and requires Producer Responsibility Plans to include assessments of potential impacts on disadvantaged and rural communities.4 The Proposed Rule also requires the Producer Responsibility Organization to report the weight of both the total material processed and the hazardous waste produced, enabling CalRecycle to evaluate the technology's performance relative to its waste generation.5 Provisions such as these ensure that innovative technologies will be deployed responsibly while advancing the Act's environmental justice and climate goals.

Response to B-33-2

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment B-33-3

II. Appropriate Treatment of Responsible End Markets under the Proposed Rule

The Act defines "responsible end market" as "a materials market in which the recycling and recovery of materials or the disposal of contaminants is conducted in a way that benefits the environment and minimizes risks to public health and worker health and safety."6 The Act defines "recycling" as "the process of collecting, sorting, cleansing, treating, and reconstituting materials that would otherwise ultimately be disposed of onto land or into water or the atmosphere, and returning them to, or maintaining them within, the economic mainstream in the form of recovered material for new, reused, or reconstituted products, including compost, that meet the quality standards necessary to be used in the marketplace."7

Both the Act and the Proposed Rule establish a broad, technology-neutral standard for Responsible End Markets that allows recycling to encompass technologies that recycle plastic into other materials for reuse. Under the Act, Responsible End Markets encompass a range of entities that use various plastic recycling and recovery processes to produce an assorted set of products. The Act thus supports the development of the diverse approaches needed to achieve the plastic recycling rates required by the Act and California's overall waste reduction goals.

Freepoint believes that the Proposed Rule's definition of the term "responsible end market" is consistent with the Act's definition. While the original language of the Proposed Rule identifying Responsible End Markets for waste plastic was unnecessarily narrow and potentially limiting to only mechanical recycling technologies, Freepoint appreciates that the Proposed Rule now provides that a Responsible End Market for plastic is an entity that "first produces plastic feedstock that meets the quality standards necessary to be used in lieu of virgin material for the creation of new or reconstituted products," and includes but is not limited to "entities that create pellet."8 Freepoint's planned facility in Yermo California will create plastic pellets that can be used in lieu of virgin material for the creation of new plastic and other products, thereby qualifying it as a Responsible End Market under the Proposed Rule.

Alternatively, Freepoint's planned pyrolysis facilities that will produce a hydrocarbon feedstock stream from the plastic pellets produced at the Yermo facility that meets "the quality standards necessary to be used in lieu of virgin material for the creation of new or reconstituted products," should also qualify as Responsible End Markets for waste plastic. Through the application of heat in the absence of oxygen, pyrolysis converts post-use plastic into a recovered product that can be reintroduced into the plastics supply chain as a substitute for virgin hydrocarbons. This process constitutes the collection, treatment, and reconstitution of materials that would otherwise be disposed of and returns them to productive use as recovered material, falling squarely within the Act's definition of "recycling."9

Moreover, Freepoint's process does not involve combustion, incineration, energy recovery, or fuel production, and thus avoids the exclusions set forth in the Act.10 Rather, the process "is conducted in a way that benefits the environment and minimizes risks to public health and worker health and safety" because Freepoint's facilities reduce diversion to landfills and incinerators, significantly lower overall lifecycle emissions compared to virgin fossil production,11 and expand the range of plastic categories that can be recycled. Nothing in the Act forecloses the recognition of such facilities as Responsible End Markets, and a reading that excludes them would contradict the Act's broad, technology-neutral framework.

The Proposed Rule appropriately implements the Act's technology-neutral approach by establishing criteria that focus on outcomes and environmental protections, rather than prescribing specific recycling technologies. Section 18980.4 sets forth a comprehensive list of requirements that a facility must meet to qualify as a Responsible End Market, including applicable environmental permits, proper handling and disposal of incompatible materials, transparency through chain-of-custody documentation, cooperation with third-party audits, and achievement of average recycling yields as specified in the producer responsibility plan. Freepoint's pyrolysis facilities satisfy each of these requirements.12

Response to B-33-3

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment B-33-4

III. The Proposed Rule's Regulations Governing Intermediate Supply Chain Entities are not Supported by Statutory Authority

The Proposed Rule establishes regulations governing "intermediate supply chain entities" and distinguishes such entities from Responsible End Markets. The term "intermediate supply chain" appears nowhere in the Act, nor does the concept of regulating an entity that is not a plastic producer, retailer, wholesaler, recycler, online marketplace, or a producer responsibility organization. The Act does not grant CalRecycle broad authority to regulate any entity that it chooses in furtherance of the goals of the Act. Rather, the Act is highly prescriptive in the regulation of specific entities to meet the recycling requirements of the Act. Moreover, California agencies may not promulgate any regulation that is not only consistent with the enabling statute, but also reasonably necessary to carry out that statute's purpose.13

Nonetheless, the Proposed Rule proposes to regulate any entity that collects "materials after they have been collected."14 In doing so, the Proposed Rule excludes entities that transfer materials offsite for further processing from the definition of "responsible end market," which is in direct contravention of the Act's definition of a Responsible End Market. The Act defines "responsible end market" as "a materials market in which the recycling and recovery of materials or the disposal of contaminants is conducted in a way that benefits the environment and minimizes risks to public health and worker health and safety."15 The Act's definition neither precludes facilities that produce recycled materials that may require further processing from qualifying as a Responsible End Market nor does it provide CalRecycle with authority to promulgate regulations narrowing the scope of the definition of Responsible End Markets. Instead, the Act simply states that CalRecycle "may adopt regulations to identify responsible end markets and to establish criteria regarding benefits to the environment and minimizes risks to public health and worker health and safety." CalRecycle has appropriately proposed regulations identifying Responsible End Markets for particular materials, but it may not categorically exclude broad swaths of otherwise qualified entities from the definition simply because the material produced by those entities requires further processing. Such exclusion does not in any way "benefit the environment" or "minimize risk to public health and worker health and safety."

The Proposed Rule's definition of "intermediate supply chain entity" is inconsistent with its identification of Responsible End Markets. Under the Proposed Rule's definition, a Responsible End Market cannot also be an intermediate supply chain entity. The Proposed Rule defines an intermediate supply chain entity as an entity that transfers materials offsite for further processing, but identifies recycled plastic feedstock producers (e.g., pellet producers) as Responsible End Markets. Recycled plastic

feedstock producers inherently transfer their pellets offsite for further processing, thereby creating an internally inconsistent series of definitions.

Therefore, Freepoint encourages CalRecycle to remove the concept of intermediate supply chain entities from the Proposed Rule. Seeking to regulate intermediate entities does not further the goals of the Act as the plastic producers and Responsible End Markets are still inherently responsible for compliance with the Act and are fully capable of such compliance if the Proposed Rule is properly drafted. Keeping this concept in the Proposed Rule only leaves it susceptible to judicial challenge without delivering any corresponding benefit to the environment or furthering the goals of the Act.

Response to B-33-4

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42041(aa), 42041(ad), 42051.1, and 42060, and the recommended change is not necessary to the implementation or enforcement of the Act. As recognized by the commenter, PRC section 42041(ad) defines a responsible end market as a materials market in which the recycling and recovery of materials or the disposal of contaminants is conducted in a way that benefits the environment and minimizes risks to public health and worker health and safety. Moreover, PRC section 42041(aa)(3) provides that, to be considered recycled, covered material must be sent to a responsible end market. These statutory provisions and others, along with the overall statutory framework, require that only one responsible end market may receive any single covered material item. This is necessary to satisfy the requirements of the Act, including, among others, the recycling rate requirements of PRC sections 42050(c) and 42057(i). If multiple responsible end markets could be said to have received and processed a single covered material item, there would be significant uncertainty and confusion as to when that covered material item could be considered to have been recycled in accordance with PRC section 42041(aa)(3). The proposed regulations' designation of intermediate supply chain entities, including in section 18980.4(b) of the proposed regulations, is necessary to offer clear guidance and to recognize that a covered material item may be accepted, processed, and transferred for further processing by multiple entities before such covered material item may be considered recycled under the Act. Contrary to the assertions made in this comment, nothing in the Act precludes this recognition of intermediate supply chain entities and the designation of such entities is necessary to the implementation of the Act. Therefore, no change is necessary.

Comment B-33-5

IV. Accounting Flexibility is Critical and the Act Allows for the Use of Mass Balance Accounting

The Act establishes a performance-based framework that requires producers to meet recycling rates, but it does not dictate the use of any specific methodology for calculating those rates. This deliberate statutory silence reflects the Legislature's intent

to provide regulated entities the flexibility to develop appropriate methodologies suited to different technologies and materials. Rigid, one-size-fits-all accounting mandates would exceed the bounds of the Act and undermine its intent to promote the development of innovative waste management solutions. Maintaining a flexible, technology-neutral framework for calculating recycling rates, including allowing the use of mass balance accounting, is thus essential to the Act's success.

The Proposed Rule appropriately reflects this statutory flexibility by authorizing the Producer Responsibility Organization to use appropriate methodologies for calculating recycling rates where it can be demonstrated to be the "most accurate way to calculate the recycling rate."16 This provision is critical to ensuring that the regulatory framework can accommodate both established and emerging recycling technologies, including those that do not lend themselves to traditional physical tracking of material inputs and outputs. In many emerging recycling systems, post-use materials are converted into a feedstock that is chemically identical to virgin materials and may necessarily be commingled in large-scale production systems. In these contexts, molecular traceability becomes infeasible. Therefore, accounting approaches, such as mass balance, may be needed to accurately trace material recovery rates.17 In fact, this has been recognized by the Producer Responsibility Organization in other jurisdictions, such as Oregon and Colorado.18 Preserving methodological flexibility, subject to appropriate documentation and verification, is necessary to maintaining a level playing field for all recycling technologies.

To ensure the continued effectiveness and adaptability of the regulatory framework, CalRecycle should ensure that the Proposed Rule remains intentionally neutral as to methodology and allows the Producer Responsibility Organization or independent producers to use a range of approaches to calculating recycling rates. By preserving flexibility in how recycling outcomes are measured, CalRecycle will help ensure that the Act remains durable, innovation-enabling, and capable of delivering the environmental benefits it was designed to achieve.

Response to B-33-5

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment B-33-6

V. Prohibiting Mass Balance Would Violate the Dormant Commerce Clause

The dormant Commerce Clause prohibits state laws that discriminate against or unduly burden interstate commerce, even when enacted for legitimate local purposes.19 Prohibiting or limiting the use of certain accounting methodologies, such as mass balance, would create an undue burden and raise serious concerns under the dormant Commerce Clause. Recycling and plastic production facilities operate as part of integrated supply chains that span multiple states and countries. In these systems, recycled feedstocks are chemically indistinguishable from virgin materials and, due to scale, must be commingled in plastic production facilities located outside California.

Prohibiting or limiting the use of accounting methods that are widely accepted in other jurisdictions to document the recycled content of these products would effectively discriminate against interstate commerce by placing a substantial burden on producers that source or process materials across state lines.20

The dormant Commerce Clause forbids states from adopting regulations that impose an undue burden on interstate commerce in pursuit of local policy goals. A prohibition on accounting methodologies that are necessary for multi-state recycling systems would effectively wall off California's program from national and global supply chains. This would force producers and recyclers, whose businesses depend on operating efficiently at a national scale, to implement costly and duplicative systems for sourcing, manufacturing, tracking, and distribution solely to serve California, or to forego use of recycled-content materials produced with these accounting methods across their entire national supply chain in order to prevent those materials from entering California. Either outcome would impermissibly burden interstate commerce. Accordingly, CalRecycle should ensure that the Proposed Rule itself, as well as the Proposed Rule's implementation, remains methodologically neutral and does not restrict the use of legitimate, auditable accounting systems used in interstate commerce.

Response to B-33-6

Comment rejected. The comment encourages CalRecycle to preserve the proposed regulations' allegedly "methodologically neutral" nature (i.e., to keep the proposed regulations as written), without suggesting changes or raising objections related to the rulemaking process.

Comment B-33-7

VI. Conclusion

Freepoint appreciates the opportunity to comment on CalRecycle's August 22, 2025 Proposed Rule implementing the Plastic Pollution Prevention and Packaging Producer Responsibility Act. Freepoint strongly supports the Act's goals of reducing plastic waste and fostering innovation in recycling technologies. However, to ensure the Proposed Rule remains consistent with the Act's statutory framework and legally durable, Freepoint emphasizes that (1) pelletization and pyrolysis facilities can meet the Act's criteria as Responsible End Markets, and respectfully urges CalRecycle to: (2) remove the concept of Intermediate Supply Chain Entities, which is unsupported by the statute; (3) preserve accounting flexibility, including the use of mass balance methodologies, consistent with legislative intent; and (4) avoid restrictions that would risk violating the Dormant Commerce Clause.

By maintaining a technology-neutral and outcomes-driven approach, CalRecycle can create a regulatory framework that advances California's leadership in addressing plastic waste, while enabling innovative recycling solutions to succeed. Freepoint looks forward to continuing to engage with CalRecycle in achieving these important objectives.

Response to B-33-7

Comment rejected. No response to this "conclusion" section of the commenter's submission is necessary because it only summarizes the issues discussed in greater detailer in earlier portions of the submission. To the extent responses to those earlier portions are required, CalRecycle has provided them. See comments B-33-1 through B-33-6.

B-34: BASF (Jeanette Hanna)

Comment B-34-1

Thank you for the opportunity to comment on the August 2025 proposed regulation text for Senate Bill (SB) 54 ("the August 2025 proposed regulation"), as issued by the California Department of Resources Recycling and Recovery ("CalRecycle").
At BASF, we create chemistry for a sustainable future. BASF is a diverse global company that manufactures products and conducts research and development in industries ranging from automotive, electronics, paints and coatings, pharmaceuticals, personal care hygiene, and agricultural products, among a wide range of others. We employ 16,000 employees in North America, including over 250 employees in California located at 9 research and development and manufacturing sites across the state. BASF prides itself on developing innovative solutions to promote a circular and sustainable economy.

The biopolymers business at BASF makes certified compostable and certified soil biodegradable resins, which are raw materials for products sold across the world that help facilitate large-scale organic waste diversion. Collection and composting of organic waste at scale is essential for California to meet its greenhouse gas (GHG) reduction goals and to offset impacts of climate change via the use of compost, which has been shown to increase water-holding capacity of soils, prevent erosion, and directly sequester carbon.

• **Comments on the new language. [General]**

We would like to acknowledge CalRecycle for conducting an informal rulemaking period earlier this year to address systemic issues from previous drafts in a comprehensive manner. Despite these engagements and improvements, we regret that many of our comments from the past rulemaking periods remain unaddressed, as key parts of the revised draft regulations are not consistent with either the intent or language in the statute with respect to critical issues for organics programs. As a result, in this document, we will revisit our comments previously outlined during the informal rulemaking process in May 2025.

The approach CalRecycle has taken with respect to compostable products and the composting marketplace remains unimplementable and illogical, arbitrarily punishing products containing certified compostable plastics in a manner that is outside the scope of the legislation, while giving a pass to other arbitrarily defined product groups.

We have significant concerns that key parts of the regulations are not based in science, common definitions, nor intent of the law. Furthermore, they undermine the importance of proven performance of certified compostable products by opening the door to toxins and persistent species in compost due to fully removing any scientific performance requirements for fiber-based products. In addition to this approach to fiber products, this regulation as currently drafted will effectively prevent any composter from accepting a certified compostable product containing plastic, even though it has proven performance and demonstrated safety for use in compost. It is not clear why CalRecycle is choosing to open the door to allow products that are untested and unproven to enter the environment, regardless of the level of harm they may cause, but seeks to prohibit participation by those that are fully tested and confirmed to meet statutory requirements.

We again wish to advise that certified compostable products are a critical part of large-scale organic waste diversion programs. Residents and businesses alike need these products to reduce contamination at composting facilities and cleanly and safely divert organics. Consumers need to be assured packaging is designed to ensure food safety and preserve shelf-life to reduce illness and/or food waste in the upstream value chain.

We are hopeful that CalRecycle will take a step back and come to recognize the importance of the role of certified compostable products in SB54 for creating a robust circular economy for organics in California in support of meeting California's climate goals. It is necessary to design a system that takes organics diversion into the future, based on evidence and learning from the past.

Response to B-34-1

Comment rejected. This portion of the commenter's submission generally summarizes the issues discussed in greater detail in later portions; it does not set forth the commenter's recommended changes to the proposed regulations. To the extent those later portions, in combination with this portion, require responses because they recommend changes to the proposed regulations or raise objections related to the rulemaking process, CalRecycle has responded accordingly.

Comment B-34-2

• **CalRecycle must align the definition of "plastic or polymers" in [18980.1(a)(16)] with correct definitions, because when taken together with [18980.3.3(c)(3)] and [18980.3.3(c)(4)] the result will be a reduction in compost quality and harm to the environment.**

We have made this request through multiple rulemaking periods. It is unfathomable that CalRecycle would intentionally exceed its statutory authority to 1) change the meaning and intent of this language already in statute from AB1201, and 2) fully ignore the meaning of a well-defined and fully understood term.

o We have made a gentle request in previous rulemaking periods to address this, but this has not drawn the attention of CalRecycle, so we will reiterate our comment and urge the agency to modify the regulatory text.

The 61-Day Changes did include a partial definition of "polymer" which was then lost in the First 15-Day changes, and despite our comments, was not remedied in the Second 15-Day Changes, nor in the May 2025 proposed regulation. As a result of not following the proper scientific definition of "polymer", *CalRecycle is opening the door to allow potentially non-biodegradable and harmful materials into compost, and ultimately the open environment, without testing or other evaluation.*

o While we appreciate the attempt to explain this action as described in the Initial Statement of Reasons (ISOR), it is clear there as well, that CalRecycle has a significant error in understanding the meaning of the statute, which, as we explain, is unambiguous.
 The first explanation given by CalRecycle for ignoring the definition of "polymer" is that the exemption relates only to the rate of composting. This is not correct. It is an exemption from having to meet a standard specification which includes requirements for biodegradation, disintegration, ecotoxicity, and control of constituents. The "rate of composting" proposed by CalRecycle in the ISOR is addressed by disintegration only; all of the other criteria are critically important for protecting compost quality and the resulting soil health. The definition of the term "polymer" does not depend the content of ASTM D6400, although it should be noted that the term, "polymer" is explicitly defined that specification.
 The second argument, suggesting that the language in PRC §42356.1(d) is absurd because fiber itself is a polymer, is itself an absurd argument. The phrasing clearly indicates that the basis of the product is fiber and that other polymers are "incorporated". The subsequent argument is therefore fully unfounded. There are many polymers used in products; the only way such an exemption would be valid is if the product could be assured to meet all the requirements of the specification, including ecotoxicity, biodegradability, and control of constituents, would be if the product was fiber-only.
 It is intended and understood to be an extremely narrow exemption; the specifications for compostable products are critical for ensuring soil health, and therefore, if there are any exemptions, they should be very narrow and only in cases where they are necessary. It would not make sense to exclude a wooden stir stick from being labeled compostable because it does not meet the disintegration requirements in the specification, when it is clear it would also meet the other criteria in the standard specification and composters are already accepting wood in their piles. It is an overreach of CalRecycle to not heed the clear meaning and intent in statute, and to propose the legislature did not intend to include language that safeguards compost quality.

o As we have previously stated, the term "polymer" is a commonly recognized term and can be found in the dictionary. To further explain the etymology of the term, "poly" means "many", and "mer" means "unit/part". A polymer is a molecule made of many

repeating units. "Polymers" are not plastics (they are a much broader category of materials), so in the current regulatory definition, it must necessarily follow that CalRecycle has decided that the word "polymers" has no meaning at all, since the regulatory definition is limited to plastics.

It should therefore be noted that a polymer is not necessarily associated with plastics. We use polymers every day in our soaps, shampoos, conditioners, detergents and so on. Polymers used in these applications can be dispersed in water; they cannot be made into plastics. Polymers are also used in a wide range of lubricants, including the type we use every day in our vehicles. These polymers also cannot be made into plastics. Internet searches turn up a number of biological molecules that are polymers, such as DNA, or proteins, etc., none of which can be made into plastics.

While there are some special polymers that can be used to make plastics, it must be noted that this is a very specific subset of the entire class of "polymers".

Based on this overview, we wish to highlight that typically non-plastic , polymers are used in the process for making paper; the polymers used depend on the performance needed in the intended fiber-based product. It is for this reason that *it is very important that composters only accept certified compostable paper products, not just any and all paper products.* Otherwise, composters will be accepting chemicals of all kinds, including not only polymers but other additives that may not break down in a timely manner, and risk introduction of toxic materials into their compost product and ultimately the soil.

o While we have previously argued this is a scientific matter, we will here reframe this topic as simply a matter of recognizing the meaning of a common term in the English language. However, we have to point out that the common usage of this term is based in robust science, and taking any other position directly undermines decades of scientific work and consensus-based standards development. By inventing a definition for "polymer" which is not correct, CalRecycle undermines and arbitrarily and invalidly modifies existing statute which requires products making a compostability claim to be tested.

o Not only is the definition incorrect, in this instance, CalRecycle has essentially stated that "polymers" is a word with no meaning since "plastics and polymers" shares a definition with "plastics". Even in the statutory text of SB 54, the definition of "plastic" does not equate all polymers to plastics, but rather, denotes that only a specific subset of polymers are examples of "plastics," proving that the intent of the legislation is not to wholly equate these two terms. See PRC §42041(t).

o The consequences of CalRecycle exceeding its authority to either attempt to change existing statute, or set a conflicting requirement under SB54 by not respecting the meaning of a word will create far-reaching and significant challenges in implementing this law.

As we have previously submitted, this incomplete and incorrect definition will result in a serious risk of harm to compost quality by turning a very narrow exemption in Section 18980.3.3(c)(4) to a very broad one, which is not in line with the intent or language of the existing statute in PRC §42356.1(d). Because paper and fiber products can contain a wide range of polymers, it is essential that paper and fiber products be certified compostable to ensure that they biodegrade and disintegrate appropriately in a compost pile, that they will not cause harm to plant growth, and that they will not contain components that are harmful to the environment. We therefore ask that the definition of "polymers" directly references the definition in ASTM D883.

***polymer**, n—a substance consisting of molecules characterized by the repetition (neglecting ends, branch junctions and other minor irregularities) of one or more types of monomeric units. (2024)*
We ask that the definition of "polymer" in ASTM D883 is included in this regulation to reflect both the intent and the language in existing statute, Public Resources Code (PRC) §42356.1(d); *it is not within the scope of rulemaking for SB54 to change the definition of "polymers" to "plastics" and create new regulations for statutes resulting from AB1201 or create new regulations under SB54 that conflict with the legislative text.*

It should be noted that the ASTM D883 definition is referenced for the meaning of "polymer" in both ASTM D6400 and ASTM D6868, which are the foundational performance criteria for products labeled compostable in existing statute.

o The intent and language behind the exemption in PRC §42356.1(d) is clear because it was written specifically using the well-known meaning of the word "polymers". It therefore only applies to products like wooden stir sticks or cutlery which are physically carved from wood and do not have any additional polymers added to them. As previously explained, CalRecycle is likely already aware that products made only of wood do not always meet the disintegration requirements of ASTM D6400, like plastic and paper-based products do, and therefore cannot be certified; it is for this reason that the exemption in PRC §42356.1(d) exists.

We must further point to the fact that the language in PRC §42356.1(d) is effectively the same as exemption language for compostable product labeling in other states, such as Minnesota and Washington . In these states, it is clear that this is a very narrow exemption for a few outlier products; unlike California, these states are not simply giving a free pass on performance and safety to all fiber-based products so long as they do not include plastics.

Considering the proposed language in section 18980.3.3(c)(4), *this incorrect definition for "plastic or polymers" results in allowing any product containing fiber to not be certified or tested, regardless of the non-biodegradable content, the rate of disintegration, or the amount of toxins it contains*, because the proposed definition of "plastic or polymers" in 18980.1(a)(16) only includes plastics. The disclaimer in section 18980.3.3(c)(6) is not sufficient to cover this oversight because it creates an impossible contradiction that would result allowing products that are not tested for performance and

safety to be treated as such under SB54, but not in the marketplace. In addition to creating an inequity under SB54, it would increase consumer confusion, which could result
in these products being sent to a composting facility and potentially contaminating the compost.

o As a result of the economic and environmental harm this matter is likely to cause, we similarly object to the references to the definition in section 18980.1(a)(16) in section 18980.3.3, and in particular, as referenced in 18980.3.3(c)(4). Furthermore, it is clearly the intention of CalRecycle to ignore the word "polymer" in 18980.3.3(c)(4)(A)(ii), since it only references that the "substance does not constitute plastic".

o We ask CalRecycle how they justify acting outside the law by not using the proper definition of "polymers", considering the impact it will have on products making false claims and having a free pass to harm the environment. Furthermore, fiber-based products that have demonstrated no evidence of compostability, but are considered compostable due to these regulations, would be expected to receive favorable treatment under the PRO, while contaminating compost piles.

Response to B-34-2

CalRecycle rejects this comment for the reasons provided in response to comment B-14-2. While this comment does include the proposed definition of "polymer," that response still applies. Also, the commenter provides no explanation of what it calls the "language behind the exemption" and the claim that it was "written specifically using the well-known meaning of the word 'polymers.'" The commenter points to no legislative history to explain those contentions. Lastly, the commenter's concerns reflect several misunderstandings of statute. The concern over non-plastic polymers incorporated into wood (or other non-plastic fiber) food service ware items is misplaced because those items are, by definition, not covered material. And, with respect to any covered material, if items contain any synthetic polymers, with very limited exception, they would fail to satisfy the requirement in public Resources Code section 42357(g)(1)(B) (requiring materials to be allowable inputs under the National Organic Program).

Comment B-34-3

• **CalRecycle must include the most important criteria for making a compostability claim prior to adding compostable materials to the covered material category (CMC) list. [18980.2.5(d)]**

In this section, CalRecycle is creating an uneven playing field by allowing a product that has not demonstrated that it is compostable to be considered compostable on the CMC list. This would make the CMC list discordant with existing statute that requires a product making a compostability claim to meet certain criteria, including meeting the ASTM standard specifications. And, according to that existing statute, PRC §42357, it

would constitute an unlawful compostability claim for the product to be included on the CMC list as compostable.

CalRecycle has not yet named a certifier, as authorized under PRC §42357(g)(1)(A); therefore to be consistent with existing statute, a change in the proposed regulatory language must be made, as we have previously requested.

o Section 18980.2.5(d) states that compostability determinations for the CMC list are based on the "criteria set forth in subdivision (b) of section 18980.3.3. However, the criteria included in section 18980.3.3(b) *alone are not sufficient to determine whether a product can be safely composted* as long as no certifier has been named; such a product is therefore not suitable for inclusion on the CMC list.

o The criteria included in section 18980.3.3(b) are all secondary to the critical performance criteria for a compostable product, namely meeting biodegradation, disintegration, and toxicity requirements that are included in the requirements in section 18980.3.3(a).

We request the language in Section 18980.2.5(d) read:

(d) To update the compostability determinations of the CMC list pursuant to subdivision (e) of section 42061 of the Public Resources Code, the Department shall follow the requirements and apply the criteria set forth in ***subdivisions (a) and (b)*** ~~*subdivision (b)*~~ *of section 18980.3.3 of these regulations.*

Response to B-34-3

Comment rejected. The commenter conflates "covered material" with "covered material category." The commenter even incorrectly describes the list of covered material categories as listing "product[s]," which is impossible: It is a list of categories, not products. Section 18980.3.3(a) through (c) and (b) unambiguously explain the difference with respect to the criteria for eligibility to be labeled "compostable." The list of covered material categories is necessarily categorical and cannot logically address any criteria that applies only on an item-by-item basis. So, if a covered material category is identified as "compostable" on the list, that does not mean that any every item of covered material within that category is excused from having to satisfy all item-by-item criteria for being eligible to be labeled "compostable" (and therefore compliant with Public Resources Code section 42050(b).

Regarding approval of a certifier pursuant to Public Resources Code section 42357(g)(1)(A), the commenter is incorrect that a change in the proposed regulatory language must be made. By its terms, that section does not yet apply. No change is necessary because it is axiomatic that references to it in the proposed regulations, as with the references to it in the statute, have no effect until it takes effect.

The commenter also argues that, "according to [Public Resources Code section 42357], it would constitute an unlawful compostability claim for the product to be

included on the CMC list as compostable." That is nonsensical because, as noted above, a "product" cannot be listed on the CMC list, and the CMC list itself cannot be an "unlawful compostability claim." Moreover, as section 18980.3.3(e) unambiguously explains, the proposed regulations serve only the purpose of determining compliance with the statute being implemented, not compliance with the laws prohibiting deceptive marketing claims. CalRecycle has no enforcement authority regarding unlawful labeling.

Comment B-34-4

• **CalRecycle must remove the references to PRC §42357(g)(1)(B) which is not consistent with legislative intent. [18980.3.3(b)] [18980.3.3(c)(2)]**

California statute contains many criteria for making a valid compostability claim. It seems to be the intention of CalRecycle to continue to refer to only one criterion from this longer list in statute that permit a product to be eligible to be labeled compostable.

o The claim in the ISOR that this is the only logical way to "interpret section 42357(b)(1)(B) for the purposes of...section 42050(b) is unfounded, especially since 42357(b)(1)(B) does not exist. There is no justification given in the ISOR to counter that the legislative text specifically references PRC Chapter 5.7 commencing with PRC §42355; in no way is PRC §42357(g)(1)(B) referenced or implied as a priority criteria in the legislation, and therefore should not be separately called out in the regulations, as the statue directly indicates it is included with all of the other criteria.

o It should be further noted that this particular criterion in PRC §42357(g)(1)(B) related to being allowed in organic compost has no technical merit. The requirement to be allowed in organic compost is arbitrary, and it would be appropriate for CalRecycle to instead reference statute that includes the entire list of criteria for being able to be labeled compostable.

o By choosing one particular criterion, CalRecycle has ignored the clear mandate in SB54 legislative text that the criteria for being eligible to be labeled compostable are established in PRC Chapter 5.7 commencing with PRC §42355.

Section 18980.3.3(b)(1) and (2) of the draft regulatory text creates new criteria which is not consistent with the legislative language in SB54; while some of these are elements are included in PRC Chapter 5.7, beginning with section 42355, it was clear the intent of SB54 was to include products that meet all the criteria in PRC Chapter 5.7 to be eligible to be labeled compostable, not to reproduce specific elements in statute in the regulations, ignoring others.

Section 18980.3.3(b)(1) states that materials must meet the requirements related to the NOP under PRC §42357(g)(1)(B), which is unnecessary, and inconsistent with the legislative language in SB54, which can be found in PRC §42050. The statute in PRC §42050 clearly states that products that meet the requirements in PRC Chapter 5.7 commencing with §42355 are to be included on the covered materials list, which would

include the language in 18980.3.3(b). As a result, we find the current proposal that specifies PRC §42357(g)(1)(B) unnecessary and duplicative, and more importantly, it overlooks the other criteria which are established in PRC Chapter 5.7 commencing with §42355, which are relevant and important for materials.

o Section 18980.3.3(b)(2) specifies additional criteria for items, but that criteria is already referenced in 18980.3.3(a), and therefore, is duplicative and irregular to arbitrarily call out individual sections which are included in 18980.3.3(a), when this can simply be directly referenced as it was in the legislation.

It should also be noted that at this time, in section 18980.3.3, *there is no requirement for any products "eligible to be labeled compostable" to be tested or certified*, because CalRecycle has not approved a third-party certifier as indicated in section 18980.3.3(c)(3).

Secondarily, none of the compostable products subject to section 18980.3.3 must meet the testing requirements, because all the requirements listed in this section that are applicable are for the materials in the products rather than the finished products themselves. This is a second significant oversight that would be devastating for both compost quality and the environment. CalRecycle must ensure finished products are required to meet the performance standards established in ASTM D6400 and ASTM D6868, as specifically directed in PRC 42357(a)(1); otherwise, there is no assurance that they will biodegrade, disintegrate, and be safe for compost. The language in section 18980.3.3(c)(6) is not sufficient to prevent the harm that will result from this regulation which is not consistent with existing statute. Those harms may include: increased confusion in the market from consumers; effective penalties for compostable product producers who do the right thing and certify their products; and ultimately, potential generation of low-quality compost that could damage the environment.

We request the language in Section 18980.3.3(b) read:

(b) The list published by the Department pursuant to subdivision (d) of section 42061 of the Public Resources Code shall identify each covered material category that ***meets the criteria in PRC section 42355-42357.5*** *~~[satisfies both of the following conditions: (1) There are materials within the covered material category that satisfy the requirements set forth in subparagraph (B) or paragraph (1) of subdivision (g) of section 42357 of the PRC. (2)]~~. The covered material category may encompass any ~~covered material that, if used by~~ individual items that* ***meet the requirements to be eligible to be labeled compostable as described in Section 18980.3.3(a)*** *~~[meets the requirements set forth in paragraphs (3) through (5) of subdivision (c), would be eligible to be labeled compostable~~].*

Response to B-34-4

Comment rejected. The commenter demands that CalRecycle remove references to Public Resources Code section 42357(g)(1)(B). However, the regulatory text at issue (18980.3.3(b)) concerns the categorical list that

CalRecycle publishes pursuant to Public Resources Code section 42061(d). Accordingly, the proposed regulation specifically "call[s] out" 42357(g)(1)(B) because it, as opposed to the other requirements in 42357(g), applies on a categorical basis rather than a product-specific basis. Nothing in the proposed regulatory text implies in any way that any other criteria will be ignored with respect to a particular material's eligibility to be labeled "compostable." In reaching the opposite conclusion, the commenter appears to be misreading 18980.3.3(b) as stating all the criteria applicable to covered material individually; however, 18980.3.3(b) unambiguously states that it concerns how CalRecycle will evaluate covered material categories for purposes of the covered material category list only.

Regarding the allegation that the criterion in Public Resources Code section 42357(g)(1)(B) has "no technical merit," whether that allegation has merit is irrelevant to this rulemaking because CalRecycle cannot change or remove that criterion, which, as the commenter acknowledges, "is included with all of the other criteria" incorporated into the statute (Public Resources Code sections 42050(b) and 42061(d)).

The commenter recommends certain changes to 18980.3.3(b) to address their concerns. Those changes would be nonsensical because it is logically impossible for a "covered material category" to meet all the criteria in Public Resources Code section 42355 through 42357.5. Those criteria, such as the requirement concerning PFAS concentration (42357(g)(1)(C)) and, in particular, the certification requirement about which the commenter expresses great concern, are product- or material-specific and cannot possibly be applied on a category-by-category basis.

Comment B-34-5

• **CalRecycle must define a responsible end market for compostables that will allow all covered products equal access. [18980.4(a)(4)(B)], [18980.4(a)4(C)]**

We find it highly irregular that requirements for individual items are specified to have different end market requirements. It far exceeds CalRecycle's authority to arbitrarily create different criteria for products that *are processed together* in the *same process* for composters *who run a single process* to compost a broad diversity of products and manufacture the *same compost*.

At the May 27, 2025 workshop, CalRecycle disclosed that this decision was taken because compostable plastic items and paper items have different responsible end markets. This reveals a fundamental lack of understanding of both compostable products and composting by CalRecycle. We ask that if CalRecycle is going to assert such a position, that they must provide the evidence that indicates this is indeed the case and explain why it is the case, as it is absurd on its face.

In general, we support requirements for a composter to demonstrate that they can process the covered materials, but the requirements in 18980.4(a)(4)(B) are impossible for a composter to achieve. First, "biologically decompose" has no scientific definition, so there is no technical criteria a composter could meet to demonstrate they are in compliance with the regulations. Secondly, conversion to carbon dioxide can only be monitored in a closed system, which therefore must take place in a laboratory. We have previously submitted that if a composter makes compost of sufficient quality, then 1) it must meet the regulatory requirements for compost quality in California, and 2) that the composter manages their process such that they make stable and mature compost, in particular as described in ASTM D8618 or ASTM D8619, which define the requirements for stable and mature compost.

Because the language in 18980.4(a)(4)(B) makes it impossible for a composter to comply, it therefore blocks the end market for compostable plastic products, which is arbitrarily defined set of products, and it harms composters who wish to accept compostable plastics, since they would be required to run a process that has to meet not only arbitrary, but unknown, criteria for their finished product.

The ISOR states that certified compostable plastics cannot be a "recycled organic product", presumably because CalRecycle does not believe they are "organic solid wastes"; however, this is not correct. Certified compostable products are organic materials, as they are comprised of carbon, and like all organic materials collected for composting, they are capable of biodegrading by the action of naturally occurring microorganisms in a composting facility, at a rate consistent with other feedstocks and without harmful effects. While current regulations allow composters to have a de-minimis level of persistent plastic contamination, like their fiber-based counterparts, certified compostable materials will also continue to biodegrade over time, ultimately leaving no persistent microplastics.

The language in 18980.4(a)(4)(B) was formerly applied to all covered materials, but in this version of the regulations, a composter who accepts fiber-based products (and an unclear and arbitrary selection of other products) can be a responsible end market, since the resulting compost must only meet a few of the current state regulations for compost quality. While we appreciate this change, we advise that it is woefully insufficient unless it includes criteria for stable and mature compost. Otherwise, the output of the composting facility will not be stable and will only be appropriate for use in limited applications. Furthermore, this section must be properly applied to all covered materials, not an arbitrary subset.

In an analogous case for recycling, it would not be appropriate or proportional for CalRecycle to declare that a responsible end market for one plastic chemistry type has criteria impossible to achieve, and another type of plastic chemistry responsible end market would have a very low performance requirement. Or, perhaps more relevant, would be a case where CalRecycle decided that metal recycling had a low bar to be considered a responsible end market, but plastics recycling was impossible to achieve because there were no defined criteria that could be met to demonstrate compliance.

We ask CalRecycle to explain why it is fair and equitable that a composter who wishes to accept compostable plastics is effectively prohibited from doing so under these regulations, receiving no funding or support for processing them or developing education programs that help residents and businesses divert organic waste.

In addition to creating an unlevel marketspace, Section 18980.4(a)(4)(C) also creates a number of problems related to terminology. First, we have to point to the fact that CalRecycle has grievously erred in not properly including the definition of "polymer"; please see our earlier comments on that definition and the resulting impact as it relates to fiber products.

Secondly, this section also refers to materials made from "natural resources" which, is undefined, and that the references to "mineral origin" or "fossil fuels" are not correct in this context. If terms with no definition or terms with the wrong definition are used throughout the regulations, it is not clear how the resulting EPR program will function, as it will lack a clear and valid framework; market participants will not be clear how they can comply.

We further object to the fact that section 18980.4(a)(4)(C) appears to allow all compostable products except those with fossil content to be included, although, that is incompatible with both the language in this section as well as what is described in Section 18980.4(a)(4)(B). It is also inconsistent with the statutory text in SB54. Most importantly, though, it is well-known that there are certified compostable resins made with fossil sources and there is no reason to exclude a product with proven performance from participating in this EPR program due to an arbitrary and out-of-scope opinion on covered material feedstocks. Indeed, it must be noted that all certified composable products, regardless of the origin of the feedstock, are tested and certified to ensure they are both biodegradable and will not have harmful effects, and they will continue to biodegrade after the composting process is complete, should a very small piece remain at the end of the composting process.8,9,10 Nothing in SB 54 authorizes the inclusion of this discriminatory requirement; and if CalRecycle believes it has the legal authority to impose such a requirement, we specifically ask that they point it out.

Therefore, we ask CalRecycle to adopt the following language for Section 18980.4(a)(4)(B), and to remove newly added Section 18980.4(a)(4)(C) entirely:

~~*[For items partially or wholly constituting plastic, any covered material or derivative material intentionally included in the process used to generate a recycled organic product must fully biologically decompose. The entity must neither dispose the undecomposed material nor send it to another entity that subsequently disposes it, and the entity must ensure that it fully biologically decomposes, through additional processes conducted either by the entity or by subsequent entities to which the material is transferred. Covered material inadvertently included in the process that remain undecomposed shall be considered incompatible materials and are subject to paragraph (3) of subdivision (a).]*~~ ***Any covered material intentionally included in the***

process used to generate a recycle organic product may be processed in a manner consistent with the management of other feedstocks to produce a stable and mature marketable product as described in ASTM D8618 or ASTM D8619, and which complies with the standards found in sections 17868.2, 17868.3, and 17868.3.1 Of Article 7 of Chapter 3.1 of Division 7 of Title 14 of the California Code of Regulations or in sections 17896.59, 17869.60, and 17896.61 of Article 6 of Chapter 3.2 of Division 7 of Title 14 of the California Code of Regulations.

Response to B-34-5

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42041(aa), 42041(ad), and 42060, and the recommended change is not necessary to the implementation of the Act. To the extent this comment recommends subjecting end markets for materials identified in sections 18980.4(a)(4)(B) and (C) to the same standard, see the response to comment B-6-5. To the extent this comment suggests that the standard for end markets identified in section 18980.4(a)(4)(B), including the standard for full biological decomposition, is unclear, impractical, or impossible, see the response to comment O-75-12. Furthermore, to the extent this comment suggests additional support or investment may be needed to ensure the standard of section 18980.4(a)(4)(B) can be satisfied, see again the response to comment B-6-5. Moreover, to the extent this comment is concerned that the standard for end markets identified in section 18980.4(a)(4)(C) is insufficient to ensure that compost will be stable and mature, no change is necessary because that standard, which already provides for both the biological decomposition of covered materials and a marketable product that complies with applicable regulatory standards, is adequate to ensure that such end markets generate a recycled organic product that meets the quality standards necessary to be used in the marketplace, consistent with PRC section 42041(aa)(1) and section 18980.4(b) of the proposed regulations. See the response to comment O-83-5. See also the response to comment O-83-5 with respect to the ISOR's characterization of plastics and recycled organic product. To the extent this comment is concerned with the application of these standards in the context of the definition of "polymer," CalRecycle has separately addressed the commenter's concerns regarding the definition of "polymer" elsewhere in this submission. See the responses to comments B-34-2 and B-14-2. Finally, to the extent this comment suggests that the current standard of section 18980.4(a)(4)(C) impermissibly excludes certain products "from participating in this EPR program," CalRecycle rejects this comment. Sections 18980.4(a)(4)(B) and (C) do not exclude any material from participating in the program; rather, those sections specify the standards that end markets for certain materials must meet to be considered a responsible end market for those materials. Other provisions of the proposed regulations, including, for instance, sections 18980.4(a)(4)(A), 18980.4(b)(7), 18980.4(b)(8), 18980.4.1(d), and 18980.4.3(b) provide potential alternative opportunities for materials that are covered by the Act to be recycled in a manner consistent with PRC sections 42041(aa) and

42041(ad). Therefore, no change to section 18980.4(a)(4)(B) or (C) of the proposed regulations is necessary.

Comment B-34-6

• **CalRecycle must make corrections relating to compostables for eco-modulation fees with respect to setting the base fee [18980.6.7(e)] and the adjusted fees, or malus fees [18980.6.7(f)]**

We have asked for this problematic language to be addressed in previous versions because it is statutorily irrelevant, would cause harm to products making legitimate compostability claims, and would increase confusion in the consumer markets. The language being proposed allows arbitrary and unsubstantiated claims.

o In proposed section 18980.6.7(e)(1)(A), the regulatory text states that a PRO shall include a justification of the base rate for a given material, and it is stated that data pertaining to the "biodegradation or disintegration rate of compostable covered materials" is relevant. This provision needs to be removed, as there is no clear statutory directive to include this provision, and in practice, it would set the compostable products industry back over 20 years to a time when these types of invalid and arbitrary relational claims were regularly made.

Nowhere in statute does it indicate that CalRecycle should use "biodegredation or disintegration rate[s] of compostable covered materials" as a metric for setting a base rate for compostable products. We do not see a justification outlined in 42053(d)(1), nor in 42053(d)(2), and subsections (d)(3) and (d)(4) are unrelated. Therefore, we specifically ask CalRecycle to justify the inclusion of this provision in the regulatory text.

In practice, "biodegredation or disintegration rate[s]" are not appropriate metrics; rather, certified compostable products meet pass-fail criteria, and meeting these criteria confirms their performance. The very purpose of the certification is to prevent producers from making arbitrary and unsubstantiated claims about a "degree" of compostability that cannot be compared in a relevant fashion. As iterated above, this section (18980.6.7(e)) references PRC 42053(d) which addresses the ease and cost of composting, based on specifically outlined considerations in subsections (1)(A)(E)); it does not address biodegradation or disintegration rates. It is therefore outside the scope of the statute for CalRecycle to arbitrarily create a forum for making false claims, as there is no way to scientifically demonstrate any relevant information on this topic for the purposes of setting rates.

Secondly, the sentence in 18980.6.7(e) regarding biodegradation and disintegration rates of compostable covered materials is used in parallel with recycling rates. These are two entirely separate criteria; recycling rates have to do with the volume of material being processed; biodegradation rates and disintegration rates have no bearing on volume or throughput. If CalRecycle is looking for parallel criteria in the composting industry, then we suggest considering the frequency of processing a given compostable item, even though that has no specific relevance for composters.

We wish to make clear that, in practice, ease and cost of composting a product come from a number of factors independent of the product, as noted in PRC 42053(d)(1). These factors include the origin of the organics feedstock stream (residential, industrial, commercial, institutional), the mix of the feedstocks (back of house or front of house), and the contamination that may come along from that location (based on composter ability to provide waste generator feedback and education programs). It should be left to the PRO to determine what criteria best fit the base rates once the needs assessment is complete. In particular, we raise this because education is the responsibility of the PRO. We ask CalRecycle to remove the reference to biodegradation and disintegration rates of compostable covered materials in 18980.6.7(e)(1)(A), as this is clearly out of scope of the statute.

Therefore, we propose the following language for Section 18980.6.7(e)(1)(A):

In setting the base fee rates, a PRO shall include a justification of each rate. The justification shall address each factor specified in subdivision (d) of section 42053 of the Public Resources Code. The justification for fees shall be informed, at a minimum, by the relevant data, if any, in the most recent needs assessment, the most recent material characterization study conducted pursuant to subdivision (a) of section 42061 of the Public Resources Code, source reduction data, data pertaining to recycling rates, and data pertaining to ***frequency of use*** *[~~the biodegradation or disintegration rates~~] of compostable covered materials* ***determined by the needs assessment or other waste audit****.*

o For the same reason, we ask that “data pertaining to biodegradation or disintegration rates of compostable covered materials” be stricken from 18980.6.7(f)(1) related to setting malus fees. This language is not in SB54 nor in any other statute, and CalRecycle should refrain from introducing this provision in the regulations. In particular, in 18980.6.7(f), all the attributes designated for malus fees and credits are related to attributes of products that are not associated with end-of-life performance which is already addressed in the covered material categories. It relates to quantity of material, use, feedstocks, and other attributes of products that can affect environmental impact or help modify consumer behavior and result in higher composting rates (e.g., PRC 42053(e)(5)). We suggest that this section is designed for products that are causing contamination at composting facilities, so capturing the contamination rate is most relevant for the assigning of malus fees for noncompostable products, as it is well-known this is one of the biggest challenges composters face at this time. Malus fees are intended to be the feedback loop for problematic products, and the end goal is to ensure that composters are successful in their endeavors. Composters do not have a sorting pre-process like recyclers do, so it is especially important that contamination is addressed at the source.

Therefore, we propose the following language for Section 18980.6.7(f)(1):

The justification shall be done by covered material category and shall address each factor specified in subdivision (e) of section 42053 of the Public Resources Code. The justification for malus fees and credits shall be informed, at a minimum, by the relevant date, if any, in the most recent needs assessment, the most recent material characterization study conducted pursuant to subdivision (a) of section 42061 of the Public Resources Code, source reduction data, data pertaining to recycling rates, and data pertaining to ***rate of contamination in composting facilities*** *[~~biodegradation or disintegration rates of compostable covered materials~~].*

Response to B-34-6

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements set forth in the Act, including in sections 42050, 42053, and 42060 of the Public Resources Code, and the recommended changes are not necessary to the implementation or enforcement of the Act. PRC section 42053(d) authorizes a PRO to structure the producer fee schedule based on factors including the costs incurred to process and transport covered materials in a manner and quality sufficient for acceptance by viable responsible end markets. Consistent with section 18980.4(a)(4)(B) of the proposed regulations, the material accepted by a responsible end market that generates a recycled organic product must be capable of fully biologically decomposing, and the relevant language in sections 18980.6.7(e)(1)(A) and (f)(1) relates to the manner and quality of covered material sufficient for acceptance by such end markets. Moreover, consistent with PRC section 42053, section 18980.6.7 of the proposed regulations allows a PRO to determine how to weigh the various factors in determining the appropriate fees under that section. Therefore, to the extent this comment argues it should be left to a PRO to determine what criteria best fit the base rates, the proposed regulations already do that by allowing the PRO, in its discretion, to determine how to weigh the applicable criteria in its justification.

Comment B-34-7

• **We request an edit to the definition of "renewable materials". [18980.6.7(j)(1)]**

We again request that CalRecycle use terms with scientific accuracy and in a responsible manner, instead of using undefined terms or terms with clear meaning in a context that does not make sense.

First of all, "renewable materials" should be inclusive of all renewable feedstocks, and it can be simplified to use common terms that are recognized globally, instead of introducing new and undefined terms, such as "natural resource".

It should be noted that "minerals" are not a feedstock for plastics; "minerals" are commonly understood to be inorganic materials, and they would not contain any carbon suitable for making a plastic, which is an organic, carbon-based product. Additionally, "fuels" are not feedstocks for plastics either; fossil resources such as oil and gas are feedstocks. We therefore also ask that the reference to "fuel" be

removed. Furthermore, because of limited access to biobased feedstocks, we ask that the requirement to be "wholly derived" be removed. The renewable feedstock content can be readily reported, and therefore, credit should be prorated accordingly. Finally, the meaning of "without resulting in the net depletion of any of the resources" is not clear. Any feedstock used to create a product will be consumed in the manufacturing process. If the idea is to consider rapidly renewable sources, then this should be defined, using terms that are already well-known and understood, such as "renewable" and "biogenic" as defined in ASTM D6866. It should be noted that these terms are also used in 18980.4(a)

We also want to make clear that the reference to "renewable materials" in PRC §42053(e)(7) is the *feedstock* of the plastic, not the final article which is stated to be *derived* from these feedstocks.

We propose and request adoption of the following:

"Renewable materials" for the purposes of paragraph (7) of subdivision (e) of section 42053 of the Public Resources Code means ***feedstocks*** *[~~materials~~] that are made using* ***renewable or biogenic carbon that is not of fossil origin*** *[~~a natural resource that is not of mineral or fossil fuel origin, without resulting in the net depletion of the resource~~]. Examples of potentially renewable material include those derived from wood, mycelium, algae,* ***animals****, or plants such as cotton, corn, sugar cane, or wheat.*

Response to B-34-7

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42053 and 42060, and the recommended changes are not necessary to the implementation or enforcement of the Act. PRC section 42053(e)(7) requires a PRO to reduce producer fees using credits for plastic covered materials that are derived from renewable materials. Section 18980.6.7(j) of the proposed regulations implements this requirement by defining "renewable materials" for the purpose of PRC section 42053(e)(7). The definition in section 18980.6.7(j)(1) is clear, understandable, and consistent with the producer fee schedule framework established in PRC sections 42053(c), (d), and (e). To the extent that this comment suggests the definition is unclear, imprecise, or overly stringent in its requirement for materials to be wholly derived, CalRecycle rejects this comment. It is necessary for only plastic covered materials that are wholly derived from renewable materials to receive a reduced fee, as opposed to plastic covered materials that are not wholly derived from renewable materials, because this establishes a rule of uniform application within which the PRO can exercise its discretion and because this rule is consistent with the intent of the eco-modulation framework. Moreover, to the extent the commenter believes the definition is unclear or imprecise, section 18980.6.7(f)(1) requires the PRO to justify its award of fee credits and section 18980.6.7(j)(2) requires the PRO to specify in its justification the feedstocks used to produce the covered material. This requirement further ensures that CalRecycle will have the opportunity to verify that fee credits will

only be awarded in a manner that is consistent with PRC section 42053(e)(7). No further change is necessary.

Comment B-34-8

• **<u>We request clarification on renewable carbon credits. [18980.6.7(j)(2)]</u>**

It should also be made clear that credits should be applied according to the percentage of biogenic carbon in the feedstocks of the article. Instead of specifying the source of the feedstocks, which is not relevant to the final article, or could be variable, such as in the case where agricultural waste products are used, producers should present a certification that verifies the biogenic carbon content of the feedstocks.

We ask CalRecycle to adopt the following approach and specific regulatory language for Section 18980.6.7(j)(2):

When awarding a credit to participant producers, the PRO shall ***apply credits according to the percentage of measured or attributed biogenic carbon in the feedstocks, when that percentage is confirmed by a third-party certification*** *~~[in its justification specify the feedstocks used to produce the covered material].~~*

This language will help support a transition to renewable feedstocks by allowing for innovation and create rewards based on merit, not arbitrary claims.

Response to B-34-8

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42053 and 42060, and no change is necessary to the implementation of the Act. PRC section 42053(a) makes clear that the PRO is responsible for establishing and developing a producer fee schedule that includes producer fees that are adjusted using malus fees or credits based on the factors specified in PRC section 42053(e), including the factor specified in PRC section 42053(e)(7). Section 18980.6.7(j)(2) implements this provision by specifying that, when awarding a credit to producers pursuant to PRC section 42053(e)(7), a PRO must specify in its justification the feedstocks used to produce the covered material. The purpose of section 18980.6.7(j)(2) is to require a PRO to specify to CalRecycle the particular types of renewable materials have been incorporated into the covered material without encroaching on the PRO's discretion to adjust fees based on PRC section 42053(e)(7) as it deems necessary. Therefore, this regulatory provision strikes an appropriate balance between reserving the necessary discretion for a PRO to establish and develop the producer fee schedule with the requisite fee adjustments and providing CalRecycle with sufficient opportunity to review and oversee the PRO's development and administration of its producer fee schedule. No further changes are necessary.

Comment B-34-9

• **CalRecycle should update the certification section allowing for sufficient time to come into compliance. [18981(b)]**

We would again request that the certification body is given a reasonable amount of time to come into compliance with the ISO17065 accreditation, and that the associated products have an additional three years to come into compliance, as long as the certification body is already accredited. This is consistent with current three-year product certification cycles, and it will allow producers to comply without causing massive disruption in testing labs for unnecessary repeated testing and recertification. We support the comments submitted by the Biodegradable Products Institute on this technical matter.

We thank you for the opportunity to comment and appreciate your consideration of the changes we have put forth above. We would welcome the opportunity to discuss these topics and others related to the implementation process for SB54.

Response to B-34-9

Comment rejected. No time is needed to allow any entity to "come into compliance with the ISO17065 accreditation" because the requirement for certification does not apply until one year after CalRecycle approves an ISO/IEC 17065-accredited entity in the first place. Moreover, PRC section 42357(g)(1)(A) does not authorize CalRecycle to modify that timeline.

B-35: Imperial Bag and Paper Co LLC DBA Imperial Dade (Kevin McGrath)

Comment B-35-1

Imperial Dade (“Imperial”) is an intermediary distributor of various foodservice, janitorial and sanitation, office supplies, packaging, and personal protection & safety products across the United States, including in California. Imperial is providing comments on the most recent update to the Proposed SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act (“Act”) Regulations published for comment on August 22, 2025 (the “Proposed Regulations”).

We appreciate the opportunity to provide our feedback in order to obtain clarification of Producers’ data reporting and fee obligations, among other requirements, under the Proposed Regulations.

Response to B-35-1

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment B-35-2

Producers1 Need Greater Clarity Regarding Reporting Requirements and Deadlines (Sections 18980.6.1, 18980.6.5, 18980.9, 18980.10.1–.2)

The Proposed Regulations, include several reporting deadlines, including for Annual Reports, Source Reduction Baseline, and Data Reporting. In order for the PRO to comply with these requirements and gather data from participant Producers, it is expected that the PRO will develop the applicable requirements and then ask its participant Producers to comply. However, the reporting requirements, including those listed in Section 18980.10.2, are not currently workable. While Imperial applauds the updates in the Proposed Regulation that would delay most PRO reports until July 1 or October 1 of each year after the PRO plan has been approved, this delay does nothing to help Producers who remain subject to PRO deadlines in the coming months and still lack guidance on what will need to be reported.

The Act gives the PRO the ability to clarify reporting requirements but without any affirmative requirements or deadlines that the PRO must meet in doing so. The PRO, Circular Action Alliance ("CAA"), has purportedly already published guidance clarifying these reporting requirements but will only release such guidance to Producers that have registered. In addition, while the Proposed Regulations would not require Producers to register with a PRO within 30 days of the effective date of the Proposed Regulations, if and when finalized, CAA purports that the deadline to register has already passed, on September 5, 2025. In addition, CAA has established a reporting deadline of November 15, 2025, which may be before the effective date of the Proposed Regulations, while the Proposed Regulations themselves would require Producers to report the necessary data to the PRO concurrent with registering despite the fact that, again, CAA will not provide guidance on reporting until *after* registration.

The Proposed Regulations as currently drafted impose a substantial burden on Producers given the time and resources required to implement data gathering techniques and analytic applications to collect required data in one place in a way that Producers can provide it to the PRO. Producers need time to implement systems to collect the required information and to implement budgets and allocate staff to support these activities. Imperial also believes that the data reporting requirements in the Proposed Regulations will be difficult for the PRO and CalRecycle to implement and administer because of this lack of clarity.

Imperial requests that CalRecycle modify the language of the Proposed Regulations to extend the reporting dates for Producers until at least six months after the deadline to register with the PRO so that Producers can establish the mechanisms internally that are needed to comply with these requirements. For this reason, CalRecycle should modify the data reporting requirements further so that it is clear to Producers exactly what data the PRO will require Producers to report, and establish a reasonable reporting deadline. Additionally, Imperial requests that CalRecycle consider including a "grace period" for reporting errors in the first year following each Producer deadline, to give time for Producers to work through these novel processes.

Response to B-35-2

CalRecycle rejects this comment as the reporting date of July 1, 2026 is necessary to ensure the statutory requirements are sufficiently and timely met, including section 42051(b) of the PRC. Section 42051(b) requires that upon approval of a plan or commencing January 1, 2027, whichever is sooner, a producer shall not sell, offer for sale, import, or distribute covered materials in the state unless that producer is covered by a PRO plan or is approved by CalRecycle as an Independent Producer. Therefore, by no later than January 1, 2027, producers should be complying with the Act and regulations. Thus, requiring the reports to be submitted to CalRecycle on or before July 1, 2026 gives the Department six months after the latest possible statutory date. This provides a balance by allowing adequate time for all reporting entities to gather the necessary information for the report, while also ensuring CalRecycle receives the information as expeditiously as possible to make any necessary updates to the source reduction baseline. Further, the July 1, 2026 date also aligns with the annual reporting dates including section 18980.6.5(a) of the proposed regulations, which should make for more efficient reporting. As this regulation is necessary for implementation of the Act and aligns with statutory requirements while striking a balance between both adequate time for the reporting entities and adequate time for the Department, no change is required as it would undermine the above.

With regard to the requested "grace period," the commenter requests that CalRecycle essentially create new carveouts that are not consistent with the statutory requirements, including the reporting required in section 42057 of the PRC, as well as the enforcement sections 42080 through 42081 of the PRC. The Department both declines and does not have the requisite authority to create the requested general and vague additional regulatory provision that would essentially exempt or shield reporting entities from penalties for reporting errors, which would exceed the Department's statutory authority and undermine statutory text as referenced above. Lastly, it is worth noting that the Department did reduce the burden on reporting entities in previous versions of proposed regulations by requiring reporting to be in annual increments rather than monthly increments to find a balance between the statutory requirements, information needed by the Department, and requirements of reporting entities. Thus, the Department rejects this comment.
See responses to comments I-63-15, B-27-2, I-63-15, O-48-5, and O-41-4 for additional information.

Comment B-35-3

CalRecycle Should Direct PROs to Allocate Fees to Producers Based on Level of Control over Packaging Content (Section 18980.6.7)

We understand that the way the various fees operate in both the Act and the Proposed Regulations are complex because they are designed to accomplish a number of

different goals. However, consistent with the requirements in Cal. Pub. Res. Code Ann. § 42053–53.5, it would be beneficial for all parties if CalRecycle provides direction to the PRO to assess individual annual Producer fees based on the “type” or “class” of Producer, varying such fees based on whether the Producer is a manufacturer, licensee, intermediate distributor, supplier, or retailer. This change would empower the PRO to charge parties that have the most control over the content of the packaging more fees to further the statute’s twin goals of increasing recycled content in packaging and supporting recycling infrastructure in the state, while charging parties with less control, e.g., an intermediate distributor, lower individual annual Producer fees.

CalRecycle should also consider setting a limit on annual individual Producer fees that the PRO can charge different types or classes of Producers, with a higher limit for parties that have the most control over the content of the packaging.

Response to B-35-3

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42041, 42051.1, 42053, and 42060, and no change is necessary to the implementation of the Act. PRC section 42041(w) allows a producer to be identified with respect to any given covered material according to a tiered list of conditions. Section 18980.1.1 of the proposed regulations implements this provision by specifying the process and requirements for identifying a single producer for a given covered material according to this tiered list. Once a producer is identified according to the tiered list of PRC section 42041(w), nothing in the Act permits the producer to be treated differently according to whether they are a producer under PRC section 42041(w)(1), (2), or (3). Indeed, a fundamental premise of the Act is that the producer is identified as such, and is thus subject to the Act, because it exercises sufficient control over the regulated covered material in the state such that it should bear responsibility for the costs associated with the end-of-life management of that material and ensure that the material is recyclable or compostable. See, e.g., PRC section 42040(b)(3)(B). Therefore, nothing in the Act permits CalRecycle to require or instruct the PRO to assess individual producer fees based on the "type" or "class" of producer. Moreover, to the extent this comment recommends setting a limit on annual individual producer fees that the PRO can charge, no such change is appropriate. PRC section 42053(a) makes clear that the PRO is responsible for establishing and developing a producer fee schedule that includes producer fees that are adjusted using malus fees or credits based on the factors specified in PRC section 42053(e). As such, under PRC section 42053(e) and sections 18980.6.7(b), (f), and (j) of the proposed regulations, the PRO retains the discretion to determine and charge eco-modulated fees in a manner that it deems appropriate so long as it is consistent with the requirements of the Act. No further change or limit on this discretion is necessary.

Comment B-35-4

CalRecycle Should Not Require Payment of Fees Prior to Approval of a Plan (Section 18980.6.7)

Imperial urges CalRecycle to revise the Proposed Regulations to ensure that fee payments are not required prior to the approval of a PRO plan and a demonstration by the PRO that it has collected sufficient data from all covered producers. As noted earlier, it will be difficult for Producers to timely gather accurate data, especially if reporting is required prior to accessing the reporting guidance published by the PRO. As a result, early fees will likely not be representative of the actual impacts of any given Producer and changes will be required as more accurate data becomes available.

If CalRecycle maintains the requirement for early fee payments, then the regulations must include a transparent and mandatory process for refunding overpayments or adjusting future fees to compensate for any disproportional contributions. This would ensure fairness and incentivize timely reporting, while protecting smaller distributors from bearing an excessive financial burden due to systemic delays or data gaps.

Response to B-35-4

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42051.1, 42053, and 42060, and no change is necessary to the implementation of the Act. To the extent this comment recommends prohibiting producer fee payments prior to the the approval of a PRO plan, such change is not necessary or appropriate. PRC section 42053(b) explicitly requires the PRO to determine the producer fee schedule based on specified conditions "during the preparation of the plan." Therefore, the Act clearly allows, and indeed requires, the assessment of producer fees based on limited factors even before the PRO plan is approved. Moreover, to the extent this comment is concerned with the lack of data to support producer fees in the early years of operation, see the response to comment B-13-12. Finally, to the extent this comment recommends including a mandatory process for refunding overpayments or otherwise compensating producers for past contributions, see the response to comment B-36-6.

Comment B-35-5

CalRecycle Should Remove Certain Other Language Regarding Fees and Credits (Section 18980.6.7)

The Proposed Regulations includes an option in section 18980.6.7(e)(1)(A) for the PRO, in setting the base fee rates for each covered material category, to include a justification “of the methodology used to derive rates” instead of a justification of the underlying base fee rate itself. Imperial is concerned that this could lead to reduced transparency for participant Producers regarding how their base fee rates were determined because disclosure of the methodology only could obscure relevant information that the PRO would be required to disclose if the regulations required the

PRO to justify each base fee rate. We encourage CalRecycle to remove this language in section 18980.6.7(e)(1)(A) and instead require a justification of the rate itself..

Additionally, CalRecycle should remove the added language that requires renewable materials to be “wholly derived from” renewable resources from section 18980.6.7(j)(1) for purposes of the Producer credit. While Imperial understands and appreciates the goal of incentivizing the creation of plastic covered materials that include the maximum amount of renewable resources possible, Imperial is concerned that the new requirement that plastic covered materials be derived from materials that are “wholly derived from” natural resources is practically impossible. Inclusion of the “wholly derived from” language could lead to Producers being disincentivized from adding renewable materials to plastic covered materials if they know they will not meet the standard to receive the credit. Said another way, the inclusion of “wholly derived from” in the renewable materials definition creates a requirement for the credit in which the perfect is the enemy of the good.

To encourage the maximum number of Producers to pursue the credit for renewable materials, and therefore to create more plastic covered material with renewable material content, Imperial recommends deletion of the “wholly derived from” language in section 18980.6.7(j)(1).

Response to B-35-5

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements set forth in the Act, including in sections 42051, 42051.1, 42053, and 42060 of the Public Resources Code, and the recommended change is not necessary to the implementation or enforcement of the Act. Sections 42053(a) and (c) authorize a PRO to exercise its discretion in establishing a producer fee structure that is sufficient to ensure the requirements of this chapter are met by the PRO and the plan is fully implemented. Pursuant to those sections, the producer fee schedule must be based on the factors established in section 42053(c) and must ensure that the PRO budget included in the plan pursuant to section 42051.1(j) is fully funded without passing any costs on to consumers as a separate item on a receipt or invoice. Section 18980.6.7(e)(1)(A) of the proposed regulations is consistent with these statutory requirements by allowing a PRO to include a justification of the base fee rate or of the methodology used to derive the base fee rate for each covered material category. Section 18980.6.7(e)(1)(A) is designed to ensure CalRecycle receives the information necessary to verify whether a PRO satisfies the requirements of sections 42053(a) and (c) in its establishment of the producer fee schedule, while still reserving sufficient flexibility for the PRO to exercise its discretion and to avoid any unnecessary or burdensome administrative costs associated with including such justification. If a PRO determines that it would be less costly or otherwise preferable to include a justification of the methodology used to derive the base fee rate, rather than a justification of the base fee rate itself, that is permissible and consistent with the requirements of the Act so long as the requirements of section 42053(a) and (c) are satisfied. As such, no change to the

proposed regulations is necessary.

To the extent this comment recommends removing the "wholly derived from" requirement of section 18980.6.7(j)(1), no change is necessary. PRC section 42053(e)(7) requires a PRO to subject plastic covered materials derived from renewable materials to a reduced fee relative to plastic covered materials derived from a nonrenewable material. Section 18980.6.7(j)(1) of the proposed regulations implements this requirement by clarifying that "derived from," for the purpose of this section, means "wholly derived from." This language offers additional clarification while supporting the overarching intent and purpose of the Act. To the extent this comment is concerned that producers may be disincentivized from adding renewable materials to plastic covered materials if they know they will not meet the standard to receive the credit, such credits may still be available to those producers through other provisions, including, for instance, PRC sections 42053(e)(1) or (e)(6). Therefore, the current language ("...wholly derived from...") is sufficiently clear and consistent with the relevant statutory provisions, and no changes to the proposed regulations are necessary.

Comment B-35-6

Penalties for Producers that Stop Manufacturing or Distributing a Non-Compliant Product Should have a Clear End Date (Section 18980.13)

For violations of Cal. Pub. Res. Code Ann. § 42050, source reduction requirements, previous drafts of the regulations stated that violations would "be deemed to end as of the date the Producer of the product ceases manufacturing and distributing the non-compliant product." The Proposed Regulations would remove that end date, so it would now be uncertain whether penalties would cease to accrue even if a manufacturer or distributor ceased manufacturing or distribution of the non-compliant product in California. This is especially significant because violations accrue per day, with potentially devastating consequences of up to $50,000 per violation per day under section 42081 of the statute. Producers require certainty that, if they exit the state, penalties will stop accruing. Relatedly, given the complexity of this regulatory scheme, it will be important to provide Producers with a grace period to return to compliance if they are making reasonable, good faith commercial efforts to comply, rather than to impose steep penalties on a per day basis, beginning 30 days after notification of a violation under section 42081(a)(3). The fact that CalRecycle "may" allow Producers to return to compliance without a corrective action plan is insufficient comfort or assurances for Producers who inadvertently violate the statute despite reasonable, good faith commercial efforts to comply.

Response to B-35-6

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42051, 42057, 42060, 42080, and 42081, and no change is necessary to the implementation or enforcement of the Act. PRC sections 42050(a) and 42057(a) clearly require a PRO to achieve the 25-percent source reduction requirement for all plastic

covered material sold, offered for sale, imported, or distributed in the state. While manufacturing is relevant to the identification of a producer under PRC section 42041(w), the act of manufacturing covered material—as opposed to the act of selling, offering for sale, importing, or distributing covered material—is not relevant to the source reduction requirements of PRC sections 42050(a) and 42057(a). Consistent with these provisions and with PRC sections 42080 and 42081, section 18980.13(h) of the proposed regulations provides that violations will be deemed to occur on each day that the product using non-compliant covered material is in distribution or offered for sale in the state. Section 18980.13(h) is therefore consistent with the source reduction requirements of PRC sections 42050(a) and 42057(a). Moreover, consistent with these provisions, a producer or a PRO on behalf of a producer will only be deemed to be in violation of the Act and subject to penalties for the actual sales, offers for sale, imports, or distributions of non-compliant covered material to which the producer itself is a party. Finally, to the extent this comment recommends a grace period for producers of non-compliant covered material before penalties are imposed, no change is necessary. The 30-day period established in PRC section 42081(a)(3), the corrective action plan process established in PRC section 42081(b)(1), and CalRecycle's enforcement discretion under, among other provisions, PRC section 42081(c) already provide a sufficient amount of flexibility and opportunity for the avoidance or reduction of penalties under the Act. Therefore, no change is necessary.

Comment B-35-7

CalRecycle Should Make Accommodations for Small Producer Acquisitions (Section 18980.5)

Imperial requests that CalRecycle include a provision providing for a one year grace period to come into compliance when an exempt Small Producer is acquired by an existing Producer. Unlike new producers entering the market for the first time or a Small Producer expanding operations that can plan for compliance in advance of such a move, acquisitions of Small Producers that did not otherwise intend to come into compliance may occur on short notice without time to build the appropriate data collection systems. In addition, an acquiring Producer will not have access to the Small Producer’s systems until the deal is complete and it may take the acquiring Producer significant time to compile data produced by the Small Producer into a reportable format that works with the acquiring Producer’s systems. A slight delay in compliance to allow for integrating the new entity is not only reasonable, but ensures that the market can continue to function normally and the Act can achieve its goals. If companies will be hit with large fines for acquiring smaller entities, there will be no incentive to ever purchase such entities. Small Producers would thus remain Small Producers, exempt from the Act’s requirements, and the economy would not benefit from other efficiencies brought about by such acquisitions.

To help mitigate this challenge, we recommend that CalRecycle consider adding the following provisions to the Proposed Regulations:

• **Transitional Exemptions:** Creation of a transitional exemption period for already obligated producers that acquire new businesses–particularly low volume entities that were previously exempt–during which exemption period the reporting requirements that apply to the obligated producer are phased in. This would allow producers time to integrate the acquired business, establish data collection systems, and begin reporting in accordance with regulatory standards.

• **Phased Reporting Requirements:** For acquisitions where historical data is unavailable, producers should be permitted to report supply data prospectively, beginning with the first full reporting period following acquisition. The PRO should not be allowed to require retroactive reporting when records do not exist, and producers should not be penalized for data gaps that are inherent to the acquisition process.

Overall, the operational reality of small-scale acquisitions by obligated producers underscores the need for flexibility in the Program's design, especially regarding data collection, phased compliance, and potential exemptions for newly acquired entities.

Response to B-35-7

CalRecycle rejects this comment as the requested changes for additional exemptions and requirements are beyond the scope of the Department's rulemaking authority, and both exceed and conflict with the statutory requirements for qualifying as a small producer. In addition to being outside the scope and in potential conflict with statutory requirements, no specific regulatory language is suggested, and an attempt to include language meant to universally apply to any specific entities' acquisition would be impracticable.

Comment B-35-8

CalRecycle Should Provide More Detailed Guidance on Eco-Modulated Fees (Section 18980.6.7)

Imperial appreciates the opportunity for producers to reduce their dues if they make eco-friendly packaging design choices. Imperial further applauds the decision in the Proposed Regulations to grant the PRO up to two years to gather appropriate data before implementing eco-modulated fees. However, the Proposed Regulations will still allow the PRO to implement eco-modulated fees at its sole discretion immediately after a PRO plan is approved. As a result, Imperial respectfully seeks clarification regarding *how* a producer must demonstrate that it qualifies for an ecomodulated fee adjustment. Imperial understands that the PRO will collect data regarding producers' covered packaging materials and apply eco-modulation adjustments after calculating base dues, but the methods by which a producer must provide evidence of meeting each benchmark is not clear in the current draft of the Proposed Regulations. How producers demonstrate compliance with the benchmarks impacts producers now, as they make packaging design choices in advance of paying their first producer dues, and especially as they make design choices to be implemented by the following round of producer

dues. Without clarification, producers will need to wait on any design changes which will harm the overall goals of the program.

Response to B-35-8

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42051.1, 42053, and 42060, and no change is necessary to the implementation of the Act. Because the PRO is given the responsibility and discretion to develop and establish eco-modulated fees under PRC section 42053, section 18980.6.7(c) appropriately extends the PRO the opportunity to determine when it has sufficient producer data to establish such eco-modulated fees. Therefore, section 18980.6.7(c) is consistent with the producer fee framework established in PRC section 42053 and no further change is necessary. While there is nothing preventing producers from seeking additional guidance or clarification from the PRO on the assessment of producer fees, further clarification as to the sufficiency of producer data is not necessary for the proposed regulations. See the response to comment B-13-12.

Comment B-35-9

CalRecycle Should Provide Operational Guidance on Producer Identification (Section 19890.1.1)

Imperial requests that CalRecycle provide operational guidance for determining the "first party to sell in the state" when the producer is neither the brand owner nor licensee. Section 19890.1.1 lacks clarity on how distributors should determine whether they are the responsible producer, particularly in complex supply chains with multiple intermediaries. The current language creates ambiguity about which entity bears compliance responsibility when products pass through multiple distributors before reaching retailers. Without clear criteria for establishing the sequence of distribution or specific thresholds for determining which entity is "first" to sell in California, distributors face significant uncertainty about their potential regulatory obligations.
CalRecycle should provide detailed operational guidance, including specific examples of common distribution scenarios and clear standards for documentation needed to demonstrate a distributor's position in the supply chain, ensuring that regulated entities can accurately determine their compliance obligations.

Thank you in advance for taking the time to review our comments and proposed solutions concerning these very important issues. We look forward to working with CalRecycle, and welcome any opportunities to discuss further and provide any additional assistance and insight.

Response to B-35-9

Comment rejected. The comment does not set forth proposed revisions to the proposed regulations. Rather, the commenter requests that CalRecycle publish separate "operational guidance" to assist distributors in understanding whether

they are "producers." No regulation is necessary for CalRecycle to publish documents providing such assistance. Moreover, section 18980.1(a)(17)(F) (defining "distribute") and section 18980.1.1(f) provide the clarity the commenter asserts is lacking: When Public Resources Code section 42041(w)(3) applies, the first person that distributes the covered material in California is the producer of that covered material, regardless of its downstream distributors.

B-36: WinCup, Inc. (Vicki O'Rourke)

Comment B-36-1

I am writing on behalf of WinCup, Inc. Thank you for the opportunity to review and comment on the revised SB 54 Permanent Regulations released on August 22, 2025.

Introduction to WinCup, Inc. and phade®

WinCup, Inc. is the creator and manufacturer of phade® products, a line of certified home and industrial compostable disposable food service products made with polyhydroxyalkanoate (PHA). Our phade® product line is the culmination of over 6 years of research and development, which is still ongoing, to make food service products from PHA because it is the most innovative and effective raw material available for such products. PHAs are the most biodegradable biopolymers available in the market today , as evidenced by eleven certifications for biodegradability in various environments by world renowned, independent third party certification bodies for our PHA resin and PHA based finished products.

In addition to their considerable environmental benefits, PHA based food service products fulfill the performance standards required by businesses and consumers today. This is critically important in California, a state with the largest economy in the U.S. Convenience and take out food and beverage options are not going away. The vision of SB 54 will only be truly successful if its goals are met while businesses and consumers in California still thrive. PHA based products perform better than paper alternatives but cost the same or less than those same paper alternatives, without PFAS or other harmful chemicals that can be released into our environment.

Last, PHA products are a biodegradable substitute for many of the most commonly littered types of products that would otherwise persist in our environment for decades.

Response to B-36-1

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it only references the commenter's recommendations; it doesn't set those recommendations forth. To the extent the issues raised require responses, CalRecycle has addressed them in response to other portions of the submission discussing the issues in detail.

Comment B-36-2
Article I Definitions

• Definition of "Significant Effect on the Environment"

We renew earlier comments to prior drafts of the Regulations to eliminate the phrase "or potentially substantial" from the definition of "Significant effect on the environment," as this phrase is vague and far too broad. In addition, in the context in which the defined term is used throughout the Regulations, the edited definition suggested below works adequately.

We recommend the definition read "Significant effect on the environment" means a substantial, ~~or potentially substantial,~~ adverse change in physical conditions, such as with respect to land, air, water, minerals, or animals, resulting from an operation, practice, product, substance, action, or any other cause. Mere disposal in a landfill does not constitute a significant effect on the environment.

Response to B-36-2

Comment rejected. The proposed change would inappropriately require any evaluation of potential effects to aim for a precise prediction of the severity of the effect. The regulation text must allow CalRecycle to exercise reasonable discretion and consider ranges of potential environmental effects in context of the relevant circumstances. Therefore, no further changes to the proposed regulations are necessary to the implementation or enforcement of the Act.

Comment B-36-3
§18980.2.5(a) Covered Material Category List Updates

Subsection (a) provides that the required annual (and then bi-annual after 2032) updates to the CMC list are based on a calendar year, not the date of the most review or update. WinCup disagrees with this interpretation as it could allow for 24 months to elapse between updates (ex. an update in January 2026 with the next update in December 2027). In § 42061(e) of SB 54, the Legislature explicitly provided that "the department shall update the list at least annually." The plain meaning of an annual update is every 12 months, not every 15, 18 or 24 months. The food service ware and packaging industries are investing hundreds of millions of dollars in novel materials and products to comply with SB 54. Producers should not have to wait potentially up to 24 months to have a product that is newly recyclable or compostable added to the CMC list.

We request that annual updates be required at least every 12 months.

Response to B-36-3

CalRecycle rejects the comment. Contrary to the commenter's contention, the annual feature of an annual activity can have the common meaning of an activity

occurring once every calendar year, and not merely an activity occurring exactly 365 days after the previous instance. Given the ambiguity attendant in the statutory text, the proposed regulation establishes a process for considering whether to update the CMC list in a manner consistent with that text. That process, moreover, addresses the commenter's concern over insufficiently frequent updates. As explained in section 18980.2.5(f), CalRecycle will consider information submitted before April 1 for the purpose of considering updates to the CMC list during that year, and it will also consider information submitted after that date if the information is sufficiently limited so that it can be evaluated in time for updates during that year. Furthermore, regarding the possibility that producers might desire more frequent updates, CalRecycle is not restricted from revising the CMC list more frequently than the statutory minimum under the proposed regulations, and thus no change is required.

Comment B-36-4
§18980.3.3(c)(4) Documentation Requirements for Fiber Exemption

WinCup disagrees with the wholesale deletion of the requirement to obtain third party testing to validate that no plastics or polymers are intentionally included in products relying on the fiber exemption. This lack of oversight for fiber based products will lead to harmful results for Californians because of the complete lack of testing of these products. Fiber based products often include "polymers" for binding the paper and fiber together, and in inks, adhesives and dyes. In addition, since fiber products are not required to be certified compostable by any independent third party organization, they may contain PFAS or heavy metals and no one will know.

For these reasons, we urge the Department to require that all products be certified compostable regardless of substrate or material from which they are made. In regulations, the Department should consistently favor third party certified compostable products instead of favoring fiber based products (which are often mistakenly assumed to have no plastics or polymers) over certified compostable plastic products.

WinCup recommends that the previous testing requirement be restored, or in the alternative, that all products, regardless of substrate, be required to be certified by an independent third party before such products will be deemed to be compostable for purposes of the Act.

Response to B-36-4

Comment rejected. The commenter's proposal would effectively nullify the exemption in Public Resources Code section 42356.1(d) from the requirement that certain products must comply with an ASTM standard specification, a requirement per section 42357(a) that applies in combination with 42357(g)(1)(A) to impose a certification requirement. Even that certification requirement is not absolute; it only applies if CalRecycle has approved an independent certification body, and CalRecycle has no obligation to do so. Lastly, CalRecycle cannot directly regulate any food service ware that contains no plastic because such

items would not even be covered material. Taken together, these statutory provisions make clear that CalRecycle lacks the authority to impose the requested certification requirement on products exempt pursuant to Public Resources Code section 42356.1(d). See, also, CalRecycle's response to comment B-38-7.

Comment B-36-5
Article 4 - Responsible End Markets

§18980.4(a)(4)(B) and (C) Responsible End Market Criteria

WinCup disagrees with the distinctions made in subsections (a)(4)(B) and (C) between plastic and fiber products, and renews its previous concerns (from prior comment submissions) regarding the term "fully biologically decompose." This distinction ignores science and makes yet another arbitrary distinction between certified plastic compostable products, which are given less favorable treatment, and fiber/paper compostable products, which are given more favorable treatment. The process for and biological decomposition of compostable products in a commercial composting facility is the same, regardless of whether the product contains plastic or paper. In fact, plastic compostable products are known to biodegrade faster and more consistently in the process. When field testing compostable products to make sure they perform as required, Composters Manufacturers Alliance (CMA) uses PLA (not cellulose or paper/fiber) as the control sample in its tests because of its reliability in biodegrading quickly.

The use of the term "fully biologically decompose" in subparagraph (B) in contrast to the use of the term "biologically decompose" in subparagraph (C) is confusing and unrealistic. The term "fully biologically decompose" fails to recognize how a compost facility actual operates. All compost facilities have "overs." This heightened standard of "full biological decomposition" has no basis in science; biodegradation is a biological process that will have variability based on the many factors that affect biodegradation, including the character of the materials in each compost pile. In seeking some "perfect" biodegradation process standard for compostable plastics, the Department imposes additional burdens on compost facilities that are highly disproportionate to the end goals sought to be achieved. This new standard will discourage compost facilities from accepting compostable plastics; rather than serving the goal of bringing more products into the circulate economy of California. With this unnecessary distinction, the Department is putting up permanent road blocks and discouraging investment and innovation by producers of food service ware.

WinCup recommends that Responsible End Market requirements for compost facilities be uniform and consistent regardless of what products are being composted. The sole criteria imposed on compost facilities as "Responsible End Markets" should be to accept only certified compostable products to be processed in a manner consistent with the management of other feedstocks to produce a marketable product which complies

with standards found in sections 17868.2, 17868.3 and 17868.3.1 of Article 7 of Chapter 3.1 of Division 7 of Title 14 of the
California Code of Regulations or in sections 17896.59, 17896.60, and 17896.61 of Article 6 of Chapter 3.2 of Division 7 of Title 14 of the California Code of Regulations, as applicable.

Response to B-36-5

CalRecycle rejects this comment. See the responses to comments B-6-5, O-75-12, and O-83-5.

Comment B-36-6

Article 6: Requirements for the Producer Responsibility Organization

§18980.6.7 Eco-modulated Fee and Fee Schedule

WinCup disagrees with the revisions to §18980.6.7(a) and (b) to allow for up to a two year delay on the PRO's implementation of eco-modulation.

This two year delay has no basis in §42053 of the Act. Section §42053(b) allows the PRO to establish the fees schedules during the first two years of operation based on "estimated costs" of "implementing the plan, operating costs, the costs of completing the needs assessment, and the costs to reimburse the department." The Legislature did not authorize the PRO to ignore explicitly mandated eco-modulation for up to two years. This delay will significantly harm producers who have invested in technology to take advantage of eco-modulated credits to make better products for the state of California, depriving those producers of the ability to offer more competitive pricing for their better products that actually cost more to manufacture than competitors' run of the mill products without any of the recognized benefits delineated in §42053(e) of the Act. Two years is a very long time in the life cycle of a business, particularly when trying to grow a new or improved product category. This two year delay will be particularly burdensome for smaller producers trying to compete with larger producers. The effect of this two year delay is a very uneven playing field for producers in the state of California.

We recommend deletion of the two year delay language in §18980.6.7(a) and (b). As an alternative if the language is not deleted, then we recommend that the regulations mandate a credit and reconciliation to take eco-modulation for the first two years into account in the fee schedule imposed in year 3 of plan operation.

Response to B-36-6

CalRecycle rejects this comment. See the response to comment B-6-6. CalRecycle further rejects this comment to the extent it makes an alternative recommendation to mandate a credit and reconciliation in year 3 of plan operation. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42051.1, 42053, and 42060, and no change is necessary to the implementation of the Act. PRC section 42053(c) establishes

the relevant considerations that must be reflected in the producer fee schedule beginning in the third year of plan operation. Section 18980.6.7(b) of the proposed regulations implements this provision by specifying the requirements for the producer fee schedule. PRC section 42053(c) does not require any credits or reconciliation for past payment of fees pursuant to PRC section 42053(b), and CalRecycle declines to include such a requirement under section 18980.6.7. There is nothing in the Act or proposed regulations preventing a PRO from incorporating credits or reconciliation into its eco-modulated fees if it determines such credits or reconciliation are necessary or appropriate to comply with the requirements of the Act. Therefore, no change is necessary.

Comment B-36-7

§18980.6.7(i) Credit for Products that are Home Compostable

WinCup renews its earlier comments made to prior drafts of the Regulations for a credit to be issued for certified home compostable products that are also certified industrial compostable, recognizing the increased benefit within the State of California of such products in reducing their overall burden on the waste collection and recovery system since they can be recovered in backyard compost.

Article 6 – Eco-modulated Fee and Fee Schedule – Section 18980.6.7(i)

We recommend adding a new subsection (3) as follows:

(3) In addition, plastic covered materials that meet the requirements of Section 42357 of the Public Resources Code to be labeled as "home compostable," which are also eligible to be labeled as "compostable" under these Regulations, shall receive a further reduced fee.

Response to B-36-7

CalRecycle rejects this comment. Express provisions of statute preclude CalRecycle from creating a compliance pathway for material merely on the basis that they are home compostable. Statute makes no reference to home-compostable goods, and PRC section 42050(b) requires that covered materials be either recyclable or "eligible for being labeled 'compostable' in accordance with Chapter 5.7 (commencing with Section 42355)." The reference to "compostable," as a single word in quotation marks, without use of the term "home compostable," makes clear that the Legislature did not intend for material that merely satisfies the requirements to be lawfully labeled "home compostable" to comply with section 42050(b). In other words, the only basis for items that are compostable but not recyclable to comply with PRC section 42050(b) is to satisfy the requirements to lawfully be labeled "compostable." Therefore, there is no basis for specifically addressing "home compostable" goods in the definition of "compost" or otherwise.

Because the express provisions of the Act preclude CalRecycle from creating a

compliance pathway for materials merely on the basis that they are home compostable, similar reasoning suggests that the Legislature did not intend for the PRO to be required to award fee credits under PRC section 42053(e) for such products. Therefore, no change to section 18980.6.7(i) is necessary to the implementation or enforcement of the Act.

Comment B-36-8

Article 1: Approval of Certification Entities

WinCup renews its earlier comments made to prior drafts of the Regulations objecting to any ISO certification requirements for third-party certification entities. Nonetheless, if such a requirement is to be imposed, ISO/IEC 17065:2012 certification is not a commonplace requirement currently and certifying bodies will need time to come into compliance.

WinCup recommends that the requirements of §18981 only come into force from and after January 1, 2028, and that the Regulations explicitly provide that product certifications issued prior to such date that do not expire until after such date remain valid until their expiration date notwithstanding that they were issued by a certifying body that was not in compliance with §18981.

Thank you for the opportunity to submit these comments. We would be happy to respond to any questions or provide additional information.

Response to B-36-8

Comment rejected. The commenter's concern over the time required for certifying bodies to "come into compliance" is unfounded because, pursuant to Public Resources Code section 42357(g)(1)(A), the proposed regulation has no effect until one year after CalRecycle has approved a certifying body that has done so. In other words, the statute already delays the effective date of the certification requirement, so the commenter's proposed delay until an arbitrary date certain is unnecessary. CalRecycle also rejects the proposal that a certification issued before the effective date be considered sufficient regardless of who issued them and remain so until "their expiration date." That change would allow the absurd result that any certification, including one with an "expiration date" set unreasonably in the future, would be acceptable regardless of the certifier's qualifications. Even if the proposed change were not unreasonable on its face, it would be inappropriate because it solves a problem that Public Resources Code section 42357(g)(1)(A) overtly addresses to begin with: The Legislature clearly intended to address the commenter's concern by codifying a delay so that there will be at least one year after there is an approved certification entity before any product must be certified.

B-37: EcoSafe Zero Waste USA Inc. (Sammy Davies)

Comment B-37-1

1. EcoSafe's Role in Advancing a Sustainable Product Marketplace

EcoSafe Zero Waste Inc. is a North American manufacturer and advocate of certified compostable films and liners designed for food service and organics collection programs. Our mission is to make composting second nature by ensuring food scraps are captured cleanly and transformed into nutrient-rich soil instead of landfill methane. We actively align our product design, certifications, and advocacy with California legislation, including AB 1201, SB 1383, and now SB 54. Every EcoSafe product is BPI-certified to ASTM D6400 standards, PFAS-free, and accepted by the Compost Manufacturing Alliance (CMA) across all commercial compost facility types. We also work directly with haulers, municipalities, and composters to educate on contamination prevention and end-of-life verification, ensuring that policy translates into practical circular outcomes.

Response to B-37-1

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it only references the commenter's recommendations; it doesn't set those recommendations forth. To the extent the issues raised require responses, CalRecycle has addressed them in response to other portions of the submission discussing the issues in detail.

Comment B-37-2

a. Definition of "Polymer"

The absence of a clear "polymer" definition, as established in ASTM D883 and referenced in AB 1201, introduces ambiguity that risks allowing non-compostable, untested materials into the marketplace.

This omission threatens both soil health and the credibility of compostable product programs already operating across the state.

We recommend explicitly incorporating the ASTM D883 definition of "polymer" into SB 54 regulations to maintain consistency with existing law and to protect compost end markets.

Response to B-37-2

CalRecycle rejects this comment for the reasons provided in response to comment B-14-2.

Comment B-37-3

b. Responsible End Markets

SB 54's current draft distinguishes between plastic and paper/fiber compostable products, despite all materials being subject to the same ASTM standards and testing conditions.
This approach is inconsistent with AB 1201, which defines compostability through scientific performance metrics, not material origin.

By allowing certain fiber-based products to persist in compost while holding polymer-based ones to stricter criteria, the regulation undermines both the science and the integrity of "responsible end markets."

We recommend CalRecycle:

• Reference the latest ASTM test methods to evaluate actual facility conditions and performance outcomes.
• Address environmental risks associated with immature compost piles containing unprocessed or uncertified materials.
• Reinforce that responsibility lies in certification and disintegration performance, not in the raw material category.

Response to B-37-3

CalRecycle rejects this comment. See the responses to comments O-75-12, O-83-5, B-22-3, and B-6-5.

Comment B-37-4

c. Exemptions for Jurisdictions and Service Providers

We support exemptions only when demonstrated limitations such as economic, technical, or legal exist.

However, CalRecycle should require an RFP process before granting exemptions to confirm that funding from SB 54 could not reasonably overcome those limitations.

This transparency would clarify where investment in compost infrastructure is most needed and ensure SB 54 funds are directed toward actual system improvements rather than bypassing them.

Response to B-37-4

CalRecycle rejects this comment for the reasons provided in responses to comments B-14-5 and O-83-6.

Comment B-37-5

3. The Importance of Certified Compostable Bags for SB 54 Success

SB 54's success depends on the ability of local jurisdictions and residents to divert food scraps cleanly and conveniently.

Certified compostable liners are the critical link in that system. Without them:

• Contamination rates rise, discouraging composters from accepting organics.
• Haulers lose participation as odors, pests, and hygiene concerns increase.
• Compost quality declines, compromising soil integrity and market viability.

By contrast, certified compostable bags:

• Enable higher capture rates of food scraps at the source.
• Maintain cleaner bins and hauler trucks, improving operational efficiency.
• Protect worker safety and reduce methane emissions by ensuring organics reach compost, not landfill.

4. Real-World Context: Compostable Bags at Scale

Imagine the waste generated at a large stadium or university, tens of thousands of people eating, drinking, and tossing their leftovers into bins. At EcoSafe, we work directly with these high-traffic venues to implement successful food-scrap-collection programs. From front-of-house bins to back-of-house kitchens, certified compostable bags are a critical tool in making organics diversion possible at scale.

They keep bins clean, reduce handling mess, and most importantly, ensure that food waste can be collected without contaminating compost with microplastics from traditional plastic bags. It would never make sense to collect landfill-bound trash in a compostable bag so why are we still collecting compost-bound food waste in plastic bags that break down into harmful microplastics and render compost unusable?

If California is leading the way on organics diversion through SB 1383, then the solution must include tools that are fit for purpose and that means certified compostable bags, not plastic.

Neglecting to promote these proven tools would betray the spirit of SB 54, undermining California's climate and circular-economy goals. Compostable films, when certified, verified, and used responsibly, are not the problem; they are part of the solution.

4. Closing

EcoSafe stands ready to collaborate with CalRecycle, composters, and allied organizations to ensure that SB 54 implementation is consistent, science-based, and aligned with California's leadership in organics recovery.
By harmonizing SB 54 with AB 1201 and leveraging existing certification systems, California can advance a truly circular, transparent, and regenerative materials economy.

Response to B-37-5

Comment rejected. The commenter offers the nonspecific request that the proposed regulation "harmoniz[e] SB 54 with AB 1201." However, the proposed regulations properly apply the provisions of AB 1201, and the commenter does not explain the suggestion otherwise, and CalRecycle cannot discern any revision the commenter is proposing. Nor is the allegation that the proposed regulations fail to "promote" certain goods a legitimate objection; promoting goods—especially goods that are not covered material (plastic bin liners are not packaging and are thus irrelevant to the statute and CalRecycle's regulatory authority—is not the purpose of the proposed regulations pursuant to Public Resources Code section 42060. Lastly, to the extent the commenter understands the proposed regulations as governing how products may be labeled, the commenter is mistaken. CalRecycle determinations concerning compostability are for purposes of compliance with only SB 54 and will not purport to govern liability under the laws prohibiting deceptive labels. Those laws, while they provide the standards applied under SB 54, do not confer any enforcement authority on CalRecycle.

B-38: Geosphere LLC (Raegan Kelly)

Comment B-38-1

Thank you for the opportunity to provide comments on the draft regulatory language issued by CalRecycle. Our comments focus on the aspects covering compostable covered materials, including both home and industrial compostable products.

Geosphere LLC, operating under the trademark Better for All, manufactures a line of pure PHA party and event cups. PHA, or polyhydroxyalkanoates, are a type of biopolymer that can serve as an alternative to traditional fossil-based plastics for use in food ware and other single and limited use applications.

We chose to make cups from pure PHA for the following reasons: pure PHA is nontoxic, resilient, durable, high heat tolerant (won't melt in warehouses), and rapidly biodegradable in both home and commercial compost systems. After years of research and after initially offering products made from PLA (polylactic acid), we switched to PHA to address the persistent problem of plastic pollution evident on our land and in our waterways, and to INCREASE the end-of-life options for our commercial and residential customers. In other words, we perceived that commercially compostable products had a similar limit to recyclable plastics – a single method and destination that could guarantee successful diversion from landfill. By making cups from PHA, we were able to earn TUV Home Compostable certification as well as BPI Commercially Compostable certification. We in fact perceive home compostable certification as the superset of commercial compostable certification, as a dually certified compostable product has many more possible waste stream options, for example community composter, backyard composting, local municipal, and state.

We hope that you will consider the following revisions as you finalize the draft regulatory language and initiate a new regulatory process:

Response to B-38-1

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it only references the commenter's recommendations; it doesn't set those recommendations forth. To the extent the issues raised require responses, CalRecycle has addressed them in response to other portions of the submission discussing the issues in detail.

Comment B-38-2

§18980.6.7(i) Credit for Products that are Home Compostable

We ask that the regulations also incentivize home compostable products. Certified home compostable products present an important solution for managing packaging and waste at the local and individual level. We ask that the Department include a credit for packaging and products that are certified home compostable. A credit is justified for products that can be diverted into a backyard or community compost pile and are not an increased burden on the State to collect and manage. FURTHER, achieving home compostable certification takes time (6 plus months) and significant cost on the part of the the brand, per item and every year to maintain certification.

Geosphere LLC supports CJ Biomaterials' recommendation to add a new subsection (3) as follows:

(***3) In addition, plastic covered materials that meet the requirements of Section 42357 of the Public Resources Code to be labeled as "home compostable," which are also eligible to be labeled as "compostable" under these Regulations, shall receive a further reduced fee.***

Response to B-38-2

CalRecycle rejects this comment. See the response to comment B-36-7.

Comment B-38-3

§ 18980.2.1 Exclusion of Reusable and Refillable Packaging and Food Service Ware.

The regulatory text proposed establishes a blanket exemption for reusable and refillable products. At the same time, the proposal removes all meaningful parameters around the definition and marketing of reusable and refillable products. PLEASE RECALL WHAT HAPPENED IN CA WHEN WE BUILT A LOOPHOLE FOR "REUSABLE" PLASTIC BAGS. The market was flooded with extra thick plastic bags printed with the word "reusable" but swapped in for single use shopping bags. These extra thick bags are still entering the market to this day and litter our streets and waterways.

As commendable as reusable systems are, a blanket exemption will allow for a host of bad actors to circumvent the program and legal requirements by claiming their product is reusable or refillable (see above example re bags). If these products are not included within the scope of covered materials, the PRO will be unable to gather data and have producers report on key metrics including production data, end of life disposal, and costs associated with their use. We ask the Department to include these products within the regulatory framework to manage the broader packaging ecosystem and ensure unintended consequences associated with shifting materials are avoided.

Response to B-38-3

CalRecycle rejects this comment, which proposes that reusable and refillable items be "within the regulatory framework to manage the broader packaging ecosystem and ensure unintended consequences associated with shifting materials are avoided." That proposal would contradict the very core of the statute: Items that satisfy the criteria in Public Resources Code section 42041(af) are not "covered material." In other words, the statute, not the proposed regulations, establish a "blanket exemption, with items that are not "covered material" necessarily outside the "regulatory framework." Regarding whether the proposed regulations must be revised to avoid the results described as "unintended consequences," see CalRecycle's response to comment B-6-2.

Comment B-38-4

§18980.2.5(a) Covered Material Category List Updates

SB 54 is designed to provide a pathway for products to be recycled or composted. To help establish this pathway, PRC 42061(d) directs CalRecycle to create a list of covered material categories that are deemed compostable. We appreciate the alignment of these determinations to the statutory eligibility to be labeled and sold in the state as 'compostable'.
We do not support the new language that reduces the frequency of these updates. The statutory language states that 'the department shall update the list at least annually'. We ask that the Department amend the regulatory text to provide for CMC list updates no less than once every 12 months.

Response to B-38-4

CalRecycle rejects this comment for the reasons stated in response to comment B-36-3.

Comment B-38-5

§18980.3.3(c)(4) Documentation Requirements for Fiber Exemption

Compostable covered products that contain no plastics or polymers can secure an exemption from third-party certification requirements for compostability. The previous

regulations appropriately established a series of requirements for these products seeking to obtain an exemption from third-party certification.
It is well known that fiber-based compostable packaging is likely to contain a variety of other materials beyond fiber. Geosphere in fact produced fiber-based bowls in 2023 and had to navigate the world of manufacturing these products to be "water and oil proof". The DEFAULT additive for oil proof fiber-based packaging and products is PFAS. And when you request alternatives or the omission of these chemicals, you are informed that any equipment that has run with PFAS is contaminated with PFAS. Finding manufacturers that have never run fiber based material with PFAS is difficult and the price premium is higher. You need to require certification so that fiber producers do not take shortcuts.

By undergoing third party certification and testing, we can ensure the safety and performance of these products.
We ask the Department to add back in the testing and ingredient disclosure requirements outlined in the previous regulatory draft.

Response to B-38-5

Comment rejected. The clear purpose of Public Resources Code section 42356.1(d) is to establish a less burdensome compliance pathway by not requiring certification to an ASTM specification, which would entail product testing. The proposed addition of a testing requirement in the proposed regulations would negate that effect, so that there would be no meaningful difference in the burdens placed on fiber-based products and those placed on other products. Regarding ingredient disclosure requirements, the proposed regulations require documentation of eligibility for the exemption and mandatory disclosure upon request by CalRecycle, which strikes the appropriate balance between requiring proof and the administrative burden on CalRecycle for enforcing the statute. Also, imposing a general, affirmative obligation to provide information to CalRecycle about plastic content would contradict statute with respect to allegedly compostable food service ware because food service ware that contains no plastic would not be covered material to begin with.

Comment B-38-6

§18980.6.7 Ecomodulated Fee and Fee Schedule

We request revision to §18980.6.7(a) and (b), allowing the PRO a two- year delay in implementing ecomodulated fees. Ecomodulated fees are an important mechanism to help new, more climate-friendly products become more cost competitive. They are a core principle behind EPR and help facilitate a shift to more sustainable products.

Response to B-38-6

CalRecycle rejects this comment. See the response to comment B-6-6.

Comment B-38-7

Home composting is appropriate for a small subset of products that are certified to break down in an ambient temperature home composting system. These products offer an important alternative for brands and consumers who want to ensure end-of-life management of their products.

Companies serving food will be especially constrained in meeting recycling targets under the new regulations. For producers of single use food ware (such as utensils, straws, plates, and cups), and in the case of film applications, compostability will be the primary means of compliance. To realize these ambitious targets, these companies need to be able to use all material typesm including home compostable products.

Limiting the end-of-life pathways for a home compostable product to industrial composting sites runs contrary to the ultimate objectives of SB 54, particularly while we are very early in efforts to build out industrial composting acceptance and infrastructure across the state. Home composting needs to be preserved as a pathway available to California consumers, communities and companies.

We ask the Department to reconsider their position and revise the regulations to effectively manage home compostable products.

Response to B-38-7

Comment rejected. The statute is unambiguous with respect to compostability: To comply with Public Resources Code section 42050(b), a single-use item must either be recyclable or meet the requirements for lawfully being labeled "compostable." Nowhere in the statute did the Legislature indicate that meeting the requirements for being lawfully labeled "home compostable" is sufficient, and, in any event, it would be impossible to implement the statutory reporting and responsible end market requirements for items that might be, but cannot be required to be, composted at home. A consumer and their home compost bin are not a "materials market" (see Public Resources Code section 42041(ad)) that can be incorporated into a producer responsibility plan.

B-39: GAF Materials, LLC (Joan Crowe)

Comment B-39-1

By this letter, GAF is submitting comments on California Senate Bill 54, “Plastic Pollution Prevention and Packaging Producer Responsibility Act” (the “Act”).

Founded in 1886, GAF is the largest roofing and waterproofing manufacturer in North America. With 30 manufacturing locations across the country, including California, GAF has approximately 5,000 employees and offers a range of products and services designed to meet the needs of both commercial and residential customers, protecting one out of every four homes in the U.S. Sustainability is a primary focus between

manufacturing reflective shingles, supporting the Cool Community project in Pacoima through use of the StreetBond solar-reflective pavement coatings, and driving energy efficiency and recycling across our plants. Our efforts include reducing energy usage, making our operations more sustainable, and addressing product and material circularity. GAF appreciates the opportunity to participate in the draft regulation process for SB 54.

The following comments are offered in response to the proposed regulation text of the Act issued on August 22, 2025.

Response to B-39-1

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process.

Comment B-39-2

Article 3: Evaluations of Covered Material and Covered Material Categories, Section 18980.3. Recyclability (Reference Sections 42041, 42050, 42061)

Article 3 of the Act indicates that a covered material shall not be considered recycled before it has been accepted by a "responsible end market." Construction material manufacturers, including GAF, use packaging that may be recycled. However, there are no collection systems in place for construction sites. So, technically speaking, there is no end market for construction packaging materials.

Due to these circumstances, we looked at the possibility that building materials packaging may be excluded or exempt, but it does not appear that such packaging can meet the onerous requirements listed in Section 18980.2. Categorically Excluded Materials and Section 18980.2.3. Exemptions for Certain Covered Materials. One of the reasons it is so difficult to comply is because the parameters primarily address general consumer products instead of specifying residential consumer products, which appears to be the intent of the Act.

We request an exception or exemption for packaging used for construction materials because there is no program to pick up construction materials packaging for recycling in California. Accordingly, construction materials packaging – even if designed to be recyclable by construction materials manufacturers – cannot actually be recycled. Moreover, insofar as CalRecycle's goal is to keep packaging out of the residential/consumer waste stream, then any such exception or exemption would not jeopardize that goal because construction material waste does not enter the residential/consumer workstream.

Article 2: Covered Materials and Covered Materials Categories (Reference Sections 42050 and 42057)

Article 2 of the Act contains provisions that require recyclability of packaging and reduction of overall packaging weight and plastic content. First, Section 42050 contains provisions to achieve certain recycling rates for packaging. However, due to the limitations described above, this requirement cannot be met since there are no collection systems in place for construction material packaging. Accordingly, building materials manufacturers cannot practically comply with this Section.

Second, Section 42057 requires the PRO to achieve the 25-percent reduction by weight and 25-percent plastic component source reduction requirement for covered material.

From a cost perspective, manufacturers are already incentivized to use as little packaging material as possible while still ensuring adequate protection for the products from damage during shipping and handling. However, packaging durability is critical for building materials because of the rough environment in which they are stored, distributed and installed. A good example to illustrate this is asphalt shingles. This type of product is shipped in "bundles" which consist of a stack of asphalt shingles wrapped in a plastic film, weighing in excess of 60 lbs per bundle. Asphalt shingles are bulky and heavy. If the packaging is too weak, the wrapper may tear and cause the asphalt shingles to slide out, which can risk significant injuries to contractors or homeowners and increase landfill waste and contractor overhead – ultimately leading to injury risks, damaged products and higher prices for consumers. Another example is wooden pallets, which are a key component of transportation of our products. Pallets can be reused and are already part of a circular system within construction.

Using recycled content to achieve such a reduction is often not a viable option as it would impact durability of the product's packaging and cause safety hazards. We have been informed through our industry contacts that the recycled resin impacts several characteristics of the packaging including, but not limited to, durability and strength. As noted above, durability is of utmost importance when maintaining the integrity of our products. The sometimes harsh environment of storage, distribution and application needs to be considered when changing out the packaging.

Given that the primary focus of the SB 54 regulations is on general consumer products, GAF urges CalRecycle to determine that Construction & Demolition (C&D) waste and packaging for business-to-business products are beyond the scope of the regulations, or incorporate exemptions for these materials in the regulations. Such exemptions should also include wooden pallets.

In closing, GAF recognizes and values the efforts of CalRecycle, and appreciates the opportunity to submit a public comment.

Thank you again for the opportunity to provide comments.

Response to B-39-2

Comment rejected. The commenter requests that CalRecycle establish specific exemptions for construction packaging materials, construction and demolition

waste, packaging for business-to-business products, and wooden pallets. However, CalRecycle does not have general authority to create exemptions not established by statute. In any event, the proposed regulations accommodate the commenter's concerns because any packaging not within a categorical exemption (e.g., for reusable packaging or for packaging of goods enumerated in Public Resources Code section 42041(e)(2)) might qualify for other exemptions based on public health, safety, and other special compliance challenges. See, e.g., PRC section 42060(a)(3) and (4), and section 18980.2.4 of the proposed regulations. Accordingly, the proposed regulations accommodate that commenter's concerns, and no change is necessary.

B-40: Recology (Julia Mangin)

Comment B-40-1

Thank you for the opportunity to comment on the Notice of Proposed Action – SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act Regulations, issued on August 22, 2025. I am writing on behalf of Recology, one of the state's leading recycling, composting, and waste collection companies.

Recology is a 100% employee-owned company with roots going back more than a century. We provide franchised curbside collection services in over 88 Northern California communities, from major metropolitan areas to rural regions, and we operate material recovery facilities and commercial composting sites across the state.

We have long partnered with cities and counties to meet California's ambitious recycling and organics diversion mandates under AB 939, AB 1826, AB 341, and SB 1383. In line with this mission, we applauded the passage of SB 54, which rightly shifts accountability for plastic waste and packaging from local governments, haulers, and ratepayers to the producers and retailers who introduce these materials into commerce.

We understand that the success of SB 54 depends on timely regulatory action to meet statutory deadlines. Accordingly, our comments are intentionally limited to essential changes to avoid prompting further rounds of comment. Our recommendations focus on ensuring the regulations provide clear definitions, protect existing solid waste collection programs and franchise agreements, safeguard end markets for compost, and prevent unintended penalty exposure for local jurisdictions and service providers.

Please feel free to contact me at jmangin@recology.com with any questions. We remain committed to working with CalRecycle and the Producer Responsibility Organization to ensure SB 54's successful and timely implementation.

Response to B-40-1

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it only references the commenter's recommendations; it doesn't set those recommendations forth. To the extent the

issues raised require responses, CalRecycle has addressed them in response to other portions of the submission discussing the issues in detail.

Comment B-40-2

ARTICLE 1: Definitions

Section 18980.1(2) – Alternative Collection

CalRecycle's reasoning explains that the purpose of this subsection is to define "alternative collection" in contrast to the broader definition of "curbside collection" under the Act, and to ensure that no program conducted by or on behalf of local jurisdictions can be considered "alternative collection".

However, the regulatory text is problematic as written because it states that alternative collection cannot be conducted by a recycling or composting service provider under contract with a local jurisdiction. This language excludes contracted providers from offering alternative collection programs, even when those programs are not operated on behalf of a jurisdiction.

In addition, inclusion of the word "discarded" introduces unnecessary confusion by invoking concepts from solid waste law that CalRecycle has expressly said are not relevant to this definition. Removing this word will better align the text with the stated purpose of the subsection. We also note, consistent with comments submitted by the Resource Recovery Coalition of California, that use of "discarded" risks conflict with established case law and franchise frameworks that have underpinned local recycling systems for decades. Eliminating the term will provide clarity, protect the stability of franchise agreements, and ensure consistency with statutory intent and the Initial Statement of Reasons (ISOR).

Recommendation: Strike "because it is not conducted by a local jurisdiction or by a recycling or composting service provider under contract with a local jurisdiction" and remove the reference to "discarded" from the definition of "alternative collection". Clarify in the ISOR that recycling or composting service providers under contract with a local jurisdiction are not excluded from conducting alternative collection, so long as the program is not conducted on behalf of a local jurisdiction.

Revision Proposal: "Alternative collection" means a program that collects covered materials, regardless of the manner and location of collection, and is not "curbside collection," as defined in subdivision (g) of section 42041 of the Public Resources Code.

Response to B-40-2

Comment rejected. The definition of "alternative collection" is a straightforward extension of the unambiguous definition given in statute to "curbside collection" (Public Resources Code section 42041(g)). The latter definition establishes a clear dichotomy: The statute refers to all programs run by local jurisdictions or their recycling service providers as "curbside collection," so all other programs

must be "alternative collection." The proposed regulation's definition of "alternative collection" reflects that dichotomy and is provided for added clarity because the definition of "curbside collection" is broader than how that phrase is typically used. No further clarification of "alternative collection" is needed because the definition is unambiguous on its face and cannot reasonably be read in any other way, such as interpreting it to encompass any program not conducted by a local jurisdictions or under contract with one (i.e., those that are "curbside collection" under section 42041(g).

Regarding "discarded," merely using that word, with no reference or citation to laws from "solid waste law" either in the proposed regulations or the initial statement of reasons, does not "invok[e] concepts from solid waste law" and is not a pronouncement of rights under franchise agreements. That word has a plain meaning and, in the contexts in which it appears in the proposed regulations, clearly refers to the act of placing items into end-of-life management systems for recovery or disposal. Moreover, the definition of "alternative collection" appropriately reflects that, while "discard" has special meaning in the solid waste context with respect to what is considered "recycling," that meaning is not relevant under the statute implemented here. In solid waste law, the word "discard" has special meaning with respect to what is considered "recycling." But that meaning comes from Public Resources Code section 40180 and therefore does not apply under the statute implemented here, which has its own definition of "recycling" (section 42041(aa)). Unlike the one in section 40180, that definition conspicuously excludes the phrase in section 40180, "would otherwise become solid waste." By itself, that difference—a deliberate choice by the Legislature—makes clear that the "established case law" (presumably, Waste Management of the Desert Inc. v. Palm Springs Recycling Center, 7 Cal. 4th 478 (1992) and other cases on the same topic) to which the commenter refers is irrelevant to understanding the scope of what constitutes "recycling" under the statute.

Lastly, although unstated, this comment impliedly asserts that the definition of "alternative collection," rather than merely addressing the semantic issue of its meaning relative to "curbside collection," nullifies Public Resources Code section 42051.1(c)(3). That provision requires that producer responsibility plans set forth how they will supplement, rather than conflict with, existing services "in accordance with local solid waste handling requirements and the intent described in Section 4004, and how the PRO will leverage and utilize existing collection programs and . . . infrastructure." Nothing in the proposed regulations purports to excuse producer responsibility plans from that requirement.

See, also CalRecycle's response to comment O-47-2 regarding effects on franchise agreements.

Comment B-40-3

ARTICLE 4: Responsible End Markets

Section 18980.4.(a)(4)(B) – Responsible End Market Criteria

We strongly support the inclusion of the following requirement.

“Covered material partially or wholly comprising plastic and intentionally included in the process used to generate a recycled organic product must fully biologically decompose, and the recycled organic product must meet standards necessary to be sold into the marketplace.”

Consistent with CalRecycle’s reasoning, full biological decomposition is essential because plastic substances are not “recycled organic product.” Compost end markets depend on products free of plastic contamination, and any residual plastic undermines market stability and consumer confidence.

Recommendation: Retain this requirement in the final regulation to protect compost markets and ensure product integrity.

Response to B-40-3

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process.

Comment B-40-4

ARTICLE 11: Requirements, Exemptions, and Extensions for Local Jurisdictions and Recycling Service Providers

Section 18980.11.1. – Extensions or Exemptions for Local Jurisdictions and Recycling Service Providers

Subsection (d) requires recycling service providers to allow PROs and Independent Producers up to 90 days to review an exemption application (and 30 days for a renewal) before submitting to the Department. This requirement inadvertently exposes providers to penalties during the review period and may delay necessary filings.

Recommendation: Modify the process by allowing a local jurisdiction or recycling service provider to first submit a notification of intent to apply for an exemption or renewal to the Department. Following this notification, the notifier should proceed with the PRO review process. Clarify that while the PRO may object to the exemption or extension sought, their objection should not prohibit a recycling service provider or local jurisdiction from filing a request with the Department once the review period has ended.

ARTICLE 13: Enforcement Oversight by the Department and Administrative Civil Penalties

Section 18980.13. – Compliance Evaluation and Determination

Subsection (j) provides that no penalty may be imposed during the pendency of an extension or exemption request. However, as drafted, providers remain at risk of penalties during the PRO/producer review period before formal submission to CalRecycle.

Recommendation: Update subsection (j) to specify that no penalty may be imposed once a notification of intent has been submitted to the Department. This will align with the Article 11 recommendation and protect service providers from undue penalty exposure during the required review period.

Response to B-40-4

Regarding PRO objections to exemptions, nothing in the proposed regulations purports to give the PRO any authority to prevent submission of a request to CalRecycle. Accordingly, CalRecycle declines to make the requested change. Regarding section 18980.13(j) and the effect of the proposed "notification of intent" under 18980.11.1, local jurisdictions and recycling service providers are effectively given at least one-year notice of the need for an exemption because changes to the covered material categories list do not take effect for one year. That affords ample time for a local jurisdiction or recycling service provider to complete the process outlined in section 18980.11.1. Moreover, giving notices of intent the effect sought would contravene statute (Public Resources Code section 42060.5(b)), which states that extensions require a written showing that compliance with Public Resources Code section 42060.5(a) is not practicable. The suggested change would allow mere notification to CalRecycle to trigger the section 42060.5(b) exemption, effectively creating an end run around the written showing requirement.

B-41: Perkins Coie LLP (Jeffrey Hunter)

Comment B-41-1

Thank you for the opportunity to provide public comments on the latest draft of the Plastic Pollution Prevention and Packaging Producer Responsibility Act (SB 54) Permanent Regulations. We look forward to continued engagement with CalRecycle throughout the implementation of SB 54.

Perkins Coie LLP represents producers in various industries including retail, food, home and garden, paper products, electronic products, apparel, building materials and shipping packaging. Our clients have been evaluating their obligations under SB 54 and collecting data in anticipation of the upcoming reporting deadline but have faced challenges in determining how SB 54 will be implemented with respect to their products and business lines.

We are submitting these comments on behalf of our clients and request that CalRecycle take these comments into consideration in the final rules. Several of these comments are similar to comments we submitted during the prior comment period ending on June 2, 2025, as the latest draft of the regulations does not reflect these changes.

Response to B-41-1

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it only references the commenter's recommendations; it doesn't set those recommendations forth. To the extent the issues raised require responses, CalRecycle has addressed them in response to other portions of the submission discussing the issues in detail.

Comment B-41-2

A. Producer Identification

The proposed rules limit producers of covered materials to only producers that are subject to the jurisdiction of the California courts as described under proposed Section 18980.1. CalRecycle's proposed definition of "in the state" is too limiting and too confusing for retailers.

For example, under proposed Section 18980.1.1(d), only persons that are "in the state" and who manufacturer the food service ware and either own the designated brand or trademark or are licensed to manufacturer the food service ware would be considered the responsible producer. Many retailers and food service establishments in California purchase plastic single-use food service ware manufactured out of the state. Under the proposed Section 18980.1.1(f), retailers and food service establishments that use the food service ware manufactured outside of California could be considered the responsible producer simply by using the food service ware to package their food. We believe this is contrary to the intent of subdivision (w) of Section 42041 of the Public Resources Code.

The statute defines a producer to mean "a person who manufactures a product that uses covered material and who owns or is the licensee of the brand or trademark under which the product is used in a commercial enterprise, sold, offered for sale, or distributed in the state." PRC § 42041(w)(1). The statute does not require the producer to be subject to the jurisdiction of California courts. Further, other states that have adopted extended producer responsibility (EPR) packaging laws do not limit the definition of producer to only producers that are in the state or subject to the jurisdiction of the state's courts.

We request that CalRecycle revise its definition of producers who are "in the state" under the proposed Section 18980.1.1(a). As currently written, the definition of "in the state" is overly narrow and it may be difficult for retailers to determine whether their suppliers are subject to service of summons in California. We request that CalRecycle revise subsection 18980.1.1(a) as follows:
(a) For purposes of paragraphs (1), (2), and (3) of subdivision (w) of section 42041 of the Public Resources Code only, a person is in the state with respect to the Act if any of the following is true: (1) The person sells, offers for sale, distributes, or imports any covered material in or into California; or (2) The person consents to being considered in the state, being served notices and accusations by any means chosen by the Department pursuant to section 18980.13.3 and being personally subject to the

jurisdiction of California courts. To be considered in the state, such person must be registered as a producer pursuant to section 18980.10 and must, upon demand, confirm the foregoing consent in writing, such as by affidavit or written agreement, and through conduct consistent with such consent. Conduct consistent with such consent includes responding to an accusation, filing a pleading, or otherwise appearing in a legal proceeding in the state.

We also request that CalRecycle revise Section 18980.1.1(e)(1) as it could be interpreted as transferring producer responsibility to food retailers that use unbranded food service ware to contain and sell their goods. (1) If the covered material is food service ware, the brand or trademark directly associated with (as described in subparagraph (E) of paragraph (17) of subdivision (a) of section 18980.1) the food service ware shall be designated. A brand shall not be considered associated with food service ware solely by adding a price tag, sticker, or label to a container associated with another person's brand. Otherwise, the designated brand or trademark shall be the one owned or licensed by the manufacturer or licensee, provided that such person satisfies the requirements of paragraph (1) of subdivision (c) or paragraph (1) of subdivision (d) for being a producer of either food service ware or packaging.

Response to B-41-2

Comment rejected. The commenter objects to implementation of the "in the state" requirement, noting that "other states that have adopted [EPR] packaging laws do not limit the definition of producer to producers that are in the state or subject to the jurisdiction of the state's courts." That assertion is immaterial to application of California's law, which does include an "in the state" criterion. However, the commenter is incorrect that the definition of "producer" in the statute is limited to those in the state: Public Resources Code section 42041(w)(3) has no such limitation.

The commenter's objection to businesses being producers because they use "food service ware to package their food" is also baseless. First, that objection conflates "food service ware" and "packaging." Packaging used with any good is, by definition, a good's "packaging" under the statute, which unambiguously provides that a person selling or distributing that packaged good may be the packaging's producer (Public Resources Code section 42041(w)(3)). Assuming the commenter intended instead to refer to the use of items that are "food service ware," as described in section 18980.1(a)(8) of the proposed regulations, not "packaging," the commenter's assertion that such use, by itself, would render the user the "producer." Unless the business is the brand owner or licensee, section 18980.1.1(f) clearly establishes that the producer would be the first one to distribute or sell the product in the state. Thus, a business that acquires food service ware items in the state from any other business would not become a producer merely through that use. The business from which they acquired the items would be the producer.

The commenter's proposed revision to section 18980.1.1(a) would be inappropriate for multiple reasons. First, it ignores the intent, reflected in the tiered definition in Public Resources Code section 42041(w)(1) through (3), to

ensure that the person held responsible for compliance with the statute can be haled into a California court so that the court can render enforceable judgments against that person. The commenter's suggestion that producers need not "be subject to the jurisdiction of California courts" would defy the core tenets of "extended producer responsibility" (EPR) laws generally and this statute specifically: EPR laws purport to hold entities responsible in California for the effects they cause here, and this statute envisions CalRecycle enforcing the law via administrative proceedings in the state.

Second, contrary to the commenter's stated aim, the proposed change would result in the "in the state" requirement being far narrower in a way inconsistent with the structure of paragraphs (1) through (3) of section 42041(w). Only paragraph (3) concerns actual sales or distribution of products. Instead, paragraphs (1) and (2) identify brand owners and licensees as "producers," but only if they are in the state. In other words, the difference between those two paragraphs and paragraph (3) highlights the Legislature's deliberate choice to ensure that entities can be producers without having any role in the sale or distribution of the covered material in the state. While paragraph (1) refers to manufacturing, neither it nor paragraph (2) mentions any other element of the supply chain; paragraph (2) makes unambiguous that participation in any part of the supply chain is not necessary for one to be a producer. The commenter's proposal would take the opposite approach and would result in brand owners not being "in the state," and thus not "producers," if they do not sell, distribute, or import products using covered materials. That is not a mere theoretical possibility; entities owning brands often do not directly participate in the supply chain and may not perform any physical acts at all (i.e., they may be holding companies or out-of-state sibling companies of an in-state company).

Third, the commenter's approach would make the three-tiered structure of paragraphs (1) through (3) unnecessary. Only paragraphs (1) and (2) require the producer to be in the state. However, the commenter's proposed text would, in effect, limit those paragraphs by importing the criterion in paragraph (3) into them: One could only be a producer under paragraph (1) or (2) if they conducted the activities described in paragraph (3). That result would leave no effective difference between paragraphs (2) and (3) and thus could not have been intended.

Regarding the sentence proposed to be added after the first sentence of section 18980.1.1(e)(1), CalRecycle rejects the proposal because it is unnecessary and would have no effect. Section 18980.1.1(d)(1) clearly precludes the addition of a tag, sticker, or label from being relevant: The designated brand or trademark must be one "used with the food service ware when they are first sold or distributed or used with such initial sale or distribution, regardless of where such use occurs." Adding a price tag, sticker, or label to a container already associated with another person's brand necessarily does not occur when the food service ware was first sold or distributed.

Comment B-41-3

B. Exclusion for Branded Food Service Ware Sold Empty

CalRecycle should clarify under the proposed definition of “food service ware” that wraps, wrappers and bags that are sold empty at retail that are not primarily intended for the packaging of food by a commercial food service establishment are not included in definition of food service ware under the proposed Section 18980.1(a)(8)(B).

PRC section 42041(e)(1)(B)(ii) specifies that only “Wraps or wrappers and bags used in the packaging of food offered for sale or provided to customers by food service establishments” are covered materials. However, Section 18980.1(a)(8)(B) could be read to imply that any wraps or wrappers that are “marketed, designed, or intended” to be used for the packaging of food for sale by food service establishments are covered materials even if they are sold to residential consumers or to businesses that are not food service establishments. Many companies that manufacturer wraps, wrappers and food service bags often market their products “heavy duty” or “commercial grade” even though the vast majority of the products are sold to residential consumers. Only those products that are actually sold to food service establishments should be covered under PRC section 42041(e)(1)(B)(ii).

In order to ensure that consumer products are not unnecessarily reported we suggest including the following new Section 18980.1(a)(8)(B)(iv): (iv) Wraps or wrappers and empty bags sold at retail or through internet transaction to individual consumers are excluded from the definition of “food service ware.”

Response to B-41-3

Comment rejected. The Legislature could not have intended for the status of items as covered material to be impossible to determine, if ever, until it is too late for it to be accounted for. That would be the outcome if whether items are covered material could vary based on whether individual consumers ultimately purchase them. Instead, the proposed regulations require items to be inherently covered material or not based on whether they are "marketed, designed, or intended to be used" in the manner described in statute. That rule presents a factual question about items themselves, not about what might happen with them in the future, and a framework within which manufacturers can readily establish their products as covered material or not covered material.

Comment B-41-4

C. Source Reduction

SB 54 requires that producers who are members of the producer responsibility organization (PRO) submit individual source reduction plans that include:
(1) any amount of covered material, by number of plastic components and weight of covered material, the producer source reduced since January 1, 2013; and
(2) the amount of covered material, by number of plastic components and weight of covered material, the producer plans to source reduce by January 1, 2027, January 1, 2030 and January 1, 2032.

PRC section 42057(d). Under PRC section 42057(a)(1), the PRO must develop and implement a plan by January 1, 2032 to achieve a 25 percent reduction by weight and 25 percent by plastics component source reduction for covered material sold, offered for sale, or distributed in the state. There are also interim source reduction requirements by January 1, 2027 and January 1, 2030. PRC 42057(a)(2)(C) and (D).

The proposed regulations still do not provide sufficient clarity on the information the producers must provide to the PRO in their individual source reduction plans or how the PRO can demonstrate that it is meeting the source reduction requirements.

CalRecycle needs to consider the feasibility of the source reduction targets and provide producers and the PRO with essential information needed to comply with SB 54's obligations. In particular, we are asking for CalRecycle to: (1) consider the impacts of source reduction requirements on growing businesses and modify targets accordingly; (2) provide the PRO and producers greater flexibility in meeting the 2032 source reduction goals, especially with respect to refillable or reusable plastic packaging and clarify that the shift to refillable or reusable packaging is not a requirement for every producer; (3) allow producers to provide estimates for source reductions since 2013; (4) clarify how producers will receive "credit" for past source reduction efforts; and (5) provide credits for producers who transition to materials that are currently less likely to be recycled but for which recycling infrastructure is being developed.

(i) Source Reduction Targets

The statute and current regulations suggest that the source reduction requirements are absolute, meaning that a specified quantity of plastic covered materials will need to be reduced based on the 2023 baseline for all covered producers regardless of the state's or a producer's economic growth. The Legislature recognized the need to allow businesses to grow following the last source reduction goal in 2032, PRC § 42057(h), but the statute and regulations fail to acknowledge the fact that businesses and the economy will continue to grow between now and 2032.

An absolute source reduction target will make it extremely difficult for covered producers of all sizes to build their businesses in California and serve growing communities. Under the current source reduction requirements, covered producers will need to not only rework the packaging for the items that they currently sell, which could take years, but will also be required to put a pause on expanding their offerings unless they are able to avoid the use of plastic covered materials. These absolute source reduction numbers may cause businesses to restrict the amount of products they sell in or into California or even pull out of California altogether.

While we recognize that the statute requires source reduction, the regulations should allow the producers and the PRO to account for producer growth and market conditions when determining compliance with the source reduction requirements. One way to do this would be to implement intensity-based source reduction requirements rather than absolute reduction requirements. For example, a covered producer could propose to

reduce the amount of plastics and plastic components in a particular packaging on an intensity basis. This would allow the covered producers and the PRO to meet SB 54's goals without limiting growth.

(ii) Refillable or Reuseable Source Reduction Goals

PRC section 42057(a)(2) states that "[a]t least 10 percent of plastic covered material sold, offered for sale, or distributed in the state shall be source reduced through shifting a plastic covered material to refillable or reusable packaging or food service ware or through eliminating a plastic comment." (emphasis added).

CalRecycle should clarify that this is an overall goal and not a requirement for **each member producer** of the PRO. For member producers that manufacturer a single item or a few items, it may be impracticable for the producer to switch to refillable or reusable packaging. For example, producers that manufacturer kitty litter or pet food sold at retail would need to create refillable packaging, deliver their product in bulk to the retailer, and coordinate with the retailer to store the product and maintain a mechanism to provide the product to customers. For every item sold or potentially sold in plastic packaging, this is not feasible or practicable.

Similarly, it is not feasible or practicable for retailers that provide fresh and prepared food through on site bakeries, service delis, meat departments, and/or produce departments to have refillable or reusable plastic packaging. In addition, the used packaging could be unsanitary especially for meat, dairy, and produce products. Retailers could potentially face liability for refilling used packaging. It is also unrealistic to assume that consumers will properly sanitize the packaging, keep the packaging, and then bring the packaging back to the retailer to purchase the same item. CalRecycle needs to provide greater flexibility to the PRO and member producers in meeting the 25 percent plastic reduction target. Individual producers should have the flexibility to use any of the mechanisms enumerated under PRC section 42057(d) or alternative mechanisms approved by CalRecycle.

(iii) Estimates for Past Source Reduction

We appreciate that PRC section 42057(f)(1) allows the PRO to consider and give credit for producers' past source reduction efforts starting in 2013. However, our clients are concerned that the significant efforts they have undergone to reduce the amount of plastic covered materials used since 2013 will go unaccounted for because they have not kept detailed records about the weight of covered materials and plastic components that have been source reduced over the past 12 years.

The regulations should clarify that producers will be able to obtain credit for source reductions of covered material since 2013 based on reasonable estimates to account for these past efforts. In addition, CalRecycle should specify the types of data needed to show past source reduction efforts. For example, if the producer can reasonably show a

packaging now contains a percentage of postconsumer recycled content, then the PRO and CalRecycle must provide the producer a credit for that percentage.

(iv) Credit for Past Source Reduction

The regulations provide little detail on how producers are given credit for past source reduction efforts. In addition to reduced fees, producers should be given credit towards their future source reduction targets consistent with PRC section 42057(d). For example, a producer who has reduced plastic or plastic components by 10 percent or more since 2013, should have no additional obligation to submit a plan to further source reduce by January 1, 2027, January 1, 2030, or January 1, 2032, as applicable. The requirement to submit source reduction plans should be on covered producers who have not previously implemented the source reduction efforts under PRC section 42057(d)(2).

(v) Plastic Reduction Credits

Producers should be able to obtain plastic source reduction credits for (1) transitioning to lighter weight plastic materials for which recycling is currently under development and (2) switching to postconsumer recycled content.

Many companies are looking to reduce the weight of their plastic packaging by transitioning from rigid plastic containers to flexible plastic bags. However, the statute's definition of "source reduction" excludes "[r]eplacing a recyclable or compostable covered material with a nonrecyclable or noncompostable covered material or a covered material that is less likely to be recycled or composted." Thus, it is unclear whether this method of source reduction would qualify, as there is less availability for recycling flexible plastics than rigid plastics. PRC § 42040(aj).

Given the long lead time for the development of recycling infrastructure, the regulations should provide a credit for producers who achieve source reduction by replacing recyclable packaging materials with materials for which recycling infrastructure is currently being developed, as long as the PRO is providing for recycling of that material under its plan. This credit would be consistent with the requirement for CalRecycle to approve source reduction credits for producers that switch to postconsumer recycled content (which is similarly not considered to be "source reduction") and meet the required criteria for an alternative compliance formula. PRC § 42057(a)(2)(B); section 18980.3.4.

Response to B-41-4

CalRecycle rejects this comment for the reasons stated in response to comment O-96-17, O-104-18, and O-101-6. As discussed throughout said comments, the source reduction reporting and compliance is already established in section 42057 of the PRC which addressed baseline-based reduction requirements. Further, the proposed regulations already allow for reasonable, documented methodologies to estimate past reductions, but exemptions or credits beyond

those authorized by statute exceed CalRecycle's current interpretation of its statutory authority. See also the statutory definition of "source reduction" in section 42041(aj) of the PRC which would exclude replacing a recyclable or compostable covered material with a nonrecyclable or non-compostable covered material or a covered material that is less likely to be recycled or composted. Finally, as indicated in statute, including section 42057(a)(2) of the PRC, refillable/reusable packaging requirement applies in the aggregate at the PRO level, not to each producer individually, and the regulations are structured accordingly to comply with and achieve statutory goals, including CalRecycle's discretion over the plans and approaches for allocating and documenting source reduction strategies and their practical implication (section 18980.9.1 and section 18981.3 of the proposed regulations) without exceeding CalRecycle's statutory authority. As such, CalRecycle rejects this comment. For further detail, in addition to the aforementioned comment responses that address these issues, please see also O-41-4, O-89-2, and O-48-5.

Comment B-41-5

D. Producer Annual Environmental Mitigation Fees

The new subsection (c) under Section 18980.6.7 should be deleted. The proposed revisions to subsection (b) clarify that the PRO can charge fees two years following approval of the PRO's plan. Adding subsection (c) creates ambiguity as to when the PRO can charge fees. The producers need certainty as to when the annual fee payments will commence.

Section 18980.6.7(g) describes how the PRO will develop a formula and calculate each participant's market share and corresponding environmental mitigation surcharge assessment. As proposed, the formula is based solely on the number of plastic components and weight of plastic covered material a producer offers for sale, distributes, or imports in or into the state without taking into consideration the type of plastic, recyclability or the source reduction efforts implemented by a producer. A producer whose plastic covered material is more recyclable, contains postconsumer recycled content or the producer has implemented other eco-modulation efforts should not have the same share as another producer whose plastic is less recyclable, contains no postconsumer recycled content or has implemented no additional eco-modulation. The formula should not be based strictly on the number of plastic components and the total weight of plastic covered material. We request that CalRecycle revise the second sentence of proposed Section 18980.6.7(g) as follows:

Pursuant to section 42064(f) of the Public Resources Code, the formula shall be based on the number of plastic components and weight of plastic covered material a producer offers for sale, sells, distributes, or imports in or into the state taking into consideration the type of plastic, the recyclability of the plastic, the postconsumer recycled content and other eco-modulation efforts implemented by the producer.

Response to B-41-5

CalRecycle rejects this comment. To the extent this comment recommends deletion of section 18980.6.7(c), see the response to comment B-13-12. CalRecycle further rejects this comment to the extent it recommends revising section 18980.6.7(g) to reflect the type of plastic, recyclability, and source reduction efforts implemented by a producer in the calculation of the environmental mitigation surcharge assessment. The proposed regulations are consistent with the requirements of the Act, including PRC sections 42053, 42060, and 42064, and no change is necessary to the implementation of the Act. PRC section 42064(f) requires a PRO to establish and impose on its participants who produce plastic covered material an environmental mitigation surcharge, accounting for both number of plastic components and weight. PRC section 42064(f) does not allow for the consideration of factors outside the number of plastic components and weight of plastic covered material, nor does it suggest that any such consideration was contemplated by the legislature. CalRecycle declines to expand the express intent of PRC section 42064(f) to include considerations that are already adequately addressed elsewhere in the Act. Therefore, no further change is necessary.

Comment B-41-6

E. Producer Supply Data

Section 18980.5(d) states that producers that apply to become a participant of an approved PRO "shall, at the time of its application, submit to the PRO the producer's supply data for **calendar year 2023**." Given the delay in the adoption of the regulations, CalRecycle should provide some flexibility to covered producers and allow covered producers to submit estimates of "supply data" for calendar year 2023. Covered producers may not have tracked all of the information required under Section 18980.10.2. CalRecycle should clarify that a covered producer may not have all of the information and allow covered producers to provide estimates if actual data is not available. As revised, Section 18980.5(d) should read:

(d) Each producer that applies to become a participant of an approved PRO pursuant to subdivision (b) of this section shall, at the time of its application, submit to the PRO that producer's supply data for calendar year 2023 **and may provide estimates if actual data is not available**. For purposes of this subdivision, "supply data" means the information described in section 18980.10.2.

Response to B-41-6

CalRecycle rejects this comment for the reasons stated in I-62-4, I-62-8, and B-1-1.

Comment B-41-7

F. Covered Materials Recycled or Disposed Out-of-State

Section 18980.2(a) should include a new subsection specifying that covered materials recycled or disposed of outside of California are not covered materials under SB 54. The preamble to SB 54 does not indicate an intent to regulate covered material disposed of outside of California or use funds to support activities outside the state. CalRecycle has no jurisdiction over recycling or disposal activities in other states. Further, other states, such as Oregon, include an explicit carve out for covered materials disposed of or recycled outside the state. See ORS 459A.863(6)(b)(J).

The new Section 18980.2(a)(7) should read:

(7) Any covered material that is not ultimately discarded, recycled, or composted inside this state, whether for purposes of recovery or disposal.

Response to B-41-7

Comment rejected. The proposed addition is inappropriate because it would define "covered material" based on items' locations. Merely defining items outside California as "covered material" does not mean that CalRecycle would exercise "jurisdiction over recycling or disposal activities in other states." To the extent the proposed regulations purport to impose restrictions or burdens beyond those CalRecycle's is authorized to impose, the proper solution would be to revise the provisions that do so—the commenter does not identify any—not change the meaning of the basic phrase that is shorthand for "single-use packaging" and "plastic single-use food service ware." For example, distributing covered material in the state results in a person being a "producer," but the proposed regulations appropriately clarify that products that do not reach the end of their supply chain in California will not be considered "distributed" here. See section 18980.1(a)(17)(F).

Comment B-41-8

G. Recyclability

The regulations should include further information about the recycling standards and practices CalRecycle will follow when determining whether a covered material is considered “recyclable” or “compostable” pursuant to Public Resources Code section 42050(b). As currently drafted, the regulations only state that the covered materials must “be within one of the covered material categories on the list maintained by the Department pursuant to subdivisions (c) and (e) of section 42061 of the Public Resources Code, satisfy the additional criteria listed in paragraph (3) of subdivision (d) of section 42355.51 of the Public Resources Code,” and for food service packaging, satisfy the requirements of California Code of Regulations Sections 17989.2(a)(1) and (3). The statutes referenced in Section 18980.3 of the proposed regulations do not address additional considerations that may impact the recyclability of the covered material such as cardboard repulpability standards and materials that may not become recyclable after being used to contain certain chemicals. At a minimum, CalRecycle should adopt the standards published by the American Forest and Paper Association and the Fibre Box Association.

Response to B-41-8

Comment rejected. The commenter offers the vague proposal that the regulations "address additional considerations that may impact the recyclability of covered materials. However, the statute is clear that Public Resources Code section 42355.51(d) sets forth the conditions that are both necessary and sufficient for establishing recyclability. Moreover, the proposed regulations already accommodate the commenter's concern by interpreting section 42355.51(d)(3)(B) as incorporating the APR design guide's provisions for components that render materials "non-recyclable" or "requires test results." The commenter's suggestion that the proposed regulations adopt standards published by certain industry associations is somewhat more specific, but the commenter neither presents the standards proposed for incorporation into the regulations nor explains why they would be sufficient. CalRecycle cannot evaluate the commenter's basis for proposing such standards and declines to incorporate them.

Comment B-41-9

H. Conclusion

Thank you for the opportunity to comment on the SB 54 Proposed Regulations, and we appreciate CalRecycle's consideration of these comments. We look forward to continuing to work with CalRecycle to address these issues.

Response to B-41-9

Comment rejected. No response specific to the commenter's submission is necessary. This closing paragraph summarizes the commenter's recommendations, to which CalRecycle has responded separately.

B-42: WM (Christine Wolfe)

Comment B-42-1

Waste Management of California, Inc. and its affiliates ("WM") appreciates the opportunity to provide comments on the August 19, 2025 Draft SB 54 Regulations.

Section 18980.1(a)(2) Alternative Collection

The definition should read as follows:

"Alternative collection ***system***" means a ~~program~~ ***system*** that collects covered materials~~, regardless of whether the covered material is discarded or considered solid waste and regardless of the manner and location of collection, and~~ ***that*** is not "curbside collection," as defined in subdivision (g) of section 42041 of the Public Resources Code,

because it is not conducted by ***or on behalf*** of a local jurisdiction ~~or recycling or composting service provider under contract with a local jurisdiction~~.

This definition, by including the clause "regardless of whether the covered material is discarded or considered solid waste," suggests that the alternative collection system can collect materials clearly included in existing franchise agreements. This is a fundamental flaw for three reasons:
1) Charging customers or paying non-franchise entities for alternative collection that occurs at the curb directly contradicts Public Resources Code (PRC) Sections 42051.1(b)(3), 42051.1(c)(3) and (4), 42051.1(i)(2) and (3)(A), 42051.1(k), 42051.1(l), 42067(e)(4) and (5)(A), in that doing so **would violate existing franchise agreements and conflict with, be disruptive of, and adversely affect the performance of the solid waste network providing services in accordance with local solid waste handling requirements** and the intent described in PRC Section 40004. This is expressly prohibited by the Act.
2) It is counter to the intent and spirit of SB 54 for a PRO to charge individual consumers and businesses directly for service. The Act and the Department's draft regulations themselves make clear that the PRO is required to pay for new and additional costs incurred specifically due to the Act, funded by fees assessed on individual producers, not, as the proposed regulatory definition would suggest, by individual consumers and businesses generating recyclables paying for an "alternative collection system." We believe this is contrary to the Department's intent and the Act.
3) The types of programs that would qualify as alternative collection systems pursuant to the Act are a) business-to-business transactions where the generator is ***selling or donating, not paying for or being charged for***, collection of covered materials, or b) mail-back or drop-off retail programs that are either free to the generator or where some incentive is provided by a producer ***to*** the generator. These pathways contemplate scenarios where the material is **not discarded** and so does **not become solid waste**. As such, the clause related to discarding in the regulatory definition is not necessary.

The proposed changes to the definition would be consistent with the Act's express purpose to leverage and utilize existing collection programs and recycling, composting, sorting, and processing infrastructure.

Likewise, the Regulations must make clear that alternative collection systems are required to meet the same requirements as local jurisdictions and recycling service providers with respect to reporting, transparency, transfer to responsible end markets, and that alternative collection systems are subject to the same penalties as local jurisdictions and recycling service providers for non-compliance.

Response to B-42-1

CalRecycle rejects this comment for the reasons stated in response to comment B-40-2. Also, the commenter's analysis of the concept of "alternative collection" erroneously incorporates concepts from solid waste law and related case law. The commenter asserts that "alternative collection systems" are limited to "material [that] is not discarded and so does not become solid waste." That

analysis appears to rest on case law addressing the definition of "recycling" under Public Resources Code section 40180. That definition, as explained in response to comment B-40-2, is irrelevant. The commenter also objects to the PRO "charg[ing] individual consumers and businesses directly for service." The proposed regulations, however, do not imply that any program can require consumers and businesses to incur costs or, because it falls within the definition of "alternative collection," nullify a PRO's obligation to cover additional costs described in Public Resources Code section 42051.1(g)(1), which refers to costs "incurred by local jurisdictions, recycling service providers, alternative collection systems, and others."
Regarding reporting, transparency, and transfer to responsible end markets, the commenter points to no statutory basis for the claim that the regulations must impose the same requirements on alternative collection systems as the statutory requirements placed on local jurisdictions and recycling service providers. The commenter does not identify the reporting and transparency requirements the statute or proposed regulations allegedly place on local jurisdictions and recycling service providers, and nothing in the proposed regulations purport to exclude alternative collection programs from the limitation, stated in Public Resources Code section 42041(aa)(3), that materials must be sent to responsible end markets to be considered "recycled."

See, also CalRecycle's response to comment O-47-2 regarding effects on franchise agreements.

Comment B-42-2

Section 18980.4(a)(4)(B) Responsible end market standards for compostable packaging and food serviceware

The strong standards for REMs for compostable plastics listed in this section are necessary to ensure the PRO Plan does not propose investments that would disrupt or adversely affect the performance of the solid waste network providing services in accordance with local solid waste handling requirements. In this case, the pertinent solid waste handling requirements are the organics collection and processing services required of local governments under CalRecycle’s SB 1383 regulations.

Response to B-42-2

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process.

Comment B-42-3

Section 18980.11(c) Local Jurisdiction and Recycling Service Provider Exemptions and Extensions

The Regulations note that the requirements of subdivision (a) of section 42060.5 of the Public Resources Code shall not take effect with respect to the additions to the CMC list

until the Department decides whether to grant or deny an extension or exemption request from a local jurisdiction or recycling service provider. The ISOR explains that this requirement is “necessary to ensure that the statutory exemption or extension serves its express purpose of preventing imposition of additional obligations caused by the change to the CMC list that are impossible to fulfill.”1 The Regulations also establish in 18980.11.1 a process a local jurisdiction or recycling service provider must follow as part of preparing an application for CalRecycle’s review. The proposed process is described in the ISOR as necessary to ensure adequate notice to stakeholders and allow for discussions between local governments, recycling service providers, and the PRO/independent producers.

To align these two sections, the Regulations should clarify that a local jurisdiction or recycling service provider shall notify CalRecycle of its intent to file for an extension or exemption, at which time the requirements of subdivision (a) of section 42060.5 of the Public Resources Code shall not take effect until the Department decides whether to grant or deny an extension or exemption request. This clarification will ensure that the consultation process with the PRO required in Section 18980.11.1(d) serves its intended purpose.

We note the Act uses the term “practicable,”2 not possible, as the ISOR would suggest at page 252. The ISOR correctly assesses the framework of practicability on page 254 pertaining to Section 18980.11.1(c)(4).

Thank you for consideration of our comments.

Response to B-42-3

Comment rejected. Subdivision (b) of PRC section 42060.5 expressly requires CalRecycle to grant extensions upon a written showing by a local jurisdiction or recycling service provider that compliance with section 42060.5(a) is not practicable. The suggested change to the regulations would contravene that provision by effectively exempting local jurisdictions and recycling service providers from section 42060.5(a) before that written showing has been submitted. Moreover, section 18980.11(c) guarantees a one-year delay before changes in the covered material list results in new obligations for local jurisdictions and recycling service providers. That one-year period provides ample time for providing the advance notice and consultation process required by section 18980.11.1(d) before submission of the application to CalRecycle.

Regarding the term "practicable," even if CalRecycle were required to respond to recommended changes to the Initial Statement of Reasons (as opposed to recommend changes to the proposed regulations), no change would be necessary because that term is a synonym of "possible." According to the Merriam-Webster dictionary, "practicable" means "capable of being put into practice or of being done or accomplished." The commenter may erroneously conflate "practicable" with "practical." The Initial Statement of Reasons used the word "possible" to avoid that incorrect understanding of the word "practicable."

B-43: Mighty Petz Inc. (Pawel Krol)

Comment B-43-1

I would appreciate if there were clear guidelines on where/how small businesses can apply for exemption. At the moment, I have not been able to find such information readily available.

Response to B-43-1

CalRecycle rejects this comment. Section 18980.5.2 establishes clear requirements for a small business seeking an exemption from the Act's requirements pursuant to paragraph (5) of subdivision (a) of section 42060 of the Public Resources Code. Therefore, the recommended change is not necessary to the implementation or enforcement of the Act.

B-44: Cedarwood-Young Company DBA Allan Company (Nenad Trifunovic)

Comment B-44-1

Dear Csilla Richmond:
This letter is submitted on behalf of Allan Company in response to the request for comments to the interpretation and implementation of Senate Bill 54 (Stats. 2022, ch. 75),
the Plastic Pollution Prevention and Packaging Producer Responsibility Act ("**SB 54**"). Allan Company appreciates the opportunity to provide comments on the updated proposed Plastic Pollution Prevention and Packaging Producer Responsibility Act Regulations (the "**Proposed Regulations**").
As one of the largest privately held, independent recycling companies on the West Coast, Allan Company has been family-owned and operated since its founding in 1963 in Baldwin Park, California. Allan Company specializes in acquiring, processing, and marketing valuable recyclable materials, including paper, plastic, metal, and glass.
We appreciate CalRecycle's commitment to a transparent and collaborative rulemaking process. Given the complexity and far-reaching implications of this regulatory framework, Allan Company respectfully submits the following comments.

Response to B-44-1

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it only references the commenter's recommendations; it doesn't set those recommendations forth. To the extent the issues raised require responses, CalRecycle has addressed them in response to other portions of the submission discussing the issues in detail.

Comment B-44-2

Background

The Department of Resources Recycling and Recovery, commonly known as CalRecycle, is established1 and authorized in its waste management powers by the California Integrated Waste Management Act of 19892 ("**CIWMA**") found in Division 30 of the Public Resources Code.

The stated purpose of the CIWMA is expressed in Division 30 as follows:

The purpose of this division is to reduce, recycle, and reuse solid waste generated in the state to the maximum extent feasible in an efficient and cost-effective manner to conserve water, energy and other natural resources, to protect the environment, to improve regulation of existing solid waste landfills, to ensure that new solid waste landfills are environmentally sound, to improve permitting procedures for solid waste management facilities, *and to specify the responsibilities of local governments to develop and implement integrated waste management programs.*

Cal. Pub. Res. Code § 40052 (emphasis added)

SB 54 furthers that stated purpose. It is codified as Chapter 3 (Plastic Pollution Prevention and Packaging Producer Responsibility Act), within Part 3 (State Programs) of Division 30 (Waste Management).

To achieve its aims, SB 54 creates an extended producer responsibility ("EPR") program to manage covered material consisting of specified plastic single-use food service ware and single-use packaging of one or more material types, including plastic and paper. Generally, producers are charged with ensuring that covered material "sold, offered for sale, or distributed in the state"3 is recyclable or compostable.

Natural Circular Economy Complements the SB 54 Circular Economy

In enacting SB 54, the Legislature ensured a role for the existing non-waste recycling industry, consisting largely of recyclers (unaffiliated with any solid waste operation) who buy, broker, process, and/or sell recyclable materials as valuable commodities in the marketplace. For instance, SB 54 requires the producer responsibility organization ("**PRO**") to prepare a plan that, among other things, describes "…how the PRO will leverage and utilize existing collection programs and recycling, composting, sorting, and processing infrastructure."4 SB 54 and the Proposed Regulations also contemplate the use of alternative collection and recycling programs (those outside of the solid waste system) for increased flexibility and innovation. Importantly, the Legislature clarified that SB 54 "does not modify, limit, or abrogate in any manner the existing rights of an owner of recyclable materials to sell or donate those materials."5 In doing so, the Legislature acknowledged the importance of the non-waste recycling industry that has for decades functioned in an effective and efficient *natural circular economy*, which long predates the SB 54 circular economy (now being established) and is separate and apart from it. This *natural circular economy* is the original closed-loop system, which is well-established, self-sustaining, and successfully operates on market-based incentives to collect, process, and sell recyclable materials that get returned to the economic mainstream in the form of new products. In such a system, recyclable materials are valuable property (i.e., commodities) that are traded in the marketplace, and their potential is maximized for as long as possible before they are discarded, if ever.

The SB 54 framework, in contrast, is primarily focused on materials with insufficient market value to cover the costs of collection, recovery, and processing. To successfully implement SB 54, the Proposed Regulations must balance the state's environmental goals with economic realities by fostering flexibility and innovation while preserving the

proven success of the *natural circular economy*. A key element of this balance lies in the definition of “alternative collection.”

_____

3 Cal. Pub. Res. Code § 42041
2 Cal. Pub. Res. Code § 40000, et seq.
1 Cal. Pub. Res. Code § 40400

Response to B-44-2

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process. To the extent other portions of the submission do suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment B-44-3

Suggested Revisions

California’s statutory and judicial authorities have long protected the rights of private parties to engage in transactions of undiscarded recyclable materials (i.e., those outside of the solid waste system). Notably, in *Waste Mgmt. of the Desert v. Palm Springs Recycling Ctr., Inc.,* 7 Cal. 4th 478 (1994), the California Supreme Court explained that until materials are intentionally discarded, they remain the property of their owner, and that individuals and businesses are entitled to lawfully sell, donate, or transfer such materials in commerce prior to being discarded, if ever.

Consistent with this principle, SB 54 and its implementing regulations must not impinge upon these established rights. An owner’s right to sell, donate, or transfer recyclable materials that have not become solid waste is protected not only in case law but is also expressly codified in Public Resources Code Section 42040(b)(5), which prohibits any construction of SB 54 that would restrict such transactions. With this in mind, we propose the following revisions to the definition of “alternative collection” to ensure the regulatory framework better aligns with statute and legal precedent.

_____

5 Cal. Pub. Res. Code § 42040(b)(5); Assembly Bill 1526 (Stats. 2023, ch. 848)
4 Cal. Pub. Res. Code § 42051.1

Response to B-44-3

Comment rejected. As explained in greater detail in responses to comments B-40-2 and B-42-1, the definition of "alternative collection" addresses the semantic issue created by the unique definition of "curbside collection" stated in Public Resources Code section 42041(g): all collection that is not "curbside collection" because it is not conducted by or on behalf of local jurisdictions is "alternative collection." The commenter's proposal is based on its concern over application of concepts from solid waste law related to the definition of "recycling." As also explained in response to comments B-40-2 and B-42-1, that definition does not apply under the statute implemented by the proposed regulations. The sentence that the commenter proposes be added to the definition of "alternative collection"

is unnecessary because it would clarify an issue not requiring any clarification. Nothing in the proposed regulations purport to authorize, or can reasonably be interpreted to authorize, local jurisdictions to restrict the sale or donation of private property.

Comment B-44-4

Section 18980.1. Definitions

Original Text from Proposed Regulations - Section 18980.1.(a) (2) "Alternative collection" means a program that collects covered materials, regardless of whether the covered material is discarded or considered solid waste and regardless of the manner and location of collection, and is not "curbside collection," as defined in subdivision (g) of section 42041 of the Public Resources Code, because it is not conducted by a local jurisdiction or recycling or composting service provider under contract with a local jurisdiction.

Suggested Text

(2) "Alternative collection" means a program that collects covered materials, regardless of whether the covered material is discarded or considered solid waste and regardless of the manner and location of collection, and is not "curbside collection," as defined in subdivision (g) of section 42041 of the Public Resources Code, because it is not a solid waste program administered by a local jurisdiction under Division 30 of the Public Resources Code~~is not conducted by a local jurisdiction or recycling or composting service provider under contract with a local jurisdiction~~. Nothing herein shall be construed to authorize a local jurisdiction to expand its solid waste programs in a manner that modifies, limits, or abrogates rights protected under Public Resources Code section 42040(b)(5). *Rationale for Suggested Text* This proposed revision is necessary to create a clear and legally defensible distinction between municipally administered solid waste programs and independent, market-based collection systems.

Creates a Bright-Line Rule. Grounding the definition in the legal framework of Division 30 of the Public Resources Code provides a clear and legally defensible standard for differentiating "curbside collection" from "alternative collection." This approach avoids ambiguity and instead creates a bright-line rule: a program administered by a local jurisdiction under its solid waste management authority is not an alternative collection program.

Safeguards Protected Rights. The revision expressly incorporates the statutory protection for the rights of material owners under Public Resources Code section 42040(b)(5). This ensures that SB 54 cannot be misconstrued to authorize local jurisdictions to expand their programs in a way that displaces, limits, or abrogates the long-standing and statutorily protected commerce in undiscarded recyclable materials. This language preserves the productive coexistence of public and private systems, consistent with legislative intent and established law.

Aligns with Statutory Exemptions. Public Resources Code section 42041(e)(2)(H)(i) 6 allows for certain covered materials to be exempted from the Act's requirements if they are collected via alternative pathways outside of residential collection services and recycled at a responsible end market. Furthermore, our proposed definition provides the clarity needed to effectuate this provision, ensuring that materials flowing through private, commercial, retail drop-off, or independent aggregator programs are rightfully

eligible for consideration under this exemption framework envisioned by the Legislature.
Aligns with Policy Objectives. A flexible and broad definition for alternative collection programs is paramount to prevent valuable materials from being compelled into the solid waste system, where their economic value and processing efficiency would be diminished. The existing natural circular economy already provides a proven model for managing these materials as marketable commodities rather than waste, consistently achieving higher recovery rates and superior environmental outcomes. The revised definition enables communities, businesses, and entrepreneurs to develop innovative, customized collection methods that build upon existing expertise. Such an approach directly aligns with SB 54's objectives by harnessing the demonstrated success of the *natural circular economy*, which has long maximized material value and advanced sustainability through market-driven solutions.
A Note of Caution. We should exercise care to avoid the centralized management of alternative collection programs because doing so would almost certainly limit the innovation, flexibility, and efficiency that are key to their success. Centralized management could impose rigid frameworks that fail to account for the diverse needs of different industries, communities, and markets, which have long relied on the adaptability of the natural circular economy. Allowing private industry and independent recyclers to develop and manage these programs ensures that materials are handled as valuable commodities, maximizing their potential and reducing environmental impacts. In this way, alternative collection programs can remain agile, responsive to market forces, and better equipped to evolve with advancements in recycling technologies and practices. This decentralized approach ensures alignment with SB 54's goals of promoting sustainability and innovation while protecting the established *natural circular economy*.

_____
6 (i) Covered material for which the producer demonstrates to the department that the covered material meets all of the following criteria: (I) The covered material is not collected through a residential recycling collection service. (II) The covered material does not undergo separation from other materials at a commingled recycling processing facility. (III) The covered material is recycled at a responsible end market. (IV) Until January 1, 2027, the producer annually demonstrates to the department that the material has had a recycling rate of 65 percent for three consecutive years. On and after January 1, 2027, the producer demonstrates to the department that the material has had a recycling rate at or over 70 percent annually, as demonstrated to the department every two years. Cal. Pub. Res. Code § 42041

Response to B-44-4

CalRecycle rejects this comment for the reasons provided in response to comment B-44-3, of which this comment is a continuation.

Comment B-44-5

Conclusion

To achieve SB 54's goals, the implementing regulations must preserve flexibility to optimize collection of covered materials, processing, and recycling methods. The Proposed Regulations should foster innovation in the new SB 54 framework while

protecting the robust, proven, market-driven *natural circular economy* that already exists.
These parallel systems are not in conflict; rather, they are complementary and can accelerate California's progress.
Allan Company is dedicated to contributing to the state's efforts and appreciates the opportunity to provide these comments.
Sincerely,
Nenad Trifunovic
General Counsel

Response to B-44-5

Comment rejected. No response specific to the commenter's submission is necessary. This closing paragraph summarizes the commenter's recommendations, to which CalRecycle has responded separately.

B-45: Eastman (Jessica Paschal)

Comment B-45-1

Eastman Chemical Company ("Eastman") respectfully submits these comments on the Department of Resources Recycling Recovery's ("CalRecycle" or "the Department") August 22, 2025, proposed additions to California Code of Regulations, Title 14, Division 7, Chapter 11.1, and Chapter 11.5 to interpret, make specific, and implement the Plastic Pollution Prevention and Packaging Producer Responsibility Act (Stats. 2022, ch.75) ("the Act"). Eastman appreciates CalRecycle's efforts to develop these regulations and clarify the requirements to meet the obligations imposed by the Act. We offer these comments to suggest certain modifications that are necessary to ensure the objectives of the Act are implemented as statutorily defined.

Eastman Background

Founded in 1920, Eastman is a global specialty materials company that produces a broad range of products found in items people use every day. With the purpose of enhancing the quality of life in a material way, Eastman works with customers to deliver innovative products and solutions while maintaining a commitment to safety and sustainability. The company's innovation-driven growth model takes advantage of world-class technology platforms, deep customer engagement, and differentiated application development to grow its leading positions in attractive end markets such as transportation, building and construction, and consumables. As a globally inclusive and diverse company, Eastman employs approximately 14,500 people around the world and serves customers in more than 100 countries. The company is headquartered in Kingsport, Tennessee.

Eastman supports the development of a clear and equitable framework for encouraging the sustainable management of the end of life of packaging waste. This type of framework will facilitate the growth of the U.S. collection, recycling, and composting industry across a myriad of plastic streams and ensures certainty for investments. Eastman is contributing to this growth by operating the world's largest polyester depolymerization facility where we produce third party verified post-consumer recycled resins. While we have strong interest in supporting the development of an effective recycling infrastructure, we recognize that there are situations where plastic recycling may be impractical, such as food service settings with the potential for contamination from large amounts of food waste. In these situations, a lower carbon emitting and more practical solution may be compostable foodservice ware. As such, we have developed compostable materials produced from renewable sources, not of petroleum origin. These materials can be used to effectively replace plastic single-use food service ware and protein packaging trays, with a fully compostable end of life. We encourage the department to ensure the inclusion of these materials as a possible source for reduction of disposal of solid waste.

We request your consideration of these comments when developing the final regulations for implementing the Act.

Response to B-45-1

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it only references the commenter's recommendations; it doesn't set those recommendations forth. To the extent the issues raised require responses, CalRecycle has addressed them in response to other portions of the submission discussing the issues in detail.

Comment B-45-2

Article 1 – Definitions

The definition of “plastics or polymers” included in the regulation is not reflective of the use of the terms as referenced in the statute, specifically subdivision (d) of Section 42356.1. The referenced section of the statute absolves materials from complying with ASTM D6868 or D6400 (“ASTM Standards”), as identified subparagraph (1) of subsection (b) of Section 42356. The referenced ASTM standards define plastics and polymers separately and as such the regulations should define the terms separately, not as a phrase. To maintain continuity for materials that are absolved from the compliance, the definition of polymer should be adopted from the relevant ASTM Standards. It is recognized that the definition of plastic is defined in section 42041of the statute and has similarity to the ASTM Standards.

Additionally, while all plastics are polymers, particularly as defined by ASTM and the statute, not all polymers are plastics. Which further necessitates the separation and individual definition of terms. It is therefore recommended that the definition of polymer

that is included in the regulation is reflective of the definition in the ASTM Standards. We suggest including the definition of polymer in Article 1 to read: "a substance consisting of molecules characterized by the repetition (neglecting ends, branch junctions and other minor irregularities) of one or more types of monomeric units."

This will ensure that the correct breadth of materials are evaluated for labeling as compostable.

Response to B-45-2

CalRecycle rejects this comment for the reasons provided in response to comment B-14-2.

Comment B-45-3

Article 4 – Responsible End Markets
18980.4.1 – End Market Identification

With approximately 260 million tons of plastic disposed of each year globally and recycling rates hovering around 10 percent both globally and in the United States, new technologies are essential to increase recycling rates in the United States and in California. The recycling rate targets set forth in the Act are critical to addressing the plastic waste issue, and existing technology, namely mechanical recycling, is not capable by itself of meeting these rates. The Act requires increases in recycling rates, in addition to source reduction and reuse/refill efforts, to realize more efficient use of plastics for Californians. The Act and these regulations recognize that complementary and innovative technologies are necessary for creating a circular economy. Subsection (d) of Section 18980.4.1 provides a viable, yet stringent, pathway to ensure that recycling minimizes generation of hazardous wastes and greenhouse gases, while also minimizing the impacts to the environment, public health, and environmental justice.

Additionally, this section opens a pathway for innovative technologies to supply the material necessary for US manufacturers to include increasing amounts of high-quality post-consumer recycled content in their products, particularly for packaging that meets food contact quality requirements. Thereby meeting the intent of the legislation to establish a comprehensive circular economy framework to reclaim certain resources1.

As stated in subsection (b) of Section 42040, the Act aims to establish a comprehensive framework for a circular economy. A primary goal of the Act is to create a model for a US circular plastic economy and to promote the recycling of postconsumer plastic waste within the country. This will be critical to fully support the program and ensure economic viability of any new or established infrastructure that is necessary to achieve the goals of the legislation. The import of plastic waste to meet goals should be discouraged, while the recycling and use of US or North American waste should be encouraged. This could come in the form of prioritized ecomodulation bonuses for use of domestically sourced post-consumer recycled content. A second option is to prioritize the use of US

sourced postconsumer recycled content, originating from US waste, to meet the source reduction goals required in subparagraph (i) of paragraph (B) of subparagraph (2) in subdivision (a) of Section 42057.

Eastman is deeply committed to supporting the development of the U.S. recycling industry. To ensure that the Act contributes to this objective and that the Act is implemented in a manner that maximizes benefits to the environment and minimizes risks to public health, we urge CalRecycle to consider these comments, as well as relevant comments that were previously provided, when finalizing the regulation.

We would welcome discussing these issues further with you and your staff, and we look forward to working with you.

Response to B-45-3

CalRecycle rejects this comment. To the extent this comment expresses support for section 18980.4.1(d) of the proposed regulations, the comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process. To the extent this comment recommends structuring eco-modulation or source reduction to encourage the use of postconsumer recycled plastic sourced from the United States, see the response to comment O-39-1.

B-46: James Hardie (Marcus Kuizenga)

Comment B-46-1

Thank you for the opportunity to comment on CalRecycle's proposed regulations, Title 14, Division 7, Chapters 11.1 and 11.5, California Code of Regulations (2025), implementing SB 54, known as the Plastic Pollution Prevention and Packaging Producer Responsibility Act, Pub. Res. Code § 42040 – 42084 et seq. ("Proposed Regulations"). While James Hardie supports the overall goals and objectives of SB 54, some of the Proposed Regulations create unique challenges when applied to homebuilding, construction, and building material manufacturers. In comparison to other forms of waste streams generated by food products, retail, or single-site industrial locations, the building industry has a complex and multi-layered supply chain, which includes material manufacturers, distributors and retailers, contractors, builders, and consumers. There are also unique challenges with ensuring that homebuilding products are appropriately packaged and protected, given that they may be held prior to use for months or years and certain products must be protected against weather and other elements on a construction site prior to their use and incorporation into a home build.

California has recently enacted a number of regulations, including but not limited to certain exemptions and streamlined regulations under the California Environmental Quality Act, to expedite homebuilding in the state, increase the stock of available affordable housing, and reduce the overall cost of owning a home in California. The Proposed Regulations will result in increased costs for homebuilding manufacturers, contractors, and homeowners through imposing additional fees on manufacturers and

distributors of building materials that currently do not have alternative options for packaging their products for delivery to the end user. These costs will likely be passed on to the end users of the products, thereby increasing the costs of homebuilding. Given this concern and the complexity of the supply chain for homebuilding materials, we respectfully request that CalRecycle and the selected Producer Responsibility Organization ("PRO"), Circular Action Alliance, consider an exemption for such materials in acknowledgment of the state's goals of quickly increasing the supply of affordable housing and reducing costs for potential homebuyers. Alternatively, we recommend that CalRecycle and the selected PRO work with the homebuilding industry to implement a pilot program to address these specific challenges. Entities potentially subject to regulation also need further clarification on what would be considered a "de minimis" amount of "covered materials" and what would be considered an "integral part" of a product. Finally, the Proposed Regulations should implement an alternative fee schedule for packaging deemed essential to product integrity.

1. James Hardie Supports the Overall Goals of the Proposed Regulations, Which Align with Our Sustainability Goals

James Hardie is North America's #1 producer and marketer of high-performance fiber cement siding and backerboard. Our affordable, durable, low maintenance and innovative fiber cement products are manufactured in the United States from durable and resilient raw materials, delivering endless possibilities of home exterior design and aesthetics to consumers. We offer a variety of patterned profiles and surface finishes for a range of applications, including external siding, trim, soffit lining, internal linings, walls, facades, floors and tile underlayment for use in residential, commercial and industrial applications. We employ Californians at our office in Mission Viejo and our manufacturing and R&D facilities in Fontana. James Hardie provides a positive economic impact to the state through its manufacturing output and the provision of diverse job opportunities. 332 employees within James Hardie call California home, with our Fontana manufacturing plant delivering over $30 million annually in local goods and service purchases.

James Hardie is a subsidiary of James Hardie Industries plc (NYSE / ASX : JHX) whose other subsidiaries also produce high-performance, low-maintenance building material brands, including TimberTech® decking, AZEK Exteriors® and Versatex® trim boards, StruXure® pergolas, Ultralox® and Intex® railing systems. Collectively, James Hardie brands offer incredible value, as well as endless design possibilities for homeowners looking for siding, decking, trim, railing, and pergolas.

James Hardie supports the overall goals of SB 54 to expand upon existing efforts to create circular waste management that reduces the amount of nonrecyclable materials and increases recycling rates to reduce waste and efficiently use the planet's resources. We believe there are ultimate benefits from increasing the amount of recycled material from construction sites. Through collaborative efforts among CalRecycle, the PRO, building material manufacturers, contractors, and homebuilders, we can significantly reduce landfill volume while advancing our recycling goals.

Sustainability is foundational to how we do business. As illustrated in our 2025 Annual Sustainability Report, we continue to make progress, evolve and innovate our manufacturing operations and product lines and services to help ensure homes are both affordable and built to last. In James Hardie's manufacturing operations, we:
• **Hire Locally**: We hire 93% of our employees from the local communities in which we operate.
•**Source Raw Materials Locally**: We source 81% of our raw materials from within 150 miles of our facilities.
•**Deliver Products Locally**: We deliver 65% of our products within 500 miles of our manufacturing operations.
• **Reduce Landfill Waste**: We diverted over 11 percent of manufacturing waste from local landfills in fiscal year 2025.

AZEK also embeds sustainability into every stage of its operations, from material sourcing and manufacturing to product durability and end-of-life solutions. AZEK TimberTech® decking board products are made with up to 85% recycled material. Guided by a full-circle approach, AZEK transforms waste and scrap into high-performance, long-lasting materials and aims to incorporate one billion pounds of recycled content into its manufacturing annually. Since 2019, AZEK has used approximately 2.6 billion pounds of waste and scrap to manufacture its products. In fact, with its Full Circle Recycling Program, AZEK has become the largest vertically integrated recycler of PVC in North America. Additional details can be found in AZEK's latest sustainability report available here. Ultimately, we want to work with CalRecycle and the PRO to reduce waste streams while continuing to ensure that we can provide high-quality and durable products for the homebuilding industry.

Response to B-46-1

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it only references the commenter's recommendations; it doesn't set those recommendations forth. To the extent the issues raised require responses, CalRecycle has addressed them in response to other portions of the submission discussing the issues in detail.

Comment B-46-2

2. CalRecycle and the PRO Should Create an Exemption for Building Materials Delivered to Homebuilding or Remodeling Locations to Avoid Significant Adverse Impacts to Homebuilders and Homebuyers

CalRecycle has set up a path for a PRO or an independent producer to submit a request for an exemption where there are unique challenges to complying with SB 54. Pub. Res. Code § 42060(a)(3). The Proposed Regulations implement this provision by creating a route for applying for a term-limited exemption. Proposed Regulations § 18980.2.4(g). Given the complexities involved in recycling and disposal of building material packaging, CalRecycle and the PRO should create an exemption for such packaging while the PRO works with the industry to identify either other products that comply with SB 54 requirements or alternatives for recycling and/or disposing of such

material. Such an exemption is critical to avoid increased homebuilding costs and potentially significant impacts to product quality and protection of homebuilding materials.

A. An Exemption for Building Materials Would Avoid Additional Homebuilding Costs and Adverse Impacts to Housing Supply

It is well known that California is in the midst of an affordable housing shortage. According to a recent McKinsey & Company report, California loses approximately $140 billion per year, or 6% of its GDP, due to the housing shortfall. The California Legislative Analyst's Office has determined that California home prices have long been—and continue to be—much more expensive than the rest of the US. Prices for mid-tier homes are more than twice as expensive as the typical mid-tier US home.1 Policies and regulations that increase complexity for both homebuilders and building material manufacturers will only aggravate these trends. The Proposed Regulations will result in increased costs for homebuilding manufacturers, contractors, and homeowners – in the short term – through imposing additional fees on manufacturers and distributors of building materials that currently do not have alternative options for packaging their product for delivery to the end user. These costs will likely be passed on to the end users of the products, thereby increasing the costs of homebuilding and, ultimately, homebuying. Adopting an exemption for such materials, while the regulated industry works with the PRO to establish feasible alternatives, would avoid adversely impacting the supply of affordable housing in California.

1See https://lao.ca.gov/LAOEconTax/Article/Detail/793

B. An Exemption Would Allow Additional Time Needed to Address the Complexities of Packaging Associated with Building Materials

While SB 54 and the Proposed Regulations impose costs and potential penalties on product manufacturers using the framework of a simple manufacturer-to-distributor-to-consumer supply chain, the homebuilding construction material industry has a much more complex supply chain that justifies exempting it from the Proposed Regulations. Home building requires a wide variety of building materials and products with diverse and unique packaging requirements, ranging from simple paper bags for commodities like cement, to complex films and composite materials for protecting high value items such as windows and factory-finished siding, to expanded polystyrene blocks, shrink wrap and complex nonwoven fabrics or laminate films.

Packaging materials used on construction sites must serve multiple critical functions beyond basic containment. They are engineered not only to safeguard products during transportation and storage but also to withstand exposure to external conditions such as moisture, dust, and temperature fluctuations while staged outdoors. This is especially important for materials that are sensitive to weather, which can degrade or become unusable if not properly protected. Their use, and the associated durability of packaging, often depends upon the construction schedule of the homebuilder, which can be days, months, or even years depending upon the nature of the project and construction schedule.

In addition to shielding products from the elements, packaging plays a vital role in ensuring the safe handling and delivery of large, fragile components—such as windows, doors, and glass panels—by providing structural support and impact resistance. These protective features help prevent damage during loading, unloading, and movement around the jobsite, reducing waste and costly delays. Moreover, well-designed packaging can contribute to site efficiency and safety, offering features like stackability, clear labeling, and ease of access that streamline inventory management and reduce the risk of accidents. In this way, packaging becomes an integral part of the construction logistics system, not just a disposable layer. Thus, the performance requirements for building material packaging can be much more demanding than for other industries. Therefore, we encourage CalRecycle and the PRO to consider the sector-specific packaging needs of the homebuilding construction industry before requiring replacement of existing materials with commonly recyclable alternatives.

C. An Exemption Would Allow Time to Address a Complicated and Varied Supply Chain

Consideration of homebuilding materials and associated packaging must also include the unique aspects of the associated supply chain. Unlike the supply chain for consumer products, where a product is purchased by a retail outlet and sold to a consumer who removes the packaging and (where available) places it into a recycling bin utilized by an existing recycling program, the supply chain for homebuilding is far more complex. There are a wide range of trades involved: concrete pouring, framing, roofing windows and siding installation, masonry, plumbing, electrical trades, interior finishing, painting and many more. Each uses its own set of building materials with its own set of packaging types. Use, disposal, and potential recycling of packaging materials is typically executed by multiple independent contractors who remove packaging at different points in time during the home building process. This packaging is often simply placed in dumpsters at the job site for eventual landfilling, with little effort to sort or segment the waste.

Mechanisms, guidance and programs for enabling efficient collection and separation of recyclable homebuilding materials at construction sites are rare, if employed at all. CalRecycle has advised that recycling opportunities in many areas of the state may be limited, and disposal may be the only option.2 While building material manufacturers may be able to improve the recyclability of the packaging they use, homebuilders will ultimately be responsible for managing the collection and removal of packaging waste from a construction site. Without clear guidance to homebuilders and an established infrastructure for processing this packaging waste, a key piece of the circular economy is missing. Collaboration between building material manufacturers, builders, recyclers, CalRecycle, and the PRO is needed to develop feasible collection solutions for recyclable packaging on construction sites. The Proposed Regulations do not adequately address and acknowledge all of these players in the homebuilding supply chain. This oversight is compounded by the fact that the Proposed Regulations do not define “producer” to include manufacturers of the “covered material” used in the homebuilding industry, just the users of the covered material. Pub. Res. Code §

42041(w). These complexities have been acknowledged in other states, such as Colorado,3 some of which have exempted packaging associated with business-to-business transactions (such as from a building product manufacturer to a homebuilder using the product).

For these reasons, the Proposed Regulations should include an exemption for homebuilding material packaging associated with home construction and remodeling, distributed pursuant to a business-to-business transaction, until a more targeted and feasible framework can be established.

Response to B-46-2

Comment rejected. The commenter requests that CalRecycle establish a specific exemption for building materials delivered to homebuilding or remodeling locations. However, CalRecycle does not have general authority to create exemptions not established by statute. In any event, the proposed regulations accommodate the commenter's concerns because any packaging not within a categorical exemption (e.g., for reusable packaging or for packaging of goods enumerated in Public Resources Code section 42041(e)(2)) might qualify for other exemptions based on public health, safety, and other special compliance challenges. See, e.g., PRC section 42060(a)(3) and (4), and section 18980.2.4 of the proposed regulations. Accordingly, the proposed regulations accommodate that commenter's concerns, and no change is necessary.

Comment B-46-3

3. CalRecycle and the PRO Should Create a Pilot Program to Evaluate how to Reduce Waste and Increase the Recyclability of Building Materials

The statute authorizes CalRecycle to adopt regulations to identify responsible end markets. Pub. Res. Code § 42041(ad). The Proposed Regulations shift this responsibility to the PRO to (1) evaluate technology that could be used to recycle covered material and ensure that the technology can constitute recycling; (2) evaluate the feasibility of collecting, transporting, processing and recycling covered material; (3) evaluate how end markets can meet the proposed standards; and (4) create pilot programs to address these issues. Proposed Regulations § 18980.4.3(b)(1).

We believe that there are opportunities to work with all components of the building material supply chain, including packaging manufacturers, building material manufacturers, homebuilding retailers, and the ultimate users of the products on homebuilding or remodeling job sites, to create a pilot program to reduce waste and increase the recyclability of packaging associated with building products, including specialty packaging like foam blocks, composite inserts, or non-woven bags. While this comment does not propose changes to the Proposed Rulemaking, we encourage CalRecycle and the PRO to engage with this industry to develop a pilot program to address these issues. Industry input from all segments of this supply chain is critical to ensure meaningful outcomes, practical data collection, and address the complexity of recycled packaging from construction sites. Since these pilot studies will take time, we

suggest that CalRecycle consider an extended compliance timeline for covered material necessary for homebuilding material packaging that could be impacted by such a pilot project.

2https://calrecycle.ca.gov/condemo/
3Co. Rev. Stat. § 25-17-703(13)(b)(VI)("'covered materials' does not include: […] packaging material used exclusively in industrial or manufacturing processes'").

Response to B-46-3

Comment rejected. As recognized by the commenter, to the extent this comment encourages CalRecycle and the PRO to engage with industry to create a pilot program for packaging associated with building products, the comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process. To the extent this comment recommends consideration by CalRecycle of an extended compliance timeline for covered material necessary for homebuilding material, no change is necessary. First, the recommendation for "an extended compliance timeline" is vague and CalRecycle cannot discern the specific changes to the proposed regulations that are being recommended by the commenter. Second, the proposed regulations are consistent with the requirements of the Act, including PRC sections 42051, 42051.1, and 42060, and no change is necessary to the implementation or enforcement of the Act. PRC section 42060, as implemented by sections 18980.2.3 and 18980.2.4 of the proposed regulations, already provides for all necessary and appropriate exemptions for covered materials under the Act. To the extent the commenter may want to extend the timeline for its compliance obligations under the Act, it may apply for an exemption for covered materials under those sections. Additionally, PRC section 42061(a)(3)(B), as implemented by section 18980.3.1 of the proposed regulations, may provide another route for producers to extend compliance timelines for covered materials. Because appropriate opportunities for exemptions and extended compliance timelines already exist under the proposed regulations, no change is necessary.

Comment B-46-4

4. Certain Key Defined Terms Remain Ambiguous and Require Further Clarification

Several key definitions are critical to regulated entities to determine the scope of their responsibilities under SB 54 but require further clarification. SB 54 defines "covered material" as including "single-use packaging that is routinely recycled, disposed of, or discarded after its contents have been used or unpackaged, and typically not refilled or otherwise reused by the producer." Pub. Res. Code § 42041(e)(1)(A). Packaging is defined as "any separable and distinct material component used for the containment, protection, handling, delivery, or presentation of goods by the producer for the user or consumer, ranging from raw materials to processed goods." Pub. Res. Code § 42041(s). It does not include (1) any element of the packaging with a de minimis weight or volume or which is not an "independent plastic component" or (2) a "component or

element that is an integral part of the product, if all components or elements of the product are intended to be consumed or disposed of together." Pub. Res. Code § 42041(s)(4)(A)-(B).

The Proposed Regulations provide requirements to guide how a PRO is to evaluate whether a component or group of components is of "de minimis weight or volume," which includes the following criteria:
(A) It is not an independent plastic component.
(B) Due to its small size or weight and other relevant characteristics, if any, it has no effect on whether any covered material satisfies any of the recyclability criteria provided in section 42355.51 of the Public Resources Code.
(C) Due to its small size or weight and other relevant characteristics, if any, it does not prevent recyclability pursuant to subdivision (c) of section 18980.3 or make recycling or composting more difficult pursuant to subdivision (h) of section 18980.6.7. 6
(D) Designating it as having a de minimis weight or volume enables usage of recyclable, compostable, reusable, or refillable packaging.
(E) Its disposal, processing, and handling does not create health or safety risks or have a significant effect on the environment.
(F) Its use in packaging is not prohibited under any law of this state or federal law.

Proposed Regulations § 18980.2.2(b)(2). "Independent plastic component" does not include "a coating, film, tape, sticker, label, or other sheet-like material adhered to the surface of another component or group of components." Proposed Regulations § 18980.2.2(b)(1)(B)(ii). James Hardie requests further clarification concerning the products that would meet these definitions. For example, there are several products that could fit into this exception, including bar code stickers on grocery store produce, plastic film on temporary tattoos that is discarded upon application, or thin film that is adhered to windows, mirrors, and other building products but removed upon installation in a home. Such materials are a small fraction (by weight, volume, or other characteristic) in comparison to the product itself; however, the Proposed Regulations are ambiguous as to whether such materials would meet the terms of the above exemption. James Hardie requests confirmation from CalRecycle and/or the PRO that such materials would be exempted under the Proposed Regulations as "de minimis weight or volume."

The Proposed Regulations also do not further define what is considered an "integral part of the product." This would appear to exempt products like a tube of toothpaste, a tube of caulk, or containers of paint. The Proposed Regulations should include a definition of what is considered an "integral part of the product" and/or examples as to what would be exempt based upon that term.

Response to B-46-4

CalRecycle rejects this comment because, rather than request a modification to the proposed regulations, it requests that CalRecycle issue a determination of how the proposed regulations would apply to certain categories of materials, some of which might not even be packaging. The proposed regulations provide detailed criteria that are sufficient to be applied consistently to packaging

components; to the extent that stakeholders would benefit from CalRecycle providing illustrative examples of such applications, no revision of the proposed regulations is necessary for CalRecycle to do so. If the commenter intended to propose that the regulations define "integral part of the product," CalRecycle declines to do so because the proposed regulations do not use that term. In any event, the word "integral" has a readily discernible, plain meaning in the context in which the statute uses it (section 42041(s)(4)(B), and the commenter does not propose any definition that it would consider sufficient.

Comment B-46-5

5. The Proposed Regulations Should Include an Alternative Rate Schedule for Packaging Considered Essential to Product Integrity within the Homebuilding Industry

The Proposed Rule outlines eco-modulated producer dues based on packaging recyclability in order to carry out Public Resources Code Section 42053. Proposed Regulations § 18980.6.7. The Proposed Regulations contemplate that the PRO may set an alternative reduced rate for select covered material if an alternative collection program is utilized. Proposed Regulations § 18980.6.7(e)(1)(D). James Hardie requests that CalRecycle consider an alternative reduced rate for covered material that is deemed essential for product integrity and not yet widely recyclable if the development of an alternative collection program for a specific industry is under development but not yet utilized. For example, James Hardie is evaluating pallet bag materials with improved durability for more effective long-term protection that eliminates the need for additional tarping on trucks, further reduces transportation costs, and improves safety. While these non-woven materials are technically recyclable, there is no established process or infrastructure for recycling them at this time.

SB 54 also identifies certain factors that may qualify participant producers for fee credits to their fee schedule. Pub. Res. Code § 42053(c)(2). Two of these factors are:
• Source reduction related to right-sizing, optimization, and bulking of packaging, or concentrating the product packaged to reduce packaging.
• Actions taken by the producer to accelerate source reduction and to invest in sustained and robust reuse and refill systems. The PRO may create a mechanism to allow producers to receive a credit for achieving source reduction beyond what producers of similar covered material are achieving.

Pub. Res. Code § 42053(e)(2), (6). James Hardie requests clarification on what meets the definition of “bulking of packaging” to be considered for the fee credit under Public Resources Code Section 42053(e). James Hardie also requests clarification on whether producers that are not currently meeting the strict reuse requirements of Public Resources Code Section 42041(af)(1) but can demonstrate through documentation that efforts to meet that standard are being made will satisfy Public Resources Code Section 42053(e)(6). James Hardie would also like to understand the extent of documentation that would need to be provided to the PRO to support credit determinations. Incorporation of the above considerations would incentivize the industry to continue to

work to improve recyclability while avoiding potential additional costs to the homebuilding industry and negatively impacting housing affordability.

Response to B-46-5

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including PRC sections 42051.1, 42053, and 42060, and no change is necessary to the implementation of the Act. To the extent this comment recommends consideration by CalRecycle of an alternative reduced rate for covered material that is not yet utilized in an alternative collection program, no such alternative reduced rate is necessary or appropriate. The purpose of section 18980.6.7(e)(1)(D) of the proposed regulations is to incentive the continued use of alternative collection programs with measurable performance relative to the statewide performance of curbside collection for the same materials. To the extent an alternative collection program is under development but not yet utilized, it may become subject to an alternative reduced base fee rate once it achieves measurable performance. Furthermore, to the extent this comment recommends clarifying "bulking of packaging" as it is used in PRC section 42053(e)(2), such language is clear and used in its ordinary sense, and no further clarification by CalRecycle is necessary. To the extent this comment recommends clarifying the reuse and refill requirements in PRC section 42053(e)(6), no clarification is necessary because such language has the same meaning as defined in PRC section 42041(af) and further clarified in section 18980.2.1 of the proposed regulations. Finally, to the extent this comment recommends clarifying the extent of documentation necessary for the PRO's credit determinations, no clarification is necessary because the amount of documentation necessary is within the discretion of the PRO under PRC section 42053. See the response to comment B-13-12. Therefore, no changes are necessary.

Comment B-46-6

6. The PRO is Required to Engage in Sector-Specific Outreach for the Homebuilding and Construction Industry

SB 54 requires that the PRO’s Producer Responsibility Plan include “efforts to use education and promotion to encourage proper participation in recycling and composting collection and reuse and refill systems,” including (1) “[e]ducation and engagement to reduce the rate of inbound contamination or unwanted materials,” and (2) “[o]utreach to obtain consistently high levels of public participation in and use of collection services and reuse and refill systems.” Pub. Res. Code § 42051.1(e). Given the complexity and specificity of the homebuilding industry’s packaging discussed above, we would welcome proactive engagement with CalRecycle and the PRO as to how to best address these issues to improve the recyclability of packaging used in the industry while ensuring that we maintain the integrity and quality of the products used in homebuilding. We recommend that the Producer Responsibility Plan include (1) dedicated technical assistance resources and sector-specific outreach (e.g., webinars, FAQs, design

guides) tailored to building material manufacturers, and (2) stakeholder engagement mechanism to identify implementation challenges in real time.

Response to B-46-6

CalRecycle rejects this comment. PRC section 42051.1(e) already requires that the Producer Responsibility Plan must include education and promotion efforts designed to encourage proper participation in recycling, composting, reuse, and refill systems while also requiring education and engagement activities to reduce inbound contamination and obtain consistently high levels of public participation in covered material collection services. As such, the statute already lays out a robust and detailed framework for the education and outreach requirements.

Further, the proposed regulations provide additional clarifications and requirements to successfully implement the statutory framework to achieve successful education and outreach, including section 18980.8(d) of the proposed regulations which indicates that in addition to the examples provided in the PRC, the PRO is required to provide a description of performance measures, which shall evaluate performance of the comprehensive education and outreach program to ensure that the education and outreach goals provided in the Act are successful.

Given the wide range of industries included in SB54, providing each industry a specific education and outreach description and requirements would not only be impracticable, but may also result in having the opposite effect of achieving the goal by creating a less flexible and robust education and outreach program. Further, the plan must also include a process for coordinating education and promotional efforts between entities, which should facilitate stakeholder participation.

Thus, the commenter's concerns are already addressed within the existing statutory and proposed regulatory framework, and additional prescriptive requirements are neither necessary to achieve successful education and outreach, nor are specific descriptions for each industry or sector feasible. As such, no changes to the proposed regulatory text are necessary in response to this comment.

Comment B-46-7

7. Conclusion

Thank you for the opportunity to comment upon the Proposed Rulemaking. As noted above, while James Hardie shares the overall objectives of SB 54 to increase recyclability of packaging materials, improve sustainability, and reduce landfill waste, there are a variety of unique issues presented by the homebuilding supply chain that require further consideration by CalRecycle and the PRO. To avoid significant adverse impacts to homebuilders and homebuyers, we propose that CalRecycle and the PRO create an exemption for covered materials used on building products, delivered as a

result of a business-to-business transaction, to homebuilding or remodeling sites. Further, we respectfully request that CalRecycle and the PRO consider adopting the recommended pilot program, alternate rate schedules, and clarification for key terms described above.

We look forward to opportunities where we can discuss these issues in greater detail with CalRecycle and the PRO to meet the goals of the program, continue to ensure the quality and integrity of our products as they are installed in homes throughout California, and avoid imposing additional costs on California homebuilders and homebuyers.

Response to B-46-7

Comment rejected. No response specific to the commenter's submission is necessary. This closing paragraph summarizes the commenter's recommendations, to which CalRecycle has responded separately.

B-47: Olivier Jamin

Comment B-47-1

Dear Ms. Richmond,
Thank you for the opportunity to submit comments regarding the latest draft regulations (referred to as the “Draft SB 54 Regulations”) from California’s Department of Resources Recycling and Recovery’s (“CalRecycle”) implementation of the Plastic Pollution Prevention and Packaging Producer Responsibility Act (“SB 54”). The comments below are submitted on behalf of a large packaging company with roughly 700 employees in California (“Company”).
At the outset, CalRecycle’s goals in implementing California’s Extended Producer Responsibility (EPR) program are consistent with Company’s sustainability goals and those of our customers. Company appreciates CalRecycle’s efforts in trying to address many different supply chain scenarios as part of its rulemaking process and recognizes that implementing the EPR program is a significant challenge given the ever-expanding complexity of supply chains in the U.S. and worldwide. Additionally, Company very much appreciates CalRecycle’s receptiveness to previous industry comments regarding the greater acceptance of chemical recycling technologies as well as the acknowledgement that empty packaging does not constitute single-use packaging and should therefore be excluded as a covered material.
However, Company is concerned that the regulations as drafted may pose significant challenges to effective compliance with SB 54 and associated regulations, and could unintentionally harm the industry’s sustainability efforts, contrary to the goals of SB 54. Company’s comments are focused on 1) the concept of “trending” for purposes of meeting recyclable goals and recycling rate targets; 2) CalRecycle’s proposed exclusion for packaging components used by a food or agricultural commodity; and 3) CalRecycle’s proposal for criteria applying to eco-modulation.

Response to B-47-1

Comment rejected because it only alludes to, but does not set forth, the commenter's objections and proposed changes. To the extent other portions of the submission do set forth objections and proposals requiring responses, CalRecycle has done so in response to those portions.

Comment B-47-2

1. The "trending" concept should also apply to the mandate of Section 42050(c) of the California Public Resources Code.

Context: As currently introduced, the concept of "trending" under SB 54 and the Draft SB 54 Regulations seems focused on meeting the requirements of Section 42050(b) of the California Public Resources Code, which requires producers to "[e]nsure that all covered material offered for sale, distributed, or imported in or into the state on or after January 1, 2032, is recyclable or eligible for being labeled 'compostable'." This transpires from the statutory framework and the "Final Statement of Reasons" published along with the Draft SB 54 Regulations which refer multiple times to material categories as "trending towards recyclability." While this concept in the context of meeting Section 42050(b) recyclability requirements is helpful, Company urges CalRecycle to consider adopting a similar concept for purposes of meeting the requirements of Section 42050(c) which requires plastic covered material to meet certain recycling rates by 2028, 2030, and 2032 to be eligible for sale in the state.

Issue: As currently drafted, a plastic covered material category may be prohibited from sale in the state if that category does not meet the 30% recycling rate target by January 1, 2028. While Company understands CalRecycle's desire to adopt aggressive recycling rate targets, those targets may also hurt the packaging industry's ability to innovate and create more sustainable and environmentally-friendly packaging options that may need a ramp-up period to achieve those recycling rate targets. While Draft SB 54 Regulations do provide limited transitional relief for new covered material categories introduced after 2024, see Section 18980.3.2, this relief is limited until one year of data is available, and is likely inadequate for producers to meet the aggressive recycling rate targets of Section 42050(c). Even for existing covered material categories, Section 42050(c)'s targets are likely unachievable for large categories that currently lack viable alternatives, which could significantly impact the ability of businesses to safely, economically, and carbon-efficiently get goods to consumers in the state. For example, flexible plastic packaging can significantly extend product shelf life which reduces food waste and the carbon emissions from food waste, and enables more efficient and reduced weight in transportation which also reduces carbon emissions compared to currently available rigid plastic and non-plastic alternatives. However, despite these benefits, there is a high risk the material may not meet the 30% recycling rate target by 2028.

Solutions: First, Company urges CalRecycle to exempt flexible plastic packaging from Section 42050(c) if it finds evidence that there is significant and positive momentum in increasing the recycling rates for this covered material category toward the required rate. For existing covered material categories, CalRecycle could exempt a plastic

covered material category from meeting the recycling rate targets of Section 42050 if the category in question is showing an increase in recycling rates year-over-year of at least 2% AND demonstrates an ability to comply with the targets by achieving the recycling rates of Section 42050(c) within a particular county or city. Alternatively, CalRecyle could exempt a plastic covered material category from meeting the recycling rate targets of Section 42050 if the category in question is showing an increase in recycling rates year-over-year of at least 2% AND the category in question is shown to be more sustainable than other available packaging options in similar categories. For new covered material categories created after 2024, those new categories should be exempt from meeting the requirements of Section 42050(c) for at least 5 years after the creation of the category so long as the category is showing an increase in recycling rates year-over-year of at least 2%. Finally, for purposes of meeting the recycling rate targets of Section 42050(c), CalRecycle should make clear that both local and alternative (including private) collection qualify for meeting those rates.

Response to B-47-2

Comment rejected. There is no statutory basis, and the commenter identifies none, for an exemption from recycling rate requirements for items showing "momentum in increasing recycling rates." Public Resources Code section 42061(a)(3)(B) addresses materials that are trending towards meeting recyclability criteria, but that provision is irrelevant to compliance with section 42060(c). The commenter also erroneously suggests that CalRecycle, through the proposed regulations, and not the Legislature through its enactment of section 42060(c), has "adopt[ed] aggressive recycling rate targets." The commenter's requested change is also unnecessary because exemptions pursuant to Public Resources Code section 42060(a)(3) (addressed in section 18980.2.) encompasses compliance with Public Resources Code section 42050(c).

The commenter also proposes that the regulations "make clear that both local and alternative (including private) collection qualify for meeting those rates." No change is necessary because the extent of recycling, not collection, is used in the calculation of recycling rates, and nothing in the proposed regulations suggests that materials recycled after being collected through alternative collection programs would be disregarded in that calculation.

Comment B-47-3

2. The food and agricultural commodity exclusion should better balance the need for innovation and sustainability with the burden on producers.

Context: The Draft SB 54 Regulations propose to adopt a categorical exclusion for packaging or packaging components used by a food or agricultural commodity “if it is not reasonably possible to use other packaging or packaging components to comply with regulations, rules, or guidelines issued by the United States Department of Agriculture or the United States Food and Drug Administration.” See Section 18980.2 of the Draft SB 54 Regulations. This seems to implement Section 42060(b) of the California Public Resources Code mandating CalRecycle to ensure that “any

regulations adopted pursuant to [SB 54] consider guidelines and do not conflict with regulations issued by the [FDA] and [USDA]…" Under the Draft SB 54 Regulations, such packaging or packaging components would not be considered "covered materials" and not be subject to the SB 54 mandates. To support the categorical exclusion, a producer must make a determination that certain packaging qualifies for the categorical exclusion and must notify CalRecycle and provide a summary of the basis for that determination.

Issue: While Company understands the purpose of this categorical exclusion to balance the goals of SB 54 and important food safety requirements, Company believes that such a categorical exclusion from the "covered material" definition unnecessarily compromises the goals of SB 54 and stifles sustainability research, development, and innovation. Under the proposed language, producers might be incentivized to abandon research initiatives that could lead to packaging alternatives that would prevent them from finding that "it is not reasonably possible to use other packaging," because such initiatives could result in more products qualifying as "covered materials" and as such, higher participation fees. Alternatively, a producer that does invest in its products to create sustainable alternatives would be penalized because that producer would not be able to claim the categorical exclusion and would have to meet the requirements of Section 42050 of the California Public Resources Code, and report and pay fees on those products despite benefiting the state by creating and putting into the market more sustainable packaging options. CalRecycle should adopt a framework within the proposed exclusion that rewards producers for innovating with more sustainable packaging options while complying with FDA and USDA regulations.

Response to B-47-3

Comment partially accepted and partially rejected. CalRecycle accepts this comment with regard to food and agricultural packaging to the extent it alleges that section 18980.2(a)(2) was unclear in scope or effect, was insufficiently clear regarding what renders it "not reasonably possible" to resolve conflicts with federal laws, or would have been overbroad in effect due to the potential for the exclusion to be applied despite the conflicts being avoidable. See CalRecycle's response to comment I-19-1, explaining the revisions responsive to this and similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2). CalRecycle rejects the comment, however, to the extent it suggests that section 18980.2(a)(2) should be further revised to establish a new "framework" for addressing innovation incentives. As the commenter concedes, section 18980.2(a)(2) strikes a balance between the goals of SB 54 and food safety requirements. The revisions clarify that balance and ensure that the exclusion of food and agriculture packaging is not overbroad or vulnerable to abuse. Moreover, the commenter does not offer a proposal more specific than "a framework . . . that rewards producers for innovating . . . while complying with FDA and USDA regulations." CalRecycle is unable to identify a framework that

would accomplish that while still fulfilling the mandate in Public Resources Code section 42060(b) to consider federal law and avoid conflicts with it. The statute does not authorize CalRecycle to create affirmative "rewards," especially for entities that are not producers to begin with, nor can a PRO plan create incentives or disincentives to directly affect behavior by entities that are not required to participate in it. Also, the commenter's implied assertion that the statute and proposed regulations do not already incentivize innovation is incorrect. Should a packaging manufacturer develop packaging that could readily be used to comply with federal laws concerning food and agricultural commodities, no entity would be able to assert that there is no such packaging available; that manufacturer would have an immediate, large market for that packaging. Because the commenter has not provided a specific proposal for such a framework, no further response is required.

Comment B-47-4

3. Eco-modulation and application of the "more difficult to recycle" test

Context: Company understands eco-modulation to be designed to incentivize product design and material choices that favor reduced environmental impact by considering factors such as recyclability, reuse, toxicity, labeling and others. By adopting design choices that reduce the environmental impacts of packaging, a producer can lower its participation fees. On the other hand, materials that are more difficult to recycle may result in an increased participation fee. This later point is emphasized in Section 42053(d)(2) of the California Public Resources Code, providing that "[i]f recycling or composting of the covered material is made more difficult by the incorporation of specific elements […] the fee for that covered material shall be sufficient to account for the increased cost to manage that covered material." In turn the Draft SB 54 Regulations provide that "[a]n element of covered material shall be considered to make recycling more difficult […] if, as described in the design guide, the element "requires test results" or otherwise prevents the covered material from being considered "preferred." See Section 18980.6.7(h) of the Draft SB 54 Regulations.

Issue: The proposed language is at odds with the goals of SB 54 and the concept of ecomodulation, which is supposed to incentivize sustainable design choices in packaging. Imposing a malus on a product simply because it "requires test results" would stifle innovation and sustainability in packaging products because a new type of packaging, while having less environmental impact, may require test results to show recyclability due to its novelty. The proposed language would thus penalize a producer from innovating and reducing its impact, contrary to the stated goals of SB 54 and eco-modulation. In addition, whether a product "requires test results" has no bearing on whether the particular product is actually more difficult to recycle. To the contrary, the test results may actually show that the product in question is easier to recycle than alternatives. Requiring testing, in and of itself, does not make a product "more difficult to recycle" if the testing shows that the product was just as easy to recycle to begin with.

Solution: Company would strongly recommend removing the language from the Draft SB 54 Regulations suggesting that a product may be "more difficult to recycle" because it requires test results for purposes of eco-modulation. Instead, the language should

recognize that a product is not “more difficult to recycle” if testing shows that the product is in fact recyclable.

Best regards,
Davis Wright Tremaine LLP

Response to B-47-4

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements set forth in the Act, including in sections 42053 and 42060 of the Public Resources Code, and the recommended change is not necessary to the implementation or enforcement of the Act. Section 42053(d)(2) requires a PRO to structure the producer fee schedule to account for any increased cost to manage covered material for which recycling is made more difficult by the incorporation of specific elements. Therefore, section 42053(d)(2) only applies to the extent the presence of certain elements increases the cost of managing covered materials. That section further authorizes CalRecycle to establish criteria to determine when recycling is made more difficult by the incorporation of specific elements. The revised section 18980.6.7(h) of the proposed regulations implements this requirement and establishes these criteria by providing that an element of covered material is considered to make recycling more difficult if, as described in the APR design guide, the element "requires test results" or otherwise prevents the covered material from being considered "preferred." Therefore, to the extent the incorporation of such elements in covered material results in increased costs to manage that covered material, those increased costs are required to be accounted for in the producer fee schedule and the producer of that covered material will be required to pay for such costs. However, if, as this comment suggests, the covered material containing such elements achieves the required test results and the elements of that covered material do not otherwise increase the cost of managing that covered material, then a PRO is not required to account for those elements in its producer fee schedule.

B-48: CJ Biomaterials (Lauren Scott)

Comment B-48-1

On behalf of CJ Biomaterials, thank you for the opportunity to provide comments on the proposed regulations issued on August 22, 2025. Our comments center around the provisions that impact compostable covered materials, including both home and industrial compostable products.

CJ Biomaterials is a division of CJ Group, a global lifestyle company with a strong footprint across the United States. CJ Group is the world's leading supplier of fermentation-based bioproducts for animal nutrition, human nutrition, and biomaterials at its 13 manufacturing facilities worldwide. Leveraging this fermentation process and

expertise, CJ Biomaterials is focused on delivering meaningful solutions to the global problem of plastic waste and other sustainability challenges at scale.

Specifically, CJ Biomaterials is working to develop and expand the use of biopolymers to help create a more sustainable future. Our focus is on a specific type of biopolymer called polyhydroxyalkanoates (PHAs). PHAs are a biopolymer that can serve as an alternative to traditional plastics for use in food serviceware, flexible film packaging, and in other products and packaging used for collection and diversion of organics from landfills.

Although there are many end-of-life scenarios that serve PHA-based products, composting presents as the most efficient, appropriate, and climate-positive pathway for PHA-based foodservice and food contact packaging.

Article 2- Covered Material and Covered Material Categories

We believe the language in § 18980.2(a)(2) provides a clear and transparent pathway for entities to pursue exemptions if they believe that compliance with the regulations will not be feasible in a specific covered material category. We support the outlined plan to establish a public database that contains a list of each exemption granted by the Department. This will help accelerate innovation targeted at these categories and applications in which no suitable existing material exists.

Response to B-48-1

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process.

Comment B-48-2

Article 2- § 18980.2.1 Exclusion of Reusable and Refillable Packaging and Food Service Ware.

The regulatory text proposed establishes a blanket exemption for reusable and refillable products. At the same time, the proposal removes all meaningful parameters around the definition and marketing of reusable and refillable products. This will allow for a host of bad actors to circumvent the program and legal requirements by claiming their product is reusable or refillable. Additionally if these products are not included within the scope of covered materials, the PRO will be unable to gather data and have producers report on key metrics including production data, end of life disposal, and costs associated with their use. We ask the Department to include these products within the regulatory framework in order to manage the broader packaging ecosystem and ensure unintended consequences associated with shifting materials are avoided.

Response to B-48-2

CalRecycle rejects this comment for the reasons provided in response to comment B-38-3.

Comment B-48-3

Article 2- §18980.2.5(a) Covered Material Category List Updates

SB 54 is designed to provide a pathway for products to be recycled or composted. To help establish this pathway, PRC 42061(d) directs CalRecycle to create a list of covered material categories that are deemed compostable. We appreciate the alignment of these determinations to the statutory eligibility to be labeled and sold in the state as 'compostable'.

We do not support the new language that reduces the frequency of these updates. The statutory language states that 'the department shall update the list at least annually'. We ask that the Department amend the regulatory text to provide for CMC list updates no less than once every 12 months and also to specify updates should be done on an ad hoc basis, as needed to reflect the statutory requirements behind the CMC list determinations

Response to B-48-3

CalRecycle rejects the comment. With regard to the assertion that the proposed regulation "reduces the frequency of these updates," the commenter is incorrect. Section 18980.2.5 incorporates the minimum frequency required by each statutory provision cited. Regarding the suggestion that the regulations reflect an ad hoc basis for providing updates, no change is appropriate because the proposed regulations do not restrict CalRecycle from revising the CMC list on an "ad hoc basis," and the proposed standard—that such revisions should be done "as needed"—is vague and impractical.

Comment B-48-4

Article 3-Section 18980.3.3. Eligibility for Being Labeled "Compostable"

We support 18980.3.3(b)(5)(A) as drafted and appreciate the Department's removal of repetitive and problematic language around the definition of 'desirable organic waste'.

Response to B-48-4

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment B-48-5

Article 4- Responsible End Market Criteria - § 18980.4(a)(4)(B) and § 18980.4(a)(4)(C)

Consistent with our previous comments, we are concerned that the statutory language around Responsible End Markets (REMs) for compostable covered products will lead to

implementation challenges. These provisions fail to recognize the overs generated in the industrial composting process. These overs are typical byproducts of composting and are materials that are typically sent to landfill. Overs are simply part of the process, and may include compostable products, food waste, other organic matter, and contaminants like rubber, glass, or traditional plastic products that end up in the compost pile.

Rather than revise the regulatory criteria around REMs to reflect the overs generated by the composting process, the Department is proposing to establish a separate carve-out for a subset of certified compostable products based on their material composition. The language in §18980.4(a)(4)(B) explicitly restricts an entity processing certified compostable covered products from disposing of any material, thereby disallowing any overs generation. Then, the language in § 18980.4(a)(4)(C) establishes a specific exemption from this requirement for compostable products that are made of paper and fiber only.

This differentiation between plastic and fiber/paper compostable products is not aligned with the intent of SB 54 which is to ensure that all certified compostable products, regardless of material type, are recovered and composted rather than landfilled. To this end, all covered compostable products should be held to the same REM requirements. Certified compostable products, both fiber/paper and plastic or fiber/paper products containing plastic, are designed and tested to international standards including ASTM D6400 and D6868 for safety through heavy metal and eco-toxicity analysis, and to completely disintegrate fully in industrial composting systems within constrained timeframes. These materials are processed together in composting operations and in the same manner and should be held to the same regulatory requirements. Comprehensive field testing conducted by Closed Loop Partners at Napa Recycling in CA, demonstrated conclusively that certified compostable plastics disintegrate the same or better than fiber/paper products in aerated static pile (ASP) systems like those commonly found in California. By holding both plastics and fiber/paper products to the same standards, the amount of overs generated from any non-disintegrated compostable products can be reduced. Furthermore, it would be infeasible for a composter to determine which overs contain plastic versus nonplastic products, especially in the case of fiber products that contain plastic binding agents or coatings.

We ask the Department to revise the language in §18980.4(a)(4)(B) to reflect a consistent approach and application of the Responsible End Market (REM) criteria across material types for compostable covered products:

(B) For items partially or wholly constituting plastic, any covered material or intentionally included in the process used to generate a recycled organic product must fully biologically decompose and be processed in a manner consistent with the management of other feedstocks to produce a marketable product which complies with standards found in sections 17868.2, 17868.3 and 17868.3.1 of Article 7 of Chapter 3.1 of Division 7 of Title 14 of the California Code of Regulations or in sections 17896.59, 17896.60, and 17896.61 of Article 6 of

Chapter 3.2 of Division 7 of Title 14 of the California Code of Regulations, as applicable. ~~The entity must neither dispose the undecomposed material nor send it to another entity that subsequently disposes it, and the entity must ensure that it fully biologically decomposes, through additional processes conducted either by the entity or by subsequent entities to which the material is transferred. Covered material and derivative material inadvertently included in the process that remain undecomposed shall be considered incompatible materials and are subject to paragraph (3) of subdivision (a).~~

Response to B-48-5

CalRecycle rejects this comment. See the responses to comments B-6-5, O-75-12, and O-83-5.

Comment B-48-6

Article 3- Documentation Requirements for Fiber Exemption

Compostable covered products that contain no plastics or polymers are able to secure an exemption from third-party certification requirements for compostability. The previous regulations appropriately established a series of requirements for these products seeking to obtain an exemption from third-party certification.

Fiber-based compostable packaging is likely to contain a variety of other materials beyond fiber in order to meet the needed performance requirements in many applications. These materials may include polymers, to act as binding agents and coatings, as well as inks, adhesives and dyes. By undergoing third party certification and testing, we can ensure the safety and performance of these products. The risk of allowing a blanket exemption for products that are asserting a fiber exemption is that consumers may be exposed to hazardous chemicals and PFAS without the guard rails established by making products undergo the certification and testing process. The earlier regulations established a requirement that any products undergo the third-party certification process and testing to ensure they are safe for use, or that manufacturers fully disclose the ingredients used in the manufacturing process and conduct laboratory testing to verify their claim that the product is made from exclusively fiber and contains no plastic.

We ask the Department to add back in the testing and ingredient disclosure requirements outlined in the previous regulatory proposal.

Response to B-48-6

CalRecycle rejects this comment for the reasons provided in response to comment B-38-5.

Comment B-48-7

Article 6- §18980.6.7 - Ecomodulated Fee and Fee Schedule

We request revision to §18980.6.7(a) and (b), allowing the PRO a two- year delay in implementing ecomodulated fees credits for plastics made from renewable materials.. Ecomodulated fees are an important mechanism to help new, more climate friendly products become more cost competitive. They are a core principle behind EPR and help facilitate a shift to more sustainable products.

There does not appear to be any statutory basis for this two-year delay in setting eco-modulated fee rates in §42053. We request that the PRO set eco-modulated fee reductions for renewable plastic covered materials at the same time as they release the initial program plan rather than delaying these provisions out alongside the base fee setting. Two years is an eternity for a new industry that needs the support of ecomodulated fees in order to obtain some level of cost competitiveness with the incumbent materials.

Response to B-48-7

CalRecycle rejects this comment. See the response to comment B-6-6.

Comment B-48-8

Article 6- §18980.6.7(i) Credit for Products that are Home Compostable

CJ Biomaterials asks that the regulations also incentivize home compostable products. Certified home compostable products present an important solution for managing packaging and waste at the local and individual level. We ask that the Department include a credit for packaging that is certified home compostable. A credit is justified for these products that are diverted into a backyard or community compost pile and are not an increased burden on the state to collect and manage.

We recommend adding a new subsection (3) as follows:
(3) In addition, plastic covered materials that meet the requirements of Section 42357 of the Public Resources Code to be labeled as "home compostable," which are also eligible to be labeled as "compostable" under these Regulations, shall receive a further reduced fee.

Response to B-48-8

CalRecycle rejects this comment. See the response to comment B-36-7.

Comment B-48-9

Article 11- Section 18980.11. Requirements for Local Jurisdictions and Recycling Services

We oppose the underlined new language in §18980.11(b). CalRecycle has explained that their intention is to clarify that local jurisdictions are not required to establish Responsible End Markets (REM). We recognize that local jurisdictions should not ultimately be accountable for the establishment of REMs and that the PRO should be liable for ensuring REMs are established through collaboration with local jurisdictions.

Local jurisdictions should not be subject to any enforcement actions or penalties as a result of the lack of existing REMs under SB 54. However, the language as drafted would establish a broad exemption allowance for local jurisdictions to pursue for materials that may not currently be part of the recycling/composting collection program or that require more focused effort by the PRO. This will allow local jurisdictions to obtain an exemption for products like compostable covered products which will make statewide uniformity and successful capture and processing of these materials challenging.

We believe the following amendment will satisfy the Department's objective without unintentionally creating a loophole that will allow challenging materials without existing REMs to be exempted from the local jurisdiction collection programs.

(b) Covered material is considered included in a local jurisdiction or recycling service provider's collection and recycling program if the local jurisdiction or recycling service provider collects the covered material and directs it to recycling at responsible end markets, either bytransfers to responsible end markets directly or to intermediate supply chain entities. The local jurisdiction or recycling service provider shall not be required to establish the availability of a responsible end market to ultimately recycle the covered material. However, the absence of responsible end markets shall be deemed a local condition, circumstance, or challenge <u>for grounds of applying for an extension or exemption in processes detailed in</u> ~~rendering inclusion of the covered material in the program impracticable for purposes of~~ subdivision (b) of section 42060.5 of the Public Resources Code and paragraph (4) of subdivision (c) of section 18980.11.1 of this chapter.

Response to B-48-9

Comment rejected. The suggested change would result in no change in the meaning of the proposed regulation's text. The change would merely restate—without any change in meaning—that absence of responsible end markets is sufficient to establish that compliance with Public Resources Code section 42060.5(a) is impracticable due to a local condition, circumstance, or challenge. To the extent the commenter intended the replacement text to mean that the absence of responsible end markets would be relevant but not necessarily sufficient to establish impracticability, the recommended change would still be inappropriate. Even assuming the recommended text could be read to have that meaning, the text would still be ambiguous on its face, and the only way it could be applied would still be to consider absence of responsible end markets sufficient to establish impracticability. "Absence" is an absolute condition that is either present or not present; it is not a matter of degree. Therefore, even if "absence" were to be considered one factor among many, the only logical way to assess it would be to determine whether the application establishes the requisite absence. Once that condition has been met, there would be no way to treat it as one factor among many that would not be arbitrary and capricious. Additional text would be necessary to explain how to consider it in that way, but the

commenter does not propose any.
CalRecycle further rejects this comment for the reasons provided in response to comment O-44-6.

Comment B-48-10

Home Compostable Products in the Regulatory Framework
We continue to advocate for the inclusion of home compostable products within the SB 54 framework and for the inclusion of specific allowances and considerations for these products. The Department has communicated their position that SB 54 does not call for the inclusion of home compostable products and that there is no basis for including home compostable products in the regulatory framework. We respectfully disagree with this assessment for the reasons outlined below.

SB 54 requires that all products be recyclable or labeled "compostable" per Chapter 5.7 and as such home compostable products should be recognized in the regulations and considered as a distinct and important subset of compostable covered products.

Under SB 54, all covered material must be (1) "recyclable in the state" or (2) "eligible for being labeled compostable in accordance with Chapter 5.7." See PRC § 42050(b). Throughout the statute, compostability is repeatedly referenced in conjunction with recyclability, and in some cases given special attention to encourage compostability as a critical part of the Legislature's vision for waste diversion. Section 42050 mandates a two-pronged plan where "recyclable" and "compostable" are the two equal tools available for implementing this plan.

Meanwhile, Chapter 5.7 of the Public Resources Code, which supplies the statutory anchor for SB 54's statements on compostability, encompasses two overlapping but distinct forms of compostable products: industrial compostable and home compostable. Because home composting favors inherently biodegradable polymers that are more susceptible to microbial activity as opposed to the hydrolysis that occurs in industrial composting, products labeled as "home compostable" must meet more stringent criteria than for "compostable" products, i.e., those that are suitable for industrial composting. The reference in SB 54's section 42050(b) to "eligible for being labeled compostable" therefore was intended, in context, to include products that are eligible for being labeled either "compostable" or "home compostable." Further evidence of this intent is found in SB 1046, which was passed during the same legislative session as AB 1201 and is now codified under Public Resources Code Section 42281.2. That law provides that a compostable bag can be either "compostable" or "home compostable" pursuant to Section 42357 – no preferential treatment is given to one over the other.

Home composting is appropriate only for a small subset of products that are certified to break down in a home composting system. These products offer an important alternative for brands and consumers who want to ensure end-of-life management of their products.

Companies serving food will be especially constrained in meeting recycling targets under the new regulations. For producers of single-use foodware (such as utensils, straws, plates, and cups), and in the case of film applications, compostability will be the primary means of compliance. To realize these ambitious targets, these companies need to be able to use all material types which includes home compostable products.

Further supporting a clear and sanctioned pathway for home compostable products is the Biodegradable Product Institute (BPI)'s September 2025 launch of a new Commercial & Home Compostable Certification. This certification represents a US-based home compostability certification and will hold products to the same high standards for compostability and safety at both lower temperatures such as in a home compost pile and at those conditions needed for commercial facilities. Applications for this new certification will open on December 1, 2025.

Limiting the end-of-life pathways for a home compostable product to industrial composting sites runs contrary to the ultimate objectives of SB 54, particularly while we are very early in efforts to build out industrial composting acceptance and infrastructure across the state. Home composting needs to be preserved as a pathway, even if short term, available to California consumers, communities and companies.

We ask the Department to reconsider their position and revise the regulations to effectively manage home compostable products.

Thank you for the opportunity to provide comments. Please do not hesitate to reach out if we can provide any additional information or clarification.

Response to B-48-10

CalRecycle rejects this comment, which misquotes PRC section 42050(b). That provision states that covered material must be recyclable or "eligible for being labeled 'compostable' in accordance with Chapter 5.7 (commencing with Section 42355)." Without explanation, this comment quotes that provision without placing "compostable" within quotation marks. That omission elides an obvious textual feature of Chapter 5.7, which consistently uses the terms "compostable" and "home compostable" separately, within separate quotation marks, to refer to two different types of labels subject to different legal requirements. The commenter's interpretation of the former term as incorporating the latter is therefore textually wrong. It also disregards the clear implication of the Legislature's choice to expressly incorporate only one of the two terms in the SB 54 context. Moreover, even if PRC section 42050(b) did not place the word "compostable" within quotation marks, the commenter's interpretation would still be untenable. Statute makes no reference to home-compostable materials even though, the commenter's own admission, they must meet different criteria than materials composted industrially. Given the drastically different technical and infrastructural needs for materials to be "home" compostable instead of just compostable industrially, it is not reasonable to assume that the Legislature decided to just ignore the former.

The contrary interpretation would have the absurd result that home compost piles would be considered within the definition of "responsible end markets," defined in Public Resources Code section 42041(ad) as a "materials market" that operate in a way that "benefits the environment and minimizes risks to public health and worker health and safety." That characterization of consumers' backyard composting operations is plainly unfeasible and could not reasonably have been intended by the Legislature. Nor could a PRO or Independent Producer possibly account for home compost piles, individually assess whether they satisfy criteria to be considered responsible end markets, or, more generally, assess the degree to which consumers actually use so-called "home compostable" goods in home compost piles rather than dispose of them.

B-49: Amy's Kitchen, LLC (Renaud des Rosiers)

Comment B-49-1

Thank you for having me. My name is Renaud des Rosiers and I'm the Director of Sustainability at Amy's Kitchen. For those of you who might not know Amy's I should mention that we're a beloved California company, rooted in Petaluma, and are one of the largest producers of organic, vegetarian prepared meals. We make over 200 frozen entrees, burritos, pizzas, and snacks as well as canned soups and chilies. We're family owned, mission driven, and committed to always striving toward more sustainable operations in a material way, beyond the performative incrementalism that is so common in corporate sustainability platforms.

I'm not here to go deeply into any of the technical issues in the current draft as there are many voices here for that purpose. Instead, I want to share a perspective about our sustainable packaging journey, our concerns about where this process appears to be headed, and to urge you to ensure this rulemaking preserves the original intent of the statute by leaving broad room for compostable packaging as a compliance pathway for brands like Amy's—who are trying to substantively lead the transformation to a fossil-plastic-free sustainable packaging future—rather than ineffectively tinkering on the margins of a deeply flawed incumbent system while further entrenching the conventional plastics the law purports to be working to reduce.

I personally have been leading Amy's sustainable packaging R&D journey for close to 10 years and am proud to report that over that time, we've made significant strides and have become a driving force toward the creation of innovative, renewable, plant-based circular packaging.

Our intent has always been to develop a proof of concept for a truly sustainable frozen meal assembly that we share broadly with our peers to transform the industry rather than trying to gain a competitive advantage through a marketing claim.

Right now, our frozen food packaging is mostly fiber based but has a plastic lining for grease resistance and a film-plastic overwrap to provide shelf life and ensure we're delivering safe food to our consumers.

The long-term goal of our sustainable packaging work has been to replace both of those conventional fossil plastic layers with plant-based alternatives. I'd say we're about 75% of the way through that journey, but without policy support from our home state, we won't be able to get to the finish line. In fact, we've been in a holding pattern through the SB54 rulemaking process due to the threats we've seen to the compostable products compliance pathway in the conversations to date.

I want to highlight a few key insights that I believe the committee has not yet given the attention they deserve and highlight what continuing to ignore these realities would mean for Amy's and other innovative companies working toward sustainable packaging if SB54 doesn't broadly accept compostable packaging as intended in the original statute.

• FUNCTIONALITY MATTERS—The idea that "unlined fiber-only" is a suitable compliance pathway for compostable products is a fantasy. Functional barrier properties and other packaging engineering requirements are a reality of our modern food system that cannot simply be wished away.
o In reality, the lack of functional properties including grease, water, and oxygen barriers mean that unlined fiber is unsuitable for most categories of food packaging, including food service ware. Its use would lead to a catastrophic failure of packaging systems and result in an exponential increase in food waste or require the creation of significant exemptions for fossil plastics to provide the needed functionality. Even many existing categories offered in fiber-only options, like paper straws, are not viable as they are rejected by a vast majority of the public—*including advocates on the plastic reduction issue*—due to their lack of functionality.
o And humility requires that this committee recognize the impossibility of telling the people of California they cannot have their morning coffee, occasional takeout dinner, frozen foods, granola bars, and chips. These packaging formats can be replaced but not without the use of a functional alternative. Failing to acknowledge this reality would result in a public revolt as people's daily lives are materially affected by a ban without a plan.

• COMPOSTABLES PROVIDE THE ONLY VIABLE ALTERNATIVE TO FILM PLASTICS—Many categories of flexible materials including food trays, films, multi-material laminates, most food service ware, and other small format packaging simply cannot be replaced by recyclable options either today or in the future. *Innovative, renewable, plant based, circular compostable products provide the only functional alternative to these categories*.
o The recycling system is already deeply burdened and only marginally economically viable. Broad-based collection of film plastic, food service ware, and small format items is a fallacy that will never be effective in terms of function, environmental benefit, or economic viability.

o Though recycling is often thought of uncritically as a virtue in all circumstances, the reality is *that there is a vast difference between the environmental and economic value in recycling rigid formats and dry fibers versus the environmental and economic cost of collecting film plastics* in the recycling system. Doing something that has no financial or social value, only to build negative-value recycling bales that have no market is a fool's errand.
o Though it goes against the mantra of *recycling everything regardless of the financial and environmental cost of doing so,* this committee should acknowledge that some materials, like thin films and wet, food-associated foodservice ware, are actually best managed outside the recycling system. For these marginal materials, the desirable management outcome is containment (to avoid leakage to the environment), dematerialization, and ideally, contribution to healthy soils (when collected in compost).

• COMPOSTABLES HAVE VALUE EVEN AS COLLECTION COMES ONLINE—The conversations around collection of compostables in this committee over the past two years represents a good example of *the perfect being the enemy of the good*. While it is true that the loudest composter voices from the California Compost Coalition do not currently want to accept compostable products, focusing only on that shortsighted reality ignores several of the meaningful benefits of compostables.
o Many composters across the country have successfully accepted compostable products for years while producing high quality compost, recognizing compostables' value in helping citizens collect and divert food scraps.
o Even when not collected in composting, compostables significantly reduce reliance on fossil plastics in a way no other material class can come close to.
o Compostables offer a significant advantage to conventional fossil plastics when mismanaged. While context and specifics vary greatly, a reasonable approximation is that *compostables offer a one to two order of magnitude advantage to conventional plastics in terms of non-persistence in the environment*. While not the intended pathway, we know systems do fail and when that happens, a mismanaged compostable material is likely to persist on the order of 1 to 10 years in the environment (for PHA and PLA respectively) versus perhaps 100 years for conventional plastic like HDPE.

• REMOVING THE COMPOSTABLE COMPLIANCE PATHWAY WILL RESULT IN MORE PLASTIC—In a deeply cynical possibility, rulemaking that disallows the use of functional compostable products would result in the so called "plastic pollution reduction act" forcing Amy's *into rigid plastic thermoform meal trays for compliance reasons* ***increasing our plastic use approximately tenfold***. If this committee is serious about its commitment to the spirit of SB54, it must avoid stifling innovation around the one form of packaging that has the potential to materially replace a broad set of categories which can otherwise only be delivered using conventional fossil plastics.

Beyond abandoning the spirit of the statute—*which explicitly calls for all packaging sold in the state of California to be recyclable compostable or reusable*—failing to create a significant role for compostable products would have the sinister effect of locking in the current failed system and doubling down on conventional plastics, contrary to the very intent of the law.

Thank you for your time.

Response to B-49-1

Comment rejected. To the extent required, CalRecycle has responded to the issues raised in this comment in its response to comments B-51-1 through B-51-4, which this commenter submitted and are, collectively, substantively the same as this comment.

B-50: Smart Planet Technologies (Will Lorenzi)

Comment B-50-1

I write as President of Smart Planet Technologies, Inc., a California-based innovator in sustainable paper-based packaging materials, including EarthCoating® and HyperBarrier. Our company is dedicated to materials innovation for reducing plastic use, increasing fiber recovery, and enabling packaging that is both functional and recyclable in real-world infrastructure. We strongly support SB 54's overarching ambition to reduce plastic waste, improve recyclability, and build a circular economy for packaging in California. With that shared goal in mind, this comment addresses three key focus areas:
1. Recognition of PF5P / PF10P / PF15P / PF17P — a positive step forward that should be fully acknowledged and built upon.
2. The problem of compostability — why it fails in practice, burdens composters, and undermines recycling.
3. The missing innovation on-ramp — why SB 54 needs a framework to encourage verifiably recyclable packaging innovations, not just regulate existing materials. We also include Appendix A, summarizing the published statement from Oregon's composters (available at:
https://oregonrecyclers.org/sites/oregonrecyclers.org//files/message_from_oregon_composters_o n_no_serviceware.pdf), which reinforces our conclusions with real-world operational evidence.

Response to B-50-1

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it only references the commenter's recommendations; it doesn't set those recommendations forth. To the extent the issues raised require responses, CalRecycle has addressed them in response to other portions of the submission discussing the issues in detail. (See comments B-50-2 through B-50-4).

Comment B-50-2

Focus Area 1 – Recognition of PF5P, PF10P, PF15P, PF17P
We commend CalRecycle for the September 2025 update to the Covered Material Categories
(CMCs), which now distinguishes between:

• PF5P – Gable-top cartons (milk, juice, cream).
• PF10P – Single-sided coated paperboard (e.g., hot drink cups, many foodservice containers.).
• PF15P – Aseptic cartons (multi-material formats with foil layers, such as Tetra Pak-style
soups and juices).
• PF17P – Double-sided coated paperboard (dual-laminated formats such as some soup
containers, ice cream cups, and heavy-duty trays).
This refinement is a major positive development.
Why it matters:
• Accuracy: These categories reflect real-world technical differences in recyclability and infrastructure compatibility.
• Fairness: By distinguishing PF10P from PF17P, CalRecycle allows recyclable singlesided
innovations to be fairly evaluated, without being lumped in with dual-sided
laminates that are much harder to recycle.
• Market signals: This separation creates clearer signals for eco-modulation, ensuring producers are incentivized to choose designs that align with recycling infrastructure.

We encourage CalRecycle to continue moving in this direction - recognizing that not all coated
paperboard is created equal, and that recyclability depends on construction, not merely the
presence of a coating.

Response to B-50-2

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment B-50-3

Focus Area 2 – The Problem of Compostability
While recyclability is an investment in circularity, compostability has proven to be an illusion in
practice. We urge CalRecycle to recommend legislative updates to remove compostable
packaging as a compliance pathway under SB 54.

A. Experience from Other Programs
• The UK's Recyclability Assessment Methodology (RAM) and the EU's Packaging and Packaging Waste Regulation (PPWR) have both abandoned compostability as a recognized compliance route.
• These programs adapted after years of evidence showing compostable packaging consistently fails to deliver diversion or environmental benefit.
• SB 54, however, locked compostability into statute with no flexibility to recalibrate, creating a policy misalignment with global best practice.

B. Oregon Composters' Statement

Oregon composters have published a detailed statement identifying nine systemic failures of compostable serviceware: incomplete degradation, contamination, reduced compost quality, chemical concerns, higher operating costs, and more. Their message was clear: compostable packaging undermines composting rather than supports it. A summary of these findings is attached as Appendix A, and the full text is available online at: https://oregonrecyclers.org/sites/oregonrecyclers.org//files/message_from_oregon_composters_on_no_serviceware.pdf.

C. California Case Studies

The same failures are visible in California:

• San Mateo County:

My understanding is that San Mateo County required coffee shops to use compostable cups that cost roughly 1.5 times more than conventional cups. My understanding is that these cups, despite being ASTM-certified, did not degrade in the county's composting facilities (which operate on 2–3 week cycles), and were ultimately screened out and landfilled.

• San Francisco:

My understanding is that San Francisco's composting program accepts poly-lined paper cups as "compostables," even though such cups do not degrade. My understanding is that they are sifted out during processing and sent to landfill, creating costs without environmental benefit.

In both cases, the outcome is identical: higher costs, higher burdens, and cups in the landfill.

D. ASTM vs. Real World

• ASTM D6400 / D6868 certifications allow up to 180 days (six months) for degradation in laboratory conditions.

• California composters run 14–21 day active composting cycles.

• The mismatch ensures compostable cups cannot degrade in practice, no matter what certification they carry.

SB 1335 recognized this problem. It only accepted compostable packaging that could actually degrade in real California facilities. SB 54 ignored this precedent and reverted to ASTM standards alone.

E. The Double Standard

• Recycling under SB 54 requires proof: at least 60% statewide collection rates and evidence of actual recycling.

• Compostability requires only ASTM certification — no proof of collection, no proof of actual composting.
• This double standard incentivizes producers to choose compostables, even though California has no infrastructure to handle them.

F. Cost Driver in SB 54
When the Governor rejected CalRecycle's initial draft regulations earlier this year due to high
costs on families, one cost-reduction measure was scaling back composting infrastructure
investment. This illustrates the enormous cost burden compostability imposes. Continuing to
support compostables in SB 54 is wasteful and unsustainable.

G. Recycling Builds Value, Composting Destroys It
• Recycling recovers fiber, enabling reuse in new paper products and extending material life.
• Composting destroys fiber value after a single use, while contaminating compost systems
meant for food scraps.
• Composting packaging is therefore irrational — it wastes resources and undermines both
recycling and composting.

H. Cross-Contamination
By allowing both recyclable and compostable packaging in the market:
• Recyclables contaminate compost streams (they will not degrade).
• Compostables contaminate recycling streams (they cannot be pulped).
The result is two broken systems instead of one strong one.

Conclusion for Focus Area 2: Compostability as a compliance pathway should be removed from
SB 54. California should align with other EPR programs the UK and EU that evolved their EPR
initiatives to dedicating all resources to recyclability, not illusions of compostability that fail in
practice.

Response to B-50-3

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process. As the comment recognizes, the proposed revisions to SB 54 would require a legislative rather than regulatory revision, which is outside the scope of this rulemaking.

Comment B-50-4

Focus Area 3 – The Missing Innovation On-Ramp
California is a world leader in innovation, yet SB 54 does not provide a pathway for innovation to succeed.

A. The Problem
SB 54 defines recyclability only by what is recycled today. This locks in the current system-including its failures — and does not allow new materials or designs to be recognized or incentivized, even when they are demonstrably compatible with paper recycling equipment and processes.

B. Coated Paper Packaging Categories and Their Challenges
The four coated paper categories - PF5P (gable-top cartons), PF10P (single-sided coated paperboard such as hot drink cups), PF15P (aseptic cartons), and PF17P (double-sided coated paperboard) — have been historically problematic for paper recycling, for different reasons and at different levels of difficulty.

Importantly, in standard paper grades commonly used by mills (e.g., OCC, DLK, mixed paper), poly-coated fiber in general is typically treated as a prohibitive or outthrow because plastic linings interfere with repulping and reduce yield. So, it is valuable to segregate barrier-coated materials into categories, but innovation in materials within these categories need to be incentivized to make these categories truly valuable to recycle.

C. Why an Innovation On-Ramp Is Essential
Despite these historic problems, there are innovations in materials and coatings — some still containing plastic — that are fully compatible with conventional paper recycling systems and can solve the recycling challenge within each PF category (e.g., demonstrated repulpability, stable fiber yield, manageable stickies, and fit within existing screens/cleaners).

However, without a formal innovation on-ramp and eco-modulation that rewards verifiable recyclability, these improved designs will not gain a foothold. Under the current SB 54 framework, they are commingled with conventional problematic designs and face the same penalties and market perceptions, which hinders adoption and slows improvements across the entire stream.

D. California’s Global Role
California is where the world looks for innovation, and SB 54 is influencing EPR programs elsewhere. Innovations in materials and processes should be proven and scaled in California. The state’s EPR framework should prioritize innovation, not sideline it. An innovation on-ramp -with clear, performance-based criteria and fee differentiation — is the quickest way to move coated fiber packaging from “historically problematic” to consistently recyclable.

Conclusion for Focus Area 3: CalRecycle should create and recommend a structured innovation on-ramp so verifiably recyclable designs within PF5P, PF10P, PF15P, and PF17P can demonstrate performance, qualify for differentiated (lower) fees, and scale in the marketplace. Without this, California risks entrenching the status quo and missing a prime opportunity to lead on solutions.

Response to B-50-4

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42051.1, 42053, 42060, and 42061, and no change is necessary to the implementation of the Act. This comment raises general objections to the statutory framework; it does not suggest specific changes to the proposed regulations or raise objections related to the rulemaking process. To the extent this comment objects to the Act's definition of "recyclability," for instance, PRC section 42061(c) specifically provides that covered material is deemed recyclable for the purpose of the Act if it meets the requirements of Section 17989.2 of Title 14 of the California Code of Regulations, and PRC section 42355.51. CalRecycle does not have any authority to modify this statutory definition in the proposed regulations. Moreover, to the extent this comment recommends an on-ramp for covered materials to demonstrate recyclability, such an on-ramp is already established by PRC section 42061(a)(3)(B) and implemented by section 18980.3.1 of the proposed regulations. Finally, to the extent this comment recommends prioritizing eco-modulation and incentivizing innovation for material recyclability, such efforts are already addressed in the Act and proposed regulations. For instance, see PRC sections 42053(e) (eco-modulation) and 42051.1(i)(3)(D) (innovation) and sections 18980.6.7(f) (eco-modulation) and 18980.4.3 (innovation) of the proposed regulations. These provisions therefore sufficiently provide for these efforts in a manner consistent with the requirements and limitations of the Act; no further change to the proposed regulations is necessary.

Comment B-50-5

Conclusion and Request
Smart Planet Technologies respectfully requests that CalRecycle:

1. Fully recognize and build upon the positive separation of PF5P, PF10P, PF15P, and PF17P.

2. Recommend legislative updates to remove compostability as a compliance pathway under SB 54, for the reasons detailed above.

3. Create an innovation on-ramp to ensure that eco-modulation rewards solutions that are compatible with recycling systems, even if not yet at full scale.

We recognize that some of the changes discussed here — in particular, the embedded statutory requirements around compostability — may be beyond the scope of what CalRecycle can alter directly through regulation. For that reason, this same letter will

also be shared with the Governor’s Office and with the editorial boards of the Los Angeles Times, the San Francisco Chronicle, and the Sacramento Bee, in order to raise public and policy awareness where legislative advocacy may ultimately be required.

California should not continue to support the illusion of compostability. Instead, all resources should be directed to building a true circular economy based on recyclability, material recovery, and innovation.

We thank CalRecycle for its leadership, and we stand ready to contribute technical expertise, share performance data, and collaborate on building the solutions that California — and the world — urgently need

Response to B-50-5

Comment rejected. No response specific to the commenter's submission is necessary. This closing paragraph summarizes the commenter's recommendations, to which CalRecycle has responded separately (see comments B-50-2 through B-50-4).

B-51: Amy's Kitchen (Renaud des Rosiers)

Comment B-51-1

Thank you for having me.· My name is Renaud des Rosiers, and I'm the director of sustainability at Amy's Kitchen.

For those of you who might not know Amy's, I should mention that we're a beloved California company rooted in Petaluma and are one of the largest producers of organic vegetarian prepared meals.· We make over 200 frozen entrees, burritos, pizzas and snacks, as well as canned soups and chilis.

We're family-owned, mission-driven, and committed to always striving towards more sustainable operations in a material way beyond the performative incrementalism that is so common in corporate sustainability platforms.

I'm not here to go deeply into any of the technical issues in the current draft, as there are many voices here for that purpose.· Instead, I want to share a perspective about our sustainable packaging journey, our concerns about where this process appears to be headed, and to urge you to ensure this rulemaking preserves the original intent of the statute by leaving broad room for compostable packaging as a compliance pathway for brands like Amy's who are trying to substantively lead the transformation to a fossil plastic free sustainable packaging future rather than ineffectively tinkering on the margins of a deeply flawed, incumbent system while further entrenching the conventional plastics the law purports to be working to reduce.

I personally have been leading Amy's sustainable packaging R&D journey for close to ten years and am proud to report that over that time, we've made significant strides and

have become a driving force towards the creation of innovation, renewable, plant-based circular packaging.

Our intent has always been to develop a proof of concept for a truly sustainable frozen meal assembly that we share broadly with our peers to transform the industry rather than trying to gain a competitive advantage through a marketing claim.

Right now, our frozen food packaging is mostly fiber-based, but has a plastic lining for grease resistance and a film plastic overwrap to provide shelf life and ensure we're delivering food safely to consumers.· This is essential to getting the product to market.

The long-term goal of our sustainable packaging work has been to replace both of those conventional fossil-plastic layers with plant-based alternatives.· I'd say we're about 75 percent of the way through the journey.

But without policy support from our home state, we won't be able to get to the finish line.· In fact, we've been in a holding pattern through the SB 54 rulemaking process due to the threats we've seen to the compostable products compliance pathway in the conversations to date.

Response to B-51-1

Comment rejected. No substantive response is required because the comment raises general concerns without stating any specific recommendation or explanation of its objections to the proposed regulations.

Comment B-51-2

I want to highlight a few key insights that I believe the committee has not yet given the attention they deserve and highlight what continuing to ignore these realities would mean for Amy's and other innovative companies working towards sustainable packaging if SB 54 doesn't broadly accept compostable packaging as intended in the original statute.

First, I want to say that functionality really does matter.· The idea that unlined, fiber-only is a suitable compliance pathway for compostable products is laughable.· Functional barrier properties and other packaging engineering requirements are a reality of our modern food system that cannot simply be wished away.

In reality, the lack of functional properties including grease, water, and oxygen barriers mean that unlined fiber is unsuitable for most categories of food packaging, including food service ware.· Its use would lead to a catastrophic failure of packaging systems and result in an exponential increase in food waste or, as we've seen already requested today, require the creation of significant exemptions for fossil plastics to provide the needed functionality.

Even many existing categories offered in fiber-only options, like paper straws, are not viable, as they are rejected by a vast majority of the public, including advocates on the plastic reduction issue, due to their lack of functionality.

And humility requires that this committee recognize the impossibility of telling the people of California they cannot have their morning coffee, occasional takeout dinner, frozen foods, granola bars, and chips.· These packaging formats can be replaced, but not without the use of a functional alternative. Failing to acknowledge this reality would result in a
public revolt as people's lives are materially affected by a ban without a plan.

Next, I want to highlight that compostables provide the only viable alternative to film plastics. Many categories of flexible materials, including food trays, films, multi-material laminates, most food service ware, and other small-format packaging simply cannot be replaced by recyclable options either today or in the future.· Innovative, renewable, plant-based, circular, compostable products provide the only functional alternative to these categories.

The recycling system is already deeply burdened and only marginally economically viable. Broad-based collection of film plastic, food service ware, and small-format items is a fallacy that will never been effective in terms of function, environmental benefit, or economic viability.

And though recycling is often thought of uncritically as a virtue in all circumstances, the reality is that there's a vast difference between the environmental and economic value in recycling rigid formats and dry fibers versus the environmental and economic cost of collecting film plastics in the recycling system.· Doing something that has no financial or social value only to build a negative value recycling bail that has no market is a fool's errand.

And though it goes against the mantra of recycling everything regardless of the financial and environmental cost of doing so, this committee should acknowledge that some materials, like thin films and wet food-associated food service ware, are actually best managed outside the recycling system.· For these marginal materials, the desirable management outcome is containment to avoid leakage to the environment, dematerialization, and ideally, contribution to healthy soils when collected in compost.

Finally, I want to add that compostables have value even as collection comes online.· The conversations around collection of compostables in this committee over the past two years represents a good example of the perfect being the enemy of the good.

While it is true that the loudest composter voices from the California Compost Coalition do not currently want to accept compostable products, focusing only on the short-sighted -- excuse me -- focusing only on that short-sighted reality ignore several of the meaningful benefits of compostables.

First, many composters across the country have successfully accepted compostable products for years while producing high-quality compost and recognizing compostables' value in helping citizens collect and divert food scraps.· Even when not collected in composting, compostables significantly reduce reliance on fossil fuels throughout their life cycle in a way that no other material class can come close to.

Response to B-51-2

Comment rejected. The commenter offers broad concern over the various ways statute, as a technical matter, allows materials to achieve compliance (apparently with respect to the requirements of Public Resources Code section 42050). The commenter explains the technical reasons why, in the commenter's opinion, certain compliance pathways are not viable for certain materials. This comment, however, is directed at technical problems with the compliance pathways established in statute—the proposed regulations only implement such pathways—and their respective merits. The commenter also offers an analysis of various issues related to the end-of-life management of different materials. Because the comment does not address the proposed regulations themselves, much less suggest changes to them, no further response is required.

Comment B-51-3

And finally, compostables offer a significant advantage to conventional fossil plastics even when mismanaged.· While context and specifics vary greatly, a reasonable approximation is that compostables offer a one to two order of magnitude advantage to conventional plastics in terms of nonpersistent in the environment.

While not intended -- while not the intended pathway, we know systems do fail.· And when that happens, a mismanaged compostable material is likely to persist on the order of one to ten years in the environment for PHA and PLA, respectively, versus perhaps 100 years or more for conventional plastics like HDPE.

Response to B-51-3

Comment rejected. The comment provides background related to the other portions of the commenter's submission but does contain suggested changes to the proposed regulations or objections related to the rulemaking process.

Comment B-51-4

And I want to add one more thing.· Removing the compostable compliance pathway will result in more plastic.· In a deeply cynical possibility, rulemaking that disallows the use of functional compostable products would result in the so-called Plastic Pollution Reduction Act forcing Amy's into rigid, plastic, thermoformed meal trays for compliance reasons, increasing our plastic use approximately tenfold.

If this committee is serious about its commitment to the spirit of SB 54, it must avoid stifling innovation around the one form of packaging that has the potential to materially

replace a broad set of categories which can otherwise only be delivered using conventional fossil plastics.

Beyond abandoning the spirit of the statute, which explicitly calls for all packaging sold in the state of California to be recyclable, compostable, or reusable, failing to create a significant role for compostable products would have the sinister effect of locking in the current failed system and doubling down on conventional plastics, contrary to the very intent of the law.

Response to B-51-4

Comment rejected. The comment provides background related to the other portions of the commenter's submission but does contain suggested changes to the proposed regulations or objections related to the rulemaking process. To the extent the commenter's objection that the proposed rulemaking "disallows the use of functional compostable plastics" requires a response, CalRecycle has provided one in response to comment B-51-2. Also, if the proposed regulation have the effect that the commenter alleges, that result necessarily flows from the mandatory criteria set forth in Public Resources Code section 42357 and surrounding sections. CalRecycle has no discretion to ignore or modify those criteria.

B-52: Bunzl Distribution (Krista Durlas)

Comment B-52-1

Bunzl is a large distributor of essential business supplies.· We sit in the middle of the supply chain between manufacturers and the businesses that use their products.· While we don't control either side, we are well-positioned to influence both.· And we help our customers improve packaging and food service ware with minimal disruption to their operations and costs.

We are going to follow up with more detailed comments today later, but we want to focus in on section 18980.1.1, which is the in-the-state aspect of producer determination.

We recognize CalRecycle for your leadership in advancing packaging sustainability and your continued engagement with the stakeholders throughout the rulemaking process.· We also value the implementation guidance that CalRecycle has provided to date to help businesses account for materials and their components.

That said, with the reporting deadline approaching quickly, we are still unclear about which specific materials and components fall under our reporting obligation.· We work with over 1,000 suppliers, and one challenge that we find -- that we face is that businesses generally don't share complete location information with one another, even when they're in long-term business relationships.· That makes it difficult to impossible to determine which upstream suppliers are in the state for EPR purposes.

The proposed regulations don't resolve this issue for businesses with complex or global supply chains.· It's nearly impossible to determine the jurisdictional status of our upstream suppliers.· And without that clarity, we can't confidently determine our own reporting obligations.

In page 4 of CalRecycle's discussion document back from May 27th in the informal rulemaking workshop, CalRecycle said that they were going to -- they acknowledged the complexity.· And they said that they were going to provide interpretive guidance and advice on how to resolve this.· And it's -- you know, the deadline is here, and we still don't have clarification.

So given these challenges, we respectively urge CalRecycle to revise the in-state test to make it operationably feasible for businesses, whether or not the rule is revised.· We also encourage the Agency to provide practical tools, clear examples, and decision-making guidance to help regulated entities interpret and comply with requirements.

Specifically, we recommend -- you know, there could be a list.· There could be a list of who is in the state.· That would be helpful.· And otherwise, you know, just any interpretive guidance with clear examples, decision trees.

Or in lieu of that, please provide safe harbor provisions for getting through the period where the uncertainty persists, and to consider enforcement leniency or a compliance grace period until this is resolved.

And with that, we just thank you for the opportunity to comment.· And like I said, we'll follow up with more comments in writing later.

Response to B-52-1

CalRecycle rejects this comment. With regard to the commenter's request that CalRecycle substitute a list of entities that are in the state in lieu of providing the standard by which an entity might be judged to be in the state, the comment is rejected because the purpose of the regulation is to provide rules of general application. With regard to the comment's suggestion that CalRecycle provide interpretive guidance in the manner described in the May 2025 materials or by the exercise of enforcement discretion, the comment is rejected because it does not pertain to the present rulemaking. In its May 2025 discussion document, CalRecycle explained its intention to "publish illustrations (outside this formal rulemaking)."

B-53: Atrium 916 (Shira Lane)

Comment B-53-1

Hi.· Shira Lane with Atrium 916. We're a creative innovation center for sustainability. I just want to put a quick comment on reuse.

I, too, with the many comments that have been heard here feel that with reuse, I wish there was some kind of threshold so people knew, like, oh, if I did this, I meet the reuse standard.

Right now it's pretty vague.· And as mentioned, I'm worried about the thicker plastic bag issue.· So just putting that out there.· I would like to see reuse take over the world.· But, yeah.· So, thank you.

And also, I wish these microphones worked better.· Didn't we just, kind of, fix these up?

So, thank you.

Response to B-53-1

CalRecycle rejects this comment for the same reasons provided in its response to O-75-3.

O-1: Trash4tokens & Trashtalk (Clare Swithebank-Bowman)

Comment O-1-1

I strongly support the intent of SB 54 to advance producer responsibility, reduce plastic pollution, and accelerate California's transition to a circular economy. However, I urge CalRecycle to strengthen these permanent regulations by embedding digital transparency and global policy alignment that will ensure accountability across all levels of the packaging and recycling system.

Response to O-1-1

Comment rejected. The comment only makes a vague suggestion to address digital transparency and global policy alignment but does not suggest specific changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-1-2

1. Adoption of the TrashTalk App for Full Transparency
A critical gap in the current system is the lack of real-time, standardized data collection across material recovery facilities (MRFs), businesses, and producers. I recommend that CalRecycle require or incentivize the adoption of tools such as the TrashTalk app across all MRFs, businesses, and Producer Responsibility Organizations (PROs).
The TrashTalk app is designed to track all packaging types—PET, LDPE, HDPE, glass, tin, multi-layered plastics, compostables, and more—providing verifiable, geo-tagged data on collection, separation, diversion, and repurposing. By using a single transparent platform:
• Producers can demonstrate compliance with SB 54 in real-time.
• MRFs can reduce contamination and increase material value.

• CalRecycle can monitor compliance efficiently, cutting administrative overhead.
• Consumers and communities can see transparent reporting on where their waste goes.
Universal adoption of a system like TrashTalk would give California global leadership in digital circular economy infrastructure, and set the precedent for transparency and accountability worldwide.

Response to O-1-2

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, and no change is necessary to the implementation of the Act. PRC section 42051.1(m)(4) requires a producer responsibility plan to include record maintenance protocols sufficient to demonstrate producers' compliance with the requirements of the plan and Act. Section 18980.6.8 of the proposed regulations implements this requirement by specifying the form, manner, and type of records that must be maintained. Moreover, PRC section 42051.1(c)(5) requires a producer responsibility plan to describe how covered material will be collected, processed, managed, and recycled in a manner consistent with the goals of the Act, including ensuring covered material collected for recycling will be transferred to viable responsible end markets. Among other requirements, sections 18980.4(a) and 18980.4.1 of the proposed regulations require producers to maintain sufficient records to demonstrate that covered materials are collected, processed, managed, and recycled in a manner consistent with the goals and requirements of the Act. These regulatory provisions require producers to maintain the necessary documentation to ensure full transparency and tracking to demonstrate compliance with the requirements of the Act. Producers and a PRO are welcome to utilize any technologies or means for tracking materials they choose, so long as such technologies or means comply with the requirements of the Act, proposed regulations, and other applicable laws. Therefore, CalRecycle declines to require the universal adoption of the referenced application, and no further change is necessary.

Comment O-1-3

2. Integration of International Maritime Code (IMDG) Amendment for Nurdles
Another overlooked driver of plastic pollution is the unchecked flow of plastic nurdles—the raw feedstock for virgin plastic production. Spills during transport, storage, and production contribute massively to microplastic contamination. The proposed amendment to the International Maritime Dangerous Goods (IMDG) Code seeks to classify nurdles as hazardous substances.
This classification would increase the cost of shipping virgin plastic pellets, creating a market correction that makes recycled and repurposed plastics more economically favorable. By explicitly recognizing and supporting the IMDG nurdle amendment in its regulatory framework, California can:
• Align state-level action with global maritime safety and pollution prevention.
• Drive market forces toward repurposing existing plastics in the environment.
• Support the development of domestic recycling and reuse infrastructure.

Response to O-1-3

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it only raises vague concerns regarding nurdle pollution but does not suggest a specific change to the proposed regulations or raise an objection concerning the rulemaking process. Amending the International Maritime Dangerous Goods Code is outside the scope of this rulemaking.

Comment O-1-4

3. Strengthening Recycling Market Incentives
As long as virgin plastic remains artificially cheap, recycling markets will remain fragile. Linking SB 54's implementation with both digital transparency requirements (via tools like TrashTalk) and international policy mechanisms (like the IMDG amendment) will ensure that:
• True costs of virgin plastic are accounted for.
• Recycling and reuse become consistently profitable.
• California achieves and sustains the source reduction and recycling targets set by law.

Response to O-1-4

Comment rejected. The comment only makes a vague suggestion to address digital transparency and international policy mechanisms but does not suggest specific changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-1-5

Conclusion
To achieve SB 54's ambitious goals, California must go beyond incremental improvements and implement systemic innovations. By requiring universal adoption of transparent digital tracking platforms such as the TrashTalk app, and by formally supporting the IMDG nurdle amendment, CalRecycle can ensure that California not only meets its statutory obligations but also leads the world in the fight against plastic pollution.
Thank you for considering these recommendations.

Response to O-1-5

Comment rejected. No response to this portion of the commenter's submission is necessary because the issues raised in it have been addressed in response to other portions of the submission discussing the same issues.

O-2: Biodegradable Food Service and Earth To Go, Inc (Kevin Duffy)

Comment O-2-1

Looking to find out what the qualification is for the term reusable and compost able for the SB 54 regulation. I have a business in Hayward that sell both of these items.

Response to O-2-1

Comment rejected. CalRecycle cannot discern the meaning of this comment or identify any recommended change to the proposed regulations or objection concerning the rulemaking process. Accordingly, no response is required. To the extent the commenter intended to request that CalRecycle respond to a compliance question specific to the commenter, no response to such questions is appropriate in the rulemaking context.

O-3: HSR.health (Ajay Gupta)

Comment O-3-1

Overview

We respectfully submit this comment to endorse California's goal of achieving a circular economy through SB 54 and recommend the technical solutions that can substantially strengthen compliance, measurement, and health outcomes.

Response to O-3-1

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it only references the commenter's recommendations; it doesn't set those recommendations forth. To the extent the issues raised require responses, CalRecycle has addressed them in response to other portions of the submission discussing the issues in detail.

Comment O-3-2

Key Technology Recommenda ons to Achieve SB 54 Goals

• **Robust Monitoring:** Ensure geospatial tracking of ocean-bound and upstream plastic flows to fill a critical gap in measuring plastic reduction efforts, particularly in underserved and rural communities.

• **Public Plastic Portal**: Establish a publicly accessible dashboard or portal to enable realtime transparency into recycling rates, material recovery, and leakages, helping producers and Producer Responsibility Organizations (PROs) meet the law's ambitious **65% recycling rate and 25% source reduction** targets by 2032.

• **Health Risk Insights:** SB 54 directs mitigation funds toward both environmental and public health protection. We strongly recommend establishing a publicly accessible dashboard or portal to identify exposure hotspots and project health risks tied to plastic pollution—maximizing the **$5 billion fund's impact on vulnerable communities.**

Response to O-3-2

Comment rejected. This comment does not propose revisions to the proposed regulations. Rather, it recommends that CalRecycle undertake three projects (plastic waste monitoring, a public portal for publishing recycling rates, and a public portal concerning "exposure hotspots" and "health risks"), without

identifying any statutory provision that mandates or permits CalRecycle undertake them.

Comment O-3-3

Requirements for a Public Portal on Plastic Risk

A public portal will both help businesses and organizations adopt the provisions of SB 54, as well as raise statewide awareness of the issue of plastic pollution and movement towards a solution. A public portal should have the following features:

1. **Data-Driven Accountability**

o Capture real-time metrics on plastic flows and recyclability—a vital complement to mandated annual reporting.

2. **Equity-Focused Impact**

o Target investments and interventions to communities disproportionately affected by plastic pollution, aligning with SB 54's environmental justice objectives.

3. **Efficient and Effective Use of Funds**

o Identify locations where mitigation dollars from the Plastic Pollution Mitigation Fund can yield the greatest overall improvement in health and environment.

4. **Early Warning & Adaptive Management**

o Detect inefficiencies or emerging risks ahead of scheduled reviews—enabling corrective action before compliance deadlines.

Response to O-3-3

Comment rejected. No response is necessary because the comment does not concern the proposed regulations. Rather than recommend a change to the proposed regulations, the comment recommends parameters for a "public portal" project related for raising awareness of the issues related to SB 54.

Comment O-3-4

Suggested Regulatory Enhancements

To fully leverage these capabilities, we recommend the following additions to the proposed regulations:

- **Include Geospatial Monitoring Requirements**

Require the PRO to deploy technology systems to monitor and report plastic recovery progress with geographic precision, and that integrate with the public plastic portal or dashboard.

Response to O-3-4

Comment rejected. Requiring the PRO to deploy a monitoring system for the purpose of reporting on "recovery progress with geographic precision" is not within CalRecycle's authority under the statute.

Comment O-3-5

• **Mandate Health Risk Screening for Funded Projects**
Prioritize mitigation fund allocations for projects demonstrably reducing exposure risks in high burden areas (e.g., low income, vulnerable, or rural communities).

Response to O-3-5

Comment rejected. The Legislature, not CalRecycle, appropriates funds, and CalRecycle does not have authority to establish the Legislature's allocation priorities.

Comment O-3-6

• **Require Transparent, Publicly Available Metrics**
Publish recovery, recyclability, and exposure data to public, online dashboards, improving accountability and enabling community engagement.

Response to O-3-6

Comment rejected. The comment states the vague proposal, "[p]ublish recovery, recyclability, and exposure data to public, online dashboards." CalRecycle cannot discern what, if any, change to the proposed regulations this comment recommends. To the extent it proposes regulations requiring the PRO to develop a public resource concerning recycling infrastructure and health risks in the state, CalRecycle rejects that suggestion because statute does not authorize CalRecycle to impose such an obligation.

Comment O-3-7

- **Incentivize Innovation in Tracking & Remediation Technologies**

Recognize and support the scalability and long-term sustainability of applications, potentially through reduced producer fees or matching fund opportunities.

Response to O-3-7

Comment rejected. The comment states the vague proposal, "[r]ecognize and support the scalability and long-term sustainability of applications, potentially through reduced producer fees or matching fund opportunities." CalRecycle cannot discern what, if any, change to the proposed regulations this comment recommends. To the extent it proposes regulations dictating with specificity how the PRO creates its fee schedule or invests funds towards achieving its mandate, CalRecycle rejects that proposal because statute contemplates those granular details to be developed by the PRO and submitted to CalRecycle for approval as part of its producer responsibility plan.

Comment O-3-8

- **Leverage Plastic Credits to Fund Cleanup Activities**

The state of California should establish a requirement for plastic credits to offset plastic production and utilization throughout operations, including but not limited to manufacturing, distribution, or retail.

Response to O-3-8

Comment rejected. This comment proposes a "plastic credit" program that would require new legislation, not a change to the proposed regulations.

Comment O-3-9

Conclusion

We congratulate the State of California in taking bold action against the harm to the our shared environment and individual health caused by plastics. Integrating geospatial intelligence & health impact modeling into SB 54's framework offers a powerful, data-driven path to exceed sustainability and equity goals. We urge CalRecycle to incorporate these approaches into the final rulemaking and funding mechanisms. We appreciate the opportunity to contribute to California's leadership in plastic pollution reduction.

Response to O-3-9

Comment rejected. No response specific to the commenter's submission is necessary. This closing paragraph summarizes the commenter's recommendations, to which CalRecycle has responded separately (comments O-3-2 through I-3-8).

O-4: Santa Monica Democratic Club (Isabel Storey)

Comment O-4-1

California has an opportunity to greatly reduce plastic pollution scourging our state and set a national example for bold action to address the plastic waste crisis.

Santa Monica Democratic Club strongly endorsed SB 54, the Plastic Pollution Prevention and Packaging Producer Responsibility Act, when it was first passed in California. If fully implemented, this landmark anti-plastic pollution law will reduce plastic pollution and litter, protect public health, improve reuse and recycling, and lower costs for all Californians. However, the current draft regulations to implement the act greatly weaken the law, with broad exemptions for food products and weakened protections against a process known as "chemical recycling."

"Chemical recycling," sometimes called "advanced recycling," is intended to convert plastic waste into fuel or raw materials for new plastic, but it is mostly a new euphemism for an old and dirty practice: incineration. Plastics-to-fuel plants are not recycling, do not reduce demand for virgin plastics, and produce fossil fuels that are then burned, contributing to air pollution and global warming. This is not a solution to the plastic waste crisis and should not be allowed in our state.

California should be a leader in protecting our communities from toxic pollutants and the current regulations do the opposite.

We urge strong implementation of SB 54 that reflects the intent of the law, which is to greatly reduce the amount of plastic we are producing and discarding into our environment, and to protect our communities from the environmental and health impacts of plastic production and disposal.

Response to O-4-1

CalRecycle rejects this comment for the reasons stated in response to comment I-6-1, I-19-1, I-25-1, and O-6-1.

O-5: Indivisible Westside Los Angeles (Isabel Storey)

Comment O-5-1

Indivisible Westside Los Angeles, a progressive advocacy group of nearly 800 members, writes in strong support of FULL IMPLEMENTATION of SB 54, the Plastic Pollution Prevention and Packaging Producer Responsibility Act.

We believe that California has an opportunity to greatly reduce the plastic pollution suffocating our state and set a national example for bold action to address the plastic waste crisis.

Our group endorsed SB 54 when the bill was first passed in California and opposes any changes to weaken it. If fully implemented, this landmark anti-plastic pollution law will reduce plastic pollution and litter, protect public health, improve reuse and recycling, and lower costs for all Californians. However, the current draft regulations to implement the act greatly weaken the law, with broad exemptions for food products and weakened protections against a process known as "chemical recycling."

"Chemical recycling," sometimes called "advanced recycling," is intended to convert plastic waste into fuel or raw materials for new plastic, but it is mostly a new euphemism for an old and dirty practice: incineration. Plastics-to-fuel plants are not recycling, do not reduce demand for virgin plastics, and produce fossil fuels that are then burned, contributing to air pollution and global warming. This is not a solution to the plastic waste crisis and should not be allowed in our state.

California should be a leader in protecting our communities from toxic pollutants and the current regulations do the opposite.

We urge strong implementation of SB 54 that reflects the intent of the law, which is to greatly reduce the amount of plastic we are producing and discarding into our

environment, and to protect our communities from the environmental and health impacts of plastic production and disposal.

Response to O-5-1

CalRecycle rejects this comment's suggestion that "chemical recycling" be banned outright in the regulations. A complete ban on any technology could have been accomplished through straightforward language establishing a prohibition based solely on the type of technology. Instead, the Legislature chose to word statute in a way that requires consideration of hazardous waste generation, not mere consideration of the type of technology.

O-6: Los Angeles Waterkeeper (Maura Monagan)

Comment O-6-1

California has an opportunity to greatly reduce plastic pollution scourging our state and set a national example for bold action to address the plastic waste crisis.

If fully implemented, the landmark Plastic Pollution Prevention and Packaging Producer Responsibility Act (SB 54), will reduce plastic pollution and litter, protect public health, improve reuse and recycling, and lower costs for all Californians. However, the current draft regulations to implement the act greatly weaken the law, with broad exemptions for food products and weakened protections against a process known as "chemical recycling."

"Chemical recycling," sometimes called "advanced recycling," is intended to convert plastic waste into fuel or raw materials for new plastic, but it is mostly a new euphemism for an old and dirty practice: incineration. Plastics-to-fuel plants are not recycling, do not reduce demand for virgin plastics, and produce fossil fuels that are then burned, contributing to air pollution and global warming. This is not a solution to the plastic waste crisis and should not be allowed in our state.

California should be a leader in protecting our communities from toxic pollutants and the current regulations do the opposite.

We urge strong implementation of SB 54 that reflects the intent of the law, which is to greatly reduce the amount of plastic we are producing and discarding into our environment, and to protect our waters and communities from the environmental and health impacts of plastic production and disposal.

Response to O-6-1

CalRecycle rejects this comment's suggestion that "chemical recycling" be banned outright in the regulations. A complete ban on any technology could have been accomplished through straightforward language establishing a prohibition

based solely on the type of technology. Instead, the Legislature chose to word statute in a way that requires consideration of hazardous waste generation, not mere consideration of the type of technology.

O-7: Recycled Materials Association (Natalie Betts)

Comment O-7-1

Thank you for your work to improve the recycling system in California through the implementation of SB54. The Recycled Materials Association (ReMA) is the trade association representing over 1,700 companies who process, sort, broker and consume recycled materials including metals, paper, plastic and glass. Our member companies operate across the U.S. and around the globe, playing a critical role in providing recycled materials to our domestic and global manufacturing supply chain.

Formerly known as ISRI until April of last year, ReMA's mission is to promote safe, environmentally responsible and economically sustainable recycling through advocacy, networking education. ReMA is the organization responsible for managing the ISRI Specifications ("ISRISpecs"), which define the quality standards and composition of recycled materials traded both nationally and internationally. The ISRISpecs are globally recognized guidelines for the purchase and sale of recycled materials. While they have been in place for well over 80 years, they are updated regularly to ensure they meet the changing needs of manufacturers and recycled material consumers, as materials, technologies and processes evolve.

ReMA and our members fully support and share California's goal expressed through the Plastic Pollution Prevention and Packaging Producer Responsibility Act to ensure that all single-use packaging and food service ware materials are responsibly recycled. We are committed partners in building a more effective, transparent, and sustainable recycling system.

Response to O-7-1

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it only references the commenter's recommendations; it doesn't set those recommendations forth. To the extent the issues raised require responses, CalRecycle has addressed them in response to other portions of the submission discussing the issues in detail.

Comment O-7-2

ReMA's comments below focus on **ARTICLE 4: Responsible End Markets** and offer recommendations on changes that would more effectively achieve the goal of ensuring all covered materials are recycled responsibly, and offers our support for changes regarding bale tracking.

Response to O-7-2

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process. To the extent this comment alludes to specific recommendations made elsewhere in the submission, CalRecycle has addressed those recommendations in response to those portions of the submission.

Comment O-7-3

Confidential Business Information

Information about buyers, sellers, volumes, and sortation or processing practices are highly protected information in the recycled materials industry, as these data points often represent the competitive advantage of firms in a tight-margin, commodity business. Exceptional care needs to be taken to protect this information from public disclosure and from competitors.

Only third-party auditors or third-party certification bodies should have access to this sensitive information and must keep this information confidential. The draft regulation's requirement in Sections 18980.4.a.2. that Responsible End Markets must submit any records on buyers and sellers to the PRO itself or Independent Producers raises significant concerns.

First, Independent Producers or PRO board members may be competitors of end market entities, given vertical integration in the industry. Second, Section 18980.4.2.d states that the PRO and Independent producers must disclose unredacted records to the Department upon request. Only the PRO and Independent Producers, not the end market entities, are given the right to specify which information records it claims are wholly or partially confidential or otherwise exempt from public disclosure. These rules create a substantial risk for end market entities that sensitive business information is disclosed.

Response to O-7-3

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42041(ad), 42051.1, 42060, and 42080, and no change is necessary to the implementation or enforcement of the Act. Section 18980.4.2(a) of the proposed regulations already provides that all compliance audits of responsible end markets must be conducted by an independent third-party, and nothing in the Act or proposed regulations requires the independent third-party auditor to provide facilities' confidential information to the PRO. Rather, the PRO merely must include the findings of the audit in its annual report (18980.4.2(b)) and verify that each end market it uses satisfies the requirement to be a responsible end market (18980.4.2(c)). While CalRecycle is required to be given full access to the compliance audit report upon request, the proposed regulations, including sections 18980.4.2(d) and 18980.14, make clear that CalRecycle is required to protect applicable confidential information from being disclosed to the public. See the response to comment O-7-4. Therefore, the proposed regulations already

provide for the necessary protections against the improper use or release of end markets' confidential information, and no change is necessary.

Comment O-7-4

Additionally, there appears to be a potential gap in statutory protection. For instance, SEC. 4 of SB 54 provides confidentiality protections, but is specifically limited to "the proprietary information of producers, retailers, wholesalers, and solid waste enterprises by keeping confidential the financial, production, and sales data reported by those entities under Section 2 of this act." Notably, recycled materials companies and end market entities that are not considered "solid waste enterprises" do not appear to fall within these enumerated categories and therefore CBI submitted for REM verification could be vulnerable to disclosure, especially if submitted to the PRO and not through California's RDRS system.

This risk of insufficient CBI protection for companies that deal in recyclable commodities (not solid waste) is compounded by SB 54's antitrust provisions in Section 42055, which create a carveout allowing the PRO and its participants to engage in certain collaborative activities without violating antitrust laws, subject to certain explicitly excluded activities. This framework could create additional competitive risks if CBI about buyers, sellers, processing practices, and markets can be used in anticompetitive ways by those who have access to it under SB 54.

ReMA strongly recommends amending this section to instead require that end market entities transparently disclose such information only to approved independent third-party auditors and that said disclosures shall be exempt from public disclosure, except for the audit result.

Response to O-7-4

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42041(ad) and 42060, and no change is necessary to the implementation of the Act. Specific provisions of the Act, including, for example, PRC sections 42051.2(b)(5), 42063(c), and 42080(e), evidence a clear intent by the Legislature to ensure that CalRecycle protects the confidential information of regulated parties, including trade secrets and financial, production, or sales data, from being disclosed to the public. The proposed regulations, including sections 18980.4.2(d), 18980.6.6(b) and 18980.14, are consistent with this legislative intent and provide for the necessary protection against any improper disclosure by CalRecycle of parties' confidential information. Consistent with those provisions, CalRecycle will protect applicable confidential information from being disclosed to the public or otherwise used in a manner that is not consistent with the Act. Therefore, the existing language of the proposed regulations already provides adequate protections against the improper disclosure of parties' confidential information and no change is necessary.

Comment O-7-5

Yield

Section 18980.4.a.4 regarding yield is incompatible with the on-the-ground realities of packaging recycling. The recycling system for packaging is intertwined with commercial and industrial systems for recycling construction materials, vehicles, durable goods, and other items not covered by the producer responsibility program. Furthermore, recyclers do not process materials from one state at a time. Isolating the covered materials from an individual state for transparency on their yield rate is infeasible without significantly disrupting business operations. Finally, information on yield is often inextricable from highly sensitive business information on recycling processes.

ReMA understands that the state is concerned that recyclable materials could be intentionally disposed of by non-responsible entities. The state should consider alternative methods of verifying that REMs are not engaging in these practices, such as an independent third-party auditor observing the entity's inbound inspection process, rather than requiring the yield data as outlined in the proposed regulation text.

Response to O-7-5

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42051.1 and 42060, and the recommended changes are not necessary to the implementation or enforcement of the Act. PRC section 42051.1(c)(2) requires a PRO plan to describe how it will support and achieve the collection, processing, recycling, or composting of covered materials to meet the requirements of the Act. Among other requirements, the Act provides that covered materials must be sent to responsible end markets to be considered recycled (PRC section 42041(aa)) and further provides that responsible end markets are materials markets in which recycling is conducted in a way that benefits the environment and minimizes risks to public health and worker health and safety (PRC section 42041(ad)). Consistent with these provisions, section 18980.4(a)(4)(A) of the proposed regulations provides that, to be a responsible end market, an end market facility's recycling process must achieve an average recycling yield that meets or exceeds the threshold recycling yield identified in the plan. Section 18980.4.1(a)(2) of the proposed regulations requires a PRO plan to describe the process by which it will evaluate whether each end market it uses meets the standards specified in section 18980.4(a), including the yield requirement of section 18980.4(a)(4)(A). Therefore, consistent with these provisions, the Act and proposed regulations clearly provide that a PRO is responsible for ensuring the end markets it uses achieve the necessary recycling yields under section 18980.4(a)(4)(A). To the extent such demonstration may currently be infeasible, the PRO is responsible for including in its plan the actions or investments necessary to meet this requirement pursuant to PRC section 42051.1(b)(1). Moreover, section 18980.4.3 of the proposed regulations already provides for compliance audits of responsible end markets by independent third parties; the recommendation of this comment to replace the yield requirement with audits is therefore misplaced because CalRecycle has determined that both yield and

audits are necessary and appropriate to ensure that end markets continue to satisfy the requirements of PRC section 42041(ad). Therefore, no changes to the proposed regulations are necessary to ensure the yield requirement of section 18980.4(a)(4)(A) can be satisfied.

Comment O-7-6

Bale Tracking Requirement

ReMA strongly supports the removal of the bale tracking requirement language in the new draft. The use of battery-powered tracking devices in bales would have created a significant risk of fires at recycling facilities, in vehicles, and throughout the supply chain. It would have endangered lives, contaminated recycling, and created a severe risk of catastrophic property damage or environmental harm. CalRecycle's decision to instead use safer forms of verification will protect workers, communities, and first responders.

Recyclers have choices and options for where they source materials. If REM verification requirements are too burdensome, too vague, compromise confidential business information, or do not allow sufficient time to adequately prepare, recyclers may decide to source material from other states or markets, which could leave California MRFs and residents in a bind, even for materials that previously had strong end markets.

In addition, it must be stressed that the materials covered by the California law sometimes represent a small minority of the inbound material for an end market: for example, steel and tin cans are processed by ferrous metal recyclers who primarily process much larger quantities of ferrous metals from used automobiles, appliances, post-industrial scrap, and construction materials. Asking recyclers to track or report differently for a small portion of their inputs adds complexity without proportional benefit.

Due to these concerns, we urge CalRecycle to reconsider its approach to REM yield requirements and confidential business information.

Response to O-7-6

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42041(ad), 42051.1, and 42060, and the recommended changes are not necessary to the implementation of the Act. To the extent this comment expresses support for the removal of the bale tracking requirement, the comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process. To the extent this comment recommends reconsideration of the yield requirement and raises concerns about entities' confidential business information, no response is necessary because these issues have been addressed in response to other portions of the submission discussing the same issues. See the responses to comments O-7-3, O-7-4, and O-7-5.

O-8: 350 Bay Area Action (Judy Sorey)

Comment O-8-1

My name is Judy Sorey. I am a volunteer/legislative advocate for 350 Bay Area Action. We are concerned about several revisions to the latest draft regulations, especially the weakened protections against "chemical recycling", sometimes called "advanced recycling".

In the language of SB 54, recycling does not include combustion, incineration or fuel production and should minimize environmental and public impacts. Chemical recycling essentially is incineration and fuel production and does have environmental impacts.

In addition to the C02 emissions and pollution produced during the making of plastic products, this so-called "recycling" process adds more emissions. Toxins such as dioxins and heavy metals, which are carcinogens and neurotoxins, are often emitted during the process. Chemical recycling is also very energy intensive. Its primary product is fuel (86-99%) to be burned, and the secondary product polymers (1-14%) to be downcycled into another plastic product [1]. Pyrolysis and gasification can produce from 55 to 238 times more greenhouse gas emissions than mechanical recycling [2].

Economically, plastic produced by chemical recycling is between 10-100 times worse on economic metrics than virgin plastic [3].

Few "chemical recycling plants are operational in the US, and they are heavily subsidized. Two plants have multi-million dollar law suits against them. Oregon's plant, Agilyx, received $577,255 in tax credits but closed in 16 months [4]. In Rohnert Park, CA, Resynergi has moved into a production plant, 600 feet away from a high school [5]. The residents are concerned about this "untested" microwave technology and California Communities Against Toxins filed an "intent to sue" notice stating Resynergi is violating the Clean Air Act [6].

Chemical/advanced recycling isn't recycling nor advanced. It is not a "solution" and we should avoid it.

We need to enforce the intent of SB 54 to reduce the amount of plastic we are producing, find safe ways to recycle and discard it, and protect our environment, health and future.

Response to O-8-1

CalRecycle rejects this comment's suggestion that "chemical recycling" be banned outright in the regulations. A complete ban on any technology could have been accomplished through straightforward language establishing a prohibition based solely on the type of technology. Instead, the Legislature chose to word statute in a way that requires consideration of hazardous waste generation, not mere consideration of the type of technology. As the commenter identifies, PRC section 42041(aa)(2)(B) expressly excludes incineration from the definition of "recycling," and nothing in the regulations contradicts that exclusion.

CalRecycle also rejects this comment for the reasons stated in responses to comments O-6-1,O-9-42, and O-62-1.

O-9: Glendale Environmental Organization (IGEC) (Jennifer Pinkerton)

Comment O-9-1

As introduced, SB 54 was ambitious, overdue legislation that could have delivered staggering environmental and encouraged equivalent action by other states. An updated economic assessment recently released by CalRecycle cites $32 billion in net benefits and a slashing of plastic waste by 1.9 billion pounds.

However, the current draft regulations cannot achieve the stated goals of single-use packaging and plastic achieving recycling rates of 30% by 2028, 40% by 2030, and 65% by 2032. This is because the regs would exempt food packaging regulated by the United States Department of Agriculture (USDA) and U.S. Food and Drug Administration (FDA), as well as over the counter (OTC) drugs, and could allow some plastic food packaging to be excluded. This is clearly contrary to the intent of the SB 54 authors.

Response to O-9-1

Comment partially rejected and partially accepted. Regarding over-the-counter drugs, CalRecycle rejects this comment because section 18980.2(a)(6) correctly interprets PRC section 42041(ee)(2)(A) as not exempting those that are cosmetics, as explained in detail in the Initial Statement of Reasons. See, also, CalRecycle's response to comment O-49-1. Regarding food and agriculture packaging, CalRecycle partially rejects the comment because, contrary to the commenter's assertion, nothing in the regulations (e.g., section 18980.2(a)(2)) exempts packaging merely because it is regulated under certain federal laws. CalRecycle partially accepts this comment with regard to food and agricultural packaging, however, to the extent it was intended to allege that section 18980.2(a)(2) was unclear in scope or effect, was insufficiently clear regarding what renders it "not reasonably possible" to resolve conflicts with federal laws, or would have been overbroad in effect due to the potential for the exclusion to be applied despite the conflicts being avoidable. See CalRecycle's response to comment I-19-1, explaining the revisions responsive to this and similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

Comment O-9-2

Further, the definitions of "reusable" or "refillable" packaging are vague, and requirements pertaining to "chemical recycling" could allow incineration (as well as other polluting technologies) to count toward recycling targets. Incineration is an easy, polluting option.

Response to O-9-2

Comment rejected. The commenter provides no support for the contention that the definitions of "reusable" or "refillable" are vague. Those definitions are set forth in statute, and the regulations contain detailed provisions interpreting and clarifying those definitions (18980.1(a)(25) and 18980.2.1). Regarding incineration, the statute itself unambiguously states that incineration is not recycling (PRC sectio n42041(aa)(2)(B)), and no provision of the proposed regulations purport otherwise.

Comment O-9-3

Over time, packaging has evolved to offer better product protection. But evolution should be strategic and responsible. Source reduction strategies ranging from redesign to light-weighting, right-sizing to fewer and alternative materials, are available and compatible with product protection and recyclability. Product and packaging manufacturers must assume responsibility for implementation of such strategies and discontinue the practice of externalizing end-of-life management costs to the public.

The Glendale Environmental Coalition opposes adoption of SB 54 as written.

Response to O-9-3

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

O-10: Indivisible Marin (Susan Morgan)

Comment O-10-1

Indivisible Marin, a political activist organization headquartered in San Rafael, has over 8000 members across the State of California. We are deeply concerned with reducing the presence of plastic in our environment.

Enactment of the Plastic Pollution Prevention and Packaging Producer Responsibility Act (SB 54) took the state a major step toward reducing plastic pollution and litter, improving reuse and recycling, and lowering costs for all Californians. We call on you to ensure the law is fully implemented, so that only real recycling technologies are allowed in our state.

Unfortunately, the draft regulations conflict with plain language in the law, stifle innovation in packaging design, and undermine the goals of SB 54 to reduce plastic pollution and hold producers accountable for the cost of managing their waste.

Excluding packaging for over-the-counter drugs, and food and agricultural commodities illegally undermines the express intent of the law. Weakening protections against so-called "chemical recycling" which converts plastics to fuel instead of other plastics, does not reduce demand for virgin plastics, and it produces fossil fuels that are subsequently still burned, which continues to contribute to air pollution and global warming.

California is at a pivotal moment in the global fight against plastic pollution. How the state implements these policies is critical to the law's success, which will have ripple effects across the country and around the globe. California must not squander this opportunity to lead the way and must not undercut the progress in other states.

We urge strong implementation of SB 54 that reflects the intent of the law, which is to greatly reduce the amount of plastic we are producing and discarding into our environment, and to protect our communities from the environmental and health impacts of plastic production and disposal.

Response to O-10-1

CalRecycle partially rejects and partially accepts this comment. CalRecycle rejects this comment generally because it does not suggest any particular revisions to the proposed regulations to address the concerns raised. Regarding over-the-counter drugs, CalRecycle also rejects this comment for the reasons provided in response to comment O-49-1. To the extent the commenter's

reference to "food and agricultural commodities" is directed at section 18980.2(a)(2), however, CalRecycle accepts that portion of the comment and has revised that provision to ensure that it is not applied in a manner contrary to the Act. See CalRecycle's response to comment I-19-1, explaining the revisions responsive to this and similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2). Regarding "chemical recycling," CalRecycle rejects this comment for the reasons provided in response to comment O-62-1.

O-11: California Poultry Federation (Bill Mattos)

Comment O-11-1

On behalf of the California Poultry Federation (CPF), we appreciate the opportunity to

provide comments on the August 22, 2025 regulations implementing SB 54, the Plastic

Pollution Prevention and Packaging Producer Responsibility Act. CPF represents poultry processors, growers, distributors and marketers in the chicken, turkey, duck, squab, game bird and layer industries. Our members are the major suppliers of poultry and eggs in California.

We are writing to express our support for the categorical exclusions provided in Section

18980.2(a)(2) of the draft regulations, which recognize packaging for food subject to regulations, rules, or guidelines for food issued by the FDA and USDA as outside the scope of covered material where no feasible alternative exists.

Support for USDA/FDA Exclusions

• Food Safety and Public Health: FDA and USDA issued regulations, rules and guidelines are not optional and optimized packaging is critical to preventing microbial contamination, maintaining freshness, and ensuring consumer health.

Aligning SB 54 with these standards avoids conflicts between federal and state regulations while ensuring Californians have safe access to protein products.

• Food Security: Protein is an essential nutritional component for California families. The regulatory exclusions help safeguard supply chains and prevent disruptions that could compromise affordability and accessibility of these products.

• Regulatory Certainty: By recognizing federal mandates, CalRecycle provides necessary clarity for producers who must comply with both federal and state law.

This reduces compliance risk and allows members to focus on reducing unnecessary packaging elsewhere in their operations.

In conclusion, the CPF strongly supports CalRecycle's recognition of the unique role of food packaging in maintaining compliance with FDA and USDA regulations, rules, or guidelines in protecting food safety and security. We urge the Department to preserve these categorical exclusions in the final regulations. This approach strikes the right balance between advancing the goals of SB 54 and maintaining California's commitment to public health and nutrition.

Thank you for your consideration of these comments.

Respectfully submitted,

California Poultry Federation

Response to O-11-1

Comment rejected. The comment must be rejected, and no response is required, because the comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

O-12: Beyond Plastics (Susan Keefe)

Comment O-12-1

Beyond Plastics is a national education and advocacy organization, working to eliminate plastic pollution, everywhere. Since the adoption of SB 54, plastic pollution problems in California have only gotten worse. Massive amounts of plastic are entering streams and rivers and the Pacific ocean. Huge amounts of fossil fuels are being used to manufacture plastics. Over 16,000 chemicals are used to make plastic including plastic packaging. Environmental justice communities where plastics are manufactured and landfilled are being harmed. Large amounts of tax dollars are being spent to dispose of single use packaging and almost every month there are new scientific papers documenting the presence of microplastics in various parts of the human body. Microplastics and nanoplastics have been found in the human brain, lungs, heart, arteries, kidney, blood, testicles, placenta to name a few. These proposed regulations will not do nearly enough to solve these problems. Given all of the negative information that has emerged since the adoption of SB 54, one would think that the Newsom Administration would propose regulations that are comprehensive, clear and commensurate to solving the problem of plastic pollution. These proposed regulations do the opposite. Contrary to the intent of the law, these proposed regulations will exempt large categories of packaging from the law. Further, these regulations open the door to the risky and expensive process known as “advanced recycling” which is neither advanced or real recycling. The fingerprints of the chemical, plastics and petrochemical industries are all over these proposed regulations. The following proposed changes would bring the regulations closer to the goals of the law, which is to actually solve the

problems caused by plastic pollution in California. The people of California deserve better than what is in this regulatory proposal.

Response to O-12-1

No response to this portion of the commenter's submission is necessary because it is preface to the commenter's substantive comments and raises general concerns without stating any specific recommendation or explanation of its objections to the proposed regulations. To the extent that following portions of the submission suggest specific changes or raise objections, CalRecycle has responded to those portions separately. See, also, CalRecycle's responses to comments I-19-1, O-6-1, O-93-9. B-47-3, O-90-3 and O-62-1, which concern issues discussed in this comment.

Comment O-12-2

Comment 1 - **Chemical recycling should be prohibited categorically.**
Chemical recycling is an industry marketing term for a set of polluting technologies that mostly turn petrochemical-based plastic waste into fuels. It is not a novel or advanced approach as it is based primarily on technologies such as pyrolysis and gasification which have struggled technically and commercially to process plastic waste for decades. It is a dangerous deception pushed by the petrochemical industry that seeks to distract from the need to reduce plastic production.

Beyond Plastics and the International Pollutants Elimination Network (IPEN) published a report on October 31, 2023 documenting the hazardous outputs from chemical recycling. The report found that three of the eleven [at that time] constructed chemical recycling facilities in the U.S. were classified by the EPA as large quantity generators of hazardous waste, and one was a small quantity generator; the others were excluded because their production volumes were so low. Hazardous wastes and air pollutants created by chemical recycling technologies include heavy metals such as cadmium, hexavalent chromium, and lead; ignitable wastes and halogenated solvents; benzene, toluene, and xylene; 1,2-dichloroethane, trichloroethane and tetrachloroethane; oily sludges and wastewater; microplastics; and char. The report also found that eight of the 11 plants were in areas with lower-than-average levels of income, and seven were in areas with higher-than-average concentrations of people of color.

Building out the chemical recycling industry will continue to threaten environmental justice communities. The economic and technical limits of this industry will also prevent it from ever living up to the promises made by the petrochemical industry. In fact, three of the 11 plants profiled in the report have since closed (Regenyx, Fulcrum, and New Hope), one was just sold at auction after a bankruptcy declaration (Brightmark), and at least one does not appear to be operating at all (Prima).

Beyond Plastics strongly supports waste reduction, composting or yard and food waste and the recycling of paper, cardboard, glass and metals. However, most plastics recycling has been an abysmal failure and there is no evidence to show that plastics will ever achieve a high recycling rate. In fact, the failures of recycling—including chemical

recycling—as a solution for plastic pollution was laid bare in California Attorney General Rob Bonta's 2024 lawsuit against ExxonMobil.

Specifically, the state of California's own lawsuit found that plastic manufacturers never intended for most single-use plastics to ever be recycled—its support for recycling programs is instead a public relations tactic waged to allow for the unchecked production of plastics, and single-use disposable products and packaging in particular. The statutory language of SB54 states that the "regulations shall include criteria to exclude plastic recycling technologies that produce significant amounts of hazardous waste." These regulations need to draw a clear line: it is important to set a categorical prohibition on chemical recycling or other so-called "advanced recycling" technologies. In fact, Senator Ben Allen, the legislation's sponsor, submitted a letter to the Senate Journal on June 30, 2022, clarifying the legislative intent of SB 54 in this regard. In the letter he stated that the definition of *recycling is intended to only include technologies that return or maintain plastic materials within the circular economy. SB 54 specifically states that recycling does not include incineration or combustion of plastic waste (Section 42041(aa)(2)) and requires the regulations to exclude from recycling the technologies that generate significant hazardous waste (Section 42041(aa)(5)). Technologies using pyrolysis, gasification, solvolysis, and similar technologies that involve combustion and incineration, as well as the generation of hazardous waste, are therefore prohibited from being considered "recycling" under SB 54.*

Furthermore, proposed Section 42021(aa)(2) excludes from the definition of "recycling," technologies that produce energy or fuels, and other forms of disposal, which includes technologies like pyrolysis and gasification.

The requirement for a prohibition of these technologies in the regulations could not be clearer. A categorical prohibition of chemical recycling would meet the statutory intent to exclude plastic management technologies that produce significant amounts of hazardous waste, and would bring the regulations in compliance with the statute's requirement that the "regulations shall encourage recycling that minimizes generation of hazardous waste, generation of greenhouse gases, environmental impacts, environmental justice impacts, and public health impacts." **Therefore, we urge a categorical prohibition on chemical recycling technologies, as envisioned in SB 54's requirement that CalRecycle "exclude plastic recycling technologies that produce significant amounts of hazardous waste."**

Response to O-12-2

CalRecycle rejects this comment's suggestion that "chemical recycling" be banned outright in the regulations. A complete ban on any technology could have been accomplished through straightforward language establishing a prohibition based solely on the type of technology. Instead, the Legislature chose to word statute in a way that requires consideration of hazardous waste generation, not mere consideration of the type of technology. As the commenter identifies, PRC section 42041(aa)(2)(B) expressly excludes incineration from the definition of

"recycling," and nothing in the regulations contradicts that exclusion. See, also, CalRecycle's responses to comments I-25-1, O-6-1, and O-62-1.

Comment O-12-3

Comment 2 - **Exemptions for certain packaging creates massive loopholes.** These regulations identify a number of categorical exemptions—particularly for food and drug packaging—that allow entire packaging classes to fall outside of the scope of SB 54 because of conflicting federal regulatory guidance. Under the proposed revised rule, is it CalRecycle's intent for all food and drug packaging, including categories of products that have highly recyclable alternatives, to be exempt because producers can claim compliance with existing or new Food and Drug Administration (FDA) and US Department of Agriculture (USDA) guidance? If so, this would undermine the statute. Exempted products would then be subject to changes in the federal political climate, creating not only a massive loophole in the law, but persistent volatility in regards to packaging that may or may not be exempt at any given time after program implementation. Additionally, there is no verification process or defined list of exemptions, meaning that this would create a nebulous, moving target that producers can exploit. The goal of SB 54 is to transform packaging systems, but these broad exclusions exempt industries that generate high volumes of problematic plastic waste—particularly in the pharmaceutical industry—and they create unfair exemptions from recyclability and source reduction mandates faced by other sectors. This stymies packaging innovation and disincentivizes companies already developing compliant, recyclable packaging (e.g., paper blister packs). Effective extended producer responsibility programs must create regulatory certainty by ensuring a consistent and level playing field for all producers. We recommend that any language allowing for exemptions be precise, necessary, and in accordance with the statutory intent.

Response to O-12-3

CalRecycle partially rejects and partially accepts this comment. CalRecycle rejects this comment with respect to drug packaging for the reasons provided in response to comment O-49-1. CalRecycle otherwise accepts this comment and has revised section 18980.2(a)(2) to address the commenter's contention that it could function as a loophole for packaging to improperly be rendered outside the scope of the Act. See CalRecycle's response to comment I-19-1, explaining the revisions responsive to this and similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

Comment O-12-4

Comment 3 - **Lack of comprehensive standards for reusable/refillable packaging**. Effective EPR programs must fund infrastructure and systems for reusable and returnable alternatives to single-use products and packaging into the program design. Additionally, the eco-modulated fee structure should incentivize producers to rely on reusable and refillable packaging as much as is feasible, as well as ensuring that there

is sufficient infrastructure to reintegrate reusable and refillable packaging back into the market after use. Standards for what packaging qualifies as reusable and refillable are critical for ensuring that the packaging is *truly* reusable/refillable. The need for precise regulatory standards was recently illustrated in California when amendments were made to correct the famously imprecise language in the state's original plastic bag ban. Amended language finally prohibited the distribution of the thicker single-use plastic bags that surfaced after the passage of the original legislation. The draft regulations for SB 54 currently do not contain comprehensive standards for what qualifies as refillable or reusable packaging, nor do they contain any standards or clarifications for multi-component packaging (such as beverage containers that contain a cup, lid, and straw) that may be totally or in part reusable or refillable. We urge that the regulations include specific definitions and standards for reusable and refillable packaging, and that they consider requiring independent third-party certification for reusable and refillable packaging in the future. Clarify that the entirety of a packaging product defined as reusable/refillable, including derivative and detachable components, be reusable/refillable, and not just one component of the item. Many reusable containers are paired with disposable lids, straws, or films, which opens the door for innumerable permutations of partially reusable products then being exempt from other requirements under SB 54. Thank you for your attention to these comments and for your consideration of Beyond Plastic's recommendations for inclusion in the subsequent draft regulations for SB 54.

Response to O-12-4

CalRecycle rejects this comment because statute contains straightforward standards for what constitutes "reusable" or "refillable" packaging, and section 18980.2.1 of the proposed regulations interpret those provisions to the extent necessary for regulated entities to comply with the law and for CalRecycle to enforce it. CalRecycle specifically rejects the suggestion for requiring third-party certifications because that would add a criterion that is not present in statute; CalRecycle cannot add requirements beyond those in section 42041(af).

O-13: City of San Jose (Kathryn Walsh)

Comment O-13-1

To Whom It May Concern:

The City of San José (City) appreciates the opportunity to submit comments on the Proposed Regulation Text for the Plastic Pollution Prevention and Packaging Producer Responsibility Act, dated August 22, 2025, developed by CalRecycle for the implementation of Senate Bill (SB) 54.

Integrated Waste Management

The Integrated Waste Management (IWM) division within the City's Environmental Services Department (ESD) oversees solid waste collection, processing, and disposal

for residential, commercial and City Facilities operations. IWM develops and implements programs to meet or exceed state regulations, provides ease of use and exceptional value to customers, and improves and protects the environment by reducing greenhouse gas emissions associated with the disposal of solid waste. The City's Residential Garbage and Recycling Program provides curbside garbage and recycling, yard trimmings, and street sweeping services to approximately 216,500 single-family and 118,400 multi-family households. IWM oversees commercial solid waste collection services to about 8,000 accounts at business sites in San José.

Response to O-13-1

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process. To the extent other portions of the submission suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-13-2

Specific Comments

SB 54 is intended to shift packaging pollution responsibility to the producers of such materials and lessen the substantial burden on local jurisdictions related to waste collection and processing of covered materials; per CA Public Resources Code (PRC) § 42040 (b)(2)(A). We commend CalRecycle's efforts to lower emissions of carbon dioxide, methane, and volatile organic compounds and reduce the amount of plastic and other packaging and food serviceware waste disposed of in landfills by shifting to materials that are either fully recyclable or fully compostable.

The City appreciates that the proposed regulations have clarified in Section 18980.3.2 that free-attribution mass-balance methodologies in the calculation of the recycling rate is not allowed.

However, as we stated during the most recent informal comment period ending on June 3, 2025, we have significant concerns about the language included in several sections that are vital to ensuring that the goals of SB 54 are met. These concerns are as follows:

Response to O-13-2

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process. To the extent other portions of the submission suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-13-3

1. Section 18980.2: Categorically Excluded Materials

The City strongly believes that the significant expansion to categorically exclude certain products set out in Section 18980.2(a) of the draft regulations is outside of the exclusions specified in statute. The only legally allowable categorical exclusions, which entirely exempt products from being considered covered material under SB 54, are those which are specified in PRC Section 42041(e)(2). An expansion of this nature is neither in keeping with the letter or the law nor the intent of the law to allow most food packaging to be exempted. SB 54 was designed to ensure those producers who design, and market packaging are responsible for its end-of-life costs and to drive a cost-effective packaging management system. The regulations as currently drafted will undermine these goals through broad exemptions for entire packaging categories and shift costs on to responsible producers. This would greatly damage the funding mechanism in SB 54; it would also be inequitable for businesses that don't qualify for a categorical exemption and create a less effective system.

The Standard Regulatory Impact Assessment that CalRecycle published in June 2025 estimates that the total benefits of SB 54 are over $53 billion, the average annual cost to regulated producers could be up to $457,114 and the average annual cost to households could be up to $190 (in the unlikely event that all of businesses' costs are passed through to consumers). However, these estimated benefits and costs assume that SB 54 is implemented as intended by the State of California. If a large percentage of the products that are currently required to be covered by statute pursue categorical exclusions under the proposed regulations, the costs to the remaining regulated producers would increase significantly and consumers' costs may increase as a result. SB 54's intent to reduce the financial burden on ratepayers would also remain unmet, as many types of packaging intended to be covered under SB 54 would be categorically excluded from all current and future requirements to meet SB 54's recycling rates and recyclability mandates. The estimated minimum of $53 billion in benefits resulting from SB 54 would also not be realized, due to the same issue.

Another strong concern we have with this section in the proposed regulations is that permanent categorical exclusions are deemed granted unless and until CalRecycle states otherwise. If exclusions are kept in the proposed regulations, it is vital to ensure that the exclusion process mirrors the various exemption processes outlined in the proposed regulations (in Sections 18980.2.3, 18980.2.4, and 1890.5.2), which only grant an exemption upon CalRecycle's review and approval of the exemption. Additionally, the City is highly concerned that as currently written, secondary and tertiary packaging for categorically excluded materials receive a categorical exclusion as well. These materials are indistinguishable from those used for primary packaging, as well as secondary and tertiary packaging associated with covered materials that would remain in the SB 54 system. Cardboard boxes and flexible film are two examples of secondary and tertiary packaging types used by a wide variety of producers for a variety of products, many of which should not be categorically excluded according to statute.

Response to O-13-3

Comment partially rejected and partially accepted. The commenter's conclusory statement that only Public Resources Code section 42041(e)(2) specifies allowable "categorical exclusions" ignores the statute's broad, express direction to CalRecycle to ensure that the regulations avoid conflicts with federal laws and regulations. Given the statute's broad mandate in section 42060 for CalRecycle to adopt regulations "necessary to implement and enforce this chapter," interpreting subdivision (b) of that section as authorizing CalRecycle to achieve its requirements by excluding materials from regulation is appropriate. Moreover, the commenter is incorrect that anything in section 18980.2(a) establishes inappropriate "broad exemptions for entire packaging categories." The only categories broadly excluded are those specifically mentioned in Public Resources Code section 42041(e)(2), as interpreted, which the commenter acknowledges is proper. Section 18980.2(a)(2) addresses packaging other than those excluded under 42041(e)(2):

•It does not result in "broad exemptions for entire packaging categories." It only concerns packaging presenting intractable compliance barriers under federal law).

•It does not create "permanent categorical exclusions." The exclusions are subject to CalRecycle's immediate review of submitted claims of exclusion, for which CalRecycle can require additional support at any time.

•It does not create a new exclusion for secondary and tertiary packaging. Section 18980.2(a)(2) does not state that secondary and tertiary packaging can be excluded based on primary packaging being excluded because of conflicts with federal law. In contrast, 18980.2(b) provides that exclusions pursuant to Public Resources Code section 42041(e)(2)(A) through (D) do encompass secondary and tertiary packaging because the plain language of statute requires that outcome.

CalRecycle accepts this comment however, to the extent it alleges that section 18980.2(a)(2) was unclear in scope or effect, was insufficiently clear regarding what renders it "not reasonably possible" to resolve conflicts with federal laws, or would have been overbroad in effect due to the potential for the exclusion to be applied despite the conflicts being avoidable. Regarding the creation of "permanent categorical exclusions" in particular, subparagraphs (C) and (F) of the revised section 18980.2(a)(2) more clearly describe how CalRecycle will review submissions upon receipt and include safeguards to prevent exclusions from effectively being permanent regardless of their merit. See, also, CalRecycle's response to comment I-19-1 explaining the revisions responsive to this and similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

Comment O-13-4

i. Recommendation: Delete the entirety of Section 18980.2(a)(2) in the current version of the proposed regulations. If it is not removed, it will directly conflict with statute and result in a failure of the state to implement SB 54 as required by statute. Instead of this expansion, we strongly recommend that the proposed regulations continue to allow producers of these materials to instead apply for an exemption under an existing process outlined in the proposed regulations (such as the "unique challenges" exemption outlined in Section 18980.2.4)— this would require these producers to remain part of the SB 54 system and would create a clear pathway for producers to onboard materials as it becomes feasible to do so.

Response to O-13-4

CalRecycle rejects this comment for the reasons stated in response to comment O-13-3[AB94.1], of which this comment is a continuation, and because removing 18980.2(a)(2) would leave the proposed regulations without a mechanism for sufficiently addressing the conflicts that must be addressed pursuant to in Public Resources Code section 42060(b). Also, the only exemptions that would potentially apply in the manner suggested are those described in 18980.2.4 (implementing Public Resources Code section 42060(a)(3) and (4)). As explained in response to comment I-59-2, removing 18980.2(a)(2) and relying on those exemptions instead would be inadequate. See, also, the response to comment O-93-9 for further explanation of why CalRecycle declines to remove 18980.2(a)(2).

Comment O-13-5

ii. Recommendation: Delete the additional categorical exclusion that was added to the draft regulations in Section 18980.2(b) for secondary and tertiary packaging of categorically excluded materials.

Response to O-13-5

CalRecycle rejects this comment for the reasons stated in response to comment O-13-4, of which this comment is a continuation. Section 18980.2(b) is appropriate because Public Resources Code section 42041(e)(2) concerns packaging for certain goods, and section 42041(s)(3) expressly defines packaging to include goods' secondary and tertiary packaging.

Comment O-13-6

iii. Recommendation: If CalRecycle keeps the categorical exclusion provision, change the process so that these materials are only able to be excluded after CalRecycle has approved an entity's application for this exclusion that satisfactorily justifies why the material does not qualify under unique challenges, instead of upon CalRecycle receiving such an application. The application must be approved or denied by CalRecycle within 3 months of the entity's submission of the application.

Response to O-13-6

Comment partially accepted and partially rejected. CalRecycle accepts the comment to the extent it suggests that mere submission of claims for exclusion under section 18980.2(a)(2) should not immediately render the packaging at issue not "covered material". Section 18980.2(a)(2) has been revised so that CalRecycle examines submissions to confirm: (1) that the submission contains the required content described in subparagraph (B); and (2) that CalRecycle has not identified alternative packaging that would resolve the legal conflict cited.

CalRecycle rejects, however, the commenter's suggestion that each application be subject to a three-month approval process. As an initial matter, it may not be possible in every case for CalRecycle to make a determination on the merits of a submission within three months. Moreover, such a process would impose uncertainty and unreasonable timelines on businesses to make packaging modifications, which are more fairly addressed through the process set forth in subparagraph (E) (formerly subparagraph (B)). The process described in subparagraph (E) more realistically balances the need to exclude only packaging that is eligible for the exclusion with the ability of businesses to shift away from packaging that is not eligible.

Lastly, the commenter's suggestion of a three-month review process for every submission would not, in most cases, result in a meaningfully different process than the one set forth in section 18980.2(a)(2), as revised. All exclusions under 18980.2(a) must be based on specifically identified federal laws, many of which greatly limit compliance pathways and of which there is a finite number that will not expand quickly, if ever. Given that reality, CalRecycle is likely to receive voluminous submissions concerning nearly identical packaging and the same conflict with federal law. Once CalRecycle examines a small number of such claims and determines that initiating the longer process described in subparagraph (E) for vetting the claims is not necessary, there would rarely, if ever, be cause for CalRecycle to initiate it for the subsequent claims. Accordingly, a formal three-month process would rarely, if ever, serve any purpose. In the alternative scenario, where the CalRecycle initiates the process described in subparagraph (E) because of an apparently unjustified exclusion claim, subparagraph (F) ensures that subsequent submissions do not result in the exclusion applying until CalRecycle makes a determination on the submissions' merits, further ameliorating the commenter's concern over unjustified assertions of the exclusion.

Comment O-13-7

2. Section 18980.4.1 & 18980.3.5: End Market Identification & Disposal Definition

The City appreciates that alternative recycling methodologies are now explicitly compared to mechanical recycling in Section 18980.4.1(d) of the draft regulations. However, the City is highly concerned that the definition of "significant amounts of hazardous waste" as "hazardous waste as defined in Title 40 of the Code of Federal

Regulations Section 261.3 that presents an imminent and substantial risk of harm to public health, or to the contamination of the environment" does not align with statute's requirement that CalRecycle's regulations "shall include criteria to exclude plastic recycling technologies that produce significant amounts of hazardous waste" (PRC Section 42040(aa)(5). Specifically, the City is concerned that rather than setting a standard for the term "significant amounts of hazardous waste," this definition actually defines "hazardous waste" and does not set the standard required by statute. This standard must be set by CalRecycle, as is required by statute, and not by the Producer Responsibility Organization (PRO) or an Independent Producer, as it is currently written in Section 18980.4.1(d)(5).

The City is also deeply concerned about Section 18980.4.1(d)(5)(1)(B) in the draft regulations, which states that "The production of hazardous waste that is handled and disposed of in substantial compliance with an applicable permit does not present a substantial risk of harm to public health or to contamination of the environment, for purposes of the Act and this chapter." This language allows for any amount of hazardous waste to be generated by plastic recycling technologies, and therefore for these technologies to be allowed as "recycling" under SB 54 as long as the hazardous material they generate is disposed of in accordance with awarded permits. The City strongly believes that this subsection must be removed in order for the regulations to align with statute and to avoid mischaracterizing technologies that generate significant amounts of hazardous waste as recycling technologies.

Additionally, the City requests that CalRecycle include additional language in this section to fulfill the statutory requirement that "The department's regulations shall encourage recycling that minimizes generation of hazardous waste, generation of greenhouse gases, environmental impacts, environmental justice impacts, and public health impacts. The regulations shall include criteria to exclude plastic recycling technologies that produce significant amounts of hazardous waste" (PRC Section 42040(aa)(5)). These additional impacts, including the generation of greenhouse gas emissions and the impacts to environmental justice communities, must be considered when technologies are being evaluated as to whether or not they can be considered recycling technologies. Impacts to environmental justice communities in particular are something that statute is explicitly concerned about, due to the disproportionate impacts that the current and historical waste management system and plastics industry have had, and continue to have, on these communities. The SB 54 regulations must ensure that communities are protected from incredibly harmful facilities being created in their neighborhoods under the guise of needing to meet SB 54's ambitious recycling targets.

Finally, the City requests that CalRecycle re-insert language in Section 18980.3.5 of the proposed regulations clarifying that "other forms of disposal" are considered disposal under SB 54. The City appreciates that CalRecycle intends for the proposed regulations not to directly duplicate statute; however, in this case, including such language provides much-needed clarity on the activities that are considered disposal, and therefore not considered recycling, under SB 54.

Response to O-13-7

CalRecycle rejects this comment for the reasons provided in responses to comments O-62-1 and O-13-11.

Comment O-13-8

i**. Recommendation:** Amend Section 18980.4.1(d)(5) to include additional language creating a clear standard for "significant amounts of hazardous waste," as is required by PRC Section 42040(aa)(5). Further amend this section to remove the requirement that the standard for "significant amounts of hazardous waste" be decided by the PRO or Independent Producers.

Response to O-13-8

CalRecycle rejects this comment for the reasons provided in response to comment O-62-1.

Comment O-13-9

ii. Recommendation: Remove Section 18980.4.1(d)(1)(B), in order for the regulations to align with statute and to avoid mischaracterizing technologies who generate significant amounts of hazardous waste as recycling technologies.

Response to O-13-9

CalRecycle rejects this comment for the reasons provided in response to comment O-62-1.

Comment O-13-10

iii. Recommendation: Add language in Section 18980.4.1(d)(5) to fulfill the statutory requirements that these regulations must meet, as stated in PRC Section 42040(aa)(5).

Response to O-13-10

CalRecycle rejects this comment for the reasons provided in response to comment O-62-1.

Comment O-13-11

iv. Recommendation: Add language in Section 18980.3.5 stating that "Other forms of disposal, as defined in subdivision (b) of section 40192 of the Public Resources Code," which was previously included in the proposed SB 54 regulations dated December 2, 2024.

Response to O-13-11

Comment rejected. Referring to Public Resources Code section 40192(b) directly is unnecessary because, in context of this statute, anything not considered "recycling" is necessarily "[o]ther forms of disposal." Accordingly, limiting what constitutes "other forms of disposal" to the activities described in Public Resources Code section 40192(b) would be, at best, redundant with the statute's

and proposed regulations' treatment of what constitutes "recycling." At worst, such a definition is inconsistent with other provisions of the proposed regulation and the statute concerning responsible end markets: Any processing by an end market that is not a "responsible end market" is necessarily not "recycling" and therefore must be an "other form of disposal," regardless of how Public Resources Code section 40192(b) defines "disposal."

Comment O-13-12
Continued Concerns

The City appreciates CalRecycle's efforts to analyze and incorporate changes based on the comments received during the first formal rulemaking process. However, several sections that are relevant to local jurisdictions remain unchanged; we look forward to reviewing the Statement of Reasons to better understand why some of our comments during the first formal rulemaking process were not addressed. We continue to have concerns related to effective implementation of the intent of SB 54, particularly in the following areas:

1. Section 18980.8(g): Covered Costs of Local Jurisdictions and Recycling Service Providers

The City appreciates that language throughout this section has been changed from "reimbursement" to "covered costs"— this is a clear allowance for the PRO to cover costs upfront instead of after the fact, where the regulations were previously unclear. The City also appreciates the addition of Section 18980.8(g)(8) to the draft regulations to require the PRO to notify local jurisdictions of the amount and type of payments made to local recycling service providers. However, the City continues to have strong concerns about this section.

The PRO is required to pay for costs incurred by a local jurisdiction or a local jurisdiction's recycling service providers to implement SB 54 (PRC section 42060(a)(1)). This includes the costs of collecting, transporting, and processing covered material, as well as the cost to educate the public about proper sorting of covered material. However, in Section 18980.8(g)(2)(A) of the draft regulations, for costs of the same type that were already being incurred by a jurisdiction, "Only the amount of the increase caused by [the] requirements [of SB 54] is reimbursable." Separating costs that are due to the existence of SB 54 from costs that are not from SB 54 implementation could prove extremely difficult and incredibly burdensome for jurisdictions.

Additionally, as currently written in Section 18980.8(g)(3) of the draft regulations, for every cost identified by the entity requesting cost coverage, the PRO shall determine the costs that are covered. This is aligned neither with statute, nor with the intent of SB 54 to shift the burden of managing covered material from local jurisdictions to the PRO. While the PRO has authority to create the process through which it will pay local jurisdictions' and local recycling service providers' costs, the PRO does not have statutory authority to make a determination on the portion of costs that are covered.

Covered costs are already specified in statute (Sections 42051.1 and 42060(a)(1) of the Public Resources Code), and the PRO must also cover costs beyond those specified in statute, as outlined in Section 42060(a)(1) of the Public Resources Code. This language gives the PRO additional powers beyond those outlined in statute, and it may have the unintended consequence of the PRO determining that only certain costs within the categories of costs that the PRO must cover will be covered.

Response to O-13-12

Comment rejected. To the extent the commenter implies that the Act supports the contention that the PRO must cover all costs associated with SB 54, regardless of whether the costs are increased due to SB 54 requirements, that assertion is incorrect. Paragraph (1) of subdivision (d) of section 42053 actually requires the opposite conclusion. That paragraph states one factor the PRO must consider when exercising its discretion with respect to its fee schedule: "[t]he costs to ensure each covered material category meets the requirements of this chapter." But subparagraphs (A) through (E) do not state costs that the fees must be sufficient to cover in their entirety. To the contrary, paragraph (1) states that the costs to be considered "may include all of the following," including the costs identified in subparagraph (C): "[c]osts incurred by local jurisdictions ... to process and transport covered materials ... ." By providing those costs as a categorical example of those that the PRO may consider, as opposed to identifying them as mandatory costs that the PRO must (or "shall") cover, this statutory text makes clear that the Legislature did not intend for funding by the PRO to cover the entirety of local jurisdictions' and recycling service providers' costs associated with SB 54. In effect, the Legislature only authorized, but did not require, the PRO to base its fee schedule to some degree on those costs.

To the extent the commenter suggests that the proposed regulations be modified to restrict the PRO's discretion concerning cost determinations, CalRecycle rejects that suggestion because the commenter proposes no alternative approach. CalRecycle also rejects the suggestion because PRC section 42051.1(g) unambiguously establishes that the Legislature intended the PRO to make cost determinations; if the Legislature did not intend the PRO to have the primary role in those determinations, there would be no purpose of having the PRO "include a process" for those determinations in its producer responsibility plan. Section 18980.8(g) of the proposed regulations requires that the PRO satisfy its statutory obligations under the PRO plan by imposing restrictions on the PRO's decision-making consistent with statute. That discretion remains subject to CalRecycle's oversight authority because the producer responsibility plan itself is subject to CalRecycle's approval. CalRecycle may reject a plan that does not ensure that the PRO will satisfy its statutory obligations, one of which is to provide necessary funding. CalRecycle also exercises ongoing oversight authority because it may hold the PRO to be in violation of its obligations if it fails to abide by its plan, including all provisions concerning provision of funding.

Comment O-13-13

i. Recommendation: Amend the language in Section 18980.8(g), "For purposes of this subdivision, costs that the PRO and Independent Producers are obligated to pay are referred to as 'covered costs'" to additionally specify that "this includes (but is not limited to), the costs specified in PRC Sections 42051.1 and 42053(d)(1)(C through E), including both direct and indirect costs, such as personnel and overhead costs, incurred while administering the law," as well as to include additional relevant specification on these statutory provisions, with regards to the specific types of costs that are covered. CalRecycle's statutory authority and requirement to include this specification is found in PRC Section 42060(a)(1).

Response to O-13-13

Comment rejected. The description of costs in section 18980.8(g) is clear and straightforward. CalRecycle declines to adopt a regulation that states that "both direct and indirect costs" are covered costs. Those terms are ambiguous, and the commenter does not provide details as to how attenuated the connection between a cost and the requirements of SB 54 may be before the cost is no longer a covered cost. Rather than relying on terms that may not be uniformly understood among the public, local jurisdictions, the PRO, Independent Producers, courts, and arbitrators called upon to resolve disputes, the framing adopted in section 18980.8(g)(2) relies on a plain, objective comparison between costs caused by SB 54 and those not caused by SB 54. Although that factual inquiry may be complex in certain scenarios, so too would be the question of how "indirect" a cost may be; by avoiding the latter complication, the proposed regulation achieves greater clarity and predictability than the suggested change would achieve.

Comment O-13-14

ii. Recommendation: Remove the requirement in Section 18980.8(g)(2)(A) that only the increase in costs resulting from SB 54 is covered. The goals outlined in SB 54 that producers are required to meet cannot be met without local jurisdictions' ongoing outreach and education efforts and collection costs related to covered material, as well as capital costs related to covered material.

Response to O-13-14

CalRecycle rejects this comment for the reasons stated in response to comment O-56-3.

Comment O-13-15

iii. Recommendation: Amend the language in Section 18980.8(g) to "the plan shall include a process for ~~determining and paying~~ detailing, in alignment with PRC Sections 42051.1 and 42053(d)(1)(C through E), how covered costs that will be incurred, or otherwise would be incurred, by local jurisdictions, recycling service providers, alternative collection programs, and others due to requirements of the Act will be paid by the PRO." This will ensure that local jurisdictions and recycling service providers will

be made whole for the full breadth of covered costs outlined in statute and will remove the draft regulations' current conflict with the intent of SB 54 and the language on covered costs set out in statute.

Response to O-13-15

Comment rejected. CalRecycle rejects the suggested revisions to the proposed regulations to restrict the PRO's discretion concerning cost determinations because PRC section 42051.1(g) unambiguously establishes that the Legislature intended the PRO to make cost determinations. If the Legislature did not intend the PRO to have the primary role in those determinations, there would be no purpose of having the PRO "include a process" for those determinations in its producer responsibility plan. Section 18980.8(g) of the proposed regulations requires that the PRO satisfy its statutory obligations under the PRO plan by imposing restrictions on the PRO's decision-making consistent with statute. That discretion remains subject to CalRecycle's oversight authority because the producer responsibility plan itself is subject to CalRecycle's approval. CalRecycle may reject a plan that does not ensure that the PRO will satisfy its statutory obligations, one of which is to provide necessary funding. CalRecycle also exercises ongoing oversight authority because it may hold the PRO to be in violation of its obligations if it fails to abide by its plan, including all provisions concerning provision of funding.

Comment O-13-16

iv. Recommendation: Amend Section 18980.8(g)(3) as follows: "For every cost identified by the entity whose costs are required by statute to be covered by the PRO or an Independent Producer, the PRO or Independent Producer shall pay all covered costs, as defined in statute, including, by not limited to, those costs identified in PRC Sections 42051.1 and 42053(d)(1) ~~determine the extent to which it is a covered cost~~. The PRO or Independent Producer shall notify the entity of all determinations in writing." This would remove the possibility, which the draft regulations create, for the PRO or an Independent Producer to refuse to fulfill their obligation to cover all costs outlined in statute.

Response to O-13-16

CalRecycle rejects this comment for the reasons stated in response to comment B-13-15.

Comment O-13-17

v. Recommendation: Amend Section 18980.8(g)(8) to require that local jurisdictions concur with the nature and amount of each payment for covered costs being made to recycling service providers prior to payment being made. This change would allow local jurisdictions to ensure that the payment is not a cost that is already being paid for through solid waste rates. This will recognize that, pursuant to Public Resources Code Section 40000, et seq., local jurisdictions have discretion in how to handle solid waste

programs and therefore are responsible for facilitating waste management programs at the local level.

Response to O-13-17

Comment rejected. Section 18980.8(g) already requires advance notice to, and discussion with, local jurisdictions regarding the payment of covered costs for recycling service providers. Therefore, no change is necessary to the implementation or enforcement of the Act. Additionally, CalRecycle does not have the authority to dictate how local jurisdictions allocate SB 54 funds or structure their ratepayer calculations, or any authority over ratepayer assessments. CalRecycle cannot lawfully depart from the statutory provisions in Public Resources Code section 42051.1(g) that require payment of costs to local jurisdictions and recycling service providers incurred due to requirements of the Act. The proposed regulation at section 18980.8 is consistent with the statutory text and legislative intent to pay these costs to local jurisdictions and recycling service providers.

Comment O-13-18

2. Section 18980.11(b): Requirements for Local Jurisdictions and Recycling Service Providers

We appreciate that language was added to clarify that local governments are not responsible for creating responsible end markets, either in the current recycling system or under SB 54. However, we have a few concerns about the way that the regulations currently attempt to clarify this in Section 18980.11. Local jurisdictions often do not have access to data showing where materials end up. San José's recycling service providers' sales information is proprietary, as is often the case for recycling service providers in California. Though data on end markets is intended to be documented through SB 343, local jurisdictions may still not have access to this documentation and may be in long term contracts. Amendments to those contracts could be costly and burdensome, both to the jurisdiction and ratepayers, which would conflict with the written intention of SB 54. Therefore, local jurisdictions may not be aware of the full scope of materials that this section would require them to apply for exemptions for. Moreover, requiring local jurisdictions to apply for exemptions for each covered material that is not being directed to a responsible end market is highly burdensome. As currently written, to comply with SB 54's collection requirements, local jurisdictions would need to apply regularly for an exemption for each CMC deemed "recyclable" or "compostable" that isn't currently directed to a responsible end market. The PRO and Independent Producers are responsible for creating and maintaining responsible end markets for local jurisdictions to send material to through local recycling service providers and intermediate supply chain entities. As such, it is intermediate supply chain entities who should be held responsible for sending covered material to responsible end markets—these entities have control over which end markets materials are sent to, while local jurisdictions do not.

Response to O-13-18

CalRecycle rejects this comment for the reasons stated in response to comment O-13-19, which is a continuation of this comment.

Comment O-13-19

i. Recommendation: Amend Section 18980.11(b) to clarify that intermediate supply chain entities are responsible for ensuring that materials are sent to responsible end markets; delete the associated requirement for local jurisdictions to apply for exemptions for each relevant covered material type that is not sent to a responsible end market. Local jurisdictions must only be held responsible for ensuring the collection of covered materials, as required by PRC Section 42060.5, and not held responsible for the requirement that these materials are sent to responsible end markets.

Response to O-13-19

Comment rejected. CalRecycle rejects this comment along with comment O-13-18.

Regarding local jurisdictions' "access to data showing where materials end up" (comment O-13-18), that concern is not sufficient to merit a change to the proposed regulations. While a recycling service providers' "sales information" might include proprietary information, information about whether material is disposed of, as opposed to recycled, is not "sales information" and, in any event, cannot be a legitimate trade secret because disposal of solid waste cannot be accomplished secretly.

Moreover, even assuming information is unavailable because it is protected as a trade secret, to the extent a local jurisdiction lacks information establishing impracticability (e.g., information establishing the absence of responsible end markets), statute unambiguously dictates the result: The local jurisdiction is not entitled to the exemption. Notably, the commenter does not allege that inability to obtain certain information hampers its ability to collect materials and transfer them within the waste management supply chain, and, contrary to the commenter's assertion, section 18980.11 does not require local jurisdictions to do more than that. Far from holding local jurisdictions responsible "for the requirement that these materials are sent to responsible end markets," 18980.11(b) expressly states that local jurisdictions fulfill their requirement by collecting covered material and transferring it to "responsible end markets directly or to intermediate supply chain entities."

Regarding the commenter's objection to local jurisdictions needing to "apply for exemptions for each covered material," the commenter offers no alternative approach, and CalRecycle cannot discern any. Moreover, the proposed regulation does not require a separate application for narrowly defined covered material items; section 18980.11.1(c)(3) expressly contemplates applications addressing multiple covered materials or covered material categories simultaneously.

Regarding holding intermediate supply chain entities responsible for sending covered material to responsible end markets, CalRecycle rejects that suggestion.

Nothing in statute places burdens directly on such entities or suggests that CalRecycle has authority to directly regulate or penalize them.

Comment O-13-20

ii. Recommendation: Simplify Section 18980.11(b) as follows to eliminate ambiguity: "The local jurisdiction or recycling service provider shall not be required to establish ~~the availability of a~~ responsible end market<u>s</u> ~~to ultimately recycle the covered material~~"

Response to O-13-20

CalRecycle rejects this comment for the reasons stated in response to comment O-13-19 and because the regulatory text at issue is not ambiguous as written. Section 18980.11(b) clarifies that local jurisdictions and recycling service providers have no obligation to establish that responsible end markets are available to recycle covered material. That clarification is plain on its face, and the commenter does not explain how it could be susceptible to multiple interpretations. Moreover, the suggestion would contradict the commenter's apparent aims because it would narrow the meaning of the text as written. The text states that there is no requirement to "establish the availability of a responsible end market," and requiring "develop[ment of] responsible end markets" would be one way to require establishing their "availability." The explicit absence of the former, broader requirement necessarily means the absence of the latter, narrower one. If the text were revised to say only that local jurisdictions and recycling service providers do not need to establish responsible end markets, it would no longer clearly state that they do not have any obligation to establish the availability of responsible end markets.

Comment O-13-21

3. Section 18980.11.1: Extensions or Exemptions for Local Jurisdictions and Recycling Service Providers

The exemption process outlined in Section 18980.11.1 continues to place an incredibly high, disproportionate burden on local jurisdictions. Other exemption processes, such as the PRO requesting exemptions, or CalRecycle deciding to exempt a material, do not require the same level of consultation and approval from other regulated entities. This does not align with the intent of SB 54 to shift the burden from local jurisdictions to producers. The language in Section 18980.11.1 (c) and (d) requiring PRO involvement and jurisdictions' responses to all comments received does not provide protection for jurisdictions from unreasonable denial or overly extensive comments from the PRO that could significantly hinder a local jurisdiction's ability to effectively apply for an exemption in a timely manner. This would increase a jurisdiction's burden and put the jurisdiction at risk of enforcement. The City has therefore recommended several times throughout the SB 54 regulatory process that this requirement be removed, to better align with the exemption process for other regulated entities.

As the City has previously stated, this process also relies on channels of communication outside the scope of local jurisdiction requirements and requires jurisdictions to not only engage with the PRO, but also all independent producers. It will be difficult for local jurisdictions to know all of the independent producers, and their contacts and

communication channels. If there are numerous independent producers, a local jurisdiction could be inundated with comments, for which they are required to respond to each individual comment. It would align more closely with public practices for local jurisdictions to submit their exemption application to CalRecycle. CalRecycle can then make the application publicly available to the PRO or independent producers, and follow-up questions could be directed to the jurisdiction as needed.

i. Recommendation: Remove Section 18980.11.1(d) and Section 18980.11.1 (c)(5) from the proposed regulations. This would remove the substantial administrative burden on local jurisdictions that this section currently creates.

Response to O-13-21

Comment rejected. The commenter asserts that the process for local jurisdictions receiving exemptions is not "align[ed] with the spirit of SB 54 to shift the burden from local jurisdictions to producers." The commenter ignores that SB 54 unambiguously, expressly places one significant burden on local jurisdictions and recycling service providers: They must comply with PRC section 42060.5(a) by including certain covered material categories in their recycling programs. Assuming, as the commenter impliedly does, that the exemption process should impose as little burden as possible is not aligned with the spirit of section 42060.5(a). Moreover, the commenter compares the process for exemptions from section 42060.5(a) to the process for exemptions for covered materials, noting that the latter does not require the same "consultation and approval from regulated entities." That comparison is erroneous because exemptions for covered materials do not affect local jurisdictions in the same manner as exemptions under section 42060.5(b) affect the PRO. Exemptions for covered materials do not affect whether local jurisdictions are required to include covered material categories in their recycling programs. In contrast, exempting jurisdictions from section 42060.5(a) means certain covered material categories will not be collected, in turn affecting producers' (through the PRO and otherwise) achievement of the policy goals and requirements established in PRC section 42050. In contemplation of that difference, statute expressly accounts for objections by the PRO in PRC section 42060.5(b); it does not do so with respect to any other exemption. Therefore, no further changes to the proposed regulations are necessary to the implementation or enforcement of the Act.

Comment O-13-22

4. Article 13: Enforcement

The City greatly appreciates the language that has been included in Section 18980.11(c) to preclude enforcement on local jurisdictions when CalRecycle is reviewing a pending exemption. The City also appreciates that the new version of the proposed regulations include language in Section 1890.11.1(a) to explicitly state that local jurisdictions are allowed to apply for extensions and exemptions to comply with collection requirements after local jurisdictions have been found to be in non-compliance with this requirement. However, the City remains highly concerned about the discrepancy between SB 54's intention as an Extended Producer Responsibility law

and the draft regulations' inclusion of local jurisdictions as entities that can incur fines of up to $50,000 per day per violation for non-compliance.

i. Recommendation: The City recommends that CalRecycle consider a penalty structure that is more equitable and aligned with the goals of SB 54. The described penalty amount would not have the same impact on multi-national companies as it would for local jurisdictions, the latter being excessively burdened with the high cost. This approach does not align with the intent of SB 54 to shift the burden of costs to producers. The City recommends that CalRecycle add language specifying that CalRecycle shall consider in its penalty determination whether the jurisdiction or its designees have received adequate support and funding by the PRO to accomplish the requirements of the Chapter and shall provide local jurisdictions the opportunity to provide information to demonstrating as such. Additionally, the City recommends that CalRecycle include clarifying language that in CalRecycle's determination of penalties, CalRecycle may assess lower penalties for public entities, or include specific penalty ranges for jurisdictions. Furthermore, local jurisdictions are already subject to enforcement under existing law such as AB 939 and SB 1383. The City recommends that CalRecycle rely on existing enforcement mechanisms for local jurisdictions, rather than introducing a new and conflicting process that could lead to supplicative violations being assessed.

Response to O-13-22

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements set forth in the Act, including in sections 42060, 42060.5, and 42081 of the Public Resources Code, and the recommended change to specify that local jurisdictions are not subject to enforcement prior to being provided the funding required to implement their programs is not necessary to the implementation or enforcement of the Act. While section 18980.8(g) of the proposed regulations clarifies the type and scope of costs incurred by local jurisdictions due to requirements of the Act that a PRO or Independent Producer is required to pay, nothing in the Act provides that a local jurisdiction's compliance obligation under the Act is conditioned on the local jurisdiction having received adequate support and payment from a PRO.

Additionally, section 42081(a)(1) provides that CalRecycle may issue a notice of violation to, and impose an administrative civil penalty not to exceed fifty thousand dollars ($50,000) per day per violation on, any entity not in compliance with the Act or any of the regulations adopted to implement the Act. Section 18980.13.2(a) of the proposed regulations implements this statutory provision by specifying that any entity, including a local jurisdiction, not in compliance with the Act is subject to penalties pursuant to section 42081(a). However, section 18980.13.2(c) further clarifies that penalty determinations will be made by the CalRecycle director or the director's designee based on evidence presented in hearings conducted pursuant to section 18980.13.4 addressing, at a minimum, the factual factors identified in section 42081(c). Therefore, while section 18980.13.2(a) preserves flexibility for CalRecycle to assess penalties of up to

$50,000 per day per violation against a noncompliant local jurisdiction consistent with statutory authority, that is a maximum amount and CalRecycle will always make its penalty determinations based on the factual factors and evidence identified in section 18980.13.2(c). The penalties assessed against a noncompliant local jurisdiction will necessarily often be far less than the maximum amount of $50,000 per day per violation that is allowed under section 42081(a)(1). No further changes to the proposed regulations are necessary to the implementation or enforcement of the Act.

Comment O-13-23

5. Section 18980.8(h): Dispute Resolution Process

The City continues to be opposed to Section 18980.8(h)(4)(E), which states, "Unless the parties agree otherwise, arbitration and mediation fees shall be apportioned equally among the parties. Each party shall be responsible for their own attorney's fees." This language creates a strong inequity in which parties can afford to engage in arbitration if needed. The resources that local jurisdictions have to participate in an arbitration process are not comparable to the resources that the PRO or Independent Producers have to engage in the same process. As currently written, many local jurisdictions will be functionally unable to enter into a dispute resolution process, thereby making this process unavailable should they strongly disagree with a PRO's decision on covered costs.

Additionally, it would be helpful to clarify the circumstances under which a local recycling service provider would initiate the dispute resolution process, instead of a local jurisdiction—as well as the role of recycling service providers when jurisdictions initiate the dispute, if any (and vice versa).

i. Recommendation: Delete Section 18980.8(h)(4)(E) and amend Section 18980.8(4) to specify that the costs of local jurisdictions to participate in a dispute process, including potential arbitration costs, must be reimbursed by the PRO, independent of the final results of the dispute. This would ensure that the cost of arbitration processes is not borne by ratepayers or taxpayers.

ii. Recommendation: Amend Section 18980.8(h) to require documentation of the results of dispute processes and outcomes between the PRO and local jurisdictions or recycling service providers and state that CalRecycle will make this information publicly available. This aligns with the transparency goals of SB 54 and will help ensure that negotiations are being handled more consistently, efficiently, and equitably across jurisdictions.

Response to O-13-23

CalRecycle rejects this comment. Regarding the first recommendation, section 18980.8(h)(4)(E) ensures that local jurisdictions and recycling service providers can never be burdened with paying more than half of the arbitration fees. Because the PRO and Independent Producers can only achieve the

requirements of statute if local jurisdictions and recycling service providers undertake the necessary steps to improve collection and other infrastructure to achieve the requirements of PRC section 42050, there is adequate incentive for them to ensure that binding arbitration results in those necessary steps being taken. Furthermore, given that incentive, there is corresponding incentive for the PRO to agree to a different fee split for binding dispute resolution that the parties mutually consider appropriate; the parties would be free to agree, for example, that the PRO will reimburse all dispute resolution fees, provided that the local jurisdiction or recycling service provider take certain actions, along with the other reimbursed costs. Taken together, these mechanisms disincentivize unreasonable cost disputes, minimize the need to engage in dispute resolution processes to begin with, and protect against the commenter's concerns. While, as a general matter, the investments and costs incurred pursuant to SB 54 are to be covered by the PRO, disputes over what those costs are cannot reasonably be characterized as those costs themselves. Without clear instruction from the Legislature to insulate a party from the costs of resolving disputes, CalRecycle cannot interpret statute as authorizing it to shift all such costs on to the PRO. See, also, CalRecycle's responses to comments O-15-6 and O-63-10.

Regarding initiation of dispute resolution processes, no change is necessary. The statute and proposed regulations are unambiguous with respect to when either a local jurisdiction or recycling service provider may initiate the dispute resolution process: When there is a dispute over "determining and paying the reasonable posts pursuant to [PRC section 42051.1(g)(1)] that arise between the PRO and a local jurisdiction or a recycling service provider." PRC section 42051.1(g)(2). Neither that statutory text nor section 18980.8(h)(1) limit who may be a party to such disputes. The only requirement is that there be a dispute, as described in that provision, between the party initiating the process and the PRO or Independent Producer.

Regarding the recommendation of "documentation of the results of dispute processes and outcomes," CalRecycle declines to make such a change. Arbitration outcomes will necessarily be documented because section 1283.4 of the Code of Civil Procedure requires arbitration awards to be in writing. However, requiring the written decision itself to be made public is unnecessary. Nothing in the proposed regulations restricts the rights of parties to a dispute from distributing a written arbitration decision or disclosing the decision's substance. Moreover, records in local jurisdictions' possession concerning expenditures, revenues, and other financial matters are, as a legal matter, already subject to mandatory disclosure, and audit provisions of the statute guarantee transparency concerning payments by the PRO. Public Resource Code section 42064 requires annual independent audits of the PRO. The PRO must provide those audits to CalRecycle with annual reports, and CalRecycle must publish the audits, subject only to limitations concerning trade secrets. Similarly, CalRecycle has the authority to audit the PRO, which may encompass payments made to local jurisdictions and recycling service providers. CalRecycle is required to publish

those audits, subject only to limitations protecting trade secrets. See Public Resources Code section 42080(a) through (e).

Comment O-13-24

6. Section 18980.6.7: Eco-modulated Fee and Fee Schedule

The City appreciates the clear language included in subsection (a)(1) that initial fees charged to producers include "Estimated costs of implementing the plan, including the costs to cover the environmental mitigation requirements of section 42064 of the Public Resources Code." The City believes that local jurisdictions' and recycling service providers' covered costs should also be explicitly included in this section, to ensure that the PRO Plan must address these covered costs when creating an initial fee structure and make it clear that these covered costs are a key part of implementing the PRO Plan.

Recommendation: Amend Section 18980.6.7 as follows: "Estimated costs of implementing the plan, including the costs to cover the environmental mitigation requirements of section 42064 of the Public Resources Code and local jurisdictions' and recycling service providers' covered costs, as specified in PRC Sections 42051.1 and 42053(d)(1)."

Response to O-13-24

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including PRC sections 42051.1, 42053, and 42060, and no change is necessary to the implementation of the Act. The recommended change is not necessary because local jurisdictions' and recycling service providers' covered costs clearly and indisputably fall within the meaning of the PRO's costs of implementing the plan, as that term is used in PRC section 42053(b) and section 18980.6.7(a) of the proposed regulations. That such covered costs fall within the scope of section 18980.6.7(a)(1) is further supported by the inclusion of such costs in PRC section 42051.1(j)(1)(B). Because there is no question as to whether such costs are required to be included and reflected in the PRO's initial fee structure, no change is necessary.

O-14: Deborah K Gregory (Deborah Gregory)

Comment O-14-1

Speaking as the President and on behalf of Ballona Creek Renaissance, a 25 year old non-profit that "Cleans, Greens, Educates, Advocates, and Beautifies the watershed area of the Ballona Creek", I am writing today to express my support of **SB54** in its' original format. In the past 15 years we have offered inland and Creekside cleanup events for up to 450 volunteers that have diverted up to 3 tons of plastic pollution annually. In Culver City, we have successfully banned the distribution of polystyrene and other single use plastic materials from entering our waste stream. When plastic

bags were banned in Los Angeles in 2014, we immediately saw a reduction of plastic bags during our events on the creek!

Chemical recycling is creating new problems with air quality and water quality, to name one major problem with the proposed weakening of SB54.

I have considered the Plastic Pollution Pandemic from many perspectives and have come to the simple conclusion that what we put out into our earth, air, and water always comes back to haunt us. Let's not kick this plastic pollution down the road any longer. Creating systems of elimination is of paramount importance. We are at the tipping point; businesses can no longer profit off of the loss of humans' quality of life.

Thank you,
Deborah Gregory

Response to O-14-1

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process. Regarding "chemical recycling," the comment neither identifies any particular process ("chemical recycling" is a generic term) nor suggests alternative approaches for CalRecycle to consider.

O-15: Marin County Hazardous and Solid Waste Management Joint Powers Authority (Kimberly Scheibly)

Comment O-15-1

This letter is in response to the proposed regulatory text to implement SB 54 the Plastic Pollution Prevention and Packaging Producer Responsibility Act (2022) published on August 19, 2025. I am writing on behalf of the Marin County Hazardous and Solid Waste Management Joint Powers Authority (Zero Waste Marin), a regional governmental agency that represents the 11 Cities and Towns and Unincorporated County of Marin. Our mission is to protect natural resources by promoting source reduction of waste through reuse, repair, and more mindful purchasing. We appreciate the opportunity to provide feedback to CalRecycle on the current draft regulatory text for the implementation of SB 54.
We understand that the proposed regulatory text for SB 54 implementation went unsigned in the 2024-2025 process, and that many changes have been made based on the comments CalRecycle received from the Governor's Office, the Legislature, and members of the public. However, despite the additional revisions, Zero Waste Marin still has concerns over the sections outlined below.

Zero Waste Marin would like to reiterate the intent of the Legislature codified in Statute by section 42040 of the Public Resources Code, specifically related to local jurisdictions. We urge CalRecycle uphold this section as Staff consider Zero Waste Marin's comments.

42040(b)(2)
(A) Local jurisdictions are the backbone of the solid waste management and recycling efforts in California. The new statewide comprehensive circular economy framework established by this chapter is **intended to shift the burden of costs to collect, process, and recycle materials from the local jurisdictions to the producers of covered material.**
(B) It is the intent of the Legislature in enacting this chapter to ensure that local jurisdictions will be made financially whole for any new costs incurred associated with the implementation of this chapter and its implementing regulations.

Response to O-15-1

CalRecycle rejects this comment. This portion of the commenter's submission does not recommend changes to any specific provision of the proposed regulations or raise an objection related to the rulemaking process. As such, no response is required. To the extent other portions of the submission address the proposed regulations or the rulemaking process directly, CalRecycle has responded to those portions separately.

Comment O-15-2

Section 18980.2.(a) Categorically Excluded Materials, pages 19-22
(a) (2) In accordance with paragraphs (1) and (2) of subdivision (b) and with subdivision (d) of section 42060 of the Public Resources Code, packaging or packaging components used by a food or agricultural commodity (without regard to its origin) if it is not reasonably possible to use other packaging or packaging components to comply with regulations, rules, or guidelines issued by the United States Department of Agriculture or the United States Food and Drug Administration.
a. Zero Waste Marin urges CalRecycle to provide additional clarity to "if it is not reasonably possible". We believe that this further clarification will provide definitive positions on the inclusion or exclusion of packaging products for producers, the PRO, local jurisdictions, recycling service providers, and the public. The current breadth of exclusions as 18980.2.(a) is written now has the potential to nullify the intent of SB 54, and local jurisdictions must prepare for the anticipated costs based on which products are included or excluded.

Response to O-15-2

Comment accepted. As described in response to comment I-19-1, CalRecycle has revised 18980.2(a)(2) to clarify what it means to show that it is "not reasonably possible" to use alternative packaging that avoids conflicts with federal law and to ensure that packaging is only excluded from the definition of "covered material" when that showing has been made. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

Comment O-15-3

(a) (6) Packaging for medical products. "Medical products" means products that are "drugs," as defined pursuant to paragraph (5), that do not require a prescription and satisfy at least one of the following criteria.
a. Per Senator Allen's office, the addition of over-the-counter (OTC) drugs into the categorically excluded materials list is a direct conflict with statute and the legislature's intent. Additionally, the final draft regulations of the 2024-2025 SB 54 regulatory process removed OTC drugs from being categorically excluded. PRC Section 42041 specifically only categorically excludes prescription drugs, and Zero Waste Marin would like to see that OTC drugs are removed from the excluded categories and included in the final SB 54 regulations. This packaging type is already well-suited for source reduction, packaging material changes, and reuse and refill, with multiple companies piloting alternatives.

Response to O-15-3

CalRecycle rejects this comment for the reasons provided in responses to comment O-49-1

Comment O-15-4

Section 18980.3.2.(f) Methodology for Recycling Rate Determination, page 60

• For a new covered material category created after 2024 for which insufficient information exists to calculate the recycling rate, the recycling rate shall be marked as "'pending"' and assumed to achieve the required rate under subdivision (c) of section 42050 of the Public Resources Code, as may be adjusted pursuant to section 42062 of the Public Resources Code.
o PRC 42040 reminds us that local jurisdictions have been the backbone of solid waste management and recycling in California, which among many other challenges, has required adapting in real time at additional unforeseen costs related to handling the ever-increasing inundation of packaging materials on the market and in our collection and sorting streams. It is significantly more difficult, and in many cases not possible, for local jurisdictions, recycling service providers, and material processors to find recycling markets for materials with which we have little or no familiarity. Zero Waste Marin asks that CalRecycle assume that new covered material categories marked as pending shall be presumed to not achieve the required recycling rate under subdivision (c) of PRC 42050, especially further considering the requirements of subdivision (aa)(3) of PRC 42041 that states to be considered recycled, covered material shall be sent to a responsible end market.

Response to O-15-4

Comment rejected. The commenter appears to misunderstand when local jurisdictions' obligation under Public Resources Code section 42060.5(a) (to include covered materials in categories listed pursuant to 42061(c) (recyclable) and (d) (compostable) in their collection and recycling programs) applies. Whether a covered material category satisfies the recycling rate requirements of Public Resources Code section 42050(c) is irrelevant to that obligation.

Accordingly, assuming a recycling rate to be sufficient, as described section 18980.3.2(f) of the proposed regulations, does not implicate the concerns the commenter raises over local jurisdictions' and recycling service providers' ability to find recycling markets.

Comment O-15-5

Section 18980.4.2.(b) End Market Compliance Audits and Verification, page 77

• Relating to annual compliance audits of responsible end markets. A [Producer Responsibility Organization] PRO or Independent Producer shall include the findings of any compliance audits in the annual report pursuant to section 18980.9.1(c). The Department shall have full access to any compliance audit reports upon request.
o As prescribed in PRC 42060.5. local jurisdictions must include all covered materials in their collection and recycling programs. Furthermore, under subdivision (aa)(3) of PRC 42041, **to be considered recycled, covered material shall be sent to a responsible end market**. To ensure that local jurisdictions fully comply with the mandates listed above, Zero Waste Marin believes that local jurisdictions should also be granted full access to any compliance audit reports upon request.

Response to O-15-5

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in section 42060 of the Public Resources Code, and the recommendation is not necessary to the implementation or enforcement of the Act. Section 18980.4.2(b) of the proposed regulations already requires a PRO to include the findings of any compliance audit in its annual report and to further give CalRecycle full access to the compliance audit report upon request. This proposed language strikes an appropriate balance between reducing burdens to the PRO and responsible end market by limiting mandatory initial disclosures to the audit findings and providing CalRecycle with the authority to inspect and review the full compliance audit if necessary. The audit findings that must be included in annual reports under section 18980.4.2(b) will provide local jurisdictions with sufficient information to comply with applicable obligations under the Act, including under PRC section 42060.5. Furthermore, as specified in section 18980.14(a) of the proposed regulations, and subject to the limitations set forth in that section, local governments have the opportunity to request and receive applicable records from CalRecycle, including any compliance audit report within its possession, pursuant to the California Public Records Act (Government Code Section 7920.000 et seq.). Therefore, local jurisdictions already have the opportunity to request and receive any compliance audit report that CalRecycle has received pursuant to its authority under section 18980.4.2(b) of the proposed regulations. No change is necessary.

Comment O-15-6

Section 18980.8.(h)(4)(E) Producer Responsibility Plan, page 118

• In relation to the PRO plan containing a dispute resolution process concerning determinations of whether, and to what extent, costs incurred by local jurisdictions or Recycling Service Providers are covered costs; "Unless the parties agree otherwise,

arbitration and mediation fees shall be apportioned equally among the parties. Each party shall be responsible for their own attorney's fees".
o Although Zero Waste Marin seeks to resolve matters collaboratively and avoid arbitration with the PRO, we want to ensure that all local jurisdictions' costs are covered as prescribed in subdivision (b)(2) of PRC 42040. Zero Waste Marin recommends that CalRecycle revise the draft regulatory text to state that, 'If the arbitration panel determines that additional reasonable costs shall be covered by the PRO, the PRO shall also be responsible for covering the costs incurred by a local jurisdiction in connection with the arbitration process".

Response to O-15-6

CalRecycle rejects this comment. Section 18980.8(h)(4)(E) ensures that local jurisdictions and recycling service providers can never be burdened with paying more than half of the arbitration fees. Because the PRO and Independent Producers can only achieve the requirements of statute if local jurisdictions and recycling service providers undertake the necessary steps to improve collection and other infrastructure to achieve the requirements of PRC section 42050, there is adequate incentive for them to ensure that binding arbitration results in those necessary steps being taken. Furthermore, given that incentive, there is corresponding incentive for the PRO to agree to a different fee split for binding dispute resolution that the parties mutually consider appropriate; the parties would be free to agree, for example, that the PRO will reimburse all dispute resolution fees, provided that the local jurisdiction or recycling service provider take certain actions, along with the other reimbursed costs. Taken together, these mechanisms disincentivize unreasonable cost disputes, minimize the need to engage in dispute resolution processes to begin with, and protect against the commenter's concerns. While, as a general matter, the investments and costs incurred pursuant to SB 54 are to be covered by the PRO, disputes over what those costs are cannot logically be characterized as those costs themselves. Lastly, the proposed change would risk unfair or absurd results because even a nominal increase in the covered costs would result in the PRO being responsible for all arbitration costs.

Comment O-15-7

Section 18980.13.(i) Compliance Evaluation and Determination, pages 151-152

• Violations by a local jurisdiction.
o Zero Waste Marin was disappointed to see that the same level of enforcement and administrative fines applied to producers and the PRO would be applied to local jurisdictions: up to $50,000 per day, per violation. These amounts are up to 5x those of SB 1383 and are a direct conflict with the intent of the Legislature.
o Zero Waste Marin urges CalRecycle to revise subdivision (i) of Section 18980.13 of the draft regulations to clarify that local jurisdictions shall be subject to lower maximum fine amounts, consistent with legislative intent and similar statutory frameworks.

Response to O-15-7

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements set forth in the Act, including in sections 42060, 42060.5, and 42081 of the Public Resources Code, and the recommended change is not necessary to the implementation or enforcement of the Act. Section 42081(a)(1) provides that CalRecycle may issue a notice of violation to, and impose an administrative civil penalty not to exceed fifty thousand dollars ($50,000) per day per violation on, any entity not in compliance with the Act or any of the regulations adopted to implement the Act. Section 18980.13.2(a) of the proposed regulations implements this statutory provision by specifying that any entity, including a local jurisdiction, not in compliance with the Act is subject to penalties pursuant to section 42081(a). However, section 18980.13.2(c) further clarifies that penalty determinations will be made by the CalRecycle director or the director's designee based on evidence presented in hearings conducted pursuant to section 18980.13.4 addressing, at a minimum, the factual factors identified in section 42081(c). Therefore, while section 18980.13.2(a) preserves flexibility for CalRecycle to assess penalties of up to $50,000 per day per violation against a noncompliant local jurisdiction consistent with statutory authority, that is a maximum amount and CalRecycle will always make its penalty determinations based on the factual factors and evidence identified in section 18980.13.2(c). The penalties assessed against a noncompliant local jurisdiction will necessarily often be far less than the maximum amount of $50,000 per day per violation that is allowed under section 42081(a)(1). No further changes to the proposed regulations are necessary to the implementation or enforcement of the Act.

Comment O-15-8

Zero Waste Marin thanks CalRecycle for providing the opportunity to collaboratively develop regulations that ensure the intent of the Legislature is reflected in the final text. We welcome any additional questions from CalRecycle or further conversations related to our comments. Thank you.

Response to O-15-8

Comment rejected. No response specific to the commenter's submission is necessary. This closing paragraph summarizes the commenter's recommendations, to which CalRecycle has responded separately.

O-16: City of Watsonville Solid Waste Division (Tami Stolzenthaler)

Comment O-16-1

To Whom it May Concern: Santa Cruz County Integrated Waste Management Local Task Force Member agencies have reviewed the draft regulations, focusing especially on Article 3 regarding Evaluations of Covered Material and Covered Materials Categories and Article 11 regarding the Requirements, Exemptions, and Extensions for

Local Jurisdictions and Recycling Service Providers. While we worked together to prepare these comments, our member agencies will approve and submit their comments individually, given the challenges to submit as a commission within the 45-day comment period.

Response to O-16-1

Comment rejected. No response to this portion of the commenter's submission is necessary because the issues raised in it have been addressed in response to other portions of the submission discussing the same issues.

Comment O-16-2

Article 3: Evaluations of Covered Material and Covered Material Categories

Our general comments on Article 3 are that the regulations defining recyclable and compostable materials should also consider the environmental impacts of where and how the materials can be recycled and/or composted. If the goal of SB 54 is to create a circular economy, it should also be to create that economy in California. Recycling and composting should happen close to home to reduce greenhouse gas emissions from transporting materials to distant lands. The impacts of reprocessing covered materials should also be considered to make sure that reprocessing methods are safe for surrounding communities, the materials are safe for their use in the marketplace, and covered materials are used for new products that reduce waste. Our specific comments and recommendations are outlined below:

Response to O-16-2

Comment rejected. No response to this introductory portion of the commenter's submission is necessary because it is an overview of the issues raised in later portions. This portion states the commenter's broad concerns only and does not set forth proposed changes to the regulatory text for CalRecycle to consider. CalRecycle has responded to the subsequent, more specific portions of the submission separately.

Comment O-16-3

Section 18980.3.1(c) effectively limits the types of relevant information and evidence that the public may present in comments by restricting the information that CalRecycle will consider when determining recyclability. We recommend the following revision to broaden CalRecycle's public outreach responsibilities when considering the recyclability of covered materials.

Recommended Change to CalRecycle's Proposed Regulation:

(c) If the Department preliminarily identifies a covered material category pursuant to subdivision (b), it shall publish the basis for its determination on its website. The Department shall provide an opportunity for public engagement and allow public comment and submission of relevant information and evidence. The Department shall

consider comments and submissions only to the extent that they address the following with respect to the covered material category:

(1) The likelihood that the covered material category will satisfy the requirements of paragraph (2) of subdivision (d) of section 42355.51 of the Public Resources Code before the next mandatory update to the material characterization study.

(2) The extent to which statewide recycling programs and alternative collection programs, such as take-back systems, as a whole have contributed to the increases in statewide collection and sorting recognized by the Department. For purposes of this section, “statewide recycling programs” refers to the aggregate of all recycling programs throughout the state administered by local jurisdictions or recycling or composting service providers under contract by a local jurisdiction.

(3) How designation of the covered material category as recyclable on the list maintained pursuant to subdivisions (c) and (e) of sections 42061 of the Public Resources Code is necessary to avoid disruption of ongoing increases in collection, sorting, and development of responsible end markets.

(4) For assertions that such disruption would be caused by the inability to lawfully label particular covered material as “recyclable” or with the chasing arrows symbol, submissions must address, in addition to the factors identified in paragraphs (1) through (3):

(A) How, and to what extent, absence of the covered material category from the recyclable covered material category list inhibits particular covered materials from being considered recyclable pursuant to paragraphs of subdivision (d) of section 42355.51 of the Public Resources Code other than paragraph (2), such as paragraph (4), (5), or (6).

(B) How labeling the covered material as “recyclable” or with the chasing arrows symbol affects consumer behavior, including with respect to disposal for collection by local recycling programs, in a way that will affect whether collection, sorting, and development of responsible end markets will increase.

(C) How, if at all, use of the term “recyclable” or the chasing arrows symbol on labels otherwise will affect collection and sorting operations of recycling programs and development of responsible end markets.

(D) How, if at all, the ability to label items as “recyclable” or with the chasing arrows symbol affects existing alternative collection programs, such as takeback systems, or will affect anticipated alternative collection programs.

(5) Any other relevant recycling information related to the covered material category, including but not limited to its environmental impact, greenhouse gas footprint, product safety, or reuse potential within the state of California.

Response to O-16-3

Comment rejected. Section 18980.3.1(c) of the proposed regulations covers all elements of Public Resources Code section 42061(a)(3)(B), listing the topics that are relevant to each of those elements. Relevance is dictated by statute, and, because the proposed regulation addresses all the elements of 42061(a)(3)(B), no other information can logically be relevant. Notably, the additional topics proposed by the commenter—environmental impact, greenhouse gas footprint, product safety, and reuse potential—have any potential relevance to the considerations permitted under section 42061(a)(3)(B) except to the extent they overlap with the topics listed in 18980.3.1(c).

Comment O-16-4

Article 11: Requirements, Exemptions, and Extensions for Local Jurisdictions and Recycling Service Providers

Our general comments on Article 11 are that the proposed regulations place unusual hardships on local jurisdictions regarding the short compliance timeframes and annual update requirements outlined in the proposed regulations. Local agencies spend considerable resources on outreach materials to educate the public about recycling and organics acceptance policies. Frequent change to those policies creates confusion and is frustrating for the public. Regular periodic change is a more effective implementation strategy to obtain compliance and is a better use of scarce local government resources. Our specific comments and recommendations are outlined below:

Response to O-16-4

CalRecycle rejects this comment as explained in response to comment O-16-5, which is a continuation of this comment and includes the change the commenter recommends.

Comment O-16-5

Section 18980.11(a) requires local agencies to change their recycling and organics collection policies on the same day that CalRecycle approves the PRO's plan.

Recommended Change to CalRecycle's Proposed Regulation:
(a) ~~No later than~~ Within two years of the date the Department first approves a PRO's plan, local jurisdictions and recycling service providers shall satisfy the requirement of subdivision (a) of section 42060.5 of the Public Resources Code that their collection and recycling programs include all covered materials within the covered material categories included in the CMC list pursuant to subdivisions (c) and (d) of section 42061 of the Public Resources Code. For all purposes under the Act, the term "recycling programs" encompasses composting-related collection and processing.

Response to O-16-5

CalRecycle rejects this comment. There is no indication in statute that the Legislature intended for the requirement that local jurisdictions include certain

covered material categories in their recycling programs not to take effect until two years after the date the Department first approves a PRO's plan. That timeline would be incongruous, given that recycling rates requirements must be satisfied by January 1, 2028, and that statute required CalRecycle to publish the covered material categories list far in advance of that date. Moreover, the commenter's concerns are adequately addressed by PRC section 42060.5(b), under which a jurisdiction is entitled to an exemption if it cannot practicably comply with 42060.5(a).

Comment O-16-6

Section 18980.11(c) requires local agencies to change their recycling and organics collection policies within one year after a change to the CMC list. Frequent policy change is frustrating for the public and leads to waste sorting non-compliance. Local agencies recommend periodic change that is predictable for local agencies and the public.

Recommended Change to CalRecycle's Proposed Regulation:

(c) As provided in subdivision (g) of section 18980.2.5, ~~a~~ changes to the CMC list pursuant to subdivision (e) of 42061 of the Public Resources Code that impose~~s~~ additional obligations on local jurisdictions or recycling service providers does not affect the obligations of local jurisdictions or recycling service providers under subdivision (a) of section 42060.5 of the Public Resources Code until those changes are compiled and released by the Department on a five year cycle to be implemented one year after the compiled list is released by the Department~~hange~~. If a local jurisdiction or recycling service provider submits a request to the Department for an extension or exemption pursuant to subdivision (b) of section 42060.5 of the Public Resources Code before the end of that one-year period, the requirement of subdivision (a) of section 42060.5 of the Public Resources Code shall not take effect with respect to the additional obligations until the Department decides whether to grant or deny the request.

Response to O-16-6

CalRecycle rejects this comment. A period of one year balances the need to implement the Act, as a standard period longer than one year would delay the positive results expected from the change and would often exceed the period local jurisdictions reasonably require for updating their recycling programs, while a shorter period might be impracticable for a local jurisdiction or recycling service provider. Further, the ability to request an extension allows for added flexibility as CalRecycle may identify an effective date later than the publication date in cases where it anticipates those affected by the change may need a longer period to implement the update successfully.

Comment O-16-7

Section 18980.11.1(b) provides for an exemption or extension period of up to two years, however **Section 18980.11.1(g)** allows CalRecycle to repeal and exemption or extension upon its determination that conditions have changed with no time specified

when the change will take effect. We recommend that all exemptions or extensions be for a minimum of five years and that no change take effect sooner than the expiration of the time remaining on the exemption or extension already granted or for an additional six months from the date notice is given, whichever is longer.

Recommended Change to CalRecycle's Proposed Regulation:

Section 18980.11.1(b) For purposes of this section, "exemption" also refers to an "extension." An extension differs from an exemption only in that an exemption becomes effective upon approval and exempts the applicant from the requirement for ~~two~~ five years, whereas an extension may be granted before the requirement has taken effect and results in delaying the requirement's applicability for ~~two~~ five years beyond when it otherwise would have taken effect.

Section 18980.11.1(g) The Department shall repeal the extension or exemption if it determines that conditions, circumstances, or challenges no longer render compliance impracticable as described in the application. Repeal of the extension or exemption will take effect on the end date of the extension or exemption or six months after notice from the Department to the local agency, whichever term is longer.

Response to O-16-7

Comment rejected. Regarding the proposed change in section 18980.11.1(b), the proposed regulations cannot implement that change because increasing the exemption period to five years would directly conflict with the statutory provision establishing the exemption. The relevant provision is in PRC section 42060.5(b), which states that the exemption must be reviewed every two years and may only be renewed after that two-year review.

Regarding the proposed change in section 18980.11.1(g), CalRecycle declines to make that change because it would subvert the purpose of Public Resources Code section 42060.5(a); an exemption that is no longer justified by impracticability no longer has any statutory basis to exist, and the statute does not prohibit CalRecycle from repealing an exemption when the conditions underlying CalRecycle's approval of it no longer exists. The statute only requires that CalRecycle not renew exemptions unless it reviews them within two years. Moreover, if the exemption could not be cut short when that justification no longer exists, local jurisdictions and recycling service providers would not have incentive not to resolve that impracticability. Lastly, under the proposed change, extensions would last two years even if it were clear that, upon submission of the application, the justification for the exemption could not reasonably be expected to persist that long. At the extreme, CalRecycle would be statutorily required to approve a two-year extension based on a condition known to expire almost instantly after such approval. Consistent with longstanding statutory interpretation principles, CalRecycle declines to interpret statute to permit such an absurd result.

Comment O-16-8

Section 18980.11.1(c)(4) requires local agencies to submit an extraordinary amount of detailed information in an application to request a two-year extension or exemption for CalRecycle to delay local implementation of changes to the local jurisdictions acceptance policies under the proposed one-year collection policies outlined in sections 18980.11(a) and (c). We recommend a more flexible application process that allows the local agency to include relevant information in its application without CalRecycle automatically disqualifying applications that fail to meet one or more currently "required" application elements.

Recommended Change to CalRecycle's Proposed Regulation:

(c)(4) A description, with supporting documentation, of the specific local conditions, circumstances, and challenges that make it impracticable for the local jurisdiction or recycling service provider to include the specified covered material or covered material categories in their collection and recycling programs. The description must demonstrate that the identified material cannot practicably be included in the collection and recycling programs. The description ~~must also address, at a minimum, the necessity of~~ should address the need for the exemption with respect to the following considerations as they apply to the local jurisdiction's collection program: program efficacy; technological or economic limitations; legal restrictions or requirements; effects on the environment, environmental justice, worker health and safety; public health; hazardous waste generation; ~~and~~ transportation safety; absence of responsible end markets; funding constraints analysis; and other relevant local waste management program considerations.

Response to O-16-8

Comment rejected. The suggested changes would result in no change in the proposed regulation's meaning. Under any reasonable reading, the proposed text only requires applications to discuss in detail the factors listed in 18980.11.1(c)(4) to the extent they apply to the local jurisdiction's collection program. The proposed text is preferable to the commenter's proposed text because it requires applicants to state affirmatively whether each item supports the alleged necessity of the exemption. Regarding the additional items the commenter proposes for the end of (c)(4), CalRecycle declines to add them because they would be redundant with the text already in (c)(4), as read in combination with section 18980.11 regarding availability of responsible end markets.

Comment O-16-9

Section 18980.11.1(d) requires local agencies to submit their extension or exemption applications to the PRO and to CalRecycle for review, comment, and determination. While we do not object to this submission requirement, we recommend that all applications and other communications related to an application be made at a single location, that all interested parties have access to the information in real time, and that review periods run concurrently. This will make the application and review process run

more smoothly for local jurisdictions, the PRO, Independent Producers, and CalRecycle.

Recommended Change to CalRecycle's Proposed Regulation:

(d) ~~No e~~Exemption applications and ~~or~~ renewal requests shall be submitted to the Department, the PRO, and Independent Producers at a single application portal specified by the Department. ~~until after the local jurisdiction or recycling service provider has provided all PROs and Independent Producers the application or advance notice of the renewal request.~~ All PROs and Independent Producers shall have 90 days to review an application, and 30 days to review a notice of a renewal request. During the review period:

(1) Each PRO and Independent Producer may submit comments to the applicant through the application portal specified by the Department concerning the assertion that collection is impracticable and the relevant conditions, circumstances, and challenges.

(2) Each PRO and Independent Producer shall notify the applicant in writing through the application portal specified by the Department whether they object to the exemption or extension sought. If a PRO or Independent Producer provides no such notice, they will be deemed not to object.

(3) Using the application portal specified by the Department, ~~T~~the parties may agree to extend the 90- or 30-day period or come to an agreement concerning the collection and recycling or composting of the covered materials or covered material categories at issue.

(4) The Department will have access to all communications between the PRO or Independent Producer and the applicant contained within the application portal and may incorporate those communications into its evaluation of the application or renewal request.

Response to O-16-9

Comment partially accepted and partially rejected. CalRecycle accepts the recommendation to require that applications be submitted via an online portal. Section 18980.11.1(c) and (h)(2)(C) have been revised accordingly. CalRecycle has not adopted the specific text the commenter proposes for subdivision (d), however, because that text would fail to account for the possibility that such a portal may not yet be operational, in which case email submissions must be permitted. CalRecycle also declines to require the use of a portal for comment submissions and communications between the PRO (or Independent Producer) and the applicant, with CalRecycle having access to all such communications. Establishing such a system would add significant technical complexity, might conflict with recordkeeping practices and requirements of the involved parties, would be unnecessarily intrusive, and would likely encompass communications that are not relevant to CalRecycle's evaluation of applications. Allowing "all

interested parties to have access to the information in real time" would also greatly increase the technical requirements of an online portal, and the benefit of such access is unclear, considering the process set forth in section 18980.11.1 does not involve public comment, and the comments submitted to the applicant must be included with the application (and thus will become public records). Regarding the recommendation "that review periods run concurrently," CalRecycle cannot respond because it cannot discern what that recommendation means. If the commenter intended to suggest that CalRecycle should review the merits of an application at the same time the PRO and Independent Producers do so, CalRecycle rejects that suggestion because the applications are not final until the applicant considers the comments it receives from the PRO and Independent Producers.

O-17: The Story of Stuff Project (Alexandria Choy)

Comment O-17-1

My name is Alexandria Choy, I live in Southern California and am commenting on behalf of The Story of Stuff Project.

Plastic litters communities, poses threats to human health, is a major contributor to climate change, and disproportionately impacts vulnerable communities near plastic production and disposal facilities. Every year, an estimated 33 billion pounds of plastic end up in our oceans. And every year, California communities spend more than $428 million to deal with pollution from plastic and other waste.

The current regulations do not protect against chemical recycling. "Chemical recycling" and "advanced recycling" are mostly a new euphemism for an old and dirty practice: incineration. Plastics-to-fuel plants are not recycling, do not reduce demand for virgin plastics, and produce fossil fuels that are then burned, contributing to air pollution and global warming. It creates toxic pollutants that harm our environment and threaten public health. This is not a solution to the plastic waste crisis.

CalRecycle must strengthen the regulations by (1) dismissing chemical recycling as a covered recycling technology, as it is *not* real recycling, and (2) not allowing for broad exclusions of packaging (food and ag products and over-the-counter drugs).

California is at a pivotal moment in the global fight against plastic pollution. Let's rise to the opportunity, not waste it.

Response to O-17-1

Comment partially rejected and partially accepted. Regarding chemical recycling, CalRecycle rejects this comment for the reasons stated in response to comments I-6-1, I-28-1, and O-62-1. Regarding over-the-counter-drugs, CalRecycle rejects this comment for the reasons stated in response to comment O-49-1. CalRecycle accepts this comment, however, to the extent it asserts that

the exclusion for food and agricultural packaging, as set forth in section 18980.2.1(a)(2), might have been inappropriately broad in application. See CalRecycle's response to comment I-19-1 for explanation of the effects of the revisions made to that provision. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

O-18: Friends Committee on Legislation of California (Jim Lindburg)

Comment O-18-1

We appreciate that Gov. Newsom signed SB 54 into law. However, as Cal Recycle moves forward with implementation, we would like to emphasize two primary objections to the draft regulations that would fundamentally undermine the intent of the legislation. The proposed regulations include:

1) Broad exemptions for the packaging of over-the-counter drugs and packaging for food and agricultural commodities.

2) Weakened protections against chemical recycling.

According to CALPIRG, plastic sent to so-called chemical recycling facilities is almost always incinerated. It produces 96 dangerous air pollutants and is far worse for the environment than virgin plastic production. Moreover, the proposed packaging exemptions are not justified and will accelerate global plastic pollution.

California is a respected environmental leader. Despite industry objections, we have demonstrated repeatedly that we can have a strong economy and regulate harmful pollutants. How California implements SB 54 will undoubtedly influence how other states regulate plastic pollution.

Therefore, FCLCA urges Cal Recycle to strengthen the implementation of SB 54 by eliminating the proposed packaging exceptions and by utilizing real recycling technology as opposed to harmful chemical recycling.

Response to O-18-1

Comment partially rejected and partially accepted. Regarding chemical recycling, CalRecycle rejects this comment for the reasons stated in response to comments I-6-1, I-28-1, and O-62-1. Regarding over-the-counter-drugs, CalRecycle rejects this comment for the reasons stated in response to comment O-49-1. CalRecycle accepts this comment, however, to the extent it asserts that the exclusion for food and agricultural packaging, as set forth in section 18980.2.1(a)(2), might have been inappropriately broad in application. See CalRecycle's response to comment I-19-1 for explanation of the effects of the revisions made to that provision. See, also, CalRecycle's response to comment

B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

O-19: California Grocers Association (Daniel Conway)

Comment O-19-1

For more than 125 years, the California Grocers Association (CGA) has served as the voice of the state's grocery community. A nonprofit, statewide trade association, CGA's membership is comprised of over 300 retailers operating more than 6,000 brick-and-mortar stores, and approximately 150 grocery supply companies.

CalRecycle's Impact Statement identifies two primary categories of affected businesses: companies that qualify as producers of covered materials and are subject to direct regulation under this Act, and businesses that will experience indirect impacts through higher costs for goods and services resulting from the regulation (page 4). Depending on a business' relationship to a covered material when it is imported, sold, distributed or used in California, numerous CGA members are expected to be affected in both categories.

Grocery stores that are "producers" under this Act anticipated to be impacted under the following circumstances:

- When importing products from other states or countries for sale in California that are manufactured and packaged into covered materials, including primary packaging (e.g., paper boxes, plastic bags and containers) and transportation packaging (e.g., cardboard boxes, pallet wrap).
- When commercially selling, offering for sale, or distributing private label packaged products grown, processed, or manufactured in California and packaged in a covered material.

Grocery stores identified as "producers" under this Act anticipate costs related to the following:

- Packaging material sourcing to meet the recyclable/compostable material 2032 deadline and all associated packaging redesign costs.
- Ensuring that suppliers provide compliant packaging and making associated vendor contract modifications.
- Reporting total weight of covered materials and plastic components sold, distributed or imported in or into the state; total weight of material that is recycled and total weight of that disposed of.
- Fee payments to the Producer Responsibility Organization.

CalRecycle estimates the total estimated cost of switching packaging from one covered material (plastic) to another (recyclable plastics and other existing material categories, such as paper, metal, glass, and compostable packaging), would be $10.2 billion (Impact Statement, page 14). These costs applied to the grocery sector will directly increase costs for both grocers and customers.

The direct production costs CalRecycle estimates as they relate to California's retail trade sector (Impact Statement, page 21) are $1.4 billion. U.S. food prices rose by 23.6 percent from 2020 – 2024, with food prices in 2022 alone increasing faster than any year since 1979.1 This added cost to consumers will likely exacerbate the rising national food insecurity trends which the United States Department of Agriculture has documented to be 13.5 percent of all U.S. households, an increase from 10.5 percent in 2020.

The implementation of this rule will lead to numerous complex economic effects, and these costs are anticipated to reach many hundreds of millions of dollars, directly affecting both consumers and grocers. We value the opportunity to provide our perspective on how the Act will affect and influence California's grocery sector. Please contact us with any questions.

Response to O-19-1

Comment rejected. The comment is informational only; it explains how implementation of the statute will affect grocery stores and their customers. No response is required because the commenter suggests no changes to the proposed regulations or raises an objection related to the rulemaking process.

O-20: Consumer Healthcare Products Association (Carlos Gutierrez)

Comment O-20-1

The Consumer Healthcare Products Association1 respectfully submits these comments on CalRecycle's proposed permanent regulations implementing SB 54, the Plastic Pollution Prevention and Packaging Producer Responsibility Act.

While we commend CalRecycle for appropriately excluding nonprescription drugs from the scope of SB 54's requirements, we respectfully oppose the proposed limitation that would exclude nonprescription drugs that are also cosmetics, soaps, or contain sunscreen active ingredients from this exemption. We urge CalRecycle to expand the medical products exclusion to encompass ALL nonprescription drugs, consistent with federal law, legislative
intent, and national best practices.

Response to O-20-1

CalRecycle rejects this comment for the reasons stated in response to comment B-11-3.

Comment O-20-2

Legal Foundation for Comprehensive Drug Exemption

SB 54 explicitly exempts "medical products" from its scope, referencing Title 21 of the United States Code, sections 321(g) and 321(h). Under federal law, nonprescription drugs are unequivocally "medical products" as defined by the Federal Food, Drug, and Cosmetic Act, 21 U.S.C. Section 321(g). This federal definition provides a comprehensive framework for
drugs that makes no distinction between prescription and nonprescription medications.

The deliberate incorporation of this expansive federal terminology in SB 54 clearly signals legislative intent to extend the exemption beyond prescription drugs to include all pharmaceutical products. Had the legislature intended to limit the exemption solely to devices and prescription drugs, the inclusion of the broader phrase "medical product" would have been unnecessary. This statutory construction demonstrates that all over-the-counter medications were intended to be exempt alongside prescription medications.

FDA Principle: A Drug is a Drug

The Food and Drug Administration (FDA) maintains a fundamental principle that governs pharmaceutical regulation: a drug is a drug, regardless of its additional properties or classifications. This principle recognizes that products meeting the statutory definition of a drug under 21 U.S.C. Section 321(g) retain their essential character as pharmaceutical
products, even when they may also qualify as cosmetics or possess other characteristics. All FDA-regulated over-the-counter (OTC) drugs—identified by their required "Drug Facts" panel—are medical products under federal law, and the fact that some provide secondary benefits such as cosmetic, cleaning, or sunscreen properties does not alter their
fundamental status as OTC drugs.

The exclusion of nonprescription drugs from SB 54's requirements recognizes the unique packaging requirements necessary to maintain product integrity, safety, and efficacy for all pharmaceutical products. These packaging requirements serve critical public health functions that cannot be compromised by regulatory distinctions based on secondary product characteristics. OTC products must meet stringent FDA criteria for maintaining active ingredient levels and concentrations throughout their shelf life, whether in medications, mouthwashes, or toothpastes. The structural integrity required to prevent moisture and vapor transmission—essential for preserving active pharmaceutical

ingredients—cannot be achieved through traditional plastic reduction methods without compromising the products' regulatory compliance. Additionally, Consumer Product Safety Commission requirements for child-resistant closures under the Poison Prevention Packaging Act create further constraints that make meeting reduction targets untenable
for FDA-regulated OTC products while maintaining their essential safety and efficacy standards.

Concerns with Current Regulatory Interpretation

CalRecycle's Initial Statement of Reasons suggests that under the draft regulation, over-the-counter (OTC) drugs also regulated as cosmetics would not be exempt from SB 54's requirements. The examples provided include dandruff shampoo, antibacterial hand soap, and antiperspirant. This interpretation creates several significant concerns:
• **Regulatory Uncertainty:** This approach introduces ambiguity that could extend to numerous other nonprescription drug categories, including oral care products and various other over-the-counter medications.
• **Undermining Statutory Text:** This interpretation contradicts the clear language in SB 54 that was adopted to exclude all nonprescription drugs from the Act's scope.
• **Inconsistent Application:** Creating distinctions among different types of nonprescription drugs based on secondary characteristics undermines the uniform treatment that federal law provides to all pharmaceutical products.

National Consistency in EPR Legislation

The exclusion of all nonprescription drugs is consistent with the national trend in extended producer responsibility (EPR) packaging legislation. Since California's passage of SB 54, multiple states have recognized the importance of exempting all OTC drugs from EPR requirements:

States with Enacted EPR Legislation Include:

• **Colorado** - Exempts all drugs from scope
• **Washington** - Exempts all drugs from scope
• **Oregon** - Exempts all drugs from scope
• **Maryland** - Exempts all drugs from scope
• **Minnesota** - Exempts all drugs from scope

This consistent approach across jurisdictions reflects a shared understanding of the unique nature of pharmaceutical products and the importance of maintaining uniform regulatory treatment for all drugs.

Governor's Directive on Regulatory Impact

The current draft regulations must also address the concerns raised by Governor Newsom when he declined to adopt CalRecycle's initial draft regulations on March 7,

2025. The Governor's decision specifically cited concerns that the proposed rules would impose excessive costs on businesses and consumers. The current approach of excluding some over-the-counter medications while subjecting others to SB 54's requirements runs contrary to this directive. By creating artificial distinctions among nonprescription drugs, the regulation increases compliance complexity and costs without providing meaningful environmental benefits.

Public Health and Economic Considerations

Subjecting certain categories of nonprescription drugs to SB 54's requirements while exempting others could:
• **Increase Healthcare Costs**: Additional regulatory compliance costs for essential healthcare products may be passed on to consumers, making these products less accessible.
• **Create Supply Chain Disruptions**: Different regulatory requirements for similar products could complicate manufacturing and distribution processes.
• **Compromise Product Safety**: Packaging modifications required for regulatory compliance could potentially affect product integrity, safety, or efficacy.
• **Generate Consumer Confusion**: Different regulatory treatment of similar pharmaceutical products could create marketplace confusion.

Response to O-20-2

CalRecycle rejects this comment for the reasons stated in response to comment B-11-3. CalRecycle also notes that the commenter's claim that "nonprescription drugs are unequivocally "medical products" as defined by the Federal Food, Drug, and Cosmetic Act" is erroneous. That term is not defined or otherwise used in the law cited.

Comment O-20-3

Recommended Regulatory Modification
CHPA respectfully requests that CalRecycle modify the medical products exclusion in Article 2 to include ALL nonprescription drugs, regardless of any additional classifications they may carry as cosmetics, soaps, or products containing sunscreen active ingredients.

This modification would:
• Align California's regulations with federal pharmaceutical law
• Respect clear legislative intent demonstrated in SB 54
• Maintain consistency with national EPR legislation trends
• Address Governor Newsom's concerns about regulatory cost and complexity
• Preserve the integrity of pharmaceutical packaging requirements
• Ensure uniform treatment of all nonprescription drugs

Response to O-20-3

This comment is a continuation of comments O-20-1 and O-20-2 and is rejected along with those comments.

Comment O-20-4

Conclusion

We appreciate CalRecycle's recognition of the importance of excluding nonprescription drugs from SB 54's requirements, which demonstrates an understanding of the unique nature of pharmaceutical products. However, we remain deeply concerned that this exclusion does not extend to all over-the-counter drugs, particularly those that may also be classified as cosmetics, or contain sunscreen active ingredients.

The medical products exclusion should encompass all nonprescription drugs to ensure that essential healthcare products are not subject to requirements that could increase costs or create supply chain disruptions without meaningful environmental benefit. This comprehensive approach would respect federal law, honor clear legislative intent, maintain national consistency with other EPR programs, and serve the broader public interest by preserving access to affordable healthcare products.

We appreciate CalRecycle's consideration of these comments and stand ready to provide additional information or clarification as needed during the regulatory development process.

Response to O-20-4

This comment is a continuation of comments O-20-1 through O-20-3. and is rejected along with those comments.

O-21: North American Insulation Manufacturers Association (Curt rich)

Comment O-21-1

The North American Insulation Manufacturers Association (“NAIMA”) submits these comments on the California Department of Resources Recycling and Recovery’s (“CalRecycle”) proposed regulations under SB 54 (the Plastic Pollution Prevention and Packaging Producer Responsibility Act). NAIMA is the trade association representing North American manufacturers of fiber glass and rock and slag wool insulation. NAIMA promotes energy savings through building envelope energy efficiency. Three of the four fiber glass insulation manufacturers in the U.S. – CertainTeed (Chowchilla), Johns Manville (Willows), and Knauf (Shasta Lake) – manufacture in California to serve the California market.

The fiber glass and mineral wool insulation industry is committed to advancing waste reduction, recycling, and a circular economy objective. U.S. manufacturers of these products have established goals to reduce and recover plastic packaging. The products we manufacture also contain substantial recycled content. For example, the fiber glass

insulation industry is the second largest user of recycled glass cullet in California. Insulation also plays a critical role in California's ambitious greenhouse gas reduction goals. Insulation is the only building material whose core purpose is the reduction of building energy usage.

NAIMA requests that SB 54 implementation be tailored to recognize the unique characteristics of construction materials and avoid imposing additional costs to products that directly impact the cost of housing in the state with limited impact to the goals of SB 54. Specifically, NAIMA requests CalRecycle to **explicitly exclude**: (a) plastic packaging used to protect construction products (including insulation), and (b) wood pallets from the scope of SB 54. The justification for this request and recommended regulatory language follows.

Response to O-21-1

Comment rejected. The commenter requests that CalRecycle establish a specific exemption for plastic packaging used to protect construction products and wood pallets. However, CalRecycle does not have general authority to create exemptions not established by statute. In any event, the proposed regulations accommodate the commenter's concerns because any packaging not within a categorical exemption (e.g., for reusable packaging or for packaging of goods enumerated in Public Resources Code section 42041(e)(2)) might qualify for other exemptions based on public health, safety, and other special compliance challenges. See, e.g., PRC section 42060(a)(3) and (4), and section 18980.2.4 of the proposed regulations. Accordingly, the proposed regulations accommodate that commenter's concerns, and no change is necessary.

Comment O-21-2

EXCLUSION OF CONSTRUCTION MATERIAL PACKAGING

Construction materials require protective packaging to guarantee product performance. Insulation (and other construction materials) require packaging to preserve dimensional integrity, resist outside moisture, prevent contamination, and avoid damage during transport and on-site handling. Without such protection, thermal performance, fire resistance, and durability could be compromised, undermining product performance. Importantly, packaging used on fiber glass and mineral wool building products not only protects but also provides compression of the products during transport, thereby enabling the reduction of plastic packaging at the source, improving jobsite handling and saving energy usage associated with transportation and storage of the building products.

Packaging failures lead to waste, not reuse. Reducing packaging materials for insulation beyond functional requirements can result in compromised performance and packaging failures. Ifinsulation is damaged or degraded during shipment or storage, it effectively becomes waste. The environmental gains of recycling packaging are thus overshadowed by increased waste, rework, or premature replacement of the primary product.

Jobsite recovery and recycling limitations. Packaging for construction materials is typically removed at job sites where waste sorting, collection, and recycling infrastructure may not exist. Unlike consumer packaging, construction waste is handled within the construction waste stream and not through municipal collection systems. Imposing EPR obligations on packaging of construction materials would require building new logistics or carry steep administrative burdens with limited recovery gains.

Risk of product price increases. Imposing a fee on construction packaging could increase material costs for insulation and other building materials. Such added regulatory costs will have an impact on insulation pricing, which will have an impact on the cost of housing and the home energy efficiency retrofit market in California.

RECOMMENDATION ON REGULATORY TEXT
"Excluded from the scope of 'packaging' are plastic protective wrappings, films, liners, and covers used expressly to transport, protect, or store construction products (such as insulation, ceiling panels, drywall, roof shingles and sheathing), provided such packaging is removed at the construction site and is managed within the construction and demolition waste stream."

Response to O-21-2

Comment rejected. The commenter requests that CalRecycle establish a specific exemption for plastic packaging used to protect construction products. However, CalRecycle does not have general authority to create exemptions not established by statute. In any event, the proposed regulations accommodate the commenter's concerns because any packaging not within a categorical exemption (e.g., for reusable packaging or for packaging of goods enumerated in Public Resources Code section 42041(e)(2)) might qualify for other exemptions based on public health, safety, and other special compliance challenges. See, e.g., PRC section 42060(a)(3) and (4), and section 18980.2.4 of the proposed regulations. Accordingly, the proposed regulations accommodate that commenter's concerns, and no change is necessary.

Comment O-21-3

EXCLUSION OF WOOD PALLETS
Pallets are durable, reusable transport platforms. Wood pallets are designed for repetitive use across transportation cycles. They are not single-use packaging in the sense envisioned by SB 54. Many pallet users already employ internal reuse, rental, repair, and exchange systems. In the case of the insulation industry, manufacturers overwhelmingly use purchased wood pallets for the production transportation to distributors and retail sellers. Upon delivery, our customers take possession of the pallets, which are then reused or sold for reuse.

Wood pallets have exceptionally high recovery rates. Pallets are integral for delivery and transport for numerous businesses, not just the construction industry, resulting in an existing robust pallet reuse and repair industry. The pallet industry reports that wood pallets constitute over 90%of the pallet market and are recovered or recycled at

extremely high rates (often cited as around 95%). Imposing EPR costs or reporting obligations on pallet owners or manufacturers would inject administrative complexity and cost into supply chains – particularly in the construction and building materials sectors – without yielding meaningful improvements in recovery.

Existing efficient industry infrastructure. The pallet and container industry maintains robust systems for pallet repair, resale, reuse, and end-of-life recycling (e.g. grinding into mulch, animal bedding, or bioenergy feedstock). These systems are mature, decentralized, and cost-efficient.Because pallets are already well reutilized and recovered, including them under SB 54 would yield little additional diversion. The regulatory burden would largely duplicate existing industry practices, with negligible incremental benefit.

RECOMMENDATION ON REGULATORY TEXT

"Wood pallets (and their associated components) used for transport and stacking of goods are expressly excluded from the definition of 'packaging' for purposes of this regulation. This exclusion applies whether new, reused, repaired, or recycled."While SB 54 does not specifically call for the inclusion of wood pallets in the regulation, if CalRecycle is concerned about the rate of pallet recovery and reuse, the regulation can require monitoring or reporting consistent with SB 54 goals, without full inclusion. Alternatively, CalRecycle could specifically designate pallets as "reusable" materials excluded from the definition of covered materials under Section 18980.2.1.

Response to O-21-3

Comment rejected. The commenter requests that CalRecycle establish a specific exemption for wood pallets. However, CalRecycle does not have general authority to create exemptions not established by statute. In any event, the proposed regulations accommodate the commenter's concerns because any packaging not within a categorical exemption (e.g., for reusable packaging or for packaging of goods enumerated in Public Resources Code section 42041(e)(2)) might qualify for other exemptions based on public health, safety, and other special compliance challenges. See, e.g., PRC section 42060(a)(3) and (4), and section 18980.2.4 of the proposed regulations. Accordingly, the proposed regulations accommodate that commenter's concerns, and no change is necessary.

Comment O-21-4

SUMMARY OF RECOMMENDATIONS AND BENEFITS

Adopting these exclusions would allow SB 54 to focus on consumer-oriented, disposable packaging streams where EPR can deliver demonstrable environmental value. At the same time, it would preserve economic efficiency and avoid unintended negative impacts on California's construction industry.

NAIMA is ready to assist CalRecycle by providing further industry specific data that may help refine the SB 54 framework. Thank you for your consideration.

Response to O-21-4

Comment rejected. No response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process. To the extent other portions of the submission do suggest changes or raise objections, CalRecycle has responded to those portions separately.

O-22: Association of Home Appliance Manufacturers (AHAM) (Jacob Cassady)

Comment O-22-1

The Association of Home Appliance Manufacturers (AHAM) appreciates the opportunity to provide comment on SB 54 Plastic Pollution Prevention & Packaging Producer Responsibility Act Regulations (45-Day Comment Period).

Covered Packaging Material List Must Acknowledge Unavoidable Use of Certain Materials

AHAM supports all material packaging EPR legislation that provides manufacturers of durable goods with the ability to deliver products to consumers in a safe, efficient manner that protects both consumer and product. The final list of “covered packaging materials” or list of packaging materials required to be collected, must consider the unavoidable use of certain materials. Materials, such as expanded polystyrene (EPS) and thin plastic film (PE), are used by packaging engineers to protect the appliance and factory personnel during storage, transport, and delivery. These materials are the safest and most cost-effective because they are lightweight, can withstand multiple impacts, and maintain their integrity in humid conditions.

Large appliances such as refrigerators, freezers, dishwashers, cooking ranges, washers and dryers are stacked as high as 30 feet and packaging cannot fail while products are warehoused, regardless of environmental or climatic conditions. Heavy durable goods have different requirements than smaller fast-moving consumer goods. They must be able to ensure the protection of workers during transportation and at distribution centers.

Worker safety in warehouses, distribution centers or during transportation/delivery must be considered, especially when dealing with large appliances such as refrigerators, freezers, dishwashers, cooking ranges, clothes washers and dryers. Once assembled, major appliances are often packaged, stored and moved in very large warehouses or distribution centers. These facilities often have limited climate control and can experience extreme temperature and humidity changes. Low temperatures can cause packaging materials to become brittle while humidity and heat can affect the packaging’s structural integrity and limit the effectiveness of adhesives or the strength of products made from fiber.

For safety purposes, it is vital to maintain the structural strength of packaging materials, particularly with respect to major appliances that are regularly stacked vertically

with multiple units above ground. Furthermore, these appliances are often moved around by clamp truck and the packaging must withstand the force of the clamps to be moved efficiently. Other paper alternatives such as cardboard, molded pulp or honeycomb can only handle a limited number of impacts and are more apt to lose structural integrity in hot and humid environments.

A fiber-based alternative to EPS would be bulkier and heavier. Consequently, this increased unit size leads to more truck loads need to transport the same number of units, more fuel to move them, and more warehouse space required to store them. It is estimated that there would be an increase in size of 5-10% in all directions for the equivalently designed protective packaging, which equates to an increase of about 20-30% more trucks needed to deliver large appliances.

Additionally, thin plastic film (PE) is used to protect the finish of appliances as well as the display screen. Fiber alternatives, such as paper, are like sandpaper and would scratch the product and would lead to consumers either accepting a damaged product or refusing delivery and the distributor returning the product to the warehouse. There is no alternative to the use of plastic film to protect the finish of appliances or the display screen.

Response to O-22-1

Comment rejected. This comment does not address the proposed regulations themselves but rather discusses packaging materials whose use the commenter alleges is unavoidable. Because no change to the proposed regulations is proposed, no substantive response is required.
To the extent the commenter intended to suggest a change to the regulations concerning the covered material list published by CalRecycle, it fails to do so; it only makes the vague suggestion that such a list "consider the unavoidable use of certain materials." Even if that request were explained, it could not justify any change to the proposed regulations because it misapprehends the function of the list. The list is not a list of "covered packaging materials." Rather, it is a list of categories into which covered materials fall and, for each category, whether the category encompasses covered material that is recyclable or eligible to be labeled "compostable." For plastic categories, the list also includes recycling rates. The list does not concern the practical necessity of using particular covered materials or covered material categories. See Public Resources Code section 42061.

Comment O-22-2

Appliance Packaging May Not Enter Residential Recycling Stream

Materials used to package appliances may ultimately not enter the residential recycling stream. Large appliances are usually delivered to a consumer’s home and, as part of the installation, the packaging material is removed by the installer and not left in the home. The installers load the packaging into the delivery truck and return those materials to be recycled through commercial (non-residential) recycling systems.

Like major appliances, packaging materials that are used for the shipping and distribution of multiple portable and floor care units are commercially recycled and do not enter the residential recycling stream. A shipment of portable and floor care appliances would include hundreds of products placed in multiple master cartons that are secured to a pallet. The pallet of product goes to a distribution center and is either separated by units or delivered to the final seller. Like major appliances, packaging materials that are used for the shipping and distribution of multiple portable and floor care units are commercially recycled and do not enter the residential recycling stream.

Response to O-22-2

CalRecycle rejects this comment. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process. If the commenter intended to suggest that the regulations create a general exemption for materials that do not enter the residential recycling stream, CalRecycle rejects that recommendation. CalRecycle does not have general authority to create exemptions not established by statute. Statute does not contemplate that merely being recycled outside the residential recycling stream could be sufficient to render single-use packaging not subject to the law; PRC section 42041(e)(2)(H) might apply but imposes additional, stringent requirements. Accordingly, the proposed regulations accommodate the commenter's concerns, and no change is necessary.

Comment O-22-3

Packaging Collected Outside Residential/Household Recycling Stream Should Remain Exempt

AHAM appreciates the “covered material exemption” that was included in the Plastic Pollution Prevention & Packaging Producer Responsibility Act. The inclusion of this language, which is similar to Oregon’s EPR law, the Plastic Pollution and Recycling Modernization Act (SB582, 2021), recognizes and encourages this successful recycling process by including a provision that exempts covered packaging materials if the producer can demonstrate that their packaging is recovered as a function of the distribution chain and is recycled at a responsible end market. The Oregon law states the following:

A producer may demonstrate to the department that a material is exempt from the requirements for a covered product if the material:
(A) Is collected through a recycling collection service not provided under the opportunity to recycle;
(B) Does not undergo separation from other materials at a commingled recycling processing facility;
and
(C) Is recycled at a responsible end market1

Ontario, Canada takes a similar approach with a regulation that allows for two deductions and home delivered appliances are one of them. The following is a common deduction in Canada:

Allowable deductions are those Blue Box materials that are:
Collected from an eligible source at the time a related product was installed or delivered. For example, packaging that is supplied with a new appliance and is removed from the household by a technician installing the new appliance.2

Circular Materials, a Canadian not-for-profit producer responsibility organization (PRO) works to develop, implement and support effective and efficient recycling programs across Canada. To help producers meet their obligations, Circular Materials publishes a Guidebook for Stewards, under extended producer responsibility (EPR) regulations in Canada's provinces.3
The 2023 Guidebook notes that there are differences in the definitions of packaging across the provinces and in an attempt to harmonize the programs, Circular Materials has designated packaging to be defined as: *"materials that are used for the containment, protection, handling, delivery or presentation of goods which are supplied to residential consumers (as opposed to industrial, commercial, or institutional consumers)."4*

Circular Material's Guidebook identifies and distinguishes between packaging materials that are supplied to residential consumers and packaging materials that would not enter the residential or household system of packaging recovery.

Response to O-22-3

Comment rejected. The comment expresses satisfaction with language included in the statute. It does not address the proposed regulations. Because it suggests no changes to the proposed regulations and raises no objections related to the rulemaking process, no response is required.

Comment O-22-4

Durable Product Manufacturers Should Have Designated Seat on Packaging Advisory Board

Manufacturers of durable products should have an equal role in the management of the program as other stakeholders. Durable goods have unique packaging needs that other, non-durable manufactured goods do not necessarily require. A designated seat or position would ensure that all stakeholders have a voice in the program.

Recovery programs that place responsibility for recycling and/or disposal of post-consumer packaging with producers must ensure producers' involvement is not limited to merely subsidizing the status quo of inefficient recovery and recycling programs. If producers are responsible for the costs to dispose/recycle in a given jurisdiction, then producers must have the authority to exercise proper oversight without being required to give preferential treatment to existing partners, collectors, or municipal programs during

the program's design and implementation. Requiring responsibility without authority is a dysfunctional management structure.

Response to O-22-4

CalRecycle rejects this comment because CalRecycle does not have the statutory authority to restructure the producer responsibility advisory board by specifically including durable product manufacturers. PRC subsections 42070(a-b), requires that the director of CalRecycle must appoint all 13 voting and 3 nonvoting members in specified categories to the advisory board on or before July 1, 2023. To the extent that the advisory board should adhere to the principles of democratic participation, proportional representation and participatory process, the Department has not placed any limitation on applications to fill vacancies on the advisory board as they become available.

Comment O-22-5

Material Fees Appropriately Assigned Based on Material's Environmental Impact

As CalRecycle and the PRO consider appropriate packaging material fees or "eco fees" they must consider the life-cycle impact of the material. The use of packaging material that is easily and readily recycled should be incentivized as compared to lightweight, non-biodegradable materials. Alternatives to existing packaging materials or material source reduction involve tradeoffs. For example, plastic-based products will generally be lighter and lower volume than fiber-based packaging. In addition, there are already inherent financial incentives for manufacturers to reduce costs and amounts of packaging, especially for home appliances that have non-consumer facing packaging, because the packaging is not used for marketing purposes.

Adequate packaging is purely an additional cost to the product manufacturer to ensure the product arrives at the home without being damaged. The methodology used to set fees should be consistent with established practices to determine fair allocation of costs based on the complexity required to collect certain material. California should require the PRO(s) to apply the minimal annual administration fee feasible to prevent less environmentally impactful materials from subsidizing more environmentally impactful materials.

Response to O-22-5

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42053 and 42060, and the recommended change is not necessary to the implementation or enforcement of the Act. PRC section 42053(e) already requires a PRO to adjust producer fees using malus fees or credits based on factors that take into account and incentivize the recyclability of covered material, including, for instance, the factors described in PRC sections 42053(e)(3) and (5). Sections 18980.6.7(e) and (f) of the proposed regulations implement the PRO's fee-setting authority by establishing the process and criteria that will guide the PRO's determination of eco-modulated producer fees, including by requiring the PRO to justify its

determination of a base fee rate and any adjustments by addressing, among other factors, data pertaining to the biodegradation or disintegration rates of compostable covered materials in sections 18980.6.7(e)(1)(A) and (f)(1). Therefore, the eco-modulated fees are already designed to incentivize materials that are easily recycled or that are biodegradable under the current statutory and regulatory framework. Additionally, CalRecycle rejects this comment's recommendation that the proposed regulations should require a PRO to apply the minimal annual administration fee feasible to prevent less environmentally impactful materials from subsidizing more environmentally impactful materials. PRC section 42053(d) grants the PRO with the authority and discretion to structure its producer fees based on the factors described in that section. CalRecycle will then have the opportunity to review and determine whether the proposed producer fee schedule satisfies the requirements of PRC section 42053 under section 18980.6.2 of the proposed regulations. CalRecycle has determined this process for review and approval allows it to retain a central role in ensuring that the PRO complies with its requirements under the Act in structuring its producer fee schedule without being overly prescriptive in the proposed regulations. No further change is necessary to the proposed regulations.

Comment O-22-6

Credit Manufacturers for Previous Packaging Reductions

Manufacturers who proactively reduced and/or included recycled material in their packaging should have those actions counted toward any source reduction or recycled material requirement. EPR programs should not penalize companies that have already taken these steps.

Response to O-22-6

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42053, 42057, and 42060, and no change is necessary to the implementation of the Act. PRC section 42053(e)(1) requires the PRO to adjust producer fees using malus fees or credits based on the percentage of postconsumer recycled content in the participant producer's covered materials. Section 18980.6.7(f) of the proposed regulations implements this requirement by clarifying the process for the PRO's adjustment of producer fees. This provision is not limited to the prospective inclusion of postconsumer recycled content, and, as such, applies equally to producers that have previously and proactively incorporated postconsumer recycled content in their covered materials prior to the enactment of the Act. Additionally, PRC section 42057(f)(1) already requires a PRO to give producers credit for source reduction achieved from the 2013 calendar year to the 2022 calendar year, and nothing in the proposed regulations is in conflict with this requirement. Therefore, to the extent this comment is concerned with counting producers' proactive source reduction or postconsumer recycled content efforts, the Act and proposed regulations already achieve this purpose and no further changes to the proposed regulations are necessary.

Comment O-22-7

States should seek a Harmonized Approach

To the greatest extent possible, AHAM requests California harmonize its program, including definitions and the process for reporting and remitting, with other state's programs. Harmonization of recycling policies will encourage economies of scale, efficiencies and convenience for consumers, while streamlining compliance. In Canada, EPR packaging programs exist in most Provinces, with manufacturers having to comply with each program that varies in scope. This is very costly to both manufacturers and to residents.

Response to O-22-7

CalRecycle rejects this comment. This comment does not suggest any specific changes to the proposed regulations. or raise issues related to the rulemaking process. With regard to harmonization with other states, CalRecycle has, to the extent possible, with the limits of the SB 54 statute, made best efforts to harmonize its regulations with those of other states implementing similar EPR programs.

Comment O-22-8

Covered Material Category Definitions

With respect to covered materials, CalRecycle should provide producers with a definition, examples and reporting tips for each of the covered material categories. The *WeRecycle Material List,5* in the Canadian *Guidebook for Stewards*, provides producers with such information. Harmonization with definitions already existing in Canada will help producers comply with *SB 54 Plastic Pollution Prevention & Packaging Producer Responsibility Act*.

Additionally, material category definitions for SB 54 should be clearly defined for producers through the rulemaking and not reliant on the material category definitions in *SB 343 Preliminary Findings Report* (reference Appendix 4. SB 343 Material Types and Forms List, Table D1), particularly since the material categories between the two regulations are not aligned. Producers should not have to go back and forth between multiple regulations and attempt to determine what are the applicable or appropriate material categories or definitions.

Response to O-22-8

Comment rejected. The commenter generally requests definitions of each covered material category. The specific parameters of covered material categories are addressed in the covered material categories list that CalRecycle publishes pursuant to Public Resources Code section 42061. That list itself is not part of this formal rulemaking. Also, a regulation is not required for CalRecycle to publish "examples and reporting tips."

The commenter's proposed inclusion of definitions in the proposed regulations themselves is unfeasible, unnecessary, and inconsistent with statute. Defining

covered material categories in regulations themselves would result in categories that could not be changed in a reasonable time frame, and the statute expressly contemplates CalRecycle making changes to the covered material categories without undertaking formal rulemaking (Public Resources Code section 42061(a) through (f)).

Comment O-22-9

Conclusion

AHAM appreciates the opportunity to provide comments on the *SB 54 Plastic Pollution Prevention & Packaging Producer Responsibility Act Regulations (45-Day Comment Period).* Manufacturers of consumer products need flexibility in choosing appropriate materials for packaging their products to avoid situations that cause product breakage and damage during transport (which ultimately increases the lifecycle impact of the product) as well as to deter theft of smaller, high value
electronics from retail establishments.

Respectfully submitted,
Jacob Cassady
Director, Government Relations

jcassady@aham.org

About AHAM

AHAM represents more than 160 member companies that manufacture 90% of the major, portable and floor care appliances shipped for sale in the U.S. Home appliances are the heart of the home, and AHAM members provide safe, innovative, sustainable and efficient products that enhance consumers' lives. The home appliance industry is a significant segment of the economy, measured by the contributions of home appliance manufacturers, wholesalers, and retailers to the U.S. economy. In all, the industry drives nearly $200 billion in economic output throughout the U.S. and manufactures products with a factory shipment value of more than $50 billion.

In California, the home appliance industry is a significant and critical segment of the economy. The total economic impact of the home appliance industry to California is $15.9 billion, more than 85,000 direct and indirect jobs, $2.4 billion in state tax revenue and more than $5.3 billion in wages. The home appliance industry, through its products and innovation, is essential to consumer lifestyle, health, safety and convenience. Home appliances also are a success story in terms of energy efficiency and environmental protection.

Response to O-22-9

Comment rejected. No response specific to the commenter's submission is necessary. The "conclusion" section summarizes the commenter's recommendations, to which CalRecycle has responded separately, and the "About AHAM" section does not concern the proposed regulations.

O-23: Asphalt Roofing Manufacturers Association (ARMA) (Miriam Higginbotham)

Comment O-23-1

The Asphalt Roofing Manufacturers Association (ARMA) welcomes the opportunity to submit, on behalf of its members, comments regarding CalRecycle's proposed SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act Permanent Regulations. ARMA is a trade association representing North America's asphalt roofing manufacturing companies and their raw material suppliers. Our members account for approximately 90% of North American production of asphalt shingles and asphalt low-slope roof membrane systems. Additional information about ARMA's mission and activities can be found on its website, https://asphaltroofing.org/about-arma/about-us/.

Given the primary focus of the SB 54 regulations on consumer products, ARMA urges CalRecycle to determine that construction & demolition (C&D) waste and packaging for business-to-business products are beyond the scope of the regulations, or incorporate exemptions for these materials in the regulations.

There are limited "responsible end markets" available for C&D waste, and yet there is no exemption available for construction materials under the proposed regulations. At a minimum, items like wooden pallets should be exempted from the regulations. As noted in prior ARMA comments submitted on June 3, our members use wooden pallets as a key component of transportation and construction packaging for asphalt roofing products. Data from the National Wooden Pallet & Container Association (NWPCA) shows that wood pallets are reused and repurposed at exceedingly high rates, particularly when compared to the 15% recycling rate for plastics: 95% of pallets are recovered into usable materials. Pallets comprise only 1.8% of all wood landfilled by MSW landfills and 5.6% landfilled by C&D landfills. See NWPCA, https://www.palletcentral.com/page/LandfillAvoidance.

Indeed, ARMA's Asphalt Shingle Roofing System Life Cycle Assessment estimates that pallets are reused 20 times in asphalt shingle roofing manufacturing. See ARMA Environmental Product Declaration: Asphalt Shingle Roofing System, Installation: Fastened (2023), https://www.asphaltroofing.org/wp-content/uploads/2024/02/111.2_ARMA-Asphalt-Shingles.pdf.

Given that wooden pallets are already part of a well-established circular system, ARMA urges CalRecycle to clarify that wooden pallets are not a priority packaging material for SB 54 regulation, and provide an exemption for wooden pallets as a covered material under SB 54. Such an exemption would be in keeping with the approach taken by Oregon under its packaging EPR law, the Plastic Pollution and Recycling Modernization Act (SB 582), which provides a specific exemption from the definition of "covered products" for "(r)igid pallets used as the structural foundation for transporting goods lifted by a forklift, pallet jack, or similar device." Section 2(6)(b)(D). ARMA requests that CalRecycle provide a similar exemption for pallets under SB 54.

We note there is inherent difficulty in trying to reduce packaging for construction materials, as it is essential to ensure adequate protection of products during shipping

and handling. Package durability is critical because of the harsh environments in which they are commonly distributed and installed.

ARMA appreciates CalRecycle's consideration of these comments, and we welcome the opportunity to respond to questions if additional information is needed.

Response to O-23-1

Comment rejected. Regarding the general recommendation that "business-to-business products" be considered outside the scope of the regulations (or, technically, the statute), CalRecycle rejects that recommendation for the reasons provided in response to comment O-38-1. Regarding the alternative request that the proposed regulations "incorporate exemptions" for construction and demolition waste, no change is necessary because the regulations already address exemptions available to any covered material that raises compliance challenges. See section 18980.2.4, addressing the exemptions authorized under Public Resources Code section 42060(a)(3) and (a)(4). It is not prudent for the regulations themselves to codify exemptions for specific types of materials; compliance challenges are not necessarily permanent.
Regarding "construction & demolition (C&D) waste" specifically, the commenter appears not to be identifying any packaging to begin with, so the request for an exemption relevant to it is out of place. The statute concerns "packaging," which by definition is used with commercial goods and is not waste or used with waste.

Regarding application of the statute to wooden pallets, see CalRecycle's response to comment O-40-1.

O-24: Outdoor Power Equipment Institute (Brandon Martin)

Comment O-24-1

Thank you for the opportunity to provide feedback on the pending permanent regulations around California SB 54. This process is critical for producers to understand their obligations and potential impacts on their respective business within the state of California.

Introduction

The Outdoor Power Equipment Institute is an international trade association representing more than 100 manufacturers and their suppliers of both gas- and electric-powered outdoor power equipment. and non-road powered engines, personal transport & utility vehicles, golf cars and consumer and commercial outdoor power equipment ("OPE"). OPE includes lawnmowers, garden tractors, trimmers, edgers, chain saws, snow throwers, tillers, leaf blowers and other related products. OPEI member companies and their suppliers contribute approximately $16 billion to US GDP each year.

We collectively appreciate the opportunity to provide feedback to CalRecyle. We understand that CalRecycle receives comments from many parties – which could lead to batch review and responses by addressing similar topics. We trust CalRecyle will consider these collective comments to represent the concerns of our full membership organizations who are obligated under the Plastic Pollution Prevention and Packaging Producer Responsibility Act.

Response to O-24-1

Comment rejected. No response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations, does not raise an objection concerning the rulemaking process, or refers to suggested changes or objections set forth in greater detail in other portions of the submission. To the extent other portions of the submission suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-24-2

Concerns and Recommendations

(Pg. 89/166) Section 18980.6.1 Producer Responsibility Plan Submission

It would be appropriate for public comments to be visible to the public during the public comment period. Public comments should be made available on the same website and should be allowed to be submitted anonymously. Paragraph (e) demands a summary of all comments; any unedited comments should be made visible during the comment period.

Public comment period should also have a required minimum number of days for review such as 60 days from when it's made available.

Response to O-24-2

CalRecycle partially accepts and partially rejects this comment. To address the commenter's concern over public comments, section 18980.6.1 has been revised to clarify that the plan must be made available to the public and be subject to a 60-day comment period. Regarding availability of comments, CalRecycle rejects that suggestion for the reasons stated in response to comment O-24-3 regarding the same suggestion related to sections 18980.6.3 and 189807.2.

Comment O-24-3

(Pg. 91/166) Section 18980.6.3 Review of Updated Producer Responsibility Plan

It would be appropriate for public comments to be visible to the public during the public comment period. Public comment period should be the same as the Advisory Board review period of 60 days.

Additionally, allowing for 120 calendar days after receiving comments from the advisory board leaves the possibility that there will be a period without an approved Plan. Paragraph (a) of this section requires submission 180 days before the expiration date of the Plan, then paragraph (b) of the section allows for 60 calendar days until the advisory board provides a response. The regulation should not allow for any period during which the PRO does not have an approved Program Plan.

This is repeated on Pg. 105/166 Section 18980.7.2. *Review of Updated Independent Producer Plan.*

Response to O-24-3

CalRecycle partially accepts and partially rejects this comment. To address the commenter's concern over public comments, sections 18980.6.3(b) and 18980.7.2(b) have been revised to clarify that the proposed updated plan must be made available to the public and be subject to a 60-day comment period. Regarding the potential for there to be a period without an approved plan, CalRecycle rejects this comment. The timeline established in PRC section 42051.2(d)(2) and further specified in sections 18980.6.3(a) through (c) of the proposed regulations ensures that there will always be a plan in effect. In the event that a plan update is not approved according to the timeline set forth in those sections, PRC section 42051.2(d)(2) authorizes CalRecycle to extend a previously approved plan until the updated plan is approved or rejected. Therefore, no further change to the proposed regulations is necessary to ensure that an approved plan is always in effect. This applies equally to updated plans for Independent Producers under section 18980.7.2 of the proposed regulations.

Regarding the suggestion that public comments be made "visible to the public during the public comment period," CalRecycle rejects that suggestion because the administrative burden on the PRO to do so would outweigh the benefits, which the commenter does not describe. No further specifications, including visibility and anonymity of comments, are necessary to give effect to the statutory provisions concerning public comments. Moreover, the public comments will ultimately be summarized in all producer responsibility plans.

Comment O-24-4

(Pg. 96/166) Section 18980.6.7. Eco-Modulated Fee and Fee Schedule

The methodology to determine the fee to each producer should be outlined within this section. It should reference paragraph (1) of subdivision (c) of section 42053 "Individual assessments imposed on a producer due to unique characteristics of their covered material, as described in subdivision (d)." The rule currently outlines the costs will be covered by the fees. However, the method of allocating those costs among the producers in the PRO is left undefined and therefore up to the PRO's discretion for up to 2 years after the Program Plan has already been approved. This ambiguity will not work for producers and should be clarified in the rulemaking.

Additionally, the method of allocating costs should not vary drastically compared to the final methodology outlined to start in Year 3. Therefore, basing the fee-setting methodology on the "unique characteristics of their covered material" as stated in paragraph (1) of subdivision (c) of section 42053 is appropriate.

If the fee-setting methodology is substantively different than the methodology outlined by Paragraph (e) of this section to start in Year 3, the change in fees due to those differences should be accounted for by the PRO. This can easily be accomplished by including (in the Year 3 budget) the costs covered by the interim fees, then applying the interim fees as a credit. That way, any producers who were "overcharged" during the interim period would have a lower bill in Year 3, and any producers who were "undercharged" during the interim period would pay the balance in Year 3. This allows for any discrepancies to be fairly accounted for and level set for producers. The regulations for Maine's EPR bill uses this approach (096 Chapter 428 Paragraph 8 Subsection C).

Response to O-24-4

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42051.1, 42053, and 42060, and no change is necessary to the implementation of the Act. PRC sections 42053(a) through (c) authorize a PRO to exercise its discretion in establishing a producer fee schedule that is sufficient to ensure the requirements of this chapter are met by the PRO and the plan is fully implemented. As set forth in PRC section 42053, and as further clarified in sections 18980.6.7(a) through (c) of the proposed regulations, the appropriate factors for the producer fee schedule and the PRO's methodology will necessarily evolve in the early years as more producer data becomes available. See the responses to comments B-6-6 and B-13-12. Moreover, because the PRO is given the responsibility and discretion to develop and establish a producer fee schedule under PRC section 42053, section 18980.6.7(e)(1)(A) appropriately allows the PRO to exercise its discretion in establishing a methodology to determine base fee rates pursuant to PRC section 42053(c)(1). Section 18980.6.7(e)(1)(A) requires the PRO to provide CalRecycle with a justification of each rate or of the methodology used to derive rates. Section 19880.6.7(e)(1)(A) therefore strikes an appropriate balance between recognizing the discretion that is afforded to the PRO by PRC section 42053 to develop and establish a producer fee schedule while providing CalRecycle with sufficient information and opportunity to oversee the methodologies involved in the development of the producer fee schedule. No further change is necessary to ensure the fair allocation of producer fees and effective oversight by CalRecycle. Finally, to the extent this comment makes the alternative recommendation to apply a credit for interim fees in year 3, CalRecycle rejects this comment for the reasons provided in response to comment B-36-6.

Comment O-24-5

(Pg. 101/166) Section 18980.6.8 Recordkeeping and Reporting Requirements

Items (C) and (D) are listed as if they are supposed to be disaggregated by each producer. However, most producers will have no way to determine what the total weight of their material is disposed of or recycled. Instead, this data should be documented in an aggregated manner unless special studies are performed for eco-modulation purposes.

Response to O-24-5

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements set forth in the Act, including in sections 42051.1, 42052, and 42060 of the Public Resources Code, and the recommended changes are not necessary to the implementation or enforcement of the Act. Section 42052(a)(4) requires a PRO or Independent Producer to annually submit any information deemed necessary to collect and report data pursuant to section 42060(a), and section 42064(d) requires a producer or PRO to maintain records of covered materials offered for sale, sold, distributed, or imported in or into the state in a form and manner established by CalRecycle that CalRecycle determines is necessary to determine if a producer is in compliance with the Act during an audit. Consistent with those statutory requirements, CalRecycle has determined that the information concerning the total weight of material disposed and total weight recycled is necessary to enforce the Act and to ensure that its requirements, including the requirements established in section 42050 and the policy goal established in section 41780.01, are met. Additionally, this requirement is not overly burdensome and will not result in unnecessary administrative costs, because the data reported pursuant to section 18980.6.8(a)(1)(D) will closely relate to each other.

Comment O-24-6

California Public Resources Code 42061.5. (a)(1)

This requirement is not covered in the draft regulation. As a result, the current board for CAA California does not represent diversity in sources of covered materials and certainly does not represent diversity in producer/entity size. It would be appropriate for CalRecycle to more precisely describe the board and how voting members are chosen.

Response to O-24-6

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42060 and 42061.5, and no change is necessary to the implementation of the Act. There is adequate clarity in statute concerning the issue identified by the commenter, and the comment does not suggest any change to the text included in the proposed regulations.

Comment O-24-7

In Closing

We hope these comments, concerns, and suggestions are helpful and we collectively urge CalRecyle to consider our comments and make appropriate amendments.

Thank you again for this opportunity to respond as we collectively welcome the opportunity to discuss further.

Response to O-24-7

Comment rejected. No response specific to the commenter's submission is necessary. This closing paragraph summarizes the commenter's recommendations, to which CalRecycle has responded separately.

O-25: National Lubricant Container Recycling Coalition (Tristan Steichen)

Comment O-25-1

RE: Comments on SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act Permanent Regulations.

The National Lubricant Container Recycling Coalition (NLCRC) was established to encourage collaboration and develop circularity solutions for lubricant packaging in the United States. To ensure a comprehensive perspective from the industry, the NLCRC's membership includes stakeholders from across the lubricant packaging value chain, including producers, packaging manufacturers, retailers, recyclers, haulers, and other interested parties together, in an equal partnership to accelerate the achievement of packaging recycling solutions. Lubricant container packaging is hard to recycle due to the challenges created by residual liquid products left in the container. The NLCRC believes in EPR that promotes results-based, efficient, equitable, and transparent practices and encourages the establishment of fit-for-purpose collection methods for complex materials.

The lubricant industry is regulated by several post-consumer waste programs in California, including packaging EPR (SB 54), the Used Oil Recycling Program (SB 546), and potentially HHW EPR under proposed bill SB 501. Impacted producers are (or will be) required to manage these programs independently, leading to challenges in efficiency, effectiveness (performance), and cost to both consumers and producers. Recognizing the need to develop a solution, the NLCRC is sponsoring AB 1325, a producer-led EPR bill that comprehensively addresses lubricant products and packaging into one program. The mechanism requires transitioning the existing Used Oil Recycling Program into a new EPR law and adding packaging and other lubricant industry products to the list of covered materials.

Despite the NLCRC's intent to develop independent EPR legislation, we are providing comments to the proposed amendments to SB 54 that we believe to be beneficial to the Department, consumers, and any producer of hard-to-recycle packaging. Most of our comments seek to amend draft language to clarify "Individual Producers" and "Alternative Collection Programs."

On behalf of the NLCRC, I appreciate your review of these comments.

Response to O-25-1

Comment rejected. No response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations, does not raise an objection concerning the rulemaking process, or refers to suggested changes or objections set forth in greater detail in other portions of the submission. To the extent other portions of the submission suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-25-2

Section 18980.1 Definitions (a)(10)

"Independent Producer" means a producer that is approved by the Department to comply with the requirements of this chapter without being a participant producer. [Cal. Code Regs., tit. 14, div. 7, ch. 11.1, § 18980.1(a)(10) (2025)]

NLCRC Comment: The definition should be amended to say, "Independent Producer means a producer that is approved by the Department to comply with the requirements of this chapter without being a participant producer, **pursuant to section 42051(b)(2)(A) of the Public Resources Code**. The NLCRC asks for this clarification to allow for a group of producers with the same or similar products/packaging to work collaboratively to support collection programs that enhance packaging collection and recycling in CA. Further, enabling a group of producers to develop an 'Independent Producer Plan' in California would support EPR harmonization efforts in the U.S., while enhancing the amount of packaging material collected and managed by producers in California.
In addition to the suggested amendment to the definition of 'Independent Producer', NLCRC is seeking clarity from CalRecycle that the definition and use of the term 'Independent Producer' throughout the proposed rule is a new term and separate from the statute provision that enables a producer to comply 'Individually', thus creating a compliance pathway for a producer or group of producers to create an independent collection program that is both administratively and operationally independent of the PRO.

Response to O-25-2

CalRecycle rejects this comment for the reasons stated in response to comment O-81-5.

Comment O-25-3

Section 18980.5.1. Application for Independent Producer Compliance

(a) A producer seeking to comply with the Act without participating in a PRO shall first, if not already registered with the Department pursuant to subdivision (a) of section

18980.5, register with the Department pursuant to subdivision (a) of section 18980.10 and submit ~~an application for individual compliance~~ **an application for independent producer compliance** to the Department.

Response to O-25-3

CalRecycle rejects this comment as the commenter's suggestion would have no substantive effect on the regulations, and further, the reasoning behind this specific recommendation is without a clear explanation as to why it is necessary. Moreover, section 1890.5.1 is even titled "Application for Independent Producer Compliance", making the suggested change in the comment duplicative and unnecessary.

O-26: Resource Recovery Coalition of California (Veronica Pardo)

Comment O-26-1

The Resource Recovery Coalition of California (RRCC) appreciates the opportunity to submit comments on the permanent regulations implementing the SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act, as transmitted to the Office of Administrative Law (OAL) on August 12, 2025. RRCC is a statewide trade association representing haulers, recyclers, and composters that provide essential waste and recycling services across California. Our members play a critical role in ensuring the successful implementation of SB 54 and in advancing the state's broader waste diversion and climate objectives.

We recognize that the success of SB 54 depends on timely action to meet the statutory deadlines. Accordingly, our recommendations are focused and essential, while intentionally limited in scope to avoid prompting further rounds of comment. Our proposed language changes align with statutory expectations by ensuring SB 54 does not disrupt existing franchise agreements, preserves local jurisdiction authority over collection services, and requires the Producer Responsibility Organization (PRO) to operate within the current solid waste handling frameworks.

With these principles in mind, we recommend that CalRecycle strike the reference to "discarded" from the definition of "alternative collection." Doing so is consistent with the Department's own Initial Statement of Reasons (ISOR). As the ISOR explains, the purpose of this subsection is to define "alternative collection" in contrast to the broader definition of "curbside collection" under the Act, and to ensure that no program conducted by or on behalf of local jurisdictions can be considered "alternative collection." The ISOR further clarifies that whether a program qualifies as "alternative collection" cannot depend on whether the material has been "discarded" or is "solid waste," because those concepts are not relevant to whether non-curbside programs successfully recover covered material or whether such recovery constitutes recycling under PRC section 42041(aa)(1). Considering this explanation, the inclusion of "discarded" in the regulatory text is unnecessary and inconsistent with the Department's stated rationale.

In addition to aligning with the ISOR, removal of “discarded” is also critical to protecting the integrity of California’s existing waste and recycling systems. Most cities and counties rely on exclusive franchise agreements that reserve to their authorized service providers the sole right to collect and process discarded solid waste, including recyclables. For more than 30 years, California courts have recognized “discarded” as the defining element of solid waste under the *Waste Management of the Desert* decision, distinguishing discarded recyclables (which may only be managed by the franchised hauler) from undiscarded recyclables that a generator may freely donate or sell. This distinction has been the financial and legal foundation for every franchise agreement, materials recovery facility, and capital investment in local recycling infrastructure. Introducing the word “discarded” into the definition of “alternative collection” undermines this settled framework, risks conflict with franchise agreements and could destabilize long-standing financing arrangements that depend on reliable material flows.

For these reasons, inclusion of “discarded” creates unnecessary conflict and confusion. Its removal will ensure the regulations remain consistent with statutory intent, the ISOR, and established solid waste law.

We therefore propose the following revision: *“Alternative collection” means a program that collects covered materials, regardless of the manner and location of collection, and is not “curbside collection,” as defined in subdivision (g) of section 42041 of the Public Resources Code.*

While programs operated by or on behalf of a local jurisdiction may not be considered “alternative collection,” nothing in this definition should be construed to prohibit franchised solid waste enterprises from conducting alternative collection programs outside the scope of their municipal contracts, provided such programs comply with applicable law and do not conflict with existing franchise agreements.

In closing, we respectfully urge CalRecycle to adopt this revision to provide clarity, protect the stability of existing waste and recycling systems, and ensure consistency with the statutory framework of SB 54. RRCC remains a committed partner in the success of this program and appreciates the opportunity to provide these comments.

Response to O-26-1

CalRecycle rejects this comment for the reasons provided in response to comments B-40-2, B-42-1, and O-47-2.

O-27: Quaker Earthcare Witness (Keith Runyan)

Comment O-27-1

Dear CalRecycle Staff,

Quaker Earthcare Witness (QEW), the environmental network of the Religious Society of Friends (Quakers) in North America, submits this comment in strong support of implementing robust, comprehensive regulations under SB 54 that fulfill the intent of the law to reduce plastic production, eliminate harmful waste streams, and hold producers accountable for the full lifecycle of their packaging.

We are deeply concerned that the current proposed regulations include exemptions for food and agricultural products and appear to weaken restrictions on so-called "chemical recycling." These provisions risk undermining the core purpose of SB 54—to dramatically reduce single-use plastics, promote genuine recycling and composting, and prevent environmental harm, particularly in communities already burdened by pollution.

We urge CalRecycle to:

Remove broad product exemptions that allow continued high volumes of single-use plastic.

Maintain strict limits on "chemical recycling" and prioritize true reuse, reduction, and mechanical recycling.

Ensure transparent reporting, producer accountability, and meaningful public participation in oversight.

As a faith-based environmental organization, we believe in right relationship with the Earth and all its inhabitants. The promise of SB 54 was to lead the nation toward a more sustainable, just, and circular economy. We encourage CalRecycle to honor that vision by adopting stronger regulations consistent with both the letter and the spirit of the law.

In Friendship,

Keith Runyan
General Secretary
Quaker Earthcare Witness

Response to O-27-1

Comment partially accepted and partially rejected. Regarding the request that CalRecycle "[r]emove broad exemptions," CalRecycle interprets the comment to refer to the exclusion described in section 18980.2(a)(2) because that is the only "exemption" the commenter specifically mentions. CalRecycle rejects that suggestion to the extent it requests that section 18980.2(a)(2) be removed because removing it would contravene Public Resources Code section 42060(b), which requires consideration of conflicts with federal law. CalRecycle accepts the suggestion, however, to the extent it was intended to allege that section 18980.2(a)(2) was unclear in scope or effect, was insufficiently clear regarding what renders it "not reasonably possible" to resolve conflicts with federal laws, or would have been overbroad in effect due to the potential for the exclusion to be

applied despite the conflicts being avoidable. See CalRecycle's response to comment I-19-1, explaining the revisions responsive to this and similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

Regarding chemical recycling, CalRecycle rejects the commenter's proposal because it is vague; it does not explain what would constitute "strict limits" or how the restrictions already in section 18980.4.1(d) are inadequate, nor does it offer any alternative limitations for CalRecycle to consider. See, also, CalRecycle's responses to comments I-6-1 and O-62-1 regarding the adequacy of 18980.4.1(d). Regarding reporting, accountability, and meaningful public participation, no particular response is possible because the commenter only offers a vague, general statement concerning basic regulatory goals, with no explanation of how the proposed regulations fail to fulfill them and no suggested changes for CalRecycle to consider.

O-28: Upstream (Sydney Harris)

Comment O-28-1

Subject: SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act - Formal Proposed Regulations

Dear Director Heller and SB54 team,

Thank you for the opportunity to submit comments once again on behalf of Upstream on the updated formal proposed regulations for SB 54. Upstream is an environmental non-profit and leading change agency for the reuse movement in the US and Canada. We spark innovative solutions to waste and forge strategic alliances to help people, businesses and communities shift from single-use to reuse.

We appreciate CalRecycle's continued efforts to craft rules for this program with public input. At this time, we have only one brief comment on the formal rules, pertaining to **Section 18980.2.1. - Exclusion of Reusable and Refillable Packaging and Food Service Ware.**

Since the informal comment period in June, we have come to realize that this section, specifically **provision (a)(4), may inadvertently exclude the ability for producers to collect reusable packaging via curbside collection programs.** Curbside collection is the gold standard in convenient packaging return, and Upstream continuously recommends to Circular Action Alliance (CAA) and others that the best way to scale reuse into the Consumer Packaged Goods (CPG) sector is to leverage existing recycling infrastructure and systems for convenient returns. This especially includes curbside recycling collection programs, as well as depots throughout the state.

In California, several municipalities are currently exploring curbside reuse collection programs, such as Berkeley, in partnership with Cyclei. Upstream has also heard from other municipalities across the state that are interested in or exploring this concept. These programs are ripe for partnership with CAA, so it is crucial that the rules make it clear this would meet the convenience standards for reuse programs in the law. We have heard from 1 several key players in the CPG space with concerns that curbside collection would not meet these standards and urge CalRecycle to update the regulations to ease those concerns.

Upstream suggests adding the following clause to (a)(4) to clarify this provision:

(1) For purposes of subparagraph (C) of paragraph (1) of subdivision (af) of section 42041 of the Public Resources Code, "infrastructure to ensure the packaging or food service ware can be conveniently and safely reused or refilled for multiple cycles" is adequate if the requirements of this paragraph are met when an item is offered for sale, sold, or distributed.

(A) Unless the item was delivered directly to a consumer, there is at least one location for returning the item that is either:

(i) the same location where the item was obtained or delivered; or
(ii) within one mile of the location where the original item was obtained and has hours of operation that encompass, at a minimum, the hours of operation of the location where the item was obtained.

(B) If the item was ordered via remote means (e.g., Internet, phone, or any method not requiring the purchaser to visit any particular physical location) and was delivered directly to a consumer, the same means must be available for return of the item without requiring travel to a location other than the delivery location. If the item was ordered by visiting a particular physical location, such as a retail store, and was delivered directly to a consumer, return of the item must be able to be arranged via remote means or by visiting that physical location or a location described in clause (ii) of subparagraph (A).

(C) In either case, if a curbside collection program is made available by a municipality, private hauler, or other collection provider working with or on behalf of the PRO or an Independent Producer, the requirements of this paragraph are satisfied.

Thank you very much for your consideration; please do not hesitate to contact me with any questions at sydney@upstreamsolutions.org.

Response to O-28-1

CalRecycle rejects the commenter's suggestion for the reasons provided in response to comment O-84-3, which makes a substantially identical suggestion.

O-29: California Waste Haulers Council (Mel Gutierrez)

Comment O-29-1

The California Waste Haulers Council (CWHC) offers the following comments in response to the Notice of Proposed Action (Notice) published by the Office of Administrative Law (OAL) on August 22, 2025 to commence the formal rulemaking process concerning the regulations described above.

Comment 1. The current definition of the term "Alternative Collection" appearing in Article 1 requires amendment. In its current form, it would authorize the collection of covered materials, including *discarded* materials, at curbside. The problem is best summarized as follows:

A majority of local agencies in California rely on exclusive franchises for the provision of waste recycling services. Virtually every exclusive franchise agreement in the state, and the ordinance schemes underpinning those agreements, reserves to the waste recycler authorized by the local agency the sole right to collect and to process recyclable solid waste.

For more than 30 years, pursuant to the bright-line financial test established by the California Supreme Court in its landmark 1994 *Waste Management of the Desert* decision, solid waste has been defined to mean materials that are "discarded," a term which the court explained refers to materials handled in exchange for a fee paid by the generator.

Thus, in communities that have adopted an exclusive system for managing solid waste, including recyclable solid waste, only the solid waste enterprise authorized by the local agency may lawfully collect or process recyclables in exchange for a fee imposed on the generator. Generators retain the right to freely donate or sell their *undiscarded*, source-separated recyclables, even in an exclusive franchise environment.

A majority of cities and counties in California utilize these franchise agreements, and every waste collection program and materials recovery facility (MRF) in existence was financed in reliance on this distinction between discarded materials (waste and recyclable solid waste) and undiscarded recyclables. All require a reliable and sustained flow of material to ensure their loans will be timely and fully repaid.

Any change to these rules would \wreak havoc on existing programs and infrastructure and would, we submit, directly conflict with the provisions of SB 54 itself, including Public Resources Code Section 42051.1.

There are several ways to remedy this problem. At a minimum, Section 18980.l(a)(2) should be revised to read as follows:

"(2) "Alternative collection" means a program that collects covered materials~~, regardless of whether the covered material is discarded or considered solid waste and regardless~~

~~of the manner and location of collection,~~ and that is not "curbside collection," as defined in subdivision (g) of section 42041 of the Public Resources Code~~, because it is not conducted by a local jurisdiction or recycling or composting service provider under contract with a local jurisdiction~~."

A more comprehensive solution would be to revise Section 18980.1 (a)(2) to read as follows:

"(2) "Alternative collection" means a program that collects covered materials~~, regardless of whether the covered material is discarded or considered solid 'Waste and regardless of the manner and location of collection,~~ and that is not "curbside collection," as defined in subdivision (g) of section 42041 of the Public Resources Code~~, because it is not conducted by a local jurisdiction or recycling or composting service provider under contract with a local jurisdiction~~, subject to all to all of the following:

(A) Alternative collection shall be implemented in a manner that does not conflict with, disrupt, or adversely affect local solid waste handling requirements and the intent described in Section 40004.

(B) Alternative collection shall be implemented in compliance with applicable law and a manner that does not violate or conflict with existing franchise agreements or the local ordinances supporting those agreements.

(C) Solid Waste. including covered materials that have been discarded. is not eligible inclusion in an alternative collection program. As used herein. materials are discarded if they are commingled with solid waste. or if a fee. charge. or other consideration. in any form or amount. is paid by the generator in exchange for the service."

We urge approval of the second option, elements of which (subdivisions (A) and (B)) were drawn from Public Resources Code Section 42051.1 (c)(3)(A) and (B). Subdivision (C) is a general reference to the standard set forth in the Supreme Court case mentioned earlier, defining the permissible limits of municipal regulation of recycling activities. It is unclear what prompted the prior amendment to the draft Alternative Collection definition, but given the attention that change has brought to this issue, the more prudent course may be to clarify more fully what an Alternative Collection service provider may lawfully do, perhaps forestalling future conflict.

Response to O-29-1

CalRecycle rejects this comment for the reasons provided in response to comments B-18-1, B-17-1, B-17-2, B-40-2, B-42-1, and O-47-2.

Comment O-29-2

Comment 2. Acknowledging the helpful change that was made to Section 18980.11 (b), we remain concerned that the regulations do not make clear enough whether a recycling service provider will be exposed to administrative civil penalties for the lack of a viable responsible end market. That is a different thing than merely stating, as Article

11 now does, that providers are not "required to establish the availability of a responsible end market." Some mention of this issue belongs, we believe, in Article 13 itself.

We therefore urge adoption of the following amendment to Section 18980. 13(j):

"The number of violations of section 42060.5 of the Public Resources Code by a recycling service provider and the accrual of penalties shall be calculated in the same manner as would apply under subdivision (i) for local jurisdictions committing the same violations. No penalty may be imposed against a recycling service provider (1) during the pendency of a request for an extension for, or exemption from, a requirement of subdivision (a) of section 42060.5 asserting that compliance with the requirement is not practicable for a specific identified covered material, or (2) for the lack of a viable responsible end market for covered materials that have been included in its collection and recycling programs. Evidence reasonably supporting the absence of a viable responsible end market shall be submitted by the recycling service provider to the Department for determination."

This amendment is derivative of what the CWHC had earlier proposed but has been scaled back given the change to Article 11. We have also added clarity to reflect that it is the department that will make the final determination.

Response to O-29-2

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, and no change is necessary to the implementation or enforcement of the Act. PRC section 42060.5(a) provides that all recycling service providers must include in their collection and recycling programs all applicable covered material. PRC section 42060.5(b) establishes an exception to this requirement in specified circumstances. Section 18980.11(b) of the proposed regulations implements PRC section 42060.5(a) by specifying when covered material is considered included in a recycling service provider's collection and recycling program. Section 18980.11(b) explicitly provides that PRC section 42060.5(a) does not require a recycling service provider to establish the availability of a responsible end market, and it further provides that the absence of responsible end markets will be deemed to satisfy the criteria for PRC section 42060.5(b). Therefore, the proposed regulations are sufficiently clear and already provide that a recycling service provider will not be subject to administrative civil penalties for the lack of a viable responsible end market. No further change is necessary.

O-30: Coalition for Protein Packaging (Erin Hass)

Comment O-30-1

On behalf of the Coalition for Protein Packaging (CPP), we appreciate the opportunity to provide comments on the August 22, 2025 regulations implementing SB 54, the Plastic

Pollution Prevention and Packaging Producer Responsibility Act. CPP represents producers, distributors, and supply chain partners committed to ensuring safe, sustainable, and affordable protein products for California consumers.
We are writing to express our support for the categorical exclusions provided in Section 18980.2(a)(2) of the draft regulations, which recognize packaging for food subject to regulations, rules, or guidelines for food issued by the FDA and USDA as outside the scope of covered material where no feasible alternative exists.
Support for USDA/FDA Exclusions
• Food Safety and Public Health: FDA and USDA issued regulations, rules and guidelines are not optional and optimized packaging is critical to preventing microbial contamination, maintaining freshness, and ensuring consumer health. Aligning SB 54 with these standards avoids conflicts between federal and state regulations while ensuring Californians have safe access to protein products.
• Food Security: Protein is an essential nutritional component for California families. The regulatory exclusions help safeguard supply chains and prevent disruptions that could compromise affordability and accessibility of these products.
• Regulatory Certainty: By recognizing federal mandates, CalRecycle provides necessary clarity for producers who must comply with both federal and state law. This reduces compliance risk and allows members to focus on reducing unnecessary packaging elsewhere in their operations.
Conclusion
CPP strongly supports CalRecycle's recognition of the unique role of food packaging in maintaining compliance with FDA and USDA regulations, rules, or guidelines in protecting food safety and security. We urge the Department to preserve these categorical exclusions in the final regulations. This approach strikes the right balance between advancing the goals of SB 54 and maintaining California's commitment to public health and nutrition.
Thank you for your consideration of these comments. We look forward to continuing our engagement with CalRecycle throughout the implementation of SB 54.
Respectfully submitted,
Coalition for Protein Packaging (CPP)

Response to O-30-1

This comment must be rejected, and no response is required, because it does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

O-31: Surfrider Foundation (Jennifer Savage)

Comment O-31-1

On behalf of the Surfrider Foundation's extensive chapter and student club network, comprising thousands of business owners, volunteers and other ocean-loving coastal recreation enthusiasts, we write to express our strong support for robust and effective implementation of the SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act. We urge CalRecycle to ensure that responsibility for plastic reduction

and end-of-life management falls squarely on producers and manufacturers—not on consumers.

As outlined in the proposed regulations, the Extended Producer Responsibility (EPR) program must prioritize source reduction of plastic packaging, phase out materials that are not truly recyclable or compostable, and significantly increase recycling and composting rates. To achieve these outcomes, producers should be required to use packaging certified by third parties to meet technical compostability and recyclability standards, as mandated under AB 1201. Clear, enforceable labeling requirements—such as those established in SB 343—are also critical for ensuring transparency and preventing misleading product marketing.

In California, we see firsthand the consequences of single-use plastics on our coastlines. This year alone, our beach cleanup volunteers have collected 23,714 plastic food wrappers, 2,149 plastic food containers, 6,118 plastic lids, 8,458 plastic straws, and 66,783 cigarette butts, along with thousands of other discarded plastic items. These numbers represent only a fraction of what washes onto our beaches and into the ocean, underscoring the urgent need for upstream solutions and producer accountability.

We have two areas of particular concern within the draft regulations:

Response to O-31-1

Comment rejected. No response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations, does not raise an objection concerning the rulemaking process, or refers to suggested changes or objections set forth in greater detail in other portions of the submission. To the extent other portions of the submission suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-31-2

• Chemical, advanced recycling, and related technologies: The current language opens the door for the use of costly and potentially harmful technologies that misrepresent their ability to recycle plastic waste. To preserve the integrity of SB 54, we strongly recommend a categorical prohibition on chemical and advanced recycling, as well as related processes.

Response to O-31-2

CalRecycle rejects this comment's suggestion that chemical recycling, advanced recycling, and related technologies be banned outright in the regulations. A complete ban on any technology could have been accomplished through straightforward, specific language that required prohibition based solely on the type of technology at issue. Instead, the Legislature chose to word statute in a way that requires consideration of hazardous waste generation, not merely consideration of the type of technology.

Comment O-31-3

• Categorical exclusions: The categorical exclusions added in the May 2025 draft regulations—and maintained in the August version—risk undermining the core intent of SB 54. By shifting costs onto other producers, local governments, and ratepayers, these provisions create a loophole that threatens the fairness and effectiveness of the extended producer responsibility framework. We recommend that this section be deleted, and producers facing unique challenges should go through the exemption process.

Response to O-31-3

Comment partially rejected and partially accepted. The commenter does not identify which section this comment concerns, but CalRecycle interprets it to refer to section 18980.2 because it refers to "categorical exclusions." The only basis for the commenter's recommendation is that the exclusions "shift[] costs onto other producers, local governments, and ratepayers." However, far from being a "loophole" created by the proposed regulations, section 18980.2 implements specific provisions in the statute that place certain packaging outside the definition of "covered material." Packaging that is not "covered material" in the first place does not have a "producer" and is necessarily outside the scope of all statutory requirements placed on covered material. Regarding the specific request that the "exemption process" for "unique challenges" should apply, CalRecycle rejects that suggestion for the reasons provided in response to comment I-59-2. To the extent this request concerns packaging excluded from the Act under Public Resources Code section 42041(e)(2), CalRecycle rejects it because the packaging at issue is not "covered material," so Public Resources Code section 42060(a)(3) and (a)(4) cannot apply to it. Regarding the appropriateness of excluding certain food and agricultural packaging under section 18980.2(a)(2) of the proposed regulations generally, see CalRecycle's response to comment I-19-1.

CalRecycle accepts this comment with regard to food and agricultural packaging, however, to the extent it alleges that section 18980.2(a)(2) was unclear in scope or effect, was insufficiently clear regarding what renders it "not reasonably possible" to resolve conflicts with federal laws, or would have been overbroad in effect due to the potential for the exclusion to be applied despite the conflicts being avoidable. See CalRecycle's response to comment I-19-1, explaining the revisions responsive to this and similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

Comment O-31-4

California has long led the nation in advancing environmental protections, and SB 54 represents a critical opportunity to accelerate the transition to a circular economy. Success will depend on shifting responsibility away from individuals—who are left with

limited recycling options—and onto the companies that design, produce, and profit from single-use packaging and foodware. This shift not only protects the environment and wildlife, but also creates a more equitable and effective system for managing materials at the end of their life cycle.

We strongly urge CalRecycle to adopt regulations that fully reflect the intent of SB 54: holding producers accountable, reducing reliance on single-use plastics, and prioritizing materials that are genuinely compostable or recyclable. The California Surfrider Foundation chapter and student club network remain committed to supporting California's leadership in reducing plastic pollution and protecting our ocean, waves, and beaches.

Response to O-31-4

Comment rejected. No response specific to the commenter's submission is necessary. This closing paragraph summarizes the commenter's recommendations, to which CalRecycle has responded separately,

O-32: City and County of San Francisco, Environment Department (Hilary Near)

Comment O-32-1

Dear CalRecycle,

City and County of San Francisco serves its over 870,000 residents and 14,000 businesses with vision for a safe, vibrant and inclusive City of shared prosperity. This letter is in response to the formal permanent of the SB 54 regulations released by CalRecycle on August 22, 2025.

We appreciate CalRecycle's work to provide a robust set of regulations so that SB 54 can achieve its potential to accelerate a shift to a more circular economy for California. We strongly support the intentions of the law to slow the flow of materials entering our communities, keeping materials in circulation through reuse and refill, and by creating packaging that is designed for recycling or composting at end of life. We also strongly support the extended producer responsibility (EPR) intent of the law – to shift the responsibility for the costs of collecting and processing covered materials to responsible end markets from jurisdictions and ratepayers to the producers of the materials themselves

The comments offered below are informed by our experience implementing and evaluating zero waste programs and policies at our local level. The City and County of San Francisco supports the detailed comments submitted by the National Stewardship Action Council (NSAC) as well as Californians Against Waste (CAW), and the comments below reiterate key feedback in four topic areas: payments to local jurisdictions, reuse and refill, categorical exemptions and end market enforcement requirements. Suggested language to remove is reflected with ~~strikethrough~~ whereas additional suggested language is *underlined and italicized.*

Response to O-32-1

Comment rejected. No response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations, does not raise an objection concerning the rulemaking process, or refers to suggested changes or objections set forth in greater detail in other portions of the submission. To the extent other portions of the submission suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-32-2

Topic #1 – Payments to local jurisdictions

The intent of SB54 Plastic Pollution Prevention and Packaging Producer Responsibility Act is to shift the burden of plastic pollution to producers. The current draft rules do not provide enough
guidance to ensure that the financial burden of meeting the requirements of the Act will be placed on producers.

Comment 1a: Reimbursement eligibility 18980.8(g)

However, we still need greater clarity on eligible covered costs. For example, the statutory requirements of SB 54 that the PRO is required to meet cannot be met without the use of existing infrastructure established by local jurisdictions and local recycling service providers. For example, transportation of covered materials will involve using trucks that are currently operating but were purchased prior to January 1, 2023. Transportation is explicitly called out as a cost that is required to be covered under SB 54 (Sections 42051.1(j) and 42060(a)(1) of the Public Resources Code), and therefore reimbursement for these costs will be necessary. Therefore, SFE recommends that amortized capital costs from investments in waste management infrastructure made prior to January 1, 2023, are required to be reimbursed in Section 18980.8(g) of the proposed regulations.

The requirement in Section 18980.8(g)(2)(A) that only the increase in costs resulting from SB 54 is reimbursable should be deleted, since the goals outlined in SB 54 that producers are required to meet cannot be met without the work that local jurisdictions are already doing; this applies to ongoing outreach and education efforts and collection costs related to covered material, as well as capital costs related to covered material.

Response to O-32-2

Comment rejected. The commenter asserts that certain costs incurred before January 1, 2023, are among the costs to be funded by the PRO. For the following reasons, no change is appropriate in response to this comment. To the extent the commenter recommends that costs incurred before passage of SB 54 be reimbursed, that contravenes the plain text of the statute and the Legislature's intent. It is not possible for costs incurred before passage of SB 54 to have been made for the purpose of complying with it. As the following provisions make

clear, the statute only concerns those costs, not earlier ones:

• PRC section 42040(b)(2)(B): "It is the intent of the Legislature in enacting this chapter to ensure that local jurisdictions will be made financially whole for any new costs incurred associated with the implementation of this chapter and its implementing regulations."

• PRC section 42051(b)(2)(B)(ii): "[Independent Producers are responsible for] [f]ully cover[ing] the costs associated with implementing this chapter to the same extent as any other producer participating in a PRO based on the producer's share of covered material."

• PRC section 42051.1(g)(1): "The plan shall include a process for determining and paying the costs that will be incurred by local jurisdictions . . . and others under this chapter."

• PRC section 42051.1(j)(1)(B): "[The plan must fund] [c]osts associated with this chapter incurred by local jurisdictions."

These statutory provisions, in particular the Legislature's statement in section 42040(b)(2)(B) that SB 54 was intended to make local jurisdictions whole for "new costs," consistently relate only to costs incurred for purposes of SB 54. Those purposes did not exist before the law's enactment, so no costs incurred before then could possibly be relevant. CalRecycle therefore rejects this suggestion.

To the extent the commenter asserts that the Act supports the contention that the PRO must cover all costs associated with SB 54, regardless of whether the costs are increased due to SB 54 requirements, that assertion is incorrect. Paragraph (1) of subdivision (d) of section 42053 actually requires the opposite conclusion. That paragraph states one factor the PRO must consider when exercising its discretion with respect to its fee schedule: "[t]he costs to ensure each covered material category meets the requirements of this chapter." But subparagraphs (A) through (E) do not state costs that the fees must be sufficient to cover in their entirety. To the contrary, paragraph (1) states that the costs to be considered "may include all of the following," including the costs identified in subparagraph (C): "[c]osts incurred by local jurisdictions ... to process and transport covered materials ... ." By providing those costs as a categorical example of those that the PRO may consider, as opposed to identifying them as mandatory costs that the PRO must (or "shall") cover, this statutory text makes clear that the Legislature did not intend for funding by the PRO to cover the entirety of local jurisdictions' and recycling service providers' costs associated with SB 54. In effect, the Legislature only authorized, but did not require, the PRO to base its fee schedule to some degree on those costs.

Comment O-32-3

Comment 1b: Administrative costs

In addition, reimbursement eligibility should specify the inclusion of both direct and indirect costs, which would include the administrative costs of compliance with the Act. The administrative burden for such a complex set of rules will require local jurisdictions to either expand staffing or hire consultants and it should be clear that administration is a reimbursable item.

Article 8, Section 18980.8, subdivision (g):
(2) The following costs are reimbursable:
(B) ~~A~~ Direct and indirect costs, including the cost of administration, ~~cost~~ that would not reasonably have been expected to be incurred in the absence of the Act...

Response to O-32-3

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment O-13-13.

Comment O-32-4

Comment 1c: Notification of local jurisdiction

We appreciate the new requirement outlined in 18980.8(g)(8) that when costs are deemed covered for a recycling service provider, the PRO or Independent Producer must notify the local jurisdiction, at a minimum describing the nature and amount of the covered costs. However, it's important that we have access to this information prior to the PRO issuing payment so we can ensure the payment is not for a cost that is already being paid for through refuse rates. It would be helpful to ask for local government concurrence of the cost/expense, prior to payment issuance.

Response to O-32-4

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment O-13-17.

Comment O-32-5

Topic #2 -- Reuse and refill convenience
Section 18980.2.1. Curbside collection program convenience standard

• SFE supports small food establishments to make the transition from single use to reusable food service ware at an average grant of $500 per business; over 350 businesses have taken advantage of the grant since 2021, many of them choosing stainless steel, glass and ceramic dishware. We will be committed to supporting local implementation of reuse systems and oversight that may require use of the transparency requirements referenced above. Our refuse collection provider has not considered adding reuseable container collection to its services, and we want to reserve the option to consider this collaboration.

We recommend adding the following language to 18980.2.1(a)4:

(C) In either case, if a curbside collection program is made available by a municipality, private hauler, or other collection provider working with or on behalf of the PRO or an Independent Producer, the requirements of this paragraph are satisfied.

Response to O-32-5

CalRecycle rejects this comment for the reasons set forth in response to comment O-84-3.

Comment O-32-6

Topic #3: Exemptions

Section 18980.2. Categorically Excluded Materials We echo the concerns regarding provisions (a)(2), (a)(5) and (a)(6) that have remained in the regulations, which would enact sweeping exemptions that threaten the integrity of the program. It is recommended to direct materials through the time-bound exemption process rather than categorically exempting packaging or packaging components. Should the language stay, improvement could be a time limit such that the producer does not get an automatic exemption and require a federal regulator conference. The submitter must justify why they do not qualify under unique challenges.

Response to O-32-6

CalRecycle partially rejects and partially accepts this comment. Regarding the suggestion to rely on "the time-bound exemption process," CalRecycle understands that to be a reference to the exemptions, including the one for "unique challenges," described in section 18980.2.4, which implements Public Resources Code section 42060(a)(3) and (4). Regarding section 18980.2(a)(5) and (6) of the proposed regulations, that approach is untenable because the products whose packaging would be exempt would be those identified in Public Resources Code section 42041(e)(2)(A). That packaging is by definition not "covered material," so the exemptions established in Public Resources Code section 42060(a)(3) and (4) cannot apply to it. Regarding the request to rely on the 18980.2.4 exemptions in lieu of the exclusion described in section 18980.2(a)(2) or to impose a time limitation for the exclusion, CalRecycle rejects that request for the reasons stated in response to comment I-59-2. Regarding the request to "require a federal regulator conference," that request is rejected because it is vague and because, as a state government entity, CalRecycle cannot impose requirements on "federal regulator[s]."

CalRecycle accepts this comment with regard to food and agricultural packaging, however, to the extent it alleges that section 18980.2(a)(2) was unclear in scope or effect, was insufficiently clear regarding what renders it "not reasonably possible" to resolve conflicts with federal laws, or would have been overbroad in effect due to the potential for the exclusion to be applied despite the conflicts being avoidable. See CalRecycle's response to comment I-19-1, explaining the revisions responsive to this and similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the

proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

Comment O-32-7

Topic #4: Requirements for local jurisdictions and recycling service providers for end markets

Section 18980.11(a) stipulates the primary requirement of a local jurisdiction or recycling service providers is to collect the covered materials. What constitutes being included in a collection and recycling program? Does being listed on electronic resources suffice? Our carts are not currently comprehensively labeled and would take years and significant investment to update. Our residential mailers are distributed biannually at the most.

Section 18980.11(b) requires the local jurisdiction or recycling service provider to collect and transfer the covered materials to responsible end markets directly or to intermediate supply chain entities. Whose responsibility is it to identify the end market, vet it per Section 18980.4.2, and communicate the findings to jurisdictions and recycling service providers? The regulations are clear that the requirement to establish markets is held by the producers, and it is not clear outside of the annual plan how this would be regulated and the specific responsibility of jurisdictions.

Thank you for your consideration of these comments. Please reach out if you have questions or if you would like to discuss them further.

Sincerely,

Hilary Near
Commercial Zero Waste Senior Coordinator
San Francisco Environment Department

Response to O-32-7

Comment rejected. Regarding the comment on section 18980.11(a), the commenter does not propose any revision but rather asks "[w]hat constitutes being included in a collection and recycling program?" To the extent the commenter intended to request that CalRecycle revise the proposed regulation to address that question, no revision is necessary because 18980.11(b) unambiguously does that: The obligation of a local jurisdiction or recycling service provider is to physically collect and transfer certain covered materials for recycling purposes, not merely educate the public on how to discard the covered materials. In other words, the local jurisdiction or recycling service provider must facilitate physical collection and then transfer them for processing, not for disposal in a landfill. This provision does not address the predicate acts necessary to maximize efficiency of the program. Statute contemplates the latter being addressed through the PRO plan, which must fund education efforts "to improve the preparation and sorting of covered material" and "improvements to

collection . . . and other infrastructure necessary to achieve recycling rates." Regarding section 18980.11(b), the commenter again asks a question rather than recommends a revision: "Whose responsibility is it to identify the end market, vet it per Section 18980.4.2, and communicate the findings to jurisdictions and recycling service providers?" To the extent the commenter intended to suggest that the regulations be clarified to address that question, CalRecycle declines to make such a change. As the commenter acknowledges, the proposed regulations are clear concerning who holds the obligation to establish end markets (e.g., sections 18980.4.3 (development of responsible end markets) and 18980.4.2(c) (annual verifications of responsible end market). To the extent the commenter asserts the general need for it to be clearer how end market development "would be regulated," no response is necessary to such a vague assertion; CalRecycle cannot discern which provisions of the proposed regulations might be revised to address that assertion. Likewise, CalRecycle cannot discern what the commenter intended to suggestion with regard to the "specific responsibility of jurisdictions." Proposed regulation section 18980.11(a) through (c) expressly state the obligation placed on local jurisdictions.

O-33: Central Contra Costa Solid Waste Authority (David Krueger)

Comment O-33-1

RecycleSmart (the Central Contra Costa Solid Waste Authority) submits the following comments regarding the proposed SB 54 regulations. RecycleSmart is a joint powers authority that manages the solid waste and recycling programs for the cities and towns of Danville, Lafayette, Moraga, Orinda, Walnut Creek, and surrounding portions of unincorporated Contra Costa County. This letter is in response to the formal draft of the SB 54 regulations published on
August 22, 2025.

Despite the unanticipated delays in adopting the regulations, RecycleSmart appreciates CalRecycle's work to provide a robust set of regulations so that SB 54 can achieve its potential to accelerate a shift to a more circular economy for California. We very much appreciate the changes CalRecycle has made that are responsive to comments that we and
other local agencies have raised. We strongly support the intentions of the law to slow the flow of materials entering our communities, keeping materials in circulation through reuse and refill, and by creating packaging that is designed for recycling or composting at end of life. We also strongly support the EPR intent of the law – to shift the responsibility for the
costs of collecting and processing covered materials from jurisdictions and ratepayers to the producers of the materials themselves.

Response to O-33-1

Comment rejected. No response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations,

does not raise an objection concerning the rulemaking process, or refers to suggested changes or objections set forth in greater detail in other portions of the submission. To the extent other portions of the submission suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-33-2

Topic #1: Funding Sources for Implementation

Chapter 3, Article 1 of SB 54 states that:

Local jurisdictions are the backbone of the solid waste management and recycling efforts in California. The new statewide comprehensive circular economy framework established by this chapter is intended to shift the burden of costs to collect, process, and recycle materials from the local jurisdictions to the producers of plastic products.

It is the intent of the Legislature in enacting this chapter to ensure that local jurisdictions will be made financially whole for any new costs incurred associated with the implementation of this chapter and its implementing regulations.

However, the proposed regulations lack language that specifically: 1) requires service providers to request funding from the PRO for any new costs incurred associated with the implementation of SB 54, and; 2) prohibits service providers from obtaining funding from local jurisdictions, ratepayers, and taxpayers for any new costs incurred associated with the implementation of SB 54; and 3) prohibits service providers from receiving cost reimbursements from the PRO and then also recovering those same costs from ratepayers, taxpayers, or local jurisdictions ("double-dipping"). Without those protections in the regulations, the requirements of Section 42060.5 of the Public Resources Code and Article 11 of the draft regulations could become an unfunded mandate on local jurisdictions, with the costs of SB 54 ultimately being incurred by ratepayers and taxpayers instead of by the producers.

We appreciate the addition to section 18980.8 of the proposed regulations regarding reimbursable costs which requires that the PRO or Independent Producer "first" notify the local jurisdiction when costs are deemed covered for a recycling service provider. However, while this will be a helpful tool to enhance transparency, it is not a mandate or prohibition under law from including reimbursed costs in ratepayers' rates. We believe that such a prohibition is necessary. The proposed regulations place the burden of enforcement against "double-dipping" on local jurisdictions. We believe this enforcement should be the responsibility of CalRecycle. Below we have provided suggested draft language. We request that this language or similar be incorporated into the adopted regulations in order to ensure the intent of SB 54.

• *Recycling service providers shall request reimbursement from a PRO for any new costs incurred in order to comply with Section 42060.5 of the Public Resources Code.*

• Recycling service providers shall not request, accept, or obtain funds from Ratepayers, taxpayers, or local jurisdictions for new costs incurred by the recycling service providers in order to comply with Section 42060.5 of the Public Resources Code.

• If a service provider receives reimbursement from a PRO for costs incurred in order to implement Section 42060.5 of the Public Resources Code, that service provider shall not request, accept, or obtain funds from Ratepayers, taxpayers or local jurisdictions for reimbursement of the same costs for which they were reimbursed by a PRO.

• If a service provider receives funds from a PRO and also receives funds for reimbursement of those same costs from Ratepayers, taxpayers, or local jurisdictions, either before or after being reimbursed by the PRO, that service provider shall refund all such funds to the Ratepayers, taxpayers, or local jurisdictions. The Department shall enforce this requirement, shall investigate related complaints from Ratepayers, taxpayers and local jurisdictions, and may assess penalties on recycling service providers equal to the amount of any funds not refunded to the Ratepayers, taxpayers, or local jurisdictions plus 10%.

Response to O-33-2

Comment rejected. The commenter reads into statute expansive authority for CalRecycle over recycling service providers, including the authority to directly affect rate-setting practices and to assess penalties not described anywhere in statute. In contrast, the statute imposes no affirmative obligation on local jurisdictions or recycling service providers other than the one pursuant to Public Resources Code section 42060.5(a) (inclusion of certain covered material categories in their collection and recycling programs). There is no open-ended grant of enforcement authority that would be required for CalRecycle to adopt the proposed changes concerning recycling service providers' funding requests, recycling service providers' funding, and the potential for "double-dipping." Regarding the latter, CalRecycle also responds as stated in response to comment I-51-1.

Comment O-33-3

Topic #2: Enforcement Oversight by the Department - Section 18980.13

As discussed in our comments dated November 4, 2024, we continue to believe that penalties of up to $50,000 per item per day for violations by local jurisdictions for failure to include covered materials in their collection programs is illogical and unreasonable. **SB 54 does not authorize these penalties**. The law authorizes monetary penalties for only PROs, producers, retailers, and wholesalers. (Public Resources Code sections 42080-42084.) This is an error in the draft regulations that needs to be corrected.

References to “PRO” and “producer” appear repeatedly in sections 42080-42084 of the Public Resources Code, the SB 54 enforcement statutory provisions. There is no reference to local jurisdictions. In section 42080, “entity” is used to refer to PRO,

producer, wholesaler, and retailer. When in section 42081 there is a reference to “any entity,” the statute goes on to provide a single exception for small producers, retailers, and wholesalers that are listed in section 42060(a)(5) – with no mention of an exception or extension for certain local jurisdictions or recycling service providers (as in 42060.5(b)), or rural counties/jurisdictions (as in 42060.5(c)), which one would expect to see if they were among the types of “entities” that could be penalized under that section. Producers and PROs are the only specific types of entities mentioned in section 42081. Therefore, “any entity” in section 42081, and all the enforcement provisions of that Article 5, are intended to refer only to producers, PROs, retailers, and wholesalers. There are no other enforcement provisions in the SB 54 statutes.
Again, this error should be corrected.

Response to O-33-3

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment O-73-3, which is substantively the same as this comment.

Comment O-33-4

Topic #3: Categorically Excluded Materials – Section 18980.2

The May 2025 version of the draft regulations added for the first time in the rulemaking process a new pathway for packaging components to be excluded from the law if it is “necessary to comply with rules, guidance, or other standards issued by the [USDA] or [FDA] … to prevent microbial contamination or to maintain the safety or structural integrity of packaging….”

We appreciate the revisions made in section 18980.2(a)(2) of the current version of the draft regulations to clarify these exclusions apply only “if it is not reasonably possible to use other packaging or packaging components…” and requiring that entities must provide rationale to the Department including the conflicting federal regulation and explanation as to why no reasonably possible alternative packaging is available. We also support the addition requiring the Department to review exclusion requests and maintain a public list of determinations.

We understand that this new categorical exclusion is intended to provide further clarity to statute section 42060(b), which, in summary, states that SB 54’s regulations should not conflict with other federal packaging requirements. We believe that should such a conflict arise, producers can utilize the exemption pathway within section 18980.2.4(c)(4), under, for example, (A) unique challenges, (C) health and safety reasons, or (D) materials determined unsafe to recycle.

Unlike categorically excluded materials, exempted materials remain covered under the law, meaning regulated producers must still report and pay fees into the system with a required phase-in plan to ultimately achieve compliance. Exemptions are also limited to two to five years, while excluded materials are permanently removed from the law’s purview. Care must be taken when excluding materials so as not to unintentionally weaken SB 54.

Recommendation:

We urge CalRecycle to remove section 18980.2(a)(2) from the draft regulations and instead rely on the existing exemption process (18980.2.4) for packaging or packaging components used by food or agricultural commodities that are unable to comply with SB 54 due to conflicting federal regulations.

Should the Department determine that section 18980.2(a)(2) must remain in the regulations, we would like to offer the following revisions to improve the current approach:

- Entities should be required to explain why an exemption under section 18980.2.4 does not apply in their case, providing the statutory basis to exclude their packaging or component from the law entirely rather than request an exemption based on unique challenges or health and safety reasons.

The Department must be able to evaluate the basis for applying an exclusion versus an exemption, and redirect requests to a more appropriate pathway when applicable.

Suggested revisions to section 18980.2(a)(2)(A):

"The basis shall identify the specific provision of this Chapter that causes a conflict, cite the conflicting federal regulations or rules, ~~or guidelines~~, and explain why no reasonably possible alternative packaging or packaging component is available and why the exemption pathways outlined in section 189890.2.4 do not apply."

Note: We also recommend removing "guidelines" because federal guidelines are not always compulsory.

- Time limits – Packaging design and recyclability are shifting rapidly as a result of SB 54. As such, materials excluded under section 18980.2(a)(2) should be limited to 2-5 years, just as exemptions are (18980.2.4(g)) and a phase-in plan or rationale for why a phase-in plan is not feasible should be required, similar to section 18980.2.4(c)(4)(A)viii for exemptions.

Innovation and development of responsible end markets will likely create new compliance pathways for materials that are currently unable to meet the requirements of the law. Excluding currently challenged materials from the law indefinitely goes beyond statutory intent, and should future conditions change, there must be a pathway to integrate excluded material back into the law.

Response to O-33-4

CalRecycle partially accepts and partially rejects this comment as described in response to comment I-59-2, which is substantially identical to this comment.

Comment O-33-5

We are also opposed to the addition of language that exempts packaging used for over-the-counter drugs (18980(a)(6). As we understand it, the inclusion of over-the-counter drugs into the list of categorically excluded materials conflicts with the legislature's intent when it enacted SB 54. Over-the-counter drugs already use packaging that is well-suited for source reduction, packaging material changes, and reuse and refill.

Response to O-33-5

CalRecycle rejects this comment for the reasons provided in response to comments O-49-1.

Comment O-33-6

Furthermore, we strongly oppose the regulatory change that exempts the secondary and tertiary packaging of excluded materials (18980.2(b)). We believe that these changes are unnecessary and go beyond the intent of the authors and many stakeholders that negotiated this bill.

Response to O-33-6

Comment rejected. CalRecycle rejects the suggestion to remove section 18980.2(b) because the statute (Public Resources Code section 42041(e)(2)) expressly excludes packaging for certain goods from the definition of "covered material" and defines packaging for any good to include its secondary and tertiary packaging (section 42041(s)(3)). Also, section 18980.2(b) does not purport to affect the scope of exclusions under 18980.2(a)(2). Under the latter provision, packaging is excluded based on conflicts with federal law, not based directly on the goods packaged, and the packaging must satisfy the requirements stated for exclusion, whether it is primary, tertiary, or secondary. Lastly, while the intent of the "authors" is legally relevant to the extent it is expressed in legislative history and can resolve ambiguities in the text of statute, the "intent" of "stakeholders that negotiated this bill" is not legislative history.

Comment O-33-7

Topic #4: Methodology for Recycling Rate Determination – Section 18980.3.2

For new covered material categories with a *pending* recycling rate, it is more rational to presume that they do NOT achieve the required recycling rate under Public Resources Code section 42050(c), rather than that they do meet the rate. Without this presumption, producers could avoid the recyclability requirements by changing to a new form of packaging every year, circumventing the law and unintentionally disadvantaging other producers. It is challenging to determine, and to meet, the recyclability requirements of

SB 54, and new items should not be exempt from going through the process that all the other covered items that have met the required recycling rate have had to go through.

Response to O-33-7

CalRecycle rejects this comment for the reasons stated in response to comment O-78-6.

Comment O-33-8

Topic #5 – Eligibility for Being Labeled "Compostable" – 18980.3.3(c)(5)

AB 1201 prohibits materials from being labeled "compostable" unless they meet specific criteria, including the requirement to be "designed to be associated with the recovery of desirable organic wastes, such as food scraps and yard trimmings, that are collected for composting, unless the product complies with the department's regulations pursuant to subparagraph (B), to the extent the department elects to adopt such regulations." (PRC § 42357(g)(1)(E).)

Section 18980.3.3(c)(5) of the draft SB 54 regulations clarifies that an item is designed to be associated with the recovery of desirable organic waste "if it is desirable organic waste itself or is marketed, labeled, or otherwise sold or distributed in a manner that directs or otherwise causes users of the item to use and discard it with desirable organic waste." This language is too broad. Marketing and labeling can be misleading and are not even mentioned in PRC section 42357(g)(1)(E).

Recommendation:

A potential fix for this issue would be to simply delete the second sentence of section 18980.3.3(c)(5), as follows:

They must satisfy the requirement set forth in subparagraph (E) of paragraph (1) of subdivision (g) of section 42357 of the Public Resources Code concerning association with the recovery of desirable organic wastes. ~~For purposes of this requirement an item is designed to be associated with the recovery of desirable organic waste if it is desirable organic waste itself or is marketed, labeled, or otherwise sold or distributed in a manner that directs or otherwise causes users of the item to use and discard it with desirable organic waste~~.

Response to O-33-8

CalRecycle rejects this comment for the reasons provided in responses to comments I-59-3 and O-78-7.

Comment O-33-9

Topic #6: Definition of Hazardous Waste

The regulations reference the *federal* definition of hazardous waste, and not the California state definition, which is far more protective of public health and the environment. This problematically opens the door to the generation of hazardous wastes that are not considered federally hazardous but should otherwise be considered 'California Hazardous.' This includes more protective toxicity tests, lower thresholds for heavy metals (e.g., lead, copper, zinc), lower thresholds for ignitability, lower thresholds for reactivity and corrosion, and prohibitions on certain chemical products and pharmaceuticals.

A more appropriate definition is the one already existing in Public Resources Code Section 40141, which defines "hazardous waste" for all of Division 30 of the Public Resources Code except where "the context requires otherwise." That section defines "hazardous waste" to include, but does not limit the definition to, RCRA hazardous waste. It also cross-references Health and Safety Code 25117, which includes any wastes that meet criteria adopted by the Department of Toxic Substances Control (DTSC).

The legislature has repeatedly stated, and the courts have upheld, that "it is in the interest of the health and safety of all Californians...to establish a regulatory program that is more stringent than federal law" (Health & Safety Code 25100) when it comes to hazardous waste. In the absence of other statutory direction, the Department must default to California statutory and regulatory definitions when implementing state laws, like SB 54.

Thank you for your consideration of these comments.

Response to O-33-9

CalRecycle rejects this comment for the reasons provided in response to comment O-62-1.

O-34: City of Long Beach (Tory Romero)

Comment O-34-1

Local jurisdiction compliance

Section 18980.11(a) reads: No later than the date the Department first approves a PRO's plan, local jurisdictions and recycling service providers shall satisfy the requirement of subdivision (a) of section 42060.5 of the Public Resources Code that their collection and recycling programs include all covered materials within the covered material categories included in the CMC list pursuant to subdivisions (c) and (d) of section 42061 of the Public Resources Code.

Recommendation: Amend 18980.11(a) to set January 1, 2028 as the date for local jurisdictions and recycling service providers to satisfy the requirement of subdivision (a) of section 42060.5 of the Public Resources Code.

The current draft of regulations provides a timeframe which can vary based on the timeliness of the PRO's plan and the timeliness of the Department's review period. Since the PRO plan must be approved by January 1, 2027, we recommend one year past this date so that local jurisdictions and recycling service providers have a determined date to satisfy their requirements and can plan to make necessary changes to collection programs, contracts, education campaigns, etc and will be adequately reimbursed through the implementation of the PRO plan to feasibly make these changes.

Response to O-34-1

CalRecycle rejects this comment. There is no indication in statute that the Legislature intended for the requirement that local jurisdictions include certain covered material categories in their recycling programs not to take effect until 2028. That timeline would be incongruous, given that recycling rates requirements must be satisfied by January 1, 2028, and that statute required CalRecycle to publish the covered material categories list far in advance of that date. Moreover, the commenter's concerns are adequately addressed by PRC section 42060.5(b), under which a jurisdiction is entitled to an exemption if it cannot practicably comply with 42060.5(a).

Comment O-34-2

Reuse

Section 18980.2.1 (a)(4) currently does not allow for scalable reuse programs that are currently on the market.

Recommendation: Add the following: (C) In either case, if a curbside collection program is made available by a municipality, private hauler, or other collection provider working with or on behalf of the PRO or an Independent Producer, the requirements of this paragraph are satisfied.

Response to O-34-2

CalRecycle rejects this comment for the reasons set forth in response to comment O-84-3.

Comment O-34-3

AD Facility as an Intermediate Supply Chain Entity

The City is concerned that due to how the definition of compostable is determined for

the CMC list, cities which utilize an anerobic digestion (AD) facility to comply with SB1383

requirements will be forced to accept material that can only be processed at a compost facility. AD facilities cannot be classified as a responsible end market for compostable covered materials since compostable packaging products are only designed to break down at industrial compost facilities. Therefore, in order to serve local jurisdictions which currently divert their organic materials to AD facilities, AD facilities must clearly qualify as an intermediate supply chain entity under SB 54. AD facilities will be required to sift out covered materials or send their digestate to a responsible end market to be further processed and composted, due to the inclusion of covered materials, in order to be able to comply with accepting all covered materials. As this is an additional need created by this legislation, the regulations must specifically state that the PRO's budget must fully fund the transport of digestate to compost facilities as it is required by statute that the PRO funds costs needed to implement this chapter instead of burdening local jurisdictions and ratepayers.

Recommendation: Amend section 18980.4(a)(4)(B) by striking the subsection requiring covered materials to fully biologically decompose, and include the following language:

(B) The recycled organic product generated by the entity which receives and processes covered materials or derivative materials will do so according to standards, verified by a third party consistent with the management of other feedstocks to produce a stable product.

Response to O-34-3

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42041(aa), 42041(ad), 42051.1, and 42060, and the recommended change is not necessary to the implementation of the Act. To the extent this comment is concerned with the characterization of anaerobic digestion facilities as responsible end markets, no change is necessary. Section 18980.4(b) of the proposed regulations already clearly and adequately specifies that an entity is an intermediate supply chain entity, and not an end market, with respect to any portion of material that it accepts and transfers to other entities for further processing. Additionally, to the extent this comment recommends revising the proposed regulations to specifically state that the PRO's budget must fully fund the transport of digestate to compost facilities, no change is necessary. The Act, including PRC sections 42051.1(c) and (j)(1)(B), and proposed regulations, specifically section 18980.8(g), already clearly and sufficiently provide for the costs that a PRO or Independent Producer is required to cover under the Act. Additionally, section 18980.4.3(a)(2) of the proposed regulations further requires a PRO or Independent Producer to describe in its plan how it will facilitate material recycling and assist end markets in satisfying the requirements of section 18980.4, including, among other requirements, by providing financial support to local jurisdictions and intermediate supply chain entities. Therefore, the relevant financial support requirements are already addressed in the proposed regulations, and no further change necessary. To the extent this comment recommends amending section 18980.4(a)(4)(B) by striking the requirement for

full biological decomposition, no change is necessary or appropriate. See the responses to comments O-75-12, B-6-5, and O-83-5. The current standard of proposed section 18980.4(a)(4)(B) is reasonable, appropriate, necessary, and consistent with CalRecycle's authority under PRC section 42041(ad).

Comment O-34-4
Eligibility to be Labelled Compostable

Section 18980.3.3(c)(5) regarding criteria required for eligibility to be labeled compostable states, "For purposes of this requirement an item is designed to be associated with the recovery of desirable organic waste if it is desirable organic waste itself or is marketed, labeled, or otherwise sold or distributed in a manner that directs or otherwise causes users of the item to use and discard it with desirable organic waste" However, only items which will truly be composted at the end of their use should be eligible.

Recommendation: change this language to include requirements of AB 1201, include materials which can break down at AD facilities, and remove "or is marketed, labeled, or otherwise sold or distributed in a manner that directs or otherwise causes users of the item to use and discard it with desirable organic waste."

Response to O-34-4

CalRecycle rejects this comment for the reasons provided in responses to comments I-59-3 and O-78-7. Also, the suggestion that the proposed regulations should "include requirements of AB 1201" is nonsensical because section 18980.3.3(c) and its subparts do so. Regarding the suggestion to "include materials which can break down at AD facilities," no change is necessary because nothing in the proposed regulations categorically excludes those (or any) materials from satisfying the criteria for being eligible for being labeled "compostable."

Comment O-34-5
Categorically Excluded Materials

Section 18980.2(a) defines packaging that is not covered materials regulated under SB54. As currently written, the exclusions in this section are overly broad and exclude most food packaging including primary, secondary, and tertiary pieces which are included for food safety and regulated under FDA and FSMA regulations. This section states, "In accordance with paragraphs (1) and (2) of subdivision (b) and with subdivision (d) of section 42060 of the Public Resources Code, packaging or packaging components used by a food or agricultural commodity (without regard to its origin) if it is not reasonably possible to use other packaging or packaging components to comply with regulations, rules, or guidelines issued by the United States Department of Agriculture or the United States Food and Drug Administration. A determination of exclusion pursuant to this paragraph may consider standards to prevent microbial contamination or to maintain the safety or structural integrity of packaging under the

Food, Drug, and Cosmetic Act; the FDA Food Safety Modernization Act; the Poultry Products Inspection Act; the Federal Meat Inspection Act; the Egg Products Inspection Act; or other applicable food or agricultural regulations, rules, or guidelines "

Recommendation: Lead oversight of categorically excluded materials to guide producers to packaging that would be included in SB54 instead of remaining as single-use waste. Part of the statement above: "..if it is not reasonably possible to use other packaging or packaging components to comply with regulations, rules, or guidelines issued by.." highlights an important component – there are other packages which are available and can be included as a covered material. The goal should be to not undermine the funding mechanism of SB54 – producer's financial responsibility incentivizes a shift towards low waste solutions. The regulations as drafted currently allow most food packaging to be excluded which will have grave impacts on the funding mechanism. Additionally, this will cause ongoing consumer confusion, ongoing contamination issues, and ongoing high disposal costs.

Recommendation: The following additional packaging is recommended to remain in scope, as developed by Mark Dargay, Director of Regulatory Compliance of Comprehensive Food Safety and National Stewardship Action Council member:

"As written, this framework has the potential to significantly reduce the applicability of SB54 to much of the food sector. While certain tertiary or display-related packaging may remain within scope, the vast majority of packaging used to protect food safety and shelf stability would likely fall under exclusions. This interpretation could substantially limit the regulation's intended impact on packaging reduction and recycling within the food industry.

Packaging remains in scope if it meets any of the following:

1. Marketing/Display Only – Secondary or tertiary packaging primarily designed for shelf

presentation, branding, or consumer appeal (e.g., multipack sleeves, decorative

wraps).

2. Logistics Convenience – Outer cases, trays, or shrink wraps used for bundling,

shipping efficiency or retail handling where food safety is not compromised by

Elimination

3. Excessive Redundancy – Layers of packaging that do not materially contribute to product protection or shelf stability.

4. Non-Regulatory Features – Components added for consumer convenience (e.g., resealable overwraps, promotional inserts) without a direct safety requirement."

Response to O-34-5

Comment partially rejected and partially accepted. CalRecycle rejects the commenter's first recommendation because CalRecycle cannot parse the phrase "[l]ead oversight of categorically excluded materials." CalRecycle cannot discern what regulatory change that phrase advocates for. Similarly, the phrase "included in SB54 instead of remaining as single-use waste" does not scan because the statute does not prohibit "single-use" materials. The commenter may have intended to propose that the regulations not exempt packaging for which alternatives that can comply with SB 54 and all federal requirements are available. However, that is exactly the effect of 18980.2(a)(2).

Regarding the second recommendation, the commenter quotes a portion of comment I-33-3 and then paraphrases the suggestions in that comment for the types of packaging that should not be exempt. CalRecycle therefore rejects the second recommendation for the reasons stated in response to that comment.

CalRecycle accepts this comment, however, to the extent it alleges that section 18980.2(a)(2) was unclear in scope or effect, was insufficiently clear with regard to what renders it "not reasonably possible" to resolve conflicts with federal laws, or would have been overbroad in effect due to the potential for the exclusion to be applied despite the conflicts being avoidable. See CalRecycle's response to comment I-19-1, explaining the revisions responsive to this and similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

O-35: CALPIRG Education Fund & Environment California Research and Policy Center (Jenn Engstrom)

Comment O-35-1

October 7, 2025

CalRecycle Director Zoe Heller
Department of Resource Recycling and Recovery
1001 I Street | Sacramento, CA 95814

Re: Request to impose strong regulations for the Plastic Pollution Prevention and Packaging Producer Responsibility Act (SB 54)

Dear Director Heller,

CALPIRG and Environment California were both proud to support the passage of the Plastic Pollution Prevention and Packaging Producer Responsibility Act (SB 54) to

address our growing plastic pollution crisis. We understood then that if well-implemented, SB 54 could reduce plastic pollution and litter, protect public health, improve reuse and recycling, and lower costs for all Californians.

We worry now that the critical intentions of this law–which thousands of Californians support–are at risk.

We understand this is both a meaningful and complex policy, and we appreciate your work developing the regulations. However, several provisions in the new draft regulations are inconsistent with the governing statute established by SB 54 and exceed CalRecycle's authority under the law.

Californian consumers want alternatives to wasteful packaging and single-use plastic products. We've had thousands of conversations with Californians at their doors, at community events, and on campuses - what we've heard loud and clear is that Californians want solutions to waste. They understand that their own decisions to be "responsible" consumers are not sufficient to solve the problem at hand, and they want government and industry to take responsibility for the systemic changes needed to make less wasteful, less polluting packaging the norm, not the exception.

Ensuring SB 54 is enforced with strong regulations is the best forum we have for achieving this transition quickly.

We are incredibly disappointed by the changes that weaken protections against harmful chemical recycling. The language of SB 54 and the previous regulations were clear that technologies were prohibited if they created more hazardous waste than mechanical recycling. Unfortunately, the current regulations make the prohibition more vague and moot with a permit. This is not how we should be protecting our communities from harmful technologies.

Chemical recycling technologies, sometimes called "advanced recycling," are expensive, inefficient, and hazardous to human and environmental health. Plastics-to-fuel facilities do not turn plastic into new plastic, do not reduce demand for virgin plastics, and produce fossil fuels that are plastic into new plastic, do not reduce demand for virgin plastics, and produce fossil fuels that are sometimes burned, contributing to air pollution and global warming. Even technologies that could, in theory, convert plastic waste to new plastics pose major threats to our environment and health, as they often release carcinogenic chemicals into the air.

CalRecycle should strengthen the regulations so that only real recycling technologies are allowed in our state, not chemical recycling. Failing to do so risks the health of Californians and threatens to undermine the key intent of this law: to greatly reduce the amount of plastic we are producing and discarding into our environment, and to protect our communities from the environmental and health impacts of plastic production and disposal.

Response to O-35-1

CalRecycle rejects this comment's suggestion that "chemical recycling" be banned outright in the regulations. A complete ban on any technology could have been accomplished through straightforward language establishing a prohibition based solely on the type of technology. Instead, the Legislature chose to word statute in a way that requires consideration of hazardous waste generation, not mere consideration of the type of technology.

See, also, CalRecycle's responses to comments O-6-1 and O-62-1.

Comment O-35-2

Additionally, we are concerned that the new, broad exemptions excluding food packaging "necessary to comply with rules, guidance, or other standards issued by the United States Department of Agriculture or the United States Food and Drug Administration" risks creating major unintended loopholes. This exclusion will deal a massive blow to the intent of the law and unnecessarily limit the amount of waste this law can prevent. Entire categories of food, agricultural, and over-the-counter drug packaging should not be excluded carte blanche. Producers seeking exclusion should be required to provide detailed verification subject to public notice and comment. Any exclusions granted should be time-bound. Without these changes, we fear much of the plastic waste this law was passed to prevent will continue to fill our landfills and litter our communities.

Response to O-35-2

CalRecycle partially rejects and partially accepts this comment as described in response to comment O-111-2, which is substantively the same as this one.

O-36: CALPIRG Education Fund, CALPIRG Students, Environmental Action, Environment CA Research & Policy Cen (Fiona Hines)

Comment O-36-1

October 6, 2025

Zoe Heller, Director
Department of Resource Recycling and Recovery
1001 I Street | Sacramento, CA 95814

Re: Request to impose strong regulations for the Plastic Pollution Prevention and Packaging Producer Responsibility Act (SB 54)

Dear Director Heller,

California has an opportunity to greatly reduce plastic pollution scourging our state and set a national example for bold action to address the plastic waste crisis.

If fully implemented, our landmark anti-plastic pollution law, the Plastic Pollution Prevention and Packaging Producer Responsibility Act (SB 54), will reduce plastic pollution and litter, protect public health, improve reuse and recycling, and lower costs for all Californians. However, the current draft regulations to implement the act greatly weaken the law, with broad exemptions for food products and weakened protections against a process known as "chemical recycling."

"Chemical recycling," sometimes called "advanced recycling," is intended to convert plastic waste into fuel or raw materials for new plastic, but it is mostly a new euphemism for an old and dirty practice: incineration. Plastics-to-fuel plants are not recycling, do not reduce demand for virgin plastics, and produce fossil fuels that are then burned, contributing to air pollution and global warming. This is not a solution to the plastic waste crisis and should not be allowed in our state.

California should be a leader in protecting our communities from toxic pollutants and the current regulations do the opposite.

We urge strong implementation of SB 54 that reflects the intent of the law, which is to greatly reduce the amount of plastic we are producing and discarding into our environment, and to protect our communities from the environmental and health impacts of plastic production and disposal.

Sincerely,

The 4,004 below Californians

[The list of names included in the submission is omitted here but available in the original copy of this comment, which is included in the rulemaking file]

Response to O-36-1

CalRecycle rejects this comment for the reasons stated in responses to comments O-6-1, which is substantively similar to this one, and O-62-1. Regarding "incineration," PRC section 42041(aa)(2)(B) expressly excludes that from the definition of "recycling," and nothing in the regulations contradicts that exclusion.

O-37: California State Association of Counties and SWANA CA LTF (Jordan Wells)

Comment O-37-1

On behalf of the California State Association of Counties and Solid Waste Association of North America’s (SWANA) California Chapters Legislative Task Force, we appreciate

the opportunity for engagement during the formal rulemaking period and write with comments on the August 12, 2025 version of the draft regulations.

Section 18980.1. Definitions

The proposed regulations include a definition of “alternative collection”, which is not defined in SB 54. The regulations attempt to differentiate between “curbside collection”, which is defined in SB 54 and “alternative collection”, which is not defined.

Defining “alternative collection” to be distinct from “curbside collection” is helpful, but the definition needs additional language to ensure that it does not supersede local jurisdiction agreements, contracts, or franchises. Allowing “alternative collection” to directly conflict with existing local jurisdiction agreements, contracts, and franchises could lead collectors to cherry-pick materials with high market value and leave the remaining materials for the jurisdiction to collect and finance. This behavior can also result in inconsistent collection of materials when the market value is low. The regulations should specify that “alternative collection” is not “curbside collection”, but the definition should also prohibit “alternative collection” methods and practices to directly conflict with local government agreements, contracts, and franchises. As such, we recommend the following amendment to the proposed definition:

(2) “Alternative collection” means a program that collects covered materials, regardless of whether the covered material is discarded or considered solid waste and regardless of the manner and location of collection, and is not “curbside collection,” as defined in subdivision (g) of section 42041 of the Public Resources Code, because it is not conducted by a local jurisdiction or recycling or composting service provider under contract with a local jurisdiction ***and does not directly conflict with local jurisdiction agreements, contracts, or franchises***.

Response to O-37-1

CalRecycle rejects this comment for the reasons provided in response to comments B-40-2 and B-42-1.

See, also CalRecycle's response to comment O-47-2 regarding effects on franchise agreements.

Comment O-37-2

Section 18980.8. Producer Responsibility Plan

• (g) (4) The process must establish reasonable periods for making determinations pursuant to paragraph (3) and issuing payments, if any.

The regulations should specify that the Producer Responsibility Organization’s (PRO) Producer Responsibility Plan (Plan) must also include the method by which payments will be made to local jurisdictions. The payment schedule should be identified in the regulations and not left up to the PRO to determine in the Plan, and payments should be made on a quarterly basis, at a minimum.

- **(g) (8) For costs determined to be a recycling service provider's covered costs, the PRO or Independent Producer shall notify the local jurisdiction on whose behalf a recycling service provider provides solid waste handling services of such determination. The notice may be the same notice provided to the local jurisdiction pursuant to paragraph (3) and shall, at a minimum, describe the nature and amount of the covered costs.**

Local jurisdictions should receive notice of this determination prior to the payment of covered costs to recycling service providers. Providing local jurisdictions with the opportunity to review this information will help ensure that payments made to recycling service providers do not include recycling service provider costs already recovered in existing contracts with the local jurisdiction.

- **(h) - Dispute Resolution Process**

This section should also include disputes related to the amount that a local jurisdiction claims for payment by the producers or PRO as "covered costs."

Response to O-37-2

Comment rejected. Regarding 18980.8(g)(4), no change is required because the requirement that the PRO plan must set forth reasonable periods for covered cost determinations and payments addresses the commenter's concerns. That element of PRO plans, just like very other element of plans, are subject to CalRecycle's approval. That approval will be subject not just to the specifics provided in regulations; they are also subject to provisions of the statute itself, some of which might not have required clarification or interpretation via regulation. For example, considered as a whole, a PRO plan and the associated budgets must:

• include "[a]ctions and investments that the PRO will implement in order to meet the requirements of this chapter" (Public Resources Code section 42051.1(b);
• show "[h]ow the PRO will meet the requirements of this chapter, including, but not limited to, how it will, in an economically efficient and practical manner, provide for the necessary infrastructure and viable responsible end markets to ensure the covered material will achieve the requirements of Section 42050 based on the needs assessments (Public Resources Code section 42051.1(c)(1)
• how demonstrate how it will be "supplemental to, and not in conflict with, disruptive of, or adversely affective, the performance of the solid waste network providing services in accordance with local solid waste handling requirements and the intent described in Section 40004, and how the PRO will leverage and utilize existing collection programs and recycling, composting, sorting, and processing infrastructure(Public Resources Code section 42051.1(b)(c)(3)(A);
• demonstrate "how the plan will be implemented in a manner utilizing solid waste collection programs and solid waste facilities as the designated system for the curbside collection and processing of covered material" (42051.1(b)(c)(3)(B);
• include "efforts to use education and promotion to encourage proper participation in recycling and composting collection [and] ensure coordination between these efforts and existing educational and promotional efforts" (Public

Resources Code section 42051.1(e); and
• address how the PRO program will "fully fund the costs necessary to implement this chapter," including those "associated with this chapter incurred by local jurisdictions, recycling service providers, and other collection programs," with such costs including "costs related to both curbside and noncurbside collection programs" (Public Resources Code section 42051.1(j)(1)(B)).
CalRecycle's review of a PRO plan necessarily considers the above requirements, and that consideration, which will be informed in party by comments provided by the advisory board and the public, provides the context for its evaluation of whether the plan provides "reasonable periods" for covered cost determinations and payments. In that context, CalRecycle can assess whether the process required by Public Resources Code section 42051.1(g)(1) includes periods that are objectively reasonable.
Regarding 18980.8(g)(8), no change is necessary because section 18980.8(g)(8) already requires the suggested process: notice is provided to the local jurisdiction when the determination of covered costs are made; that determination necessarily happens before payment is made. Also, as explained above and in response to comment I-51-1, the statute provides mechanisms for preventing harm that may result from costs associated with existing contracts.
Regarding 18980.8(h), no change is necessary because subdivision (h) addresses precisely the disputes described by the commenter: those concerning a local jurisdiction's claims of costs that are "covered costs."

Comment O-37-3

Section 18980.13.2. Administrative Civil Penalties

• (a) Any entity, such as a PRO, producer, local jurisdiction, recycling service provider, retailer, or wholesaler, not in compliance with the Act or this chapter is subject to penalties pursuant to subdivision (a) of section 42081 of the Public Resources Code. If a PRO acting on behalf of its participants causes participants to be in violation of the Act or this chapter, such participants shall not be exempt from penalties on the grounds that their noncompliance was caused by the PRO's conduct.The proposed regulations are predicated on the assumption that the term "any entity" in Public Resources Code (PRC) 42081(a)(1) broadens the scope of its enforcement authority; however, that term should be defined in context of the other provisions included in Article 5 of SB 54. PRC 42081 seeks to interpret and implement PRC 42080 and does not vest CalRecycle with additional authority to determine what constitutes a violation of SB 54 beyond the scope of PRC 42080.

PRC 42080 establishes what constitutes a violation of SB 54 and provides that failure to comply with the requirements of SB 54 will subject a PRO, producer, wholesaler, or retailer to penalties for those violations or revocation of an approved plan. PRC 42081 in turn:
o Sets the amount of penalties;
o Provides that they shall not accrue against a producer or PRO until 30 days after notification of the violation;

o Allows a producer or PRO to submit a corrective action plan to CalRecycle for approval detailing how and when it will come into compliance with SB 54; and,
o Sets forth various factors CalRecycle shall consider when determining the penalty amount, including whether the violation was beyond the reasonable control of the producer or PRO, the size and economic condition of the producer or PRO, etc.

PRC 42083 and 42084 also allows CalRecycle to impose additional requirements on a producer or PRO for failure to meet various requirements of SB 54.

Response to O-37-3

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process. To the extent other portions of the submission do suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-37-4

Great lengths are taken in statute to outline the potential enforcement actions that can be imposed against producers or the PRO, yet there is not a single instance in statute that refers to enforcement upon local jurisdictions or recycling service providers. Neither PRC 42080 nor PRC 42081 contemplate penalties against local governments or recycling service providers. Furthermore, the proposed regulations would have inappropriately subjected local jurisdictions and recycling service providers to even more severe consequences for violations of SB 54 than apply to the PRO and producers since local governments and recycling service providers cannot implement a corrective action plan, as is available for the PRO and producers. It is difficult to imagine the Legislature providing a more lenient compliance pathway for a producer or PRO than that which would be available to a local jurisdiction or recycling service provider, given that the law is intended to shift the burden of solid waste recycling away from local jurisdictions and onto producers who introduce packaging into the marketplace.

Local jurisdictions are subject to AB 939's diversion requirements and must develop source reduction and recycling elements outlining how they will achieve the state's solid waste and recycling requirements. Under the AB 939 framework, CalRecycle is required to regularly review jurisdictions and determine whether they have made a good faith effort to implement their source reduction and recycling element, with penalties of up to $10,000/day for noncompliance. Therefore, a local jurisdiction's failure to comply with SB 54 should be considered a violation of their existing requirements to implement diversion programs through AB 939 and subject them to these penalties exclusively.

Reporting and compliance review for SB 54 should be incorporated into CalRecycle's existing Electronic Annual Report (EAR) system, as currently utilized for other laws that govern local jurisdiction diversion requirements such as SB 1383, AB 341, and AB 1826 compliance. This existing system can be updated to require local jurisdictions to self-report SB 54 compliance by certifying whether they collect the required recyclable or compostable covered material categories.

Considering that the PRO is responsible for reimbursing local governments for SB 54 implementation costs, failure to include all covered materials in local collection and recycling programs is a strong indication that the local jurisdiction has not made a good faith effort to implement its diversion programs. This existing process is ideal, as it affords a more holistic review of the jurisdiction and considers whether certain extraneous factors impacted the jurisdiction's compliance, including whether the PRO failed to reimburse the jurisdiction for its implementation costs.

Response to O-37-4

Comment rejected. CalRecycle rejects this comment for the reasons stated in response to comment I-59-8, which is substantively the same as this comment.

O-38: Nixon Peabody LLP (Chris Schlag)

Comment O-38-1

On behalf of multiple manufacturing clients operating across the industrial and business-to-business ("**B2B**") sectors that do business within California, we are providing comments on CalRecycle's proposed regulations to implement California's Plastic Pollution Prevention and Packaging Producer Responsibility Act ("**SB 54**") ("**Proposed SB 54 Implementing Regulations**" and "**Proposed Regulations**").

We appreciate and support the State's commitment to reducing plastic pollution and enhancing circularity, as well as share a common goal of achieving responsible, long-term solutions for the management and disposal of packaging materials. We are, however, concerned that CalRecycle's Proposed SB 54 Implementing Regulations introduce significant, novel, and unreasonable Extended Producer Responsibility ("**EPR**") compliance burdens, particularly for industrial and B2B manufacturers. As discussed in greater detail below, the proposed regulations do not adequately account for the complexity and diversity of manufacturing supply chains, logistics, and distribution activities. They also establish entirely new compliance obligations that extend well beyond both California's borders and the legislative intent of SB 54. If adopted in their current form, these regulations impose disproportionate operational and financial burdens on affected businesses and delegate substantial regulatory authority and oversight to non-governmental entities, with limited mechanisms for accountability, fairness, or transparency.

I. SB 54 Targets Single-Use Packaging, Not B2B or Industrial Materials

SB 54 was enacted with the express purpose of addressing the environmental and public health impacts of certain types of packaging and food service ware, with a particular emphasis on postconsumer single-use plastic items.1 The Legislature deliberately focused on consumer-facing materials, as reflected in SB 54's

___

1. See e.g., Senate Bill No. 54, Legislative Counsel's https://leginfo.legislature.ca.gov/faces/billTextClient.xhtml?bill_id=202120220SB54.

___

plain language, which defines "single-use packaging" and "plastic single-use food service ware" as materials that are routinely recycled, disposed of, or discarded ***by the user or consumer*** after their contents have been used or unpackaged.2 The term "consumer" appears in SB 54 a total of 42 times,3 most often in the context of describing the impacts of single-use items encountered by consumers and underscoring the State's goal to reduce confusion and improve recycling outcomes for consumer-facing packaging. Notably, there is no explicit mention in SB 54 of any legislative intent or desire to regulate materials that are not consumer-facing or are not single-use.

The term "covered material" is specifically defined in SB 54 to include "single-use packaging that is routinely recycled, disposed of, or discarded after use, and ***is not*** typically ***refilled*** or ***reused*** by the producer." The definition was also carefully constructed to exclude certain types of packaging from its requirements, including:

 Packaging used for federally regulated products, such as medical products, devices, and prescription drugs, animal medicines and drugs, infant formula, medical food, fortified nutritional supplements, insecticides, rodenticides, fungicides, hazardous materials, hazardous or flammable products, and beverage containers subject to the California Beverage Container Recycling and Litter Reduction Act ("**Bottle Bill**").

 Packaging for long-term protection or storage, and paint covered by the paint recovery program.

 Packaging materials that do not undergo separation from other materials at a commingled processing facility, are **recycled at a responsible end market**, and have **demonstrated recycling rate**.4

Therefore, a straightforward reading of SB 54 and its legislative history makes clear that the EPR obligations established by the law were intended to focus on single-use packaging and food service ware primarily encountered in the consumer context. Legislative analyses for SB 54 also repeatedly emphasize the issue of single-use consumer items.5 Consistent with this focus, SB 54 was not intended to regulate packaging that is designed for or primarily used in B2B, industrial, or manufacturing settings, especially where such packaging is not single-use or does not enter commingled consumer waste streams.

II. CalRecycle's Proposed Regulatory Definitions Overstep SB 54 by Expanding EPR to B2B and Industrial Materials

CalRecycle's definitions in the Proposed SB 54 Implementing Regulations for "producer," "covered material," and, most notably, "consumer," significantly broaden the scope of SB 54 beyond its intended focus on "single-use" items. For example, the

Proposed Regulations define “consumer” as “the end user of an item, **or the last person in the supply chain who acquires and uses an item**.” 6 The Proposed Regulations would further clarify that a “consumer” may include a retailer that uses a covered item in its business operations—regardless of whether the item is single-use, consumer-facing, or ultimately returned to a manufacturer or distributor for refilling or reuse.

___

2. See id. See also e.g., Assembly Committee on Natural Resources Hearing and Analysis on SB 54, (Jun. 26, 2022), https://leginfo.legislature.ca.gov/faces/billAnalysisClient.xhtml?bill_id=202120220SB54#.

3. SB 54 also states “It is the intent of the Legislature to establish a producer responsibility program designed to ensure that producers of single-use packaging and food service ware covered by this program take responsibility for the costs associated with the end-of-life management of that material and ensure that the material is recyclable or compostable. This standardization will reduce consumer confusion regarding recycling and composting, reduce costs to rate payers, and increase system efficiency.”

4. See Senate Bill No. 54; Cal. Pub. Resource Code § 42041(e). See also generally, Senate Bill No. 54 Bill Analysis, https://leginfo.legislature.ca.gov/faces/billAnalysisClient.xhtml?bill_id=202120220SB54 (with reports from the Assembly Appropriations, Assembly Floor Analysis, Senate Floor Analyses, Assembly Natural Resources, Senate Floor Analyses, and Senate Environmental Quality discussing the intent and purpose of SB 54).

5. See generally, Senate Bill No. 54 Bill Analysis, supra n. 2.

6. See Section 18980.2.1(a)(B)(Proposed).

___

CalRecycle’s proposed definition diverges from the widely accepted understanding of “consumer” as being an individual who purchases goods for personal, household, or non-commercial use.7 CalRecycle’s approach also sharply contrasts with how the Legislature consistently referred to “consumers” in SB 54. This expanded definition of “consumer,” together with the proposed regulatory definitions for “producer” and the producer identification hierarchy, would extend EPR requirements to packaging materials that are not single-use and are used exclusively in business or industrial contexts. These types of materials simply were not the focus of SB 54 and should not be subject to EPR requirements.

Expanding these definitions to allow EPR obligations to attach to non-single-use and non-consumer-use materials would fundamentally alter the scope of the State’s EPR program, imposing significant and unintended regulatory burdens on manufacturers that

were never meant to be covered. This approach is also inconsistent with the legislative history of SB 54 and diverges from how other states have implemented similar EPR programs, resulting in regulatory inconsistency, increased administrative burden, and logistical challenges for manufacturers operating both within and outside California.8

CalRecycle should revise all relevant regulatory definitions in the Proposed Regulations to align with the intent of SB 54 and provide regulatory clarity. In particular, the definition of "consumer" should be updated to reflect the generally accepted meaning of the term—namely, an individual who purchases goods for personal, household, or non-commercial use. This revision would appropriately refocus the scope of materials subject to EPR on single-use packaging and food service ware that are primarily encountered in the consumer context, consistent with the Legislature's original intent.

III. CalRecycle's Proposed Regulations Blur the Scope of EPR Requirements for Industrial and B2B Packaging Materials

CalRecycle's Proposed SB 54 Implementing Regulations provide definitions that suggest packaging used exclusively in B2B transactions for shipping and logistics, such as shrink wrap, pallet wrap, protective foams, and corrugated materials, could fall within the definition of "covered material." These materials are specifically designed for the transport and protection of goods between manufacturers, distributors, and retailers, and are not generated or handled by individual consumers or households. Unlike consumer-facing packaging, B2B packaging serves a distinct purpose, follows a separate distribution pathway, and is managed through commercial end-of-life systems. These materials are also not intended for, nor typically encountered by individual consumers or households.

In other jurisdictions with EPR programs, such as Oregon and Colorado,9 industrial and B2B packaging materials are explicitly excluded from EPR requirements due to their unique role in the supply chain and their typical reuse, on-site recycling, or management through established B2B channels. In contrast, CalRecycle's hierarchy for determining producer status and definitions in the Proposed Regulations suggest that industrial and B2B packaging, including materials that may be refillable or reusable, are

___

7. The definition also departs from how California has defined "consumer" under other state laws. For example, under the California Consumer Privacy Act ("**CCPA**"), a consumer is defined as a natural person who is a California resident. This broad definition includes any individual who resides in the state for a non-temporary purpose or is a domiciliary of the state and temporarily away, but notably excludes legal entities like corporations, which do not have personal data privacy rights under the CCPA. The proposed definition here also conflicts with California's use of "consumer" in connection with regulated consumer products, which are generally considered to be a tangible item or product component produced or distributed for sale to a consumer for personal, family, or household use. See CA Health & Safety Code § 108042 (2024).

8. For example, both Oregon and Colorado have expressly excluded certain B2B and industrial-use materials (e.g., pallets) in their EPR frameworks. See Colorado's Producer Responsibility Program for Statewide Recycling Act (HB 22-1355) and Oregon's Plastic Pollution and Recycling Modernization Act (SB-582B), and corresponding implementing regulations ORS 459A.863(6)(b)(D)-(E) and CO Rev Stat § 25-17-703(13)(b)(VI) (2024), respectively.

9. For example, Oregon's EPR Program excludes packaging materials used in industrial settings and manufacturing through language in ORS 459A.863(6)(b)(D)-(E) stating a "covered product" does not include "[r]igid pallets used as the structural foundation for transporting goods lifted by a forklift, pallet jack or similar device," and "[s]pecialty packaging items that are used exclusively in industrial or manufacturing processes." Colorado's EPR Program similarly excludes "[p]ackaging material used exclusively in industrial or manufacturing processes," from its definition of "covered products" in CO Rev Stat § 25-17-703(13)(b)(VI) (2024).

___

subject to EPR requirements when classified as "secondary" or "tertiary" packaging.10

This result is further complicated by CalRecycle's producer identification framework, which introduces different producers for industrial and B2B packaging materials based on branding, contractual relationships (e.g., licensor vs. licensee), product use, occurrence of sale or distribution in California, the "consumer" definition, and when packaging is added to a product.11 CalRecycle's producer identification framework and approach result in a clear inference that commercial, non-single-use, and non-consumer packaging, which is used solely in manufacturing settings may have EPR requirements. Further, the materials may have different designated producers at various times, even when these materials are circulated between business entities in a value chain as part of a circular system. This approach can create significant confusion over material management responsibilities and result in unintended consequences, including potentially reducing the current circular system and creating additional waste, particularly for secondary and tertiary packaging components that are not single-use. For example, by blurring the application of EPR requirements to industrial and B2B materials, CalRecycle risks unintentionally disincentivizing established circular programs and take-back initiatives that are already effective within the business sector. Imposing EPR fees on these materials could lead to duplicative material management costs and may prompt businesses to discontinue voluntary circular or take-back programs under the assumption that these materials are now the responsibility of the EPR system. This outcome would undermine existing, efficient recycling and reuse systems, contrary to the broader goals of SB 54.

Including B2B packaging within California's EPR framework would not only depart from national and international norms but would also run counter to the legislative intent of SB 54, which was designed to address consumer-facing, single-use items entering municipal waste streams—not industrial transport packaging. Additionally, extending EPR obligations to these materials would exceed SB 54's intended scope and impose

significant compliance costs and operational burdens on manufacturers, many of whom lack control over the materials' end-of-life. It would also risk diverting resources away from SB 54's core goals of reducing plastic pollution, enhancing recyclability, and advancing a circular economy for singleuse consumer items. Other EPR programs recognize the importance of keeping business materials such as shrink wrap, pallet wrap, protective foams, and corrugated materials outside the definition of "covered material" to continue incentivizing circularity and B2B take-back initiatives.12

For these reasons, we respectfully urge CalRecycle to revise the regulatory definitions to expressly exclude B2B and industrial packaging materials from the definition of "covered material," in alignment with the intent of SB 54 and consistent with established best practices in other EPR jurisdictions.13 In addition, we recommend that CalRecycle revise the proposed producer hierarchy and its overall approach to identifying "producers" and "covered materials" to promote regulatory clarity and ensure alignment with the statute's consumer-facing focus. In particular, the regulations should be simplified to allow manufacturers to readily determine their compliance obligations and to avoid unintended inclusion of materials already managed through effective, closed-loop commercial systems. This clarity is essential to preserve and support existing circular systems for B2B and industrial packaging, while maintaining SB 54's focus on reducing waste from single-use packaging and improving outcomes within the municipal waste stream.

IV. CalRecycle's Proposed Regulations Improperly Delegate Core Regulatory Functions to a Non-Governmental Entity

CalRecycle's Proposed SB 54 Implementing Regulations grant significant authority to the State's approved Producer Responsibility Organization(s)("**PROs**") to administer key elements of the program, including

___

10. "Secondary" and "tertiary" packaging are not, however, defined in the Proposed Regulations.

11. See Section 18980.1.1(Proposed).

12. See e.g., Oregon's Plastic Pollution and Recycling Modernization Act (SB-582B), and corresponding implementing regulations ORS 459A.863(6)(b)(J) and ORS 459A.869(13), which allow for an exclusion and exemption of industrial and B2B materials that do not undergo separation at a commingled processing facility; and are further used or recycled responsibly.

13. See e.g., supra n. 8.

___

authority that in many respects amounts to regulatory oversight and decision-making.14 For example, under the Proposed Regulations, PROs are able to design all elements of

the stewardship plan for EPR data collection, reporting, and fee assessments, as well as coordinate determinations of exempt materials and use of responsible end markets.15 While PROs are intended to serve as administrative entities supporting the State's implementation of SB 54, the Proposed Regulations risk shifting too much governmental and quasi-regulatory power to these private or non-governmental entities, without sufficient checks and balances or meaningful opportunities for producer input and review. Key concerns with the Proposed Regulations' approach include:

 PRO Obligations and Responsibilities Exceed Appropriate Delegation. Under CalRecycle's Proposed Regulations, the PRO is primarily responsible for reviewing producer compliance with EPR requirements, including the identification of material exemptions, evaluation of whether materials meet recyclability or compostability criteria, and approval of selected responsible end markets. This framework effectively positions the PRO to interpret and apply regulatory standards—functions that are fundamentally governmental in nature and more appropriately reserved for CalRecycle. Currently, there is no clearly defined process for producers to challenge or appeal a PRO's determination, nor is there an explicit role for CalRecycle to ensure that exemption evaluations are conducted fairly and consistently across all sectors.

 Restriction of Access to Exemption Processes for Independent Producers. The Proposed Regulations appear to allow only PROs, or, in limited cases, approved independent producers, to submit material exemption requests. This restriction effectively forces producers to rely on a PRO as the gatekeeper for regulatory relief, even where the PRO may have conflicting interests or where a minority of producers may have legitimate concerns not represented by the majority within the PRO. Such a system limits fair and equal access to administrative processes and introduces the risk that producer interests will be subordinated to internal PRO politics or majority rule.

 Lack of Accountability or Oversight Mechanisms for PROs. Perhaps most concerning, the Proposed Regulations do not establish meaningful accountability structures for PRO administration. Producers who are members of a PRO currently have no clearly defined process for raising grievances, challenging PRO decisions, or petitioning CalRecycle to intervene in cases of mismanagement, bias, or failure to meet statutory objectives. Nor is there a process by which minority producers—those whose voices may be marginalized within a PRO—can ensure their concerns are heard and addressed. Additionally, there is no clear regulatory pathway for the removal or replacement of a PRO that fails to meet its obligations or does not represent the interests of a sizable portion of its members. Given the scope of authority delegated to the PRO, this is a serious gap in governance and oversight that must be addressed.

To ensure alignment with the intent of SB 54 and uphold regulatory integrity, we respectfully urge CalRecycle to reconsider the extent of authority delegated to PROs. CalRecycle should retain final decision-making authority over all regulatory determinations, including exemption approvals and responsible end market designations. The regulations should be revised to allow all producers—regardless of PRO affiliation—to directly submit material exemption requests to CalRecycle.

Additionally, the PRO framework must include a clear and formal grievance and appeals process, enabling producers to challenge PRO decisions or raise concerns about PRO administration directly with CalRecycle. To promote effective, fair, and transparent administration, CalRecycle should establish robust accountability and transparency standards for PROs, including requirements for regular reporting, stakeholder engagement, and independent third-party audits.

Finally, CalRecycle's regulations should provide a mechanism for the agency to review and, if necessary,

___

14. See Section 18980.6(Proposed).

15. See id.

___

decertify or replace a PRO that fails to meet its obligations or does not fairly represent the interests of its members. By incorporating these accountability measures, CalRecycle can ensure that SB 54 is implemented in a manner that is fair, transparent, and consistent with the statute's objectives, without ceding undue regulatory authority to entities that lack direct public oversight.

V. Industrial Producers May Be Unprepared for Imminent Compliance Requirements

CalRecycle's Proposed Regulations impose highly accelerated compliance timelines for producer registration, reporting, and fee payments, some of which are triggered as soon as 30 days after the regulations take effect. While such urgency may be manageable for consumer-facing producers clearly anticipated to fall within the scope of SB 54, applying these same timelines to industrial and B2B packaging—much of which is not single-use—would create substantial and unintended compliance burdens.

As noted in earlier comments, including materials such as industrial shrink wrap, pallet wrap, protective shipping foams, and similar transport packaging within the definition of "covered material" would effectively bring entire sectors of industrial and commercial manufacturers into the SB 54 framework. These producers, who have operated under the reasonable understanding that their materials fall outside the scope of a law focused on consumer-facing, single-use packaging, would suddenly be subject to complex new obligations.

Under the proposed timelines, these newly affected producers would be expected to:

 Determine whether their materials fall under the newly defined scope of "covered material";
 Trace packaging components across complex, global supply chains;

 Establish systems for data collection, reporting, and EPR fee payment, despite having had little or no prior engagement with the SB 54 regulatory development process.

This abrupt shift, coupled with aggressive deadlines, creates a significant risk of confusion, noncompliance, and disproportionate economic impacts, particularly on sectors that were not part of stakeholder consultations and were never intended to be the focus of SB 54.

If CalRecycle elects to retain the current definitions of “covered material,” the producer hierarchy framework, and the associated processes for identifying regulated entities and packaging types, we strongly urge the Department to include a phased compliance schedule for non-single-use, industrial, and B2B packaging materials.

Such a phased approach would allow:

 Adequate time for affected producers to understand their obligations;
 The development of appropriate internal systems and supply chain coordination mechanisms;
 Better alignment with SB 54’s original intent and the practical realities of managing industrial packaging flows.

Incorporating a phased timeline would help mitigate unintended regulatory burdens while preserving the integrity and enforceability of SB 54’s core objectives.

VI. Conclusion and Recommendations

We appreciate CalRecycle’s efforts to implement SB 54 and share the State’s commitment to reducing plastic pollution and improving recycling systems. However, the Proposed Regulations, as currently drafted, significantly expand the scope of SB 54 beyond its intended focus on consumer-facing, single-use packaging. This overreach risks unintended compliance burdens on industrial and B2B manufacturers, disrupts existing circular systems, and delegates excessive regulatory authority to PROs without adequate oversight or accountability.

To ensure effective and equitable implementation, we respectfully urge CalRecycle to:

1. Revise definitions to clearly exclude industrial and B2B packaging from EPR requirements;
2. Align the definition of “consumer” with its plain meaning of an individual who purchases goods for personal, household, or non-commercial use;
3. Retain regulatory authority within CalRecycle, with direct access for all producers to request exemptions;
4. Establish transparent accountability mechanisms for PROs; and
5. Adopt a phased compliance schedule for newly affected materials.

We remain committed to supporting the successful implementation of SB 54 and believe these changes are necessary to preserve SB 54's integrity, prevent regulatory overreach, and support California's environmental goals without undermining responsible business operations. We welcome continued engagement on these matters through Advisory Board meetings, this public commenting period, or further direct discussions with CalRecycle.

Response to O-38-1

Regarding the assertion that the law should only apply to items "primarily encountered in the consumer context," CalRecycle rejects that interpretation because the statute expressly, repeatedly states otherwise. In particular, section 42041(s)(3) expressly incorporates "tertiary packaging intended to protect the product during transport," with no limitation that it only applies to the end users of the contents of the packaging. Moreover, as the commenter acknowledges, the definition of packaging expressly encompasses items used by the producer "for the user or consumer," not just consumers (section 42041(s) and (s)(1). Even more, there is no legal reason to limit the word "consumer" only to apply to natural persons and not businesses. Any time packaging is ultimately discarded by a business, that business was the consumer of that packaging; there can be no other "consumer" or "user" of that packaging. Lastly, the definition of "reusable"/"refillable"/"reuse"/"refill" obliterates the commenter's interpretation of "single-use": That definition establishes when packaging can be considered not "single-use" and unambiguously applies to packaging "reused or refilled by a producer," not just items reused or refilled by users or consumers. Therefore, packaging used or filled by a producer but not reused or refilled by them, as such action is defined in section 42041(af)(1), would necessarily be "single-use"; If the statute did not apply to such packaging, section 42041(af)(1) would have no relevance to what is single-use and therefore covered material. Given all these statutory provisions, the commenter's reading of statute is not plausible.

Sections II and III of the commenter's submission make essentially the same assertion: that the law does not cover packaging used in the "B2B" or industrial context. CalRecycle rejects that assertion for similar reasons. There is no logical reason why a business would not be neither the "consumer" nor the "user" of packaging that is consumed (i.e., used and discarded) by that business. Reading the statute otherwise would omit an enormous amount of packaging—essentially all shipping materials received by businesses—from the scope of the law.

CalRecycle also rejects the core assertion of section IV of the commenter's submission, that the regulations improperly delegate functions to a non-governmental entity. This section identifies no particular statutory provisions to support its assertions, instead offering conclusory statements about what is "appropriate." The comment does advance three proposals: allowing producers to directly submit exemption requests to CalRecycle, establishing a "grievance and appeals process" before CalRecycle, and providing a "mechanism for [CalRecycle] to decertify or replace a PRO that fails to meet its obligations or does not fairly represent the interests of its members."

CalRecycle rejects the first proposal because statute authorizes, but does not

require, CalRecycle to grant exemptions under PRC section 42060(a)(3) and (4). Rather than requiring a process for exempting producers, those provisions require CalRecycle to create a "process to identify covered material" for CalRecycle to consider exempting. Nowhere does statute state that the exemptions are to be specific to any producer, so there is no basis for the commenter's assertion that that producers have a right to request them, much less have any exemption personal to them; the "unique challenges" or health and safety reasons are those presented by materials themselves, not those that any certain person faces. Accordingly, for participant producers, creating a process that necessarily goes through their PRO is appropriate because the PRO is responsible for acting on producers' behalf to ensure fulfillment of statutory requirements. Notably, those requirements include achieving recycling rates for all plastic covered material, and plastic covered materials affect those rates regardless of whether they are exempt under PRC section 42060(a)(3) or (4), highlighting the importance of the PRO retaining discretion over which exemptions are consistent with, and will not prevent satisfaction of, statutory requirements Lastly, producers have the option to comply with their obligations and to request exemptions as Independent Producers.

CalRecycle rejects the second proposal because a grievance and appeals process would essentially create a tribunal, with CalRecycle as the decision maker. No provision in the statute suggests that the Legislature considered that to be CalRecycle's role, and assuming such a role would be the type of significant authority that a statute would typically expressly address, especially considering the enormous administrative burden that it would require. In contrast, two features of statute prove that the Legislature did not intend CalRecycle to be adjudicator of disputes between PROs and producers. First, section 42051.1(g)(2) requires producer responsibility plans themselves to establish the process for resolving disputes, and the proposed regulations impose strict requirements on that process. Second, sections 42080 through 42084 lay out CalRecycle's enforcement authority, with no mention of CalRecycle acting as an adjudicator in producer-PRO disputes. Rather, when there are violations of legal requirements underlying those disputes, CalRecycle's role is to investigate the violations and impose penalties pursuant to section 42080 and 42081.

The commenter also mentions that the regulations should establish "accountability and transparency standards for PROs," but statute and the proposed regulations do that at length. See, e.g., Pub. Resources Code sections 42051.3 (annual reports), 42054 (audits of PRO), and 42080 (authority of CalRecycle to conduct audits); proposed regulations sections 18980.4.2 (end market compliance audits and verifications), and 18980.6.5 (annual reports),

CalRecycle rejects the third proposal because statute and the proposed regulations unambiguously establish that CalRecycle has the authority to decertify a PRO, which would mean that producers would be under obligation to form a new one. See Pub. Resources Code sections 42051 (obligation to form PRO and participate in plan), 42056 (plan termination), and 42061.5(c) (revocation of PRO approval); and proposed regulation section 18980.8.2 (closure and transfer plans) and 18980.13.5 (disciplinary actions).

Lastly, CalRecycle rejects the proposal in section V: that the regulations incorporate a "phased timeline." The commenter seeks to "mitigate unintended regulatory burdens," but those burdens are not "unintended," and, in any event, the statute and proposed regulations already provide for phased compliance timelines when justified. See Pub. Resources Code 42060(a)(3) ("unique challenges" and phase-in plans) and 42081(b) (corrective action plans) and related sections of proposed regulations (18980.2.5 and 18980.13.1).

O-39: Association of Plastic Recyclers (APR) (Kate Bailey)

Comment O-39-1

PRIORITY 1: BUILD A SYSTEM THAT SUPPORTS NORTH AMERICAN RECYCLING INFRASTRUCTURE

APR's primary concern with the draft regulations is a lack of robust support for domestic and North American recycling infrastructure. SB 54 is about building a stronger, more transparent recycling system for California. This must include directly supporting recycling infrastructure both within California and North America, and ensure that the policy and incentives are not supporting investments in recycling infrastructure outside of North America.

In just the last month, California lost a major piece of in-state recycling infrastructure with the closure of rPlanet Earth, one of the five remaining PET reclaimers in the state and approximately 4% of the national capacity for recycling PET plastics. APR has stated that the rPlanet closure is a wake-up call for the urgent need for state and federal policies that support local recycling infrastructure by creating stronger manufacturing demand for companies to buy recycled plastics made from the materials collected by California's recycling programs.

California plastic reclaimers are struggling to stay in business as manufacturers import recycled plastic from overseas instead of buying from CA or North American businesses. Purchasing recycled content from overseas markets directly undermines investments in the US recycling system and is contrary to the goals of SB 54. California's program is meant to improve California's recycling programs, not subsidize recycling in Asia or other regions.

In-state and other North American reclaimers cannot compete with the lower price of material recycled in other countries where labor costs, energy costs, and environmental standards can be much lower. SB 54 will collect millions of additional pounds of recyclable plastics from California communities. If reclaimers cannot sell the recycled material back to manufacturers because they are being undercut by imports, they will close their businesses and California's circular economy will break down. Therefore, it is incumbent upon California to build a recycling system that supports a truly circular economy and invests in California and North American reclaimers.

This is not a hypothetical situation. In just two years, recycled PET (rPET) imports to the U.S. rose by over 65%, from 150,000 metric tons in 2022 to more than 250,000 metric tons in 2024. Imports from Asia now represent 44% of this volume, up from 20% in 2020. When California started the SB 54 regulations development, **California had six PET plastics reclaimers. Now there are only four.** The surge in imported plastics and overall weak market demand for recycled plastics strongly contributed to the closure of rPlanet Earth in Vernon, CA last month and shuttering of the PET wash and sort lines at Evergreen Recycling (Riverside, CA) in early 2025.

We cannot wait to address this issue. These regulations must support North American recyclers for SB 54 to be effective. To that end, we strongly recommend the following changes:

TEXT RECOMMENDATIONS

1. Apply the source reduction credit to recycled content produced only from North American sources.
The statute allows for the use of recycled content to apply toward a portion of the source reduction credit. This incentive should be limited to only recycled plastic produced from plastics collected within the US or North America in order to support recycling programs in these regions. Without this language, companies would be rewarded for buying recycled content from overseas markets which are undermining the viability of US and North American recycling operations. Because the recycled content credit is an optional program, not a mandate, it is our understanding that the state has legal authority to allow only North American sources without infringing upon global trade protections. Producers are intentional about the use of postconsumer recycled content and the percentage levels in their products and packaging. They will be able to work with their reclaimer suppliers and CAA to verify North American PCR sources given the lead time before full implementation of SB 54. Additionally, SB 54 requires third party certification of recycled content used toward the source reduction credit. While third party certification does not currently report on the use of North American sources, it can be leveraged to do so given the SB 54 program goals and lead time.

- **P. 67, add new (6):** How the formula will grant source reduction credit only for usage of postconsumer recycled content processed at North American reclamation facilities and generated from plastics collected from North American sources.

2. Direct PRO investments only in domestic or North American operations
The PRO is tasked with supporting the development, expansion, and continued operations of responsible end markets. To ensure the success of the EPR program in increasing statewide collection and recycling of materials, investments should be focused on domestic and North American recycling facilities to process recyclables collected from California programs.

- **P. 74 (a), add new (4):** Describe how the PRO will give preference to end markets in North America.
- **P. 79 (a)(1), add new (A):** Financial support shall only be given to US and North American end markets.
- **P. 97-98, (C):** "A PRO shall set base fee rates for covered material categories to account for investments or other expenditures necessary to develop North American-based responsible end markets for such covered material categories…"

Again, we emphasize that the aforementioned revisions **to support domestic recycling are the most impactful changes you can make to support California recyclers and foster a truly local circular economy.**

Response to O-39-1

Comment rejected. CalRecycle regulations cannot lawfully disfavor interstate or international commerce.

Comment O-39-2

PRIORITY TWO: AMEND DEFINITION OF DETACHABLE COMPONENTS TO ALIGN WITH DESIGN GUIDELINES TO INCREASE RECYCLING

APR is concerned that the definition of components, and how individual components could be categorized differently than their base packaging, will undermine plastic recycling rates and best practices in designing components to be recyclable with the base packaging (e.g. caps on bottles). Our concern is with this highlighted portion of the definition:

Section 18980.1. Definitions (a) (4) (B) "For purposes of categorizing components into covered material categories, each detachable component shall be considered individually and not necessarily categorized in the same category as the components from which it was detached."

APR has spent 30 years working with recyclers, producers, and the entire supply chain to design plastic packaging, including plastic packaging components, to be compatible with recycling processes. When components are designed to be recyclable and recycled, we can create a system where residents can simply put the entire plastic package into the recycling bin and the entire package--including attached plastic components--can be effectively sorted and recycled by MRFs and plastic reclaimers. **The current definition directly contradicts other sections of statute that require and incentivize the use of the APR Design® Guide for Plastics Recyclability.** The APR Design® Guide evaluates attached components as part of the base packaging. **Please see Appendix B for more discussion on this issue.**

Under the current definitions, if all plastic components are put in separate CMC and EPR fee categories from their base packaging, this will:

- Lower recycling rates
- Distort producer fees
- Create more consumer confusion
- Discourage proven design best practices

Here are common examples of plastic components that are routinely recycled by consumers as part of the base plastic packaging that should be categorized with their base packaging:

Plastic component types
Components not typically removed for consumer use

Plastic product examples
Shampoo bottle cap or pump Body lotion cap or pump Cleaner bottle sprayer Rigid container with hinged lid (e.g. salad box) Bucket handle Adhered label

Plastic component types
Components typically removed and re-attached for recycling

Plastic component types
Screw-on bottle caps Screw-on jar lids Screw-on detergent cap
It is critical that the SB 54 definition distinguishes between components that are recycled or disposed together with the base packaging from components that are detached and discarded separately.

We understand that this definition of component is primarily needed to quantify the number and types of plastic components to reach the source reduction goals. However, the goal to count all components should not undermine recycling efforts, and we believe there is a way for the state to set the definitions to both quantify the number of components and ensure components are effectively recyclable and recycled. APR requests CalRecycle amend the definition of detachable component to recognize that some plastic components are best recycled as part of the base packaging and should be categorized as part of the base packaging. This includes differentiating when the component is routinely removed by the consumer and routinely re-attached by the consumer prior to recycling. We believe related revisions are needed in the CMC Guidance documents and will submit this feedback through the separate comment process for that document.

TEXT RECOMMENDATIONS

- **P. 3, (B)** For purposes of categorizing components into covered material categories, each detachable component shall be considered individually and not necessarily categorized in the same category as the components from which it was detached unless the component is designed for recyclability as defined in PRC 42355.51.

- **P. 3, (C):** A “detachable component” is one that may be completely detached from all other components or material and is either of the following:
- (i) A component designed such that it ~~may be~~ is routinely detached by consumers or during or after collection without the use of tools, substances, or non-manual processes. A component shall not be considered designed to be detached merely because it may be detached from all other components or materials during processing.
- (ii) Typically or necessarily detached through ordinary usage by the consumer before being discarded, and is not routinely re-attached prior to disposal. ~~regardless of whether the component is discarded attached to the other components.~~
- **P. 3, add new (D):** Notwithstanding paragraph (B), a detachable component that is typically discarded while attached to the base packaging component, and that does not render the packaging non-recyclable pursuant to the design for recycling standards in PRC 42355.51 shall be considered in the same category as the components from which it was detached.
- **P. 60, (d):** Recycling rate shall be calculated for each covered material category, except as established in subdivisions (f) and (g).
- (1) For covered material components that are not detachable components, a single recycling rate shall be calculated for the covered material category applicable to the item comprising those components rather than calculating a recycling rate for each component.
- (2) For covered material components that are detachable components, a recycling rate shall be calculated using the covered material category applicable to each detachable component.

It is imperative that the regulations align with SB 343 definitions of recyclability and recognize the components that are designed for recyclability with the base packaging. The current definitions are directly in conflict with design guidance and will result in lower recycling rates and distorted producer fees.

Response to O-39-2

CalRecycle rejects this comment for the reasons stated in response to comment O-39-5.

Comment O-39-3

ADDITIONAL RECOMMENDATIONS

APR wishes to reiterate the following concerns with the regulations that we have submitted in previous comments. We strongly support the following text revisions that will improve plastics recycling and the implementation of SB 54. These are listed in order of urgency and impact upon the scalability of plastics recycling. Please see Appendix A for a chronological list of revisions:

Provide greater clarity on categorical exemptions for products under Section 18980.2(a)(2).

APR supports the concerns voiced by numerous stakeholders that these exemptions are overly broad, will be difficult to administer, and may substantially undermine the effective implementation of SB 54. APR recommends CalRecycle remove this language in favor of a more objective and specific exemption process.

Provide greater clarity on criteria to be designated recyclable.

For plastic products that are not yet recyclable at scale, there remains significant confusion on the steps necessary to be designated as recyclable. APR recommends several changes targeting how a producer can request a recyclability designation, how both curbside and alternative collection programs count toward recyclability criteria.

- **P. 47, add new (g):** A PRO or an independent producer may submit a request to CalRecycle requesting a recyclable designation pursuant to PRC 42355.51(d)(6). The request must include:
- (1) A justification for the designation that demonstrates that collection, sortation and availability of responsible end markets for the identified covered materials are advancing with a reasonable likelihood of satisfying any of the recyclable criteria pursuant to PRC 42355.51 within a time period specified within the request.
- (2) A description of specific investments and actions in an approved PRO Plan or pending Plan amendment that the PRO and member producers will take to ensure that designating the materials as recyclable will not increase contamination of curbside recycling or deceive consumers as to the recyclability of the product or packaging. Such steps may include, but not be limited to: t(i) A description of any recyclable marketing claims that are or will be used on the targeted covered materials, and how consumers will be informed about how to recycle them in their community.
- (ii) Specific investments and improvements in specific recycling system facilities and programs that will mitigate contamination and/or be used to demonstrate successful models.
- **P. 52 (f)(1), add to end**: For the purposes of applying this requirement to paragraph (5) of subdivision (d) of section 42355.51 of the Public Resources Code, “program” means any type of collection and recycling program, including alternative collection and local jurisdiction collection.

Recognize physical recycling as distinct from chemical recycling

The November 2024 draft SB 54 regulations separated out both mechanical and physical technologies from chemical recycling technologies. APR recommends reinserting this distinction. Physical recycling should not be considered a form of chemical recycling because the physical recycling processes do not chemically alter the plastic polymers or break chemical bonds. Physical recycling processes maintain the

physical structure of the plastics, just like mechanical recycling. Leading organizations and US states are already grouping mechanical and physical technologies apart from chemical recycling technologies: 1) The US FDA groups recycling technologies into physical or chemical recycling when issues guidance on the use of recycled plastics in food-contact packaging; 2) Both the Oregon and Washington packaging EPR laws distinguish between physical and chemical recycling technologies.

- **P. 75, (d):** A PRO or Independent Producer shall identify in its plan any recycling technology that was not a type of mechanical or physical recycling technology in use within the United States ~~State~~ as of the effective date of this Act..."
- **P. 75 (d) (1) (A):** Mechanical and physical recycling technologies that were in use within the United States ~~State~~ as of the effective date of the Act do not produce significant amounts of hazardous waste for the purposes of the Act and this chapter.
- **P. 76, B (2):** "A facility's use of a technology that is not a mechanical or physical recycling technology ~~within the State~~ as of the effective date of this Act…"

Allow for mechanical and physical recycling technologies outside of California.

The viability of the mechanical or physical recycling technology is also not based upon whether the operations are physically located in California. The state should recognize technologies and responsible operations based on objective criteria rather than geographic location within California by amending this sentence:

- **P. 75, (d):** A PRO or Independent Producer shall identify in its plan any recycling technology that was not a type of mechanical or physical recycling technology in use within the United States ~~State~~ as of the effective date of this Act..."
- **P. 75 (d) (1) (A):** Mechanical and physical recycling technologies that were in use within the United States ~~State~~ as of the effective date of the Act do not produce significant amounts of hazardous waste for the purposes of the Act and this chapter.
- **P. 76, B (2):** "A facility's use of a technology that is not a mechanical or physical recycling technology ~~within the State~~ as of the effective date of this Act…"

Remove recycled materials from the definition of covered materials. This definition is concerning and could include recycled content produced from covered materials through the recycling process, such as the recycled plastic flake or pellet that is manufactured into new products, whether or not those new products would be covered properties based on their inherent characteristics.

- **P. 3 (5):** "Covered material" has the same definition as in subdivision (e) of section 42041 of the Public Resources Code ~~and encompasses materials that originated from covered material items. In the context of end-of-life handling~~

~~and processing, if a substance comprises both materials that are covered material because they originated from such items and materials from other origins, only the portions originating from covered material items shall be considered covered materials."~~

Include CRV materials within curbside collection programs in yield calculations. It is not practical to have plastic recyclers calculate CRV container recycling through a separate methodology when these materials are mixed into the curbside bales. It is critical for CalRecycle to clarify where CRV containers fit into yield calculations so recyclers are given credit for processing them.

- **P. 58-59, (2)(A) add to end:** "except for the proportion covered by the Beverage containers subject to the California Beverage Container Recycling and Litter Reduction Act (Division 12.1 (commencing with Section 14500))."

Contextualize PFAS testing: Recyclers do not have the technology to continuously monitor and test the presence of PFAS in every load of covered materials entering a facility. The credit for recycled content should clarify that recycled content should not contain PFAS added or used during the recycling process.

- **P. 67, (5):** "…contains no intentionally added perfluoroalkyl and polyfluoroalkyl substances used or added during the recycling process."

Clarify that recyclers are only required to recycle "incompatible materials" that are deemed be recyclable by CalRecycle. There is a substantial difference between what can be "technically" recycled compared to what can be economically and effectively recycled. We request clarification that only materials deemed by the state to be recyclable should be required to be further processed by the REMs by referencing the covered materials category list published pursuant to Public Resources Code (PRC) Section 42061(a)(1), (c), and (d):

- **P. 70, (3)(A):** "For incompatible materials listed under the Covered Materials list that can be further processed…"

Establish a process for a REM to challenge requirements to recycle incompatible materials. If the REM is required to recycle incompatible materials, this removes both the incentive for MRFs to produce cleaner bales with fewer incompatible materials and the incentive for packaging designers to use fewer incompatible materials, both of which are critical solutions to reaching the state's recycling goals and building a higher-performing recycling system. APR requests a process to exempt REMs from this blanket requirement based on costs and/or technical feasibility and still be considered a REM:

- **P. 70-71(3), add (C):** If the REM cannot process incompatible material based on costs, facility design, or technical barriers, the REM shall submit documentation of these challenges to the PRO. The PRO shall not exclude an entity from being considered a REM if the REM can reasonably and sufficiently demonstrate that it cannot recycle incompatible materials based on this documentation.

Clarify further recycling at another REM. Our interpretation is that this applies to other recyclable materials that are later processed by another REM, such that those materials are part of the yield rate for the second REM and not the first entity. If this is the intent, we suggest the addition of the word "another":

- **P. 71, (i):** "…excluding material sent to another REM for further processing."

Remove contaminants, moisture, and food/liquid residue from yield calculations

The calculation rate methodology should specifically address the amount of contaminants, moisture, and liquid/food residue in the incoming bales. The REM does not have control over the amount of contamination in the incoming bales, and SB54 does not place requirements on MRFs to reduce residue levels. Therefore, any materials that are not processable by the REM should not be counted toward yield loss:

- **P. 71 (i), add to end:** "The PRO may propose additional calculations to account for the inherent losses in the materials accepted, including contaminants, food and liquid moisture, and other residues, to more accurately reflect the yield of processable materials received at the REM."

Clarification of new language under definition of end market. The proposed rules add a new sentence to the definition of end market that could be interpreted to mean there is more than one end market entity. While we recognize the need to define the different types of businesses that may be an end market, we request that the law clearly identifies only one entity as the official measurement reporting point for end markets:

- **P. 72 (b):** "An end market is an entity that produces and sells or transfers recycled organic product or recycled content feedstock that meets the quality standards necessary to be used for the creation of new or reconstituted products. An entity that produces and uses such material in the creation of new or reconstituted products can also be an end market, but there shall not be more than one end market for any one material. An entity may be an end market for some materials and an intermediate supply chain entity for others…"~~"An entity that produces and uses such material in the creation of new or reconstituted products is also an end market."~~

Respect proprietary information for REMs similar to other businesses. REMs should be eligible for the same protection as other stakeholders regarding the safeguarding of their financial information and proprietary information about the recycling process in the auditing process.

- **P. 77, (b) add to end:** The REM may request that proprietary information and f inancial analysis in the compliance report is not made public.

Recognize the role of MRFs in ensuring success of REMs. The ability for processors and end markets to meet yield and other performance requirements is highly dependent on the quality of the incoming bales collected from recycling programs. It is critical to identify actions to improve yield based on incoming material quality through steps such as this:

- **P. 78, add new (6):** Recommendations from the REM and/or PRO on improvements to MRF quality or processing standards, and product design changes, that could improve the ability of the REM to improve yield and compliance.

Invest in both existing and new end markets. REM investments should not be limited to new markets—funding should also be available to existing REMs to improve operations that result in higher material yield or lower environmental impacts:

- **P. 79, (a)(1):** "Provide financial support to end markets as necessary to expand and develop responsible end markets and ensure that they continue to satisfy and/or exceed the standards specified in section 18980.4(a)..."
- **P. 79, (a) add (4):** The PRO or Independent Producer must evaluate and incentivize opportunities to facilitate the purchasing of recycled content from North American REMs through longer-term supply agreements that extend for one or more years.

End markets should be plural. The recycling system depends on having multiple processors and buyers to ensure a robust and competitive system. The regulations should recognize the goal of multiple end markets for covered materials:

- **P. 80 (b):** "If a PRO or an Independent Producer identifies a covered material that does not have ~~an~~ North American end markets, as described in section 18980.4(b), the following requirements apply:"
- **P. 80 (b)(1)(B):** "Evaluates both the financial and operational feasibility of collecting, transporting, processing, and recycling the covered material.
- **P. 80 (b)(1), add new (E):** "Evaluates at least two viable processors and at least two viable manufacturing uses for the covered materials within North America"

- **P. 80 (b)(1), add new (F):** "Evaluates the recovered and processed material to determine that there would be at least two manufacturers to consistently use the material in their products."

The producer of components should be the same as the producer of the base packaging. The definition of detachable components creates confusion on the responsible party for individual components. The producer responsible for the base packaging is the entity that makes the decisions about which components to include, such as which cap, sprayer, or carrier handle to put on the product. Therefore the responsible party for the components should not be separate from that of the base packaging–it should be considered all part of the packaging design.

- **P. 3, add new (E):** Manufacturers of "component" parts are not considered producers and responsibility for such items are the responsibility of the producer of the packaging in which the component part is affixed.

Renewable feedstocks should not be detrimental to plastics recycling. For example, paper labels are one of the biggest contaminants to plastics recycling. By promoting renewable resources without any consideration on the impacts of recycling, the state is creating a situation where recycling could become more costly, or, worse, these feedstocks could render packaging non-recyclable.

- **P. 100, add to end of (j):** "so long as the renewable resource does not interfere with, or is not detrimental to, the recycling of the plastic covered material per the design guide referenced in subparagraph (A) of paragraph (3) of subdivision (d) of section 42355.51(d)(3)(A) of the Public Resources Code."

Allow for interim plan revisions based on updates to the design guide. The APR Design® Guide for Plastics Recyclability is a dynamic guide with updates incorporated to reflect changing packaging design and recycling operations. Consider additional language to allow for updated revisions to be submitted between the Program Plans such as:

- **P. 120, (B) add:** Updates to the Guide that would affect the recyclability of covered materials should be submitted when relevant between plans with an explanation of the changes and impacts.

Local jurisdictions' responsibility related to REMs: The PRO is responsible for establishing the availability of responsible end markets. However, local jurisdictions and recycling service providers do hold some responsibility for ensuring that their bales meet the quality specifications of those REMs. The phrase "absence of responsible end markets" implies that any problems are solely based on the availability of markets,

rather than the possibility that the problem is too much contamination in the bales that would render the materials not acceptable by a REM. Excess contamination should not be deemed a reason to exclude those materials from a local collection program when there are REMs that process materials from other jurisdictions with higher quality standards:

- **P. 141, (b) add: (1):** Excessive contamination or other bale conditions that render the material unacceptable by markets that exist for and would otherwise accept such material are not allowable reasons for determining the lack of insufficient end markets.

Provide further guidance on producer hierarchy for plastic food service ware. The distribution network for food service ware is significantly different from that of other covered materials under SB 54 and requires further clarification on which party is the obligated producer. This is an active area of concern in the implementation of Oregon's packaging EPR program. APR supports requests from plastic food service ware providers for revisions and/or additional guidance documents to streamline compliance.

Moving Forward

APR recognizes the need to move forward with SB 54 implementation given the pending timelines. **We strongly encourage CalRecycle to commit to future rulemaking processes to address these and other critical stakeholder issues. In addition, we request CalRecycle provide adequate flexibility to CAA in its initial Program Plan in areas where there remains substantial challenges with the regulations**.

APR staff and members are available at your convenience to discuss these comments, share further information, and collaborate on solutions for the effective implementation of SB 54. Please contact Kate Bailey, Chief Policy Officer, at katebailey@plasticsrecycling.org.

Response to O-39-3

CalRecycle partially accepts and partially rejects the commenter's suggestions. Regarding section 18980.2(a)(2), CalRecycle rejects the proposal to remove and replace it entirely but otherwise accepts the comment and has significantly revised section 18980.2(a)(2), by adding clearer, objective criteria and more specific procedural details to ensure that the exclusion is applied properly and efficiently. See CalRecycle's response to comment I-19-1, explaining the revisions responsive to this and similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

Regarding the request for "greater clarity on criteria to be designated recyclable," CalRecycle rejects the commenter's suggested edits. Having CalRecycle issue recyclability designations upon request is not practicable; it would likely require CalRecycle to process many thousands of such requests, each of which would necessarily be complex under the requirements proposed, which would call for identification of responsible end markets and "reasonable likelihood" of them satisfying recyclability criteria under section 42355.51 within some requested timeframe. Besides establishing a vague timeframe requirement—no limitation is proposed on what period might be specified within the request—the proposed requirement would be contrary to law. To be recyclable, covered material must satisfy the requirements under section 42355.51(d) as they exist currently, not at some future date. Moreover, the overall approach advanced by the commenter would serve the same purpose as corrective action plans, a process that CalRecycle will administer as part of its enforcement activities. Under corrective action plans, producers of covered material that currently cannot meet statutory requirements may be afforded time to remedy such violations.

Regarding the suggested change to 18980.3(f)(1), CalRecycle declines to add the suggested language because the language would add no clarity. In context, it is clear that "program" may include any type of collection program.

Regarding physical recycling, CalRecycle declines to make the suggested changes to section 189804.1(d). Notably, the commenter offers no explanation based on the generation of hazardous waste, despite the express purpose of the relevant statutory provision (Pub. Resources Code section 42041(aa)(5)) being the avoidance of significant amounts of such waste. Furthermore, the commenter's suggestion to base the evaluation of technologies on the usage of technologies outside the state of California would be illogical because California does not set the policies of other states, so such usage may not be consistent with the considerations embodied in SB 54 and other state laws concerning recycling, disposal, and hazardous wastes. See, also, CalRecycle's response to comment B-11-8.

Regarding the proposed deletion from section 18980.1(a)(5), CalRecycle rejects that suggestion. The statute consistently uses the term "covered material" to refer to single-use packaging and plastic single-use food service ware both before and after it enters the waste stream or is processed. Also, without explanation, the commenter also uses the phrase "covered properties" a phrase not used anywhere in statute. The commenter's objection to the scope of the term "covered material," as interpreted in the regulatory text, is therefore not sufficiently clear to further respond to.

Regarding the proposed addition to 18980.3.2(b)(2)(A), CalRecycle rejects that suggestion because statute (Pub. Resources Code 42041(e)(2)(E)) unambiguously states that "beverage containers" (to which CalRecycle understands the commenter refers as "CRV materials") are not covered material.

The commenter's suggestion would, in effect, impermissibly consider beverage containers "covered material."

Regarding the proposed addition to section 18980.3.4(b)(5), CalRecycle rejects that suggestion because the provision at issue would not require recyclers to continuously monitor and test for the presence of PFAS. That provision only requires there to be a description of how an alternative compliance formula, if any, is incorporated into a producer responsibility plan. Statute expressly requires there to be no PFAS in postconsumer recycled content underlying any alternative compliance formula, with no distinction concerning when or how PFAS was incorporated into the material.

Regarding the proposed addition to 18980.4(a)(3)(A), CalRecycle rejects that suggestion because it is unnecessary. The provision immediately following that (18980.4(a)(3)(B)) accounts for incompatible materials that cannot be recycled. There is no absolute requirement that all incompatible materials must be further processed.

Regarding the proposed addition to 18980.4(a)(3)(C), CalRecycle rejects that suggestion for the same reasons as stated with respect to the proposed change to 18980.4(a)(3)(A). An end market does not need to be able to recycle incompatible materials. It only needs to send materials that can be processed and recycled to entities that can do so. Otherwise, incompatible materials may be disposed of responsibly.

Regarding the proposed change within the currently proposed section18980.4(a)(4)(i), CalRecycle rejects that suggestion because it would not change the meaning of the provision. It is grammatically clear that "not sent to a responsible end market for further processing" (indefinite article) refers to an end market other than "the end market" (definite article).

Regarding the proposed addition to 18980.4(b)(4)(i), CalRecycle rejects that suggestion. The proposed regulations already permit calculations to account for any material, such as contaminants, food, and moisture, that are not the covered material being assessed. If materials such as contaminants, food, and moisture are not part of the material being processed, then it would not be within the amount of "material" used in the denominator of the calculation.

Regarding the proposed change to 18980.4(b), CalRecycle rejects that suggestion because it would add no clarity to the proposed regulation. An end market is, by definition, the point in the supply chain where recycling is completed, so it is axiomatic that once material reaches its end market, there is no other end market. If that were not the case, the regulation makes clear that the entity would be an intermediate supply chain with respect to that material.

Regarding the proposed addition to 118980.4.2(b), CalRecycle rejects that

suggestion because the proposed regulations do not otherwise restrict responsible end markets from requesting that proprietary information and analyses not be made public. Section 18980.14 addresses confidentiality of any records submitted to CalRecycle.

Regarding the proposed addition of (6) to 18980.4.2(c), CalRecycle rejects that suggestion because subdivision (c) is a non-exhaustive list of the documentation annual reports must contain concerning verification that end markets satisfy the requirements to be considered responsible end markets. The commenter's suggestion is not relevant to such verifications.

Regarding the proposed changes to section 18980.4.3(a), CalRecycle rejects the suggested additions in (a)(1) because they are redundant with the proposed regulation. CalRecycle rejects the addition of (a)(4) because it would be unlawful for CalRecycle regulations to impose different restrictions or requirements on commercial activity based on whether it involves foreign or domestic partners.

Regarding the recommended change to section 18980.4.3(b) and the addition of (b)(1)(E), CalRecycle rejects the suggestion change because CalRecycle regulations cannot impose different restrictions based on whether business is conducted with foreign versus domestic partners. Also, changing the sentence so it uses the phrase "end markets" does not change the sentence's meaning. Likewise, the suggested change to (b)(1)(B) would add words that add no substance; "feasibility" already encompasses the concepts of "financial" feasibility and "operational" feasibility. Regarding the addition of (b)(1)(F), that addition is rejected because it is nonsensical to say that an evaluation would be "to determine that there would be at least two manufacturers to consistently use the materials in their products." Whether that circumstance exists would naturally fall within the evaluations described in the preceding subparagraphs.

Regarding the proposed addition to 18980.1(a)(4), no change is appropriate because there is no ambiguity over whether a person might be a "producer" merely because they manufactured a packaging component. Nothing in the proposed regulations or Public Resources Code section 42041(w) or other statutory section states otherwise.

Regarding the proposed subsection (j) for section 18980.4, no change is appropriate because statute expressly requires that "[p]lastic covered materials derived from renewable materials shall be subject to a reduced fee" (Pub. Resources Code section 42053(e)(7)). Also, Public Resources Code 42053)(e)(2) already unambiguously requires the fee structure to account for materials that are detrimental to recycling.

Regarding the proposed addition to subsection (B) of section 18980.8(j)(2), [AB116.1]CalRecycle rejects that suggestion because it would directly contradict the text that would precede it. A producer responsibility plan must stand on its

own, and the statute requires it to be approved by CalRecycle. (E.g., Pub. Resources Code section 42051(b)). Only CalRecycle, not private parties such as the commenter, can approve of changes to a plan; therefore, the Design Guide that a plan incorporates must follow the requirements for plan updates and amendments.

Regarding 18980.11(b), CalRecycle rejects the proposed addition because it is unnecessary. Because the question under Public Resources Code 42060.6 is one of practicability, it already accounts for the commenter's concerns. Practicability logically must be prospective: If it is practicable to provide material in bales that satisfy end market requirements, then the outcome would be the one desired by the commenter. The existence of contamination or other bale conditions that render material unacceptable would not retroactively affect that practicability; rather, it would mean that the local jurisdiction or recycling service provider's actions failed to achieve what was reasonably possible.

Regarding "guidance on producer hierarchy for plastic food service ware," the commenter only vaguely refers to "requests from plastic food service ware providers." The commenter neither submits its own suggested revisions nor explains what it would consider "further clarification." Also, no regulation is necessary for CalRecycle to provide "guidance documents" that demonstrate application of the ultimately adopted regulations.

Comment O-39-4

APPENDIX A: LIST OF ALL TEXT REVISIONS PROPOSED ABOVE

- **P. 3, (B)** For purposes of categorizing components into covered material categories, each detachable component shall be considered individually and not necessarily categorized in the same category as the components from which it was detached unless the component is designed for recyclability as defined in PRC 42355.51.
- **P. 3, (C):** A “detachable component” is one that may be completely detached from all other components or material and is either of the following:
- (i) A component designed such that it ~~may be~~ is routinely detached by consumers or during or after collection without the use of tools, substances, or non-manual processes. A component shall not be considered designed to be detached merely because it may be detached from all other components or materials during processing.
- (ii) Typically or necessarily detached through ordinary usage by the consumer before being discarded, and is not routinely re-attached prior to disposal. ~~regardless of whether the component is discarded attached to the other components.~~
- **P. 3, add new (E):** Manufacturers of “component” parts are not considered producers and responsibility for such items are the responsibility of the producer of the packaging in which the component part is affixed.

- **P. 3 (5):** “Covered material” has the same definition as in subdivision (e) of section 42041 of the Public Resources Code ~~and encompasses materials that originated from covered material items. In the context of end-of-life handling and processing, if a substance comprises both materials that are covered material because they originated from such items and materials from other origins, only the portions originating from covered material items shall be considered covered materials.”~~
- **P. 47, add new (g):** A PRO or an independent producer may submit a request to CalRecycle requesting a recyclable designation pursuant to PRC 42355.51(d)(6). The request must include:
- (1) A justification for the designation that demonstrates that collection, sortation and availability of responsible end markets for the identified covered materials are advancing with a reasonable likelihood of satisfying any of the recyclable criteria pursuant to PRC 42355.51 within a time period specified within the request.
- (2) A description of specific investments and actions in an approved PRO Plan or pending Plan amendment that the PRO and member producers will take to ensure that designating the materials as recyclable will not increase contamination of curbside recycling or deceive consumers as to the recyclability of the product or packaging. Such steps may include, but not be limited to:
- (i) A description of any recyclable marketing claims that are or will be used on the targeted covered materials, and how consumers will be informed about how to recycle them in their community.
- (ii) Specific investments and improvements in specific recycling system facilities and programs that will mitigate contamination and/or be used to demonstrate successful models.
- **P. 52 (f)(1), add to end:** For the purposes of applying this requirement to paragraph (5) of subdivision (d) of section 42355.51 of the Public Resources Code, “program” means any type of collection and recycling program, including alternative collection and local jurisdiction collection.
- **P. 58-59, (2)(A) add to end:** “except for the proportion covered by the Beverage containers subject to the California Beverage Container Recycling and Litter Reduction Act (Division 12.1 (commencing with Section 14500)).”
- **P. 60, (d):** Recycling rate shall be calculated for each covered material category, except as established in subdivisions (f) and (g).
- (1) For covered material components that are not detachable components, a single recycling rate shall be calculated for the covered material category applicable to the item comprising those components rather than calculating a recycling rate for each component.
- (2) For covered material components that are detachable components, a recycling rate shall be calculated using the covered material category applicable to each detachable component.
- **P. 67, (5):** “…contains no intentionally added perfluoroalkyl and polyfluoroalkyl substances used or added during the recycling process.”
- **P. 67, add new (6):** How the formula will grant source reduction credit only for usage of postconsumer recycled content processed at North American

reclamation facilities and generated from plastics collected from North American sources.

- **P. 70, (3)(A):** "For incompatible materials listed under the Covered Materials list that can be further processed…"
- **P. 70-71(3), add (C):** If the REM cannot process incompatible material based on costs, facility design, or technical barriers, the REM shall submit documentation of these challenges to the PRO. The PRO shall not exclude an entity from being considered a REM if the REM can reasonably and sufficiently demonstrate that it cannot recycle incompatible materials based on this documentation.
- **P. 71, (i):** "…excluding material sent to another REM for further processing."
- **P. 71 (i), add to end:** "The PRO may propose additional calculations to account for the inherent losses in the materials accepted, including contaminants, food and liquid moisture, and other residues, to more accurately reflect the yield of processable materials received at the REM."
- **P. 72 (b):** "An end market is an entity that produces and sells or transfers recycled organic product or recycled content feedstock that meets the quality standards necessary to be used for the creation of new or reconstituted products. An entity that produces and uses such material in the creation of new or reconstituted products can also be an end market, but there shall not be more than one end market for any one material. An entity may be an end market for some materials and an intermediate supply chain entity for others…"~~"An entity that produces and uses such material in the creation of new or reconstituted products is also an end market."~~
- **P. 74 (a), add new (4):** Describe how the PRO will give preference to end markets in North America.
- **P. 75, (d):** A PRO or Independent Producer shall identify in its plan any recycling technology that was not a type of mechanical or physical recycling technology in use within the United States ~~State~~ as of the effective date of this Act..."
- **P. 75 (d) (1) (A):** Mechanical and physical recycling technologies that were in use within the United States ~~State~~ as of the effective date of the Act do not produce significant amounts of hazardous waste for the purposes of the Act and this chapter.
- **P. 76, B (2):** "A facility's use of a technology that is not a mechanical or physical recycling technology ~~within the State~~ as of the effective date of this Act…"
- **P. 75, (d):** A PRO or Independent Producer shall identify in its plan any recycling technology that was not a type of mechanical or physical recycling technology in use within the United States ~~State~~ as of the effective date of this Act..."
- **P. 75 (d) (1) (A):** Mechanical and physical recycling technologies that were in use within the United States ~~State~~ as of the effective date of the Act do not produce significant amounts of hazardous waste for the purposes of the Act and this chapter.
- **P. 76, B (2):** "A facility's use of a technology that is not a mechanical or physical recycling technology ~~within the State~~ as of the effective date of this Act…"
- **P. 77, (b) add to end:** The REM may request that proprietary information and financial analysis in the compliance report is not made public.

- **P. 78, add new (6):** Recommendations from the REM and/or PRO on improvements to MRF quality or processing standards, and product design changes, that could improve the ability of the REM to improve yield and compliance.
- **P. 79, (a)(1):** "Provide financial support to end markets as necessary to expand and develop responsible end markets and ensure that they continue to satisfy and/or exceed the standards specified in section 18980.4(a)..."
- **P. 79, (a) add (4):** The PRO or Independent Producer must evaluate and incentivize opportunities to facilitate the purchasing of recycled content from North American REMs through longer-term supply agreements that extend for one or more years.
- **P. 79 (a)(1), add new (A):** Financial support shall only be given to US and North American end markets.
- **P. 80 (b):** "If a PRO or an Independent Producer identifies a covered material that does not have ~~an~~ North American end markets, as described in section 18980.4(b), the following requirements apply:"
- **P. 80 (b)(1)(B):** "Evaluates both the financial and operational feasibility of collecting, transporting, processing, and recycling the covered material.
- **P. 80 (b)(1), add new (E):** "Evaluates at least two viable processors and at least two viable manufacturing uses for the covered materials within North America"
- **P. 80 (b)(1), add new (F):** "Evaluates the recovered and processed material to determine that there would be at least two manufacturers to consistently use the material in their products."
- **P. 97-98, (C):** "A PRO shall set base fee rates for covered material categories to account for investments or other expenditures necessary to develop North American-based responsible end markets for such covered material categories…"
- **P. 100, add to end of (j):** "so long as the renewable resource does not interfere with, or is not detrimental to, the recycling of the plastic covered material per the design guide referenced in subparagraph (A) of paragraph (3) of subdivision (d) of section 42355.51(d)(3)(A) of the Public Resources Code."
- **P. 120, (B) add:** Updates to the Guide that would affect the recyclability of covered materials should be submitted when relevant between plans with an explanation of the changes and impacts.
- **P. 141, (b) add:** (1): Excessive contamination or other bale conditions that render the material unacceptable by markets that exist for and would otherwise accept such material are not allowable reasons for determining the lack of insufficient end markets.

Response to O-39-4

Comment rejected. This portion of the commenter's submission reiterates the proposals set forth in earlier portions of the submission. CalRecycle has addressed each proposal in response to those earlier portions.

Comment O-39-5

APPENDIX B: APR DISCUSSION BRIEF

HOW PLASTIC COMPONENTS ARE RECYCLED WITH PLASTIC PACKAGING & REQUESTED CHANGES TO SB 54 DETACHABLE COMPONENT DEFINITION

The Association of Plastic Recyclers (APR) represents over 80% of the processing capacity for post-consumer plastic packaging in North America. Our members include the businesses that recycle most of the PET, HDPE, LDPE, and PP plastic packaging after it has been collected by California's curbside and CRV recycling programs. This includes five California-based processors (reclaimers) of post-consumer recycled plastics, as well as dozens of California-based businesses throughout the value chain of plastics recycling.

APR has spent 30 years working with recyclers, producers, and the entire supply chain to design plastic packaging, including plastic packaging components, to be compatible with recycling processes. When components are designed to be recyclable and recycled, we can create a system where residents can simply put the entire plastic package into the recycling bin and the entire package--including attached plastic components--can be effectively sorted and recycled by MRFs and plastic reclaimers.

As the voice of plastic recyclers, APR is focused on how the SB 54 requirements can effectively and efficiently drive higher recycling rates for plastic packaging to reduce plastic pollution. Unfortunately, APR is deeply concerned that the proposed definition of detachable components under the SB 54 revised rules (released August 2025) will treat all components as distinct parts, and not as part of the base packaging. This will lead to lower recycling rates. **APR requests CalRecycle amend the definition of detachable component to recognize that some plastic components are best recycled as part of the base packaging and should be categorized as part of the base packaging.** This includes differentiating when the component is routinely removed by the consumer and routinely re-attached by the consumer prior to recycling.

PROBLEM: If all plastic components are put in separate EPR fee categories than the base plastic packaging, this will • Conflict with design standards and best practices • Lower recycling rates • Distort the producer fees • Create more consumer confusion • Promote poor design choices

Examples of plastic components on plastic packaging

The following table identifies common examples of how plastic components are used by consumers and how the consumer may recycle these components. The components in the green rows are commonly recycled today as part of the base packaging. In other cases, components are more likely to be recycled separately from the base packaging. There are still some cases in which it is unclear if there is sufficient data to know how consumers are recycling these components.

Examples of plastic components on plastic packaging and how they are commonly recycled by the consumer*

Plastic component types Plastic product examples Typical recycling pathway Components not typically removed for use Shampoo bottle cap or pump Body lotion cap or pump Cleaner bottle sprayer Rigid container with hinged lid (e.g. salad box) Bucket handle Adhered label Recycled with original packaging Components typically removed and re-attached for recycling Screw-on bottle caps Screw-on jar lids Screw-on detergent cap Recycled with original packaging Components typically removed entirely from package and not reattached Tear-away pouch top Yogurt foil lid Recycled separately Components that may be removed and may be re-attached Snap-on lids Non-screw on dispenser cup To-go cup lids More data needed on consumer behavior and MRF sorting

** Please note these examples only apply to plastic packaging with plastic components. This is not reflective of plastic components used on non-plastic packaging such as straws attached to drink cartons.*

The above examples illustrate that there are many common plastic packaging components that are recycled today along with the base packaging. It is critical that the Covered Material Categories reflect how consumers are actually recycling the products. This is why the definition of detachable components must differentiate when components are attached or re-attached by the consumer for recycling.

CONCERN 1: CONTRADICTS BEST PRACTICES OF DESIGNING COMPONENTS TO BE RECYCLABLE WITH ENTIRE PACKAGE

Plastic components can and should be designed to be recyclable when attached or reattached to the base packaging. CalRecycle already recognizes the importance of product design for plastic packaging in SB 54. Further, SB 343 (Allen, Chapter 507, Statues of 2021) specifically references the APR Design® Guide as the tool to address how components affect the recyclability of plastic products:

PRC 42355.51: *"(3)A product or packaging shall not be considered recyclable in the state unless the product or packaging meets all of the following criteria, as applicable: (A) For plastic packaging, the plastic packaging is designed to not include any components, inks, adhesives, or labels that prevent the recyclability of the packaging according to the APR Design® Guide published by the Association of Plastic Recyclers…"*

Statute requires producers to be compliant with the APR Design® Guide because the Design® Guide evaluates components as part of the entire packaging. See the diagram below to demonstrate how the APR Design® Guide assesses all the product design features including components, inks, colors, sizes, additives, and more. This means it would be contradictory for CalRecycle to use the current definition of detachable components because it would classify all components as distinct parts when best

practices look at these components as part of the base packaging. **This current definition is at odds with the leading design standards already recognized in California law.** The definition of detachable component must recognize that some components are successfully recyclable and recycled as part of the base packaging.

Figure 1: APR Whole Package Assessment includes product components

CONCERN 2: LOWERS RECYCLING RATES

In addition to the examples in the chart on page two, here are two common ways plastic components can be effectively recycled as part of the plastic product when properly designed for recyclability.

Example 1: Caps on plastic bottles. APR's model bale specs have endorsed caps on bottles since 2011. APR Design standards ensure that the caps can either be separated from bottles during the recycling process and recovered for recycling (e.g., caps on PET bottles), or are sufficiently compatible with the main bottle packaging (e.g., caps on HDPE bottles). Please see more information on caps in the plastics recycling process here.

Data shows that California consumers are in fact putting caps back on the bottles. In 2025, the PET Recycling Corporation of California (PRCC) conducted a bale sort that found that over 78% of bottles collected through the CRV program had the cap attached, and 57% of bottles processed at MRFs had caps on bottles prior to baling.

Example 2: Design-compatible pumps and sprayers. Pumps and sprayers often contain a small metal spring that is very problematic to sort out during the plastic recycling process. APR's Design Guide recommends plastic-only pumps and sprays, and there are over 60 variations of APR approved designs for sprayers and pumps that a company can use to ensure the entire container and pump/sprayer are fully recyclable. Proper design eliminates the need for the consumer to remove any pump or sprayer, and instead, allows the consumer to simply put the entire container in the recycling bin. Plastic recyclers can then fully recycle the container and pump, leading to higher recycling rates.

CONCERN 3: DISTORTS EPR FEES

The statute requires the PRO to set fees that reflect the *"Costs to collect, sort, avoid or remove contamination, aggregate, and transport the covered material into defined streams to support the viable responsible end markets for the remanufacturing of the covered material…."* This means producer fees, as based on the Covered Material Categories (CMCs), are required to reflect the actual costs of recycling and should reflect how plastic components are currently managed. For example, plastic caps on PET plastic bottles are collected and recycled today as part of the PET bottles. The costs collect and sort PET bottles are based on recycling all of the components together as a single unit. Similarly, the plastic reclaimers' costs to recycle a bale of PET bottles

include the routine operational steps of separating the caps for recycling, along with any other non-PET “floatable” material.

To base the EPR fees on the actual costs, the PRO must consider how products are actually recycled, which means differentiating between components that are attached or re-attached for recycling. **Treating attached and re-attached components as part of the entire packaging unit is the most accurate reflection of the actual recycling costs of managing these components based on how they are recycled today.**

CONCERN 4: INCREASES CONSUMER CONFUSION

When all the attached or re-attached plastic components are designed to be recyclable with the product, recycling is easier for California residents. One of the overarching principles of SB 54 is to streamline, standardize, and simplify plastics recycling for residents to increase participation. This means **moving toward a future where there is less onus on the resident to intentionally remove any plastic components prior to recycling.** The role of the resident is to simply put the plastic package into the recycling bin, and then, with proper packaging design, the full product can be effectively recycled into new products.

If components are all considered separately, then it may lead to more cases of when the resident is instructed to remove parts for recycling. This moves in a contrary direction to the statute goals. Components that are already recyclable when attached or re-attached should be incentivized, not treated the same as components that must be removed and recycled or disposed separately. There are too many nuances around how components are handled by consumers and how they flow in the recycling to simply set one baseline for all materials. A**PR strongly recommends CalRecycle differentiate between component types in its definition and CMC guidance and incentivize those that can be recycled as part of the base package.**

CONCERN 5: PROMOTES POOR DESIGN CHOICES

APR anticipates several significant problems caused by charging EPR fees based on separate components with two examples provided here:

Scenario 1: Counting separate components may result in larger lids that use more plastic
If a producer must consider the screw-on lid as a separate and distinct component, then the producer may need to design the lid to be recycled separately from the container. Since smaller format plastics are more challenging to recycle, the producer would be incentivized to make the lid larger so it could be more effectively sorted by the MRFs. For example, a plastic jar lid (e.g., peanut butter jar) could be expanded to 3” or 4” width, or increased in height to 3” or more, to increase recyclability as a standalone component. This change in lid size will increase the amount of plastic being used in product design, which is contrary to the statutory goals.

Scenario 2: Moving to metal caps will result in less recycling.
If the plastic cap is considered a separate category and has a different fee than the plastic container, then producers will look for ways to reduce their fees on the cap itself. Because metal typically has lower EPR fees than plastics, producers would have a financial incentive to move toward metal caps. While this might *sound* like a good way to reduce the number of plastic components, it has many unintended consequences. Metal components are the number one contaminant on PET containers. Small pieces of metal are extremely problematic in the plastic recycling system because they are extremely challenging to separate and degrade the quality of the recycled content. If more companies move to metal caps, it will have several negative impacts, including less recycled plastic and lower quality of recycled content. In addition, small metal caps are challenging to recycle because of their size and because they contain a plastic lining on the inside of the cap. By contrast, plastic caps are recyclable today on bottles. Moving toward more plastic-lined metal caps would be a huge step backward and would create more problems rather than solve problems.

Moving forward

APR recognizes that one of the goals of SB 54 is to reduce plastic waste from small components, and the subsequent need to quantify the number and types of plastic components. However, the goal to count all components should not undermine recycling efforts, and we believe there is a way for the state to set the definitions to both quantify the number of components and ensure components are effectively recyclable and recycled.

APR requests CalRecycle amend the definition of detachable component to recognize that some plastic components are best recycled as part of the base packaging and should be categorized as part of the base packaging.

Response to O-39-5

Comment rejected. CalRecycle declines to adopt the suggested change because it is vague: The suggestion does not explain what change would "recognize that some plastic components are best recycled as part of the base packaging." Moreover, such a change wouldn't describe an inherent characteristic of components because whether components are present in the configuration in which they are "best recycled" depends on consumer behavior and whether and how they have been processed. By not describing an inherent characteristic that can be ascertained, the definition suggested highlights, but does not solve, that problem. The proposed text avoids that problem and provides a definition that can be applied to products as they are encountered before they are discarded and without regard to consumer compliance with the handling desired by producers, clarifying that "detachable component" does not encompass components designed to be removed during the recycling process rather than by consumers. This addresses the issue raised by the commenter; components that are successfully designed to remain attached until the recycling process are not considered "detachable," while those that are likely to become detached are

"detachable." Further clarification in (a)(4)(D) explains that a component that may intentionally be detached during recycling is not necessarily "detachable."

O-40: National Wooden Pallet and Container Association (Jason Ortega)

Comment O-40-1

The National Wooden Pallet and Container Association (NWPCA) appreciates the opportunity to submit comments on the rulemaking for California Senate Bill 54, the Plastic Pollution Prevention and Packaging Producer Responsibility Act (SB 54).

Wooden pallets are not "covered material" under a plain reading of SB 54. NWPCA respectfully requests that CalRecycle acknowledge and state that SB 54 does not apply to wooden pallet producers or users.

NWPCA & THE INDUSTRY

NWPCA is the only global wood pallet trade association, representing more than 450 companies in the United States and another 400 globally. The US wood pallet sector is a relatively small but critical industry comprised of over 3,4001 predominantly small- and medium-sized businesses spread across every state. This network of companies ensures the supply chain has the pallets needed to move essential goods throughout the country. Any disruption or unnecessary burden will simply hurt family-owned businesses and translate to higher costs to the consumer. All without cause, as pallets already have the highest documented recovery, reuse, and recycle rate of any packaging product in the supply chain (95%)2 when compared to other published numbers.3

EVIDENCE

Wooden pallets are not a "covered material" as defined in SB 54. The legislation defines "covered material" as "single-use packaging," i.e., "packaging that is routinely [discarded] after its contents have been used" which is "typically not [reused]." PRC § 42041(e)(1). Both by design and in practice, wooden pallets are not single-use.

A third-party verified study found that, depending on design and use, they are reused between ten (10) and sixty-six (66) times in a lifecycle. 4

Comprehensive, peer-reviewed wooden pallet studies recently found:

- Over ninety-five percent (95%+) of wooden pallets are recycled, repaired, remanufactured, chipped, used as animal bedding, fuel, etc., and sold—not landfilled5
- The reuse market is robust, accounting for over forty percent (40%+) of the industry.6
- A quarter of companies' sales dollars come from reused pallets.7

- Pallet remanufacturers landfill less than one percent (<1%) of their pallets.8

Simply put, all the best available evidence demonstrates that wooden pallets are designed for multiple uses and are, in fact, repeatedly re-used across industries. Wooden pallets are categorically not single-use. SB 54 does not apply.

INDUSTRY, EXPLAINED

The data shows that the US pallet sector is a model in circularity, driven by the inherent value of reusable lumber, the repairability of wooden pallets, and the customization the industry can provide its customers. This value has already created an incentive for manufacturers and end-users to reuse and recycle at rates far above the rates set forth in any policy, including SB 54. Companies that have excess pallets after receiving goods want to avoid the cost of landfill disposal and recover some value, and pallet remanufacturers need used pallets to repair and re-sell. These two parties are driven to engage for mutual benefit.

Wooden pallets are not a burden on the waste system. As a sustainable, circular choice for packaging that is not a burden on waste management, it is clear that the wooden pallet industry is not the intended target of this legislation. As explained by the bill's sponsor, the legislation "creates the California Plastic Pollution Mitigation Fund, which will dedicate $500 million per year for the next decade – paid for by industry – to fund the monitoring and mitigation of plastics pollution."9 CalRecycle explains that the purpose of the fines are to "address the environmental impacts of plastic pollution and aid affected environmental justice communities most impacted by the damaging effects of single-use plastic waste."10 Wooden pallets are inherently different from single-use plastic this legislation deems as the issue.

Wooden pallets are designed for reuse and easy recycling. They're composed of 98.5% wood, and the remaining 1.5% is fasteners (nails, staples, bolts), which are also recovered and recycled. Only about 1% of pallets are chemically treated.11 Additionally, the paint used in the industry is a water-based pigment and thus the product is still 100% recyclable if applied.12 This makes it easy for the industry to recycle a wooden pallet without utilizing public waste management systems. The bill sponsor also stated that "this law has always been about affordability" of waste management because "it's been increasingly difficult for our cities and counties to handle the endless influx of plastics into our waste stream, and they have been forced to increase rates on regular folks over and over again." Wooden pallets are designed to avoid the waste stream.

Further proof is California's own data which shows that wooden pallets account for only 0.8%13 of California's Municipal Waste Stream (MWS). And of the few pallets that do arrive at landfills, approximately 67% nationwide are diverted from landfilling because they are reused, ground for recycled applications, or used as top-cover material at the landfill, utilizing their biodegradable material for a sustainable solution.14 That diversion rate is even higher in California at 88%.15 This data shows that the wooden pallet

industry is not burdening the waste stream the same way as single-use packaging. If the goal of producer fees is, as stated by the Circular Action Alliance, “to ensure each producer contributes its fair share of fees to the program based on the type and quantity of materials it supplies and their impacts,” then any fines imposed on wooden pallet producers would be an unjust punishment on predominantly small businesses that won’t lead to a material benefit on an industry already achieving a 95% recovery rate.

CONCLUSION

In summary, the data shows that wooden pallets are not single-use and therefore are not a “covered material” as defined by SB 54. On behalf of the US wooden pallet industry, NWPCA respectfully requests that CalRecycle determine that wooden pallets do not fall within the jurisdictional parameters of SB 54. We welcome continued engagement on this matter.

Response to O-40-1

Comment rejected. The commenter's justification for why "SB 54 does not apply" to wooden pallets actually proves the opposite point: The commenter argues why pallets should be considered not "single-use," but the reason for advancing that argument in the first place is that SB 54 requires materials like wooden pallets to be recyclable or compostable if they are not "single-use." To the extent that any wooden pallets, like any other packaging, satisfy the statutory requirements for being "reusable," the commenter is correct that they would fall outside the definition of "covered material." No change to the proposed regulations is necessary to clarify that effect of statute. Regarding the commenter's justification for why wooden pallets should be considered reusable, that justification fails to consider the criteria in Public Resources Code section 42041(af) and, even if it did, would not merit a change to the proposed regulations, which are not the appropriate place to make particularized determinations. Moreover, entire categories of packaging cannot be considered "reusable" in the manner the commenter desires. Applying the criteria in Public Resources Code section 42041(af) requires examination of the particular characteristics of packaging and the circumstances of its use.

O-41: Household & Commercial Products Association (Molly Blessing)

Comment O-41-1

On behalf of the undersigned organizations, thank you for the opportunity to provide feedback on the draft proposed regulations for California Senate Bill 54 (SB 54), the Plastic Pollution Prevention and Packaging Producer Responsibility Act of 2022. We share California’s laudable goals of ending plastic pollution and improving material circularity and are strongly committed to developing and funding a program that successfully achieves these aims.

We represent a coalition of producers who manufacture and sell trusted and familiar household brands, personal care, and food products. We appreciate the thoughtful approach that the California Department of Resources Recycling and Recovery (CalRecycle) has taken in developing the revised SB 54 proposed regulations (draft dated August 22, 2025) and believe the regulations carefully balance environmental stewardship with current economic realities.

We would like to highlight some remaining concerns that we believe are essential to address in order to effectively implement the proposed regulations. Specifically, we consider the proposed approach to component definitions and source reduction requirements to be critical issues that require modifications to ensure the regulations are consistent with the intent of SB 54. Additionally, as CalRecycle considers the technical specifications of certain packaging and product types, such as items that should be considered de minimis, we wish to be a resource to the Department so that implementation accurately reflects the state of packaging on the market today.

Response to O-41-1

Comment rejected. No response to this portion of the commenter's submission is necessary because it refers to suggested changes or objections set forth in greater detail in other portions of the submission. To the extent other portions of the submission suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-41-2

Components

We are concerned that the proposed approach to defining components for the purposes of recyclability and source reduction reporting is unclear, inconsistent with current recycling practice, and will create significant challenges for system implementation.

Regarding reporting, we are concerned that the proposed approach outlined in source reduction guidance shared on September 2, 2025, continues to consider components to be distinct from each other even if they are not detachable and cannot be separated during disposal, collection, or recycling. SB 54 does not require disaggregating inseparable internal sub-parts and doing so would extend the definition beyond what the statute provides. The proposed approach creates major complexity and in some instances, it is impossible to determine the component count given that producers are not provided confidential business information from suppliers that would allow for an accurate assessment.

For example, a trigger spray, commonly used to dispense products such as cleaners and personal care, can have over ten distinct parts that work together to generate the trigger spray functionality. However, the consumer is unable to separate the trigger spray into these various parts and recyclers process the trigger spray as one item. Similarly, the consumer is not able to separate multilayer and laminate films by layer; in-mold labels on a container; plastic necks for screw-top cartons, which are melted into

the carton; and connected “front” and “back” zippers from each other or from the pouch they are attached to.

If only *detachable* components are required to be reported separately, this both simplifies reporting and generates more meaningful and accurate data. Under this approach, for example, a trigger spray would be considered one component instead of 10+ components.

This is helpful for several reasons:
It is consistent with how consumers sort these items and with how they are treated in the recycling process.
It is also consistent with statutory requirements, which are to collect data on the number and weight of plastic components overall, not broken out to more granular detail.
The data collected would be more accurate and consistent because producers would better understand what needs to be reported and be able to gather the appropriate information. It eliminates the issue of producers trying to obtain packaging design information that suppliers may consider confidential and not be willing to share.
The data from 2023 can more easily be compared to future years due to improved consistency in producer reporting, as well as to other states that may be collecting general EPR reporting but not source reduction-specific information.

CalRecycle should adhere to statutory requirements and clarify that components which are not intended to be separated by the consumer or recyclers are considered a single plastic component for the purpose of the source reduction baseline.

Response to O-41-2

CalRecycle rejects this comment, which proposes that components that are not "intended to be separated by the consumer or recyclers" be considered a single component. CalRecycle rejects that proposal for the reasons discussed in responses to comments O-39-5 and O-41-3. To the extent the commenter proposes that the regulations should state that reporting of non-detachable components is not required, CalRecycle rejects that proposal as well. The proposal would eliminate reporting for information necessary for assessing source reduction and recycling rates. The proposal also misunderstands how the regulations identify discrete "components." A single component might have physical subparts if those subparts are not detachable and the component is "distinct with respect to its composition or function." More fundamentally, the commenter's discussion of how, if at all, components are separated in the waste stream ignores why the number of components is even relevant to source reduction. The statute requires reduction in the number of plastic components by 25 percent, so there must be a method for counting that number, but nothing in statute suggests that how and when components are separated from each other should strictly dictate how they should be counted. Lastly, CalRecycle rejects the contention that it might be impossible for producers to know the composition and construction of their own products. No producer—especially trademark owners, whose right to control the use of their brand on goods depends on them retaining

ultimate authority over those goods—is required to conduct business with a supplier that refuses to share basic information required for the business to know whether it is reducing the amount of plastic in its goods.

Comment O-41-3

Regarding recyclability, the definition in the proposed regulations appears to consider detachable components that are typically reattached to a recyclable container before being discarded to be *not recyclable* unless the component itself is independently recyclable. This is clearly inconsistent with the recommendations of plastic recyclers as described in the Association of Plastic Recyclers (APR) Design Guide, which requires evaluation of attachments in conjunction with primary packaging. If SB 54 is implemented in a manner that is inconsistent with what recyclers need to more effectively recycle material, this will hurt, not help California's progress towards a more circular economy.

As written, the proposed approach to detachable components would incentivize producers to a) tether caps to bottles to enable them to be considered "nondetachable," leading to increased plastic use from manufacturing the tether; b) use larger caps that do not fall within the 2-inch small parts range, leading to increased plastic use from the bigger cap; or c) switch from plastic caps to aluminum caps, which can be more expensive for both producers to purchase and recyclers to recover, driving up the cost of the product (especially now with the tariffs they have to adhere to). None of these outcomes are consistent with the laudable goals of SB 54 to improve the recycling system and decrease plastic pollution.

CalRecycle should clarify that, for the purposes of determining recyclability status and recycling rates, components which are instructed to be reattached to a recyclable container must be considered together with the packaging to which they are designed to be reattached prior to disposal.

Response to O-41-3

CalRecycle rejects this comment for the reasons provided in responses to comment O-39-5 and comment O-91-12. Regarding the particular circumstances listed in the comment, those outcomes are not necessarily inconsistent with the goals of SB 54 because they would eliminate the dependence on consumer behavior for products to go through the waste stream intact. In contrast, the change the commenter suggested would mean components would always be considered the same item based on any instruction to do so, regardless of the clarity of those instructions and even if consumers rarely comply. That would undermine the integrity of recycling rate calculations and recyclability determinations.

Comment O-41-4

Source Reduction

The plastic source reduction targets in SB 54 are overly ambitious, unprecedented, and it is highly unlikely they are feasible without significant negative impacts on Californian consumers.

It is unclear whether producers will be able to achieve the goals without a substantial reduction in the amounts of products sold in California, meaning less access by California consumers to everyday items and/or higher prices. Further, we are unable to forecast future economic conditions or the number of producers that may participate with the Producer Responsibility Organization (PRO) at a given point, both of which may impact the ability to meet source reduction targets.

Producers are attempting to prepare for source reduction obligations in the face of this uncertainty, but still do not have finalized regulations, finalized guidance on what is considered source reduction, or an approved PRO plan. If producers are asked to meet targets on an unachievable timeline without adequate guidance, this will likely result in forced noncompliance rather than a meaningful transition to a more circular economy.

To promote successful achievement of source reduction targets, CalRecycle should do the following:

Clearly establish that producer reporting for calendar years 2027, 2030, and 2032 will be used to assess compliance with 2027, 2030, and 2032 source reduction requirements, respectively. This is consistent with the statutory requirement, which does not require compliance prior to January 1, 2027, and provides necessary time for the regulations, guidance, and PRO plan to be finalized so that producers are able to rely on these important documents when making packaging changes.

Restore an adjustment factor for fluctuations in economic conditions or the number of participating producers and add an adjustment factor for sales growth over time. This gives CalRecycle important flexibility to consider changes in the marketplace that may not have been predicted at the time of SB 54's passage, promotes fair competition among businesses, and maintains access of Californians to new products over time.

Remove the requirement to tie post-consumer recycled (PCR) content increases to a 2023 baseline. While there is a statutory requirement to measure overall source reduction against a 2023 baseline, there is not a requirement for CalRecycle to adhere to a specific baseline year in determining an alternative compliance formula for source reduction credit from PCR content use. The use of a 2023 baseline penalizes companies that have proactively incorporated significant amounts of PCR content in their packaging in the decades prior. These companies will be less able to receive a source reduction credit than producers that have put in minimal effort previously, contrary to the intent of SB 54.

Response to O-41-4

CalRecyce rejects this comment to the extent the commenter expresses general dissatisfaction with SB 54 as this is outside the scope of the rulemaking process

and CalRecycle's authority. To the extent the commenter states hypothetical scenarios regarding reduction in products sold, the status of the rulemaking process, reporting entities compliance, the timing of an approved PRO plan, etc., CalRecycle rejects this portion of the comment as it does not state any specific changes to regulatory language, and moreover is primarily dealing in hypothetical situations as opposed to statutory obligations. To the extent the commenter suggests establishing reporting requirements for calendar years, this is already clearly addressed in statute and sufficiently clarified in regulations consistent with statute, with no changes necessary. Finally, regarding the general suggestion of accounting for adjustment factors for fluctuating economic conditions, there is again no specific proposed regulatory text or statutory support regarding how this would be implemented and is consistent with statute. Lastly, the commenter requesting to remove the inclusion of post-consumer recycled content from the 2023 source reduction baseline is inconsistent with the clear intent of statute, especially when the relevant sections are read in conjunction, including section 42057(b) of the PRC which requires CalRecycle to establish a source reduction baseline based on the amount of plastic covered material that was sold, offered for sale, or distributed in the state in the 2023 calendar. As such, the commenter's suggestion goes against language and intent of the Act. As such, CalRecycle rejects this comment. See also responses to I-63-15 and B-27-2.

Comment O-41-5
Technical Resources

All of our members have specific packaging requirements, some required by regulation and some that are part of industry product stewardship practices, to ensure the safety and quality of products ranging from food to personal care, to household cleaning, protection, and maintenance. We would greatly appreciate the opportunity to share information about these packaging requirements with CalRecycle and how the theoretical SB 54 categories, descriptions, and approach to components translate to the practical for our members. We want to be a resource for the Department as the Department considers how to effectively implement these novel packaging policies. Please do not hesitate to let us know if there is information we can provide about our product types and the packaging used for them.

In conclusion, to reiterate, we greatly appreciate the effort that CalRecycle has put into soliciting public comment as part of the implementation process and the Department's consideration of our concerns. We welcome any questions about this letter and look forward to continuing to engage with CalRecycle to position California as an ongoing leader in preventing plastic pollution.

Response to O-41-5

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

O-42: League of California Cities (Melissa Sparks-Kranz)

Comment O-42-1

The League of California Cities (Cal Cities) appreciates the opportunity to provide public comment to the California Department of Resources, Recycling, and Recovery (CalRecycle) on the draft regulations for the Plastic Pollution Prevention and Packaging Producer Responsibility Act (SB 54, Chapter 75, Statutes 2022) on behalf of California's 483 cities statewide. Given the circumstances that CalRecycle is now navigating a second iteration of the rulemaking on SB 54, we sincerely appreciate that CalRecycle has continued to provide opportunities for interested parties to provide input on the proposed draft regulations.

In California, local jurisdictions are the backbone of solid waste management and recycling efforts . Cal Cities has long-supported solid waste management and recycling goals that are developed with reasonable and achievable implementation measures, anticipating the need to ensure that communities maintain public health and advance recycling efforts based on our changing climate. SB 54 was successfully chaptered into statute based on several critical components being incorporated into the law, including that producers are responsible for the full costs of processing covered materials to drive towards a more circular economy. Full costs include the costs incurred by local jurisdictions.

The draft regulations are intended to address "affordability concerns", which was the primary response from the Governor's Office as to why the regulations were withheld, preventing CalRecycle from finalizing the rulemaking in March 2025. Local jurisdictions continue to have "affordability concerns" with the draft regulations. If the draft regulations are not clarified to fully implement the requirements of SB 54, as we request in this letter, the program will cause greater affordability burdens on local governments and their ratepayers. It is imperative the regulations support the successful implementation of SB 54 and ensure the program does not cause these greater affordability burdens.

California's Constitution requires that the state reimburse local governments for programs the state requires local governments to carry out. Extensive statutory and regulatory structure governs the manner in which local governments are reimbursed. SB 54 imposes a mandate on local governments. Instead of requiring the state to reimburse local governments for the costs incurred to comply with the mandates, SB 54 requires the PRO to reimburse local governments. Yet the draft regulations fail to explain with any specificity the process for reimbursement, the costs that will be reimbursed, the mechanism for transferring payment to local governments, and even at a minimum the regulations do not even acknowledge that these cost recovery details be included as a requirement in the PRO Plan and budget. We additional have serious concerns with two potential loopholes in the draft regulations with the inclusion of the new categorical exclusion and the eligibility of products being labeled 'compostable'.

Cal Cities respectfully submits for CalRecycle's record that we have remaining concerns with the draft regulations that we believe will hinder how implementation progresses. The following concerns are detailed below:

Response to O-42-1

Comment rejected. No response is necessary to this comment because it only raises general issues discussed in greater detail in later portions of the commenter's submission. To the extent the comment recommends changes related to those issues or raises specific objections, CalRecycle has responded to those later portions accordingly.

Comment O-42-2

1) Comment 1: Section 18980.8 must be clarified to include the definition of a "covered costs" to comply with the mandate to protect ratepayers by fully funding the implementation of the PRO Plan, including paying costs incurred by local jurisdictions.

As drafted, the regulations do not ensure that local governments will be fully reimbursed by the PRO as required by the enacting legislation. Specifically, SB 54 requires that the regulations "ensure the PRO fully funds plan implementation," including "the costs incurred by a local jurisdiction". Ultimately, the Legislature's goal in ensuring fully funding plan implementation was to "allow local jurisdictions to protect ratepayers from increased costs associated with the processing and marketing of covered material."

Cal Cities believes that the draft regulations must include in Article 8, Sections 18980.8 to reflect that covered costs must be consistent with the requirements of the Act, including but not limited to Sections 42051.1 and 42060 of Public Resources Code. This would clarify that the PRO plan must specify, based on statute, eligible covered costs.

Response to O-42-2

Comment rejected. The commenter incorrectly assumes that CalRecycle's evaluation of the process for determining and paying costs can ignore the requirements set forth in the statute. In all cases, a PRO plan must satisfy statutory requirements. The first sentence of subdivision (g) acknowledges this requirement: Pursuant to [42051.1(g)(1)], the plan shall include a process for determining and paying that will be incurred, or otherwise would be incurred . . . due to requirements of the Act." Moreover, those costs are defined in section 18980.8(g)(2) of the proposed regulations such that they will have the effect the commenter asserts the PRO plan must achieve. In particular, consistent with the statement in Public Resources Code section 42060(a)(1) concerning "protect[ing] ratepayers from increased costs," a cost is necessarily "greater due to the requirements of the Act" if it would exposed ratepayers to increased costs. See, also, CalRecycle's responses to comment I-51-1 and B-29-2.

Comment O-42-3

2) Comment 2: Section 18980.8(g) must include specific requirements for the PRO plan to identify the "mechanism and schedule" for fully funding costs pursuant to the Act.

SB 54 requires that the PRO Plan include not only a process for determining costs incurrent by local jurisdictions (based on information provided by the local jurisdiction), but the mechanism and schedule for transferring the portion of the fee required by Public Resources Code Section 42053(c)(7) to local jurisdictions. The Draft Regulation Section 18980.8(g) does not include adequate information regarding the mechanism and schedule for issuing payments to local jurisdictions for covered costs. As written, the Draft Regulation Section 18980.8(g)(4) simply requires an undefined "reasonable period" and fails require the PRO to include in their plan the "mechanism" for reimbursement.

Cal Cities strongly urges clarification in the draft regulations to address the following:

• Covered costs must be based on information provided by the local jurisdiction;
• The PRO plan must specify how covered costs will be determined in writing by the PRO; and
• The PRO plan must specify the schedule for issuing payments and payment mechanism;

Response to O-42-3

Comment rejected. The commenter cites asserts that statute requires PRO plan to set forth "the mechanism and schedule for transferring the portion of the fee required by Public Resources Code Section 42053(c)(7) to local jurisdictions." However, whether a revision to the proposed regulation is appropriate does not turn on whether the statute includes that requirement for a PRO plan; the question is whether greater detail in the proposed regulation concerning such "mechanism and schedule" is needed. The statute does not require such greater detail because the commenter misinterprets section 42053(c)(7). That provision concerns what the "fee schedule" set forth in a PRO plan must include, not what the proposed regulations must include, and "fee schedule" does not concern the "mechanism" or "schedule" for payments of covered costs. The phrase "fee schedule" must be read as a unitary phrase; in context, "fee schedule" is a description of the various fees that a plan will impose, not a reference to the timing of payments of covered costs, which 42053(c) does not concern, anyway.

Comment O-42-4

3) Comment 3: The draft regulations must specify that the local jurisdiction should be consulted and then notified of payments directly to recycling service providers from the PRO to prevent duplication in cost recovery from local jurisdictions.

Many, but not all, local jurisdictions have existing contracts with recycling service providers to provide the waste management and recycling services within their jurisdiction. While SB 54 allows for both local jurisdictions and recycling service providers to receive payment for their costs from the PRO, it is important not to duplicate requests for payment. For example, if a local jurisdiction has a franchise agreement and is requesting reimbursement directly from the PRO for covered costs, the recycling service provider should not request the same costs of the PRO. To ensure this is handled smoothly, the regulations in Article 8, Section 18980.8 should be revised regarding any costs determined to be a recycling service provider's covered costs, where the PRO or Independent Producer must first consult with and then subsequently notify the local jurisdiction on whose behalf a recycling service provider provides solid waste handling services of such determination. By initiating a consultation first, the local jurisdiction can clarify if the request for covered costs is already a part of their existing contract with the recycling service provider and already a covered cost of the local jurisdiction.

Response to O-42-4

CalRecycle rejects this comment for the reasons provided in responses to comments I-51-1, O-42-2, B-29-2, and O-47-2.

Comment O-42-5

4) Comment 4: The draft regulations must be revised to address how to resolve disputes over the amount that will be paid for a "covered cost" as part of the dispute resolution process.

Section 18980.8(h) offers mediation or arbitration, or any process agreed to by the parties as a way of resolving disputes over what's a "covered cost." However, there's no process for resolving disputes over the amount that is owed to the local jurisdiction for an agreed-upon "covered cost." We believe this is simply a clarification that should be added to Section 18980.8 (h) to ensure that the dispute resolution process does not only address whether a cost is a "covered costs" but also to resolve the amount claimed by the local jurisdiction. We believe this needs to be more explicitly stated in the regulations.

Response to O-42-5

Comment rejected. Section 18980.8(h) of the proposed regulations requires the dispute resolution process to include not only a determination of whether costs incurred by local jurisdictions and recycling service providers are covered costs, but also to "what extent" they are covered costs. This provision addresses the commenter's concerns by including in the dispute resolution process the ability to resolve the amount claimed by the local jurisdiction or recycling service provider. Accordingly, no further changes to the proposed regulations are necessary to the implementation or enforcement of the Act.

Comment O-42-6

5) Comment 5: Section 18980.13, the enforcement provisions pertaining to local jurisdictions, must be **revised to ensure that penalties and fines are not imposed prior to providing local jurisdictions the opportunity to respond to a notice of violation and to cure the violation and that the local jurisdiction's role of materials collection (not transfer) is clarified in the regulations to be consistent with statute.**

As clearly stated in statute, failure to comply with the requirements of the Act, including failure by a PRO to implement and satisfy the requirements of its plan, shall subject a PRO, producer, wholesaler, or retailer to penalties for violations or revocation of an approved plan. SB 54 specifically states the penalties for violation are subject to a PRO, producer, wholesaler, or retailer. Local jurisdictions are not explicitly authorized to develop a corrective action plan to remedy a violation under SB 54 (in large part because they were not anticipated to be subject to enforcement actions).

Firstly, Local jurisdictions are solely required to collect covered materials on the covered materials list, as required in statute under SB 54. Article 11, Section 18980.11 must be revised to explicitly require 'collection', not 'collection and transfer' of covered materials to a responsible end market or intermediate supply chain entity. Cal Cities believes that the provisions in the draft regulations to transfer materials to responsible end markets directly must be removed. This is critical when it comes to enforcement of the regulations and the scope of the local government's responsibility under the Act.

Prior to imposing penalties for a violation, CalRecycle should identify if the PRO or producer are preventing the local government or recycling service providers from complying. CalRecycle should then be required to provide notice to the local jurisdiction/recycling service provider (proposed as two notices issued 90 days apart) and provide a minimum of 180 days to remedy the violation before penalties are invoked. CalRecycle must provide the local jurisdiction/recycling service provider the opportunity to develop a response to remedy the violation prior to any further compliance action being taken.

The draft regulations must recognize that SB 54's enforcement authority is directed toward producers and the PRO and respect that local jurisdictions and recycling service providers are instead subject to existing enforcement regimes, including AB 939. The draft regulations impermissibly sought to impose SB 54's enforcement regime intended for the PRO on local jurisdictions and recycling service providers. This approach was unsupported by SB 54's statutory construction and local compliance can be better accomplished through existing enforcement pathways.

SB 54's enforcement authority is clearly limited to imposing penalties on producers and the PRO. The regulations are predicated on the assumption that the term "any entity" in Section 42081(a)(1) of Public Resources Code broadens the scope of its enforcement authority; however, that term must be defined in the draft regulations. Public Resources Code Section 42081 seeks to interpret and implement Public Resources Code Section

42080 and does not vest CalRecycle with additional authority to determine what constitutes a violation of SB 54 beyond the scope of Public Resources Code Section 42080.

Public Resources Code Section 42080 establishes what constitutes a violation of SB 54 and provides that failure to comply with the requirements of SB 54 will subject a PRO, producer, wholesaler, or retailer to penalties for those violations or revocation of an approved plan. Public Resources Code Section 42081 in turn:
• Sets the amount of penalties;
• Provides that they shall not accrue against a producer or PRO until 30 days after notification of the violation;
• Allows a producer or PRO to submit a corrective action plan to CalRecycle for approval detailing how and when it will come into compliance with SB 54; and
• Sets forth various factors CalRecycle shall consider when determining the penalty amount, including whether the violation was beyond the reasonable control of the producer or PRO, the size and economic condition of the producer or PRO [...]
Public Resources Code Sections 42083 and 42084 also allows CalRecycle to impose additional requirements on a producer or PRO for failure to meet various requirements of SB 54.

Great lengths are taken in statute to outline the potential enforcement actions that can be imposed against producers or the PRO, yet there is not a single instance in statute that refers to enforcement upon local jurisdictions or recycling service providers. Neither Public Resources Code Sections 42080 nor 42081 contemplate penalties against local governments or recycling service providers. Furthermore, the draft regulations would have inappropriately subjected local jurisdictions and recycling service providers to even more severe consequences for violations of SB 54 than apply to the PRO and producers since local governments and recycling service providers cannot implement a corrective action plan, as is available for the PRO and producers. It is difficult to imagine the Legislature providing a more lenient compliance pathway for a producer or PRO than that which would be available to a local jurisdiction or recycling service provider, given that the law is intended to shift the burden of solid waste recycling away from local jurisdictions and onto producers who introduce packaging into the marketplace.

Local jurisdictions are subject to AB 939's diversion requirements and must develop source reduction and recycling elements outlining how they will achieve the state's solid waste and recycling requirements. Under the AB 939 framework, CalRecycle is required to regularly review jurisdictions and determine whether they have made a good faith effort to implement their source reduction and recycling element, with penalties of up to $10,000/day for noncompliance. Therefore, a local jurisdiction's failure to comply with SB 54 should be considered a violation of their existing requirements to implement diversion programs through AB 939 and subject them to these penalties exclusively.

Reporting and compliance review for SB 54 should be incorporated into existing Electronic Annual Report (EAR) system run by CalRecycle, as currently utilized for other laws that govern local jurisdiction diversion requirements such as SB 1383, AB

341, and AB 1826 compliance. This existing system can be updated to require local jurisdictions to self-report SB 54 compliance by certifying whether they collect the required recyclable or compostable covered material categories.

Response to O-42-6

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42060, 42060.5, 42080, and 42081, and no change is necessary to the implementation or enforcement of the Act. First, local jurisdictions are required to comply with the requirements of the Act and may be subject to penalties for any violations of these requirements. See the response to comment O-15-7. PRC section 42081(a)(3) already provides that penalties for any violation of the Act may not begin accruing until 30 calendar days following notification of the violation pursuant to PRC section 42081(a)(1). Therefore, to the extent this comment recommends providing an opportunity for local jurisdictions to remedy violations following notification and before penalties begin to accrue, PRC section 42081(a)(3) already provides local jurisdictions with sufficient opportunity to remedy any violations without incurring penalties. CalRecycle declines to adopt the recommended 180-days period because such period is unnecessarily long and would cause undue delay to the accrual of appropriate penalties for prolonged violations. Moreover, to the extent this comment recommends removal of "and transfers" from section 18980.11(b) of the proposed regulations, no change is necessary because the proposed regulations are already sufficiently clear that local jurisdictions will not be deemed to be in violation or subject to penalties for the lack of responsible end markets. See the response to comment O-29-2. Finally, to the extent this comment makes other recommendations concerning the role of the local jurisdictions in complying with the Act and coordinating with the PRO, see the response to comment O-13-22. No change to the proposed regulations is necessary.

Comment O-42-7

6) Comment 6: The newly added categorical exclusion and the eligibility of products being labeled 'compostable' are two potential unintended loopholes that will drastically effective implementation and increase affordability concerns associated with SB 54.

The draft regulations added for the first time in the rulemaking process a new pathway for packaging components to be excluded from the law if it is necessary to comply with rules, guidance, or other standards issued by the USDA or FDA to prevent microbial contamination or to maintain the safety or structural integrity of packaging. If a conflict arises in implementation, producers can utilize the exemption pathway within subparagraph (4) of Section 18980.2.4 Exemptions for Certain Covered Materials for (A) unique challenges, (C) health and safety reasons, or (D) materials determined unsafe to recycle. Unlike categorically excluded materials, exempted materials remain covered under the law, meaning regulated producers must still report and pay fees into the system with a required phase-in plan to ultimately achieve compliance. Exemptions

are also limited to 2 to 5 years, while excluded materials are permanently removed from the law's purview. We urge CalRecycle to remove Section 18980.2(a)(2) from the draft regulations and instead rely on the existing exemption process (Section 18980.2.4) for packaging or packaging components used by food or agricultural commodities that are unable to comply with SB 54 due to conflicting federal regulations.

This new categorical exclusion of materials creates a significant and unfounded potential loophole for many producers to exclude their materials from the requirements of SB 54. Not only does this expansion go beyond statutory boundaries, but excluding more materials will result in higher costs for many regulated producers as the fixed costs—such as outreach, collection, processing, reuse/refill infrastructure, and development of responsible end markets—will be spread over fewer businesses. It also means that local governments and our ratepayers will remain responsible for the end-of-life management of much of the single-use packaging that SB 54 intended to shift to producer responsibility. These concerns are shared by a wide range of stakeholders, including producers themselves, and we request this exclusion be removed completely from the draft regulations.

Response to O-42-7

CalRecycle partially accepts and partially rejects this comment as described in response to comment I-59-2, a portion of which is substantively the same as this comment and encompasses it entirely. To the extent the final paragraph of this comment is broader in scope than comment I-59-2, CalRecycle still rejects the commenter's suggestion. The revisions to section 18980.2(a)(2) remedy that alleged potential for it to act as a "loophole, and it does not go beyond statutory boundaries but is rather authorized under Public Resources Code section 42060(b). Regarding costs specifically, that concern cannot justify ignoring the clear statutory directive to prevent conflict between the Act and obligations under federal law.

Comment O-42-8

Similarly, the eligibility of items being labeled 'compostable' is highly problematic for successful implementation. AB 1201 prohibits materials from being labeled "compostable" unless they meet specific criteria, including the requirement to be "designed to be associated with the recovery of desirable organic wastes, such as food scraps and yard trimmings, that are collected for composting, unless the product complies with the department's regulations pursuant to subparagraph (B), to the extent the department elects to adopt such regulations." (Public Resources Code Section 42357(g)(E)).

However, Section 18980.3.3(c)(5) of the draft SB 54 regulations clarifies that an item is designed to be associated with the recovery of desirable organic waste *"if it is desirable organic waste itself or is marketed, labeled, or otherwise sold or distributed in a manner that directs or otherwise causes users of the item to use and discard it with desirable organic waste."* This regulatory framing essentially provides that any material marketed or labeled to be composted, is considered "associated with the recovery of desirable

organic waste" and therefore potentially compostable under SB 54. The intent of Section 42357(g)(E) is that a product facilitates the capture of desirable organics, such as food scraps and yard waste. The Section 18980.3.3(c)(5) of the current draft regulations effectively says that to be able to be labeled "compostable," a product simply needs to be labeled "compostable," provided it meets the other criteria in Section 42357. Allowing all packaging and food ware, regardless of its material composition, bearing a "compostable" label to be considered "desirable" was certainly not the intent of AB 1201, and the draft regulations must be updated to close this unintended loophole. Further, while the SB 54 regulations will only affect food ware and packaging, including this definition in these regulations could open the door for the same or similar circular logic to be applied to other products seeking to be labeled compostable. Local jurisdictions will have to go to greater lengths to separate these non-materially compostable products in the waste stream which will add greater cost concerns on the backs of ratepayers, which remains a significant concerns for overall implementation.

Cal Cities respectfully requests CalRecycle consider these comments in finalizing their regulatory package.

Response to O-42-8

CalRecycle rejects this comment for the reasons provided in responses to comments I-59-3 and O-78-7.

O-43: American Coatings Association (Annebelle Klein)

Comment O-43-1

The American Coatings Association (ACA) submits the following comments to the California Department of Resources Recycling and Recovery (CalRecycle) regarding the agency's proposed permanent regulations for the Plastic Pollution Prevention and Packaging Producer Responsibility Act (SB 54). ACA is a voluntary, nonprofit trade association working to advance the needs of the paint and coatings industry and the professionals who work in it. The organization represents paint and coatings manufacturers, raw materials suppliers, distributors, and technical professionals. ACA serves as an advocate and ally for members on legislative, regulatory, and judicial issues, and provides forums for the advancement and promotion of the industry and coatings science. ACA appreciates the opportunity to comment and looks forward to working with CalRecycle throughout the rulemaking process.

ACA provides the following recommendations to alleviate any undue burden imposed on the paint and coatings industry.

Response to O-43-1

Comment rejected. No response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations, does not raise an objection concerning the rulemaking process, or refers to

suggested changes or objections set forth in greater detail in other portions of the submission. To the extent other portions of the submission suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-43-2

1. Revise the proposed definitions for the terms 'plastic' and 'plastic or polymers.'

SB 54 and the proposed permanent regulations do not provide an adequate and/or clear definition of what constitutes plastic packaging. SB 54 clarifies that 'packaging' is inclusive of packaging components, including independent plastic components, and ancillary elements integrated into packaging. The state's packaging extended producer responsibility (EPR) law defines the term 'plastic' as "a synthetic or semisynthetic material chemically synthesized by the polymerization of organic substances that can be shaped into various rigid and flexible forms, [that] includes coatings and adhesives." Moreover, SB 54 defines the term 'plastic component' as "any single piece of covered *material made partially or entirely of plastic*" (emphasis added). CalRecycle's proposed definitions for the terms 'plastic' and 'plastic or polymers' utilize the same or similar language. While SB 54 provides examples of what is and what is not considered to be plastic, the definitions in the law and the proposed permanent regulations lack the necessary clarity for members of the paint and coatings industry to determine what constitutes plastic packaging. Accordingly, ACA urges CalRecycle to reconsider this issue and provide the necessary clarity for all producers. ACA notes that California also has a rigid plastic packaging program for which paint and coatings manufacturers must also develop compliance strategies. ACA recommends that CalRecycle consider alternative methodologies such as developing an exclusive list of what does and what does not constitute plastic, and/or providing that independent plastic components qualify for the de minimis weight and volume exemption in SB 54's definition for the term 'packaging.'

Response to O-43-2

CalRecycle rejects this comment because, rather than request a modification to the proposed regulations, it requests that CalRecycle issue a determination of how the proposed regulations would apply to certain categories of materials, some of which might not even be packaging. The proposed regulations provide detailed criteria that are sufficient to be applied consistently to packaging components; to the extent that stakeholders would benefit from CalRecycle providing illustrative examples of such applications, no revision of the proposed regulations is necessary for CalRecycle to do so. If the commenter intended to propose that the regulations define "integral part of the product," CalRecycle declines to do so because the proposed regulations do not use that term. In any event, the word "integral" has a readily discernible, plain meaning in the context in which the statute uses it (section 42041(s)(4)(B), and the commenter does not propose any definition that it would consider sufficient.

Comment O-43-3

2. Revise Section 18980.13.2 Administrative Civil Penalties to provide that producers will be exempt from penalties on the grounds that any noncompliance was caused by the producer responsibility organization's (PRO) conduct.

Under Section 18980.13.2 Administrative Civil Penalties of the proposed permanent regulations, producers can be issued penalties for noncompliance caused by the PRO's conduct. CalRecycle's proposal unfairly burdens members of the paint and coatings industry by subjecting producers to exorbitant administrative civil penalties for behavior beyond their control. Accordingly, ACA urges CalRecycle to revise its proposal to provide that producers will be exempt from administrative civil penalties on the grounds that any noncompliance was caused by the PRO's conduct.

Response to O-43-3

CalRecycle rejects this comment. See the response to comment I-60-4.

Comment O-43-4

3. Revise Section 18980.13.4 Procedure for a Hearing to provide that respondents have a minimum of forty-five days after receiving a notice of violation or notice of disciplinary action to request a hearing.

Under Section 18980.13.4 Procedure for a Hearing of the proposed permanent regulations, producers (i.e., respondents) are required to request a hearing within fifteen days of being served a notice of violation or notice of disciplinary action. CalRecycle's proposal unfairly burdens members of the paint and coatings industry by subjecting producers to an unreasonably short timeframe to request said hearing and contest any penalties and/or other disciplinary action. Accordingly, ACA urges CalRecycle to revise its proposal to provide that producers have a minimum of forty-five days after receiving a notice of violation or notice of disciplinary action to request a hearing to contest the future imposition of penalties and/or other disciplinary action.

Thank you for your consideration of ACA's comments. Please do not hesitate to contact me should you have any questions and/or require further clarification.

Response to O-43-4

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act and no change is necessary to the implementation or enforcement of the Act. The timeframe established in section 18980.13.4 of the proposed regulations is reasonable and the recommended timeline of forty-five days is not necessary to the effective implementation of the Act. See the response to comment O-82-80.

O-44: Carton Council (Jordan Fengel)

Comment O-44-1

Dear CalRecycle SB 54 Regulatory Team,
The Carton Council of North America is composed of four leading carton manufacturers -Elopak, Novolex Pactiv, SIG, and Tetra Pak. Formed in 2009, the Carton Council works to deliver long-term collaborative solutions to divert valuable cartons from the landfill. We appreciate the opportunity to provide comments on CalRecycle's draft regulations for SB 54 and offer the following comments for consideration.

> **Response to O-44-1**
>
> Comment rejected. No response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations, does not raise an objection concerning the rulemaking process, or refers to suggested changes or objections set forth in greater detail in other portions of the submission. To the extent other portions of the submission suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-44-2

Section 18980.2.5 Covered Material Category List Updates
Comment:
In the discussion document for the SB 54 Informal Public Workshop on the SB 54 "Permanent Regulations" (May 27, 2025) CalRecycle noted that it "deleted language in subdivision (b) of section 18980.2.5 that required updates to the Covered Material Categories List in response to new information or changed circumstances." It seems that CalRecycle only intends to update the CMC List if information has changed, but no more frequently than once per year.
Subdivision (e) of section 42061 of the Public Resources Code states "As part of the process, the Department shall update the list ***at least*** [emphasis added] annually until January 1, 2032." We believe that CalRecycle has an obligation to consider additional data as they become available and publish changes to the list throughout the calendar year to be true to the spirit of the law and to avoid potential negative impacts in these early phases of implementation. Local government service provider contracts (for recycling collection list purposes) need to be informed by any CMC "recyclable" changes well before contracts are renewed. A single update once per year is simply not adequate, as it is not reflective of dynamic circumstances of recyclable determinations. If the list is not current and accurate it will lead to consumer confusion as materials are dropped from collection programs, only to potentially be added back in. This will create consumer distrust of the program. It will also be a burden to businesses and stifle innovation as producers that are committed to using recyclable packaging make unnecessary and costly packaging changes.
We recommend explicitly adding language requiring the CMC list to be updated more frequently than annually if information has changed, but we also understand

CalRecycle's desire to limit administrative burdens. Therefore, we propose the following language:
18980.2.5(b) For purposes of subdivision (a), updates are necessary if new information or changed circumstances renders the list out of date, incomplete, or otherwise inaccurate with respect to how it relates to waste generation and the handling and end-of-life management of covered material. At a minimum the Department shall update the list twice annually if new information and changed circumstances warrant it.

Response to O-44-2

CalRecycle rejects the comment. The commenter's principal assertion—that the proposed regulations limit updates to the CMC list to "no more frequently than once per year—is incorrect. The regulations do not restrict CalRecycle from revising the CMC list more frequently than the statutory minimum when appropriate for the circumstances, and thus no change is required. Furthermore, the process set forth by regulation to review and, if necessary, update the list is completely consonant with the requirement to update the list "at least" within (or "no less than") particular timeframes. A commitment to review twice a year, as proposed by the commenter, would significantly truncate the time needed to obtain longitudinal information and to analyze that information without the guarantee that review and changes are warranted; therefore, it would be inappropriate to set a default for review twice per year. Also, the commenter's concern about the timing of the list and its effect on local jurisdictions and service providers is addressed by section 18980.2.5(g), which explains that list updates imposing additional obligations on local jurisdictions or recycling service providers will not take effect until one year after the change is published.

Comment O-44-3

Section 18980.2.6 Covered Material Category List Recommendations
Comment:
The Carton Council speaks on behalf of four leading carton manufacturers and the obligated producers that carton manufacturers furnish with carton packaging material. We do not understand CalRecycle's methodology regarding how it characterizes material types and forms (MT&F) for cartons – specifically that CalRecycle has divided cartons into two separate CMC and MT&F categories – despite at least 10 requests to CalRecycle by the Carton Council to combine them. The Carton Council asks that CalRecycle explain why it divides aseptic cartons (Category ID PF15P) and gable-top cartons (Category ID PF5P) into two categories when they should be combined into a single CMC. Gable-top and aseptic cartons are widely recognized and managed within the recycling industry under a single material category (including in the EPR systems in Oregon and Colorado and on the draft list in Maine). **These cartons are baled, marketed, and sold** together at Material Recovery Facilities (MRFs) across the country, including within California. The industry does not differentiate between gable-top and aseptic cartons when preparing bales for end markets. In fact, ReMA (formerly ISRI)'s specifications for the Grade 52 bale, keeps gable top and aseptic cartons together. The U.S. EPA, in its waste characterization studies, also keeps aseptic and gable-top cartons together. Consumers often have difficulty discerning the two types of

cartons. CalRecycle's SB 343 MCS Report issued in April 2025 found that the difference in acceptance in recycling programs between the two types of cartons is negligible and programs that stated in the past that they manage them differently in all likelihood no longer do (i.e., any implication that they are collected, sorted, or marketed separately from each other is based on outdated information). Furthermore, the MCS Report found that large volume transfer and processing facilities (LVTPFs) sort both types of cartons at the same percentage for recycling and into the same output stream. Maintaining this artificial and unnecessary distinction between the two types of cartons increases the cost to California consumers, the PRO, and CalRecycle by requiring additional composition study sorting, additional data collection, calculation of two instead of one recycling rates, and separate cost allocation to each carton type.

Response to O-44-3

CalRecycle rejects this comment for the reasons provided in response to comment I-63-11.

Comment O-44-4

Section 18980.4 Responsible End Market Criteria
Comments:

The phrase "can be further processed and recycled" is very broad and the word "can" is subject to interpretation. The Carton Council is concerned that end markets may choose not to source materials from California due to regulatory ambiguity and uncertainty over whether they will be determined to not be a responsible end market if they do not recycle incompatible material that they currently receive and dispose of. CalRecycle's explanatory language states that the subsection is necessary to effectuate the intent of section 42041 of the PRC to prevent responsible end markets from being able to dispose of materials that are capable of being further processed and recycled [to maximize environmental benefits]. This begs the question as to whether CalRecycle expects such activities to take place for minimal amounts of material, and at all costs. This regulatory uncertainty and financial risk could prevent end markets from sourcing material from California. Furthermore, forcing end markets to recycle incompatible material that is not able to be recycled cost-effectively in order to qualify as a responsible end market will increase the program costs due to these regulations, as markets will have to reduce bale purchase prices to comply with these regulations, resulting in higher net costs to California recycling facilities, and ultimately higher costs to California consumers. The Carton Council requests the following edits to this paragraph:

(A) For incompatible materials that the end market determines can be further processed and recycled cost-effectively, the entity sends materials to entities that are authorized to further process and recycle the material.

Alternatively, CalRecycle can address regulatory risk and uncertainty by adding a specific dollar-per-ton cost limit for what is practicable for responsible end markets with respect to incompatible materials.

Response to O-44-4

CalRecycle rejects this comment. Section 18980.4(a)(3) of the proposed regulations is sufficiently clear and consistent with the relevant statutory provisions, including in PRC sections 42041(aa), 42041(ad), and 42060. The recommended change is not necessary or appropriate for the implementation or enforcement of the Act. See the response to comment O-55-4.

Comment O-44-5

Section 18980.6.7 Eco-modulated Fee and Fee Schedule
Comments:

We request that the word "wholly" be deleted from the draft rules. The declared intent of SB 54 is to reduce plastic use in the absolute, and any packaging that reduces the use of fossil-based plastic, including shifts to formats made from renewable materials, should be incentivized, even if some non-renewable plastic remains. Such innovation should be encouraged rather than discouraged.

Response to O-44-5

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42053 and 42060, and the recommended change is not necessary to the implementation of the Act. PRC section 42053(e) requires a PRO to adjust producer fees using malus fees or credits based on specified factors, and PRC section 42053(e)(7) specifically provides that plastic covered materials derived from renewable materials must be subject to a reduced fee relative to plastic covered material derived from a nonrenewable material. Section 18980.6.7(j)(1) of the proposed regulations implements this requirement by defining "renewable materials," for the purpose of PRC section 42053(e)(7), as "materials that are wholly derived from natural resources...[.]" The definition in section 18980.6.7(j)(1) is necessary and appropriate to offer clear, consistent, and certain guidance to a PRO and its participant producers as to when an adjusted producer fee may be expected and appropriate. Moreover, because PRC section 42053(e)(7) presents plastic covered materials derived from renewable materials and plastic covered material derived from a nonrenewable material as a dichotomy, the clear, unambiguous rule in section 18980.6.7(j)(1) is the most reasonable interpretation. As recognized by this comment, one goal of the Act is to reduce plastic use. Accordingly, the language of section 18980.6.7(j)(1) is necessary to ensure that producers' shifts from plastic covered material derived from a nonrenewable material to plastic covered material derived from renewable materials are maximized. In contrast, the recommended change would limit this effect by rewarding and encouraging partial, limited, and incomplete shifts from plastic covered material derived from a nonrenewable material to plastic covered material derived from renewable materials. CalRecycle declines to adopt this recommendation.

Comment O-44-6

Section 18980.11 Requirements for Local Jurisdictions and Recycling Service Providers

Comments:

The Carton Council is supportive of all cartons being recycled by responsible end markets but is concerned that CalRecycle, with this proposed text, may provide too much leniency for local governments and/or material recovery facilities to choose not to recycle a material type, which would disrupt the recycling of that material type and result in consumer confusion.

There is no prohibition of or penalty against a recycling service provider selling processed covered materials to an entity that is not classified as a "responsible end market." However, materials delivered to non-REM facilities cannot be counted by the PRO as "recycled" when assessing the targets of SB 54, so it is to the PRO's advantage to ensure all recyclables are delivered to responsible end markets. SB 54 also requires the PRO to, "in an economically efficient and practical manner," provide responsible end markets. Specifically, the Public Resources Code in paragraph (1) of subdivision (j) of section 42051.1 places the responsibility on the PRO in its budget to include "investments to develop and sustain viable responsible end markets for each covered material." Furthermore, per the Public Resources Code section 42053, subdivision (d), paragraph (1), it is the responsibility of the PRO to incur "costs to develop and sustain viable responsible end markets for each covered material category." The PRO cannot develop markets if there is no assurance of the ability to obtain adequate material supply for end markets, potentially resulting in a chicken-and-egg scenario of no end markets due to no supply, and no supply due to no end markets.

The Carton Council is also concerned that temporary market disruptions, such as those due to a port or transportation strike or a mechanical issue at a recycling facility, could result in ceasing to collect otherwise recyclable materials for a period of two years, inhibiting market development efforts. For the above reasons the Carton Council requests that this proposed text be deleted:

However, the absence of responsible end markets shall be deemed a local condition, circumstance, or challenge rendering inclusion of the covered material in the program impracticable for purposes of subdivision (b) of section 42060.5 of the Public Resources Code and paragraph (4) of subdivision (c) of section 18980.11.1 of this chapter.

Thank you for the opportunity to provide these comments on behalf of the Carton Council and its members.

Response to O-44-6

Comment rejected. To justify the requested deletion of the final sentence of 18980.11, the commenter states two concerns: that the proposed regulations "provide too much leniency for local governments and/or material recovery facilities to choose not to recycle a material type" and that "temporary market disruptions . . . could result in ceasing to collect otherwise recyclable materials for a period of two years." CalRecycle declines to make that change because that sentence states a straightforward, unavoidable application of plain language in statute. Public Resources Code section 42060.5(b) requires CalRecycle to

grant exemptions from the requirement that local jurisdictions and recycling service providers include certain covered material "in their collection and recycling programs" if doing so is "not practicable." For two reasons, impracticability must be deemed established if there are no responsible end markets available to process the covered material. First, it would be nonsensical for the Legislature to have intended that materials be considered "include[d] in . . . collection and recycling programs" if those materials will not possibly be recycled after collection. If that were how the statute applied to local jurisdictions' and recycling service providers' obligation, then they could satisfy it by simply collecting materials and dumping them in landfills. Second, the only way for materials to be considered "recycled" is for them to be processed by responsible end markets. So, the absence of such end markets necessarily establishes that recycling of the collected material is impossible.

The commenter's concern over temporary market disruptions is also overstated because, if a market disruption is known to be "temporary," there would not be an "absence of responsible end markets" and thus no "impracticability," and the disruption would be unlikely, in any event, to last longer than needed for completion of the process outlined in section 18980.11.1(d).

O-45: Surfrider Foundation (Miho Ligare)

Comment O-45-1

The Surfrider Foundation ("Surfrider") is a national non-profit organization dedicated to the protection and enjoyment of the world's ocean, waves, and beaches for all people through a powerful network of activists. Surfrider Foundation works to eliminate the impacts of plastics on the environment and communities by advocating for a reduction in single-use plastics.

Overall, the successful implementation of the Plastic Pollution Prevention & Packaging Producer Responsibility Act (SB 54) hinges on CalRecycle maintaining strong oversight of the Producer Responsibility Organization and the implementation process. Processes must be clearly laid out and transparent, including data collection, and true and effective source reduction must be prioritized by cultivating robust, equitable reuse and refill systems, all while centering and prioritizing environmental justice and tribal voices.

Many of Surfrider's previous comments throughout the rulemaking process still have yet to be adequately addressed in this round of updated regulations. Although CalRecycle staff have stated that further refinements will be made in the future, it is imperative to have the strongest set of regulations that lay out a clear framework as to how the objectives of the law will be met. In this vein, we are reinforcing the following comments:

- Ensuring Effective Allocation of Mitigation Fund
- Article II: Covered Material and Covered Material Categories
- Article IV: Responsible End Markets

• Effective Implementation and Enforcement of Statewide EPS Foodware Prohibition

Response to O-45-1

Comment rejected. No substantive response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations or raise an objection concerning the rulemaking process. To the extent other portions of the submission do suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-45-2

Ensuring Effective Allocation of Mitigation Funds

Overall, there are concerns about the mitigation funds, the process, and how to ensure that the funding will go to the communities most burdened by plastic pollution. Although the mitigation funds will be allocated through the legislative budget process and are not addressed in the draft regulations, **it is critical to ensure environmental justice and tribal representation throughout the SB 54 implementation process and establish a clear process and understanding of how the mitigation funds will be allocated**.

We encourage CalRecycle to hold public workshops throughout the state on this topic and dedicate a webpage to helping the public understand the mitigation fund, timeline, and process to access funding. Please also explain how CalRecycle plans to work with other State agencies, including the California Department of Finance, to maximize coordination and positive impact on disadvantaged communities, and minimize barriers in the grant-making process to marginalized communities.

Response to O-45-2

CalRecycle rejects this comment. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process. To the extent this comment recommends ensuring that environmental justice and tribal interests are represented in the allocation of mitigation funds, as acknowledged by this comment, the allocation of such funds is not within CalRecycle's authority under the Act. See the response to comment I-63-18. Moreover, to the extent this comment recommends holding public workshops and dedicating a webpage to help the public understand the mitigation fund, these recommendations are not within the scope of the proposed regulations or present rulemaking process. Therefore, no further response or change to the proposed regulations is necessary.

Comment O-45-3

Article II: Covered Material and Covered Material Categories

Exclusion of Reusable and Refillable Packaging and Food Service Ware (§18980.2.1): Additional Clarity Needed

Source reduction through refill and reuse systems should be prioritized as they are the most effective ways of reducing plastic pollution.

We appreciate CalRecycle's approach to allowing for innovation and room to grow for refill and reuse systems. However, we have concerns that the ***Exclusion of Reusable and Refillable Packaging and Food Service Ware (§18980.2.1)*** may be too lax, and additional clarity is needed. The current regulations allow for more opportunities for disingenuous "reuse" designed to skirt the fees and recyclability requirements of the law. To allow for only truly refillable or reusable packaging, we recommend CalRecycle:

• Adopt stricter, performance-based definitions for reusable packaging, informed by lifecycle data and enforcement capacity.
• For consumer good packaging, producers should be required to submit verified reuse/refill take-back data as a condition of maintaining reuse/refill status. The PRO plan should also identify a clear strategy for quantifying the amount of reusable and refillable packaging that is actually reused, as well as outlining steps that the PRO is implementing to maximize these numbers (including through deposits or other incentives).
• Packaging cannot be considered reusable if it doesn't get collected and reused, which should be backed by verifiable data, and proper and clear labeling.
• Establish a process for adopting third-party certification requirements when they become available.

We also heard from over 50 California-based Ocean Friendly Restaurants (OFRs), who are a part of Surfrider's national network of over 600 OFRs, that without adequate standards for reusable and refillable packaging, it will make it harder for businesses to implement reuse and refill systems affordably and effectively. Broad exclusions for more types of products will stifle innovation and confuse business owners without lowering the price of sustainable alternatives.

Response to O-45-3

CalRecycle rejects this comment for the reasons stated in response to comment O-75-3.

Comment O-45-4

Categorically Excluded Materials (§18980.2): Must Drastically Narrow Scope and Include Mandatory Sunset

Although we understand that the intent for categorical exclusions is to only apply to materials that are not "reasonably possible" to transition to a compliant material due to unique challenges. However, we are concerned that the categorical exclusion framework in Section 18980.2 is overly broad and could exempt large portions of food packaging, including primary, secondary, and tertiary components, simply because they serve a food safety function under FDA or FSMA standards.

Unlike categorically excluded materials, exempted materials remain covered under the law, meaning regulated producers must still report and pay fees into the system with a required phase-in plan to ultimately achieve compliance. Exemptions are also limited to 2-5 years, while excluded materials are permanently removed from the law's purview.

Should such a conflict arise, producers can utilize the exemption pathway within subparagraph (4) of section 18980.2.4 Exemptions for Certain Covered Materials for (A) unique challenges, (C) health and safety reasons, or (D) materials determined unsafe to recycle.

We recommend CalRecycle to remove section 18980.2(a)(2) from the draft regulations and instead rely on the existing exemption process (18980.2.4) for packaging or packaging components used by food or agricultural commodities that are unable to comply with SB 54 due to conflicting federal regulations.

Furthermore, we urge the exclusions to have a prescribed sunset. When exclusions are granted, they should also be time-bound. Packaging design and recyclability are shifting rapidly as a result of SB 54. As such, materials excluded under section 18980.2(a)(2) should be limited to 2-5 years, just as exemptions are (18980.2.4(g)) and a phase-in plan or rationale for why a phase-in plan is not feasible should be required, similar to section 18980.2.4(c)(4)(A)viii for exemptions. Without these changes, the FDA/USDA exclusion risks creating a loophole large enough to exempt the majority of food packaging—undercutting the recyclability and source reduction objectives at the heart of SB 54. With such a wide swath of categorically excluded materials, it seems like the PRO is set up to fail, as it will be underfunded, and there will be an unfair burden on those participating in the PRO. This also means that it would be harder to meet source reduction targets, as there are fewer producers. Finally, it will also have ripple effects on refill and reuse, and create an equitable system, as there will be fewer incentives and funding from the PRO to transition from disposable packaging to refill.

Response to O-45-4

CalRecycle partially accepts and partially rejects this comment as described in response to comment I-59-2, a portion of which is substantively the same as this comment and encompasses it entirely. To the extent the final paragraph of this comment is broader in scope than comment I-59-2, CalRecycle still rejects the commenter's suggestion. The revisions to section 18980.2(a)(2) remedy the alleged potential for it to act as a "loophole. Regarding funding and the distribution of burden, that concern cannot justify ignoring the clear statutory directive to prevent conflict between the Act and obligations under federal law.

Comment O-45-5

Exemptions for Certain Covered Materials (§18980.2.4): The Exemption Application process must include public deliberation and be public record

The proposed exemption process for packaging based on "unique challenges for compliance " doesn't have any requirement that decisions be made in an open forum with input from the public. Despite subsection (d) of 18980.2.4 proclaiming that applications are "public documentssubject to mandatory disclosure under the California Public Records Act ," there is no mandated transparency in the regulations, and is instead reliant on the public requesting data. Given the wide range of possible applications, **it is imperative that any proposed exemption only be granted with public input and adoption of any exemptions should become a part of public record**.

Response to O-45-5

CalRecycle rejects this comment. Statute requires CalRecycle to establish processes for identifying circumstances that may warrant exemptions (PRC section 42060(a)(3) and (4)) but leaves the details of those processes to CalRecycle's discretion and includes no requirement that CalRecycle consider public input. The only limitation set forth in statute is the overall mandate set forth in PRC section 42060(a): that CalRecycle "adopt regulations necessary to implement and enforce this chapter and to ensure that the requirements of this chapter and in particular the requirements established in Section 42050 and the policy goal established in Section 41780.01 as it relates to covered material are met." Moreover, it is not practicable to require every exemption request to be subject to a formal public comment process, which would impede CalRecycle's processing of exemption requests to an extreme degree. Lastly, CalRecycle is competent to evaluate whether an exemption request properly accounts for the interests of affected parties or whether input from such parties is required for CalRecycle to fully assess the justification for the exemption. While the proposed regulations do not expressly require an exemption application to include such input, CalRecycle retains the discretion to reject applications where the lack of it renders the justification for the exemption insufficient.

Comment O-45-6

Article IV: Responsible End Markets

End Market Identification (§18980.4.1): Provisions around recycling technologies are dangerous, inconsistent with statutory requirements, and devastatingly lenient

The focus on management of waste through permits and the production of "significant quantity of hazardous waste" in Section 18980.4.1(d)(1) and Section 18980.4.1 (d)(B) as to the generation of waste which is in statute is a significant shift away and opens the door for chemical recycling and is problematic. SB54 language refers to the ***amount*** of hazardous waste, not the ***"risk"*** associated with it, and these are clearly different standards. The proposed regulatory framework in this regard is also clearly and critically at odds with the SB 54 statute.

We would like to see alignment with the statute and regulations in the form of a categorical prohibition on chemical recycling technologies, as envisioned in SB 54's requirement that CalRecycle "exclude plastic recycling technologies that produce significant amounts of hazardous waste."

Furthermore, the regulations reference the *federal* definition of hazardous waste, and not the California state definition, which is far more protective of public health and the environment. Use of the weaker federal definition problematically opens the door to the generation of hazardous wastes that are not considered federally hazardous but should otherwise be considered 'California Hazardous.' This includes more protective toxicity tests, lower thresholds for heavy metals (e.g., lead, copper, zinc), lower thresholds for ignitability, lower thresholds for reactivity and corrosion, and prohibitions on certain chemical products and pharmaceuticals.

CalRecycle should reference and cite the chemical recycling technologies identified in Senator Allen's Letter to the Journal and respective committee analyses, including solvolysis, solvent-based technologies, pyrolysis, incineration, and gasification .

Chemical recycling and related technologies are ultimately a form of burning plastic and harm our communities and the environment. Uncontrolled pollution from these processes poses significant health and safety risks for local populations, placing a heavy toxic burden on workers and surrounding communities, the majority of which are low-income and communities of color.

Statutory construction of the definition of "recycling" in PRC § 42041 (aa) allows for arguments on both sides, **but the strongest arguments rely on the Legislature's intent to exclude chemical recycling from the definition of "recycling.**" The legislative history, as evidenced by discussions of the harmful effects of chemical recycling in committee reports, shows the Legislature did not intend for producers to use chemical recycling processes to comply with SB 54's recycling targets.

Response to O-45-6

CalRecycle rejects this comment for the reasons provided in response to comment O-62-1.

Comment O-45-7

Effective Implementation and Enforcement of Statewide EPS Foodware Prohibition

Due to EPS's negative impact on our communities, human health, and environment, EPS food service ware has a different timeline and recycling rates outlined in the statute (Section 42057(i)), compared to other covered materials categories in the statute.

We appreciate CalRecycle's work to create a webpage and send out notices with additional information to EPS producers. However, the draft regulatory text is still too

vague. **We would like to see CalRecycle provide more enforcement beyond education and assistance**.

We would also like to see more transparency regarding how and who CalRecycle is reaching out to and providing compliance support. For example, what is happening with CalRecycle's online notification portal?

Furthermore, producers who are unable to demonstrate to the department that the polystyrene recycling rate is met on January 1, 2025, should not have the opportunity to come back in the future attempting to show that they meet the target recycling rate. There is concern that there will be an increased focus on false "recycling" of EPS at the cost of communities and the environment. Some facilities process EPS using chemical recycling methods, but as stated in past comments, **chemical recycling and related technologies should not be counted as recycling.**

We look forward to staying engaged in this important process and appreciate the staff's dedication and hard work to review and incorporate comments.
Thank you for your consideration.

Response to O-45-7

CalRecycle rejects this comment. To the extent this comment recommends further clarification as to CalRecycle's enforcement authorities with respect to the expanded polystyrene recycling rate requirements of PRC section 42057(i), the proposed regulations are consistent with the requirements of the Act, including PRC sections 42057, 42060, 42080, and 42081, and no change is necessary to the implementation or enforcement of the Act. Section 18980.13 already establishes the extent of CalRecycle's enforcement authorities under the Act, including when a violation will be deemed to occur and the process by which penalties will accrue. Section 18980.13 applies to violations under PRC section 42057(i) as it does to violations of any other provision of the Act. To the extent this comment poses questions to CalRecycle, as opposed to making any recommendation or objection that is specifically directed at CalRecycle's proposed regulations, no response is required. To the extent this comment urges more transparency to the online notification portal, no response is required because this comment is outside the scope of the proposed regulations and does not relate to the present rulemaking process. Finally, to the extent this comment recommends the prohibition of chemical recycling, no response to this portion of the commenter's submission is necessary because the issues raised in it have been addressed in response to other portions of the submission discussing the same issues.

O-46: Personal Care Products Council (Bridget Corridon)

Comment O-46-1

The Personal Care Products Council1 (PCPC) is pleased to submit the following comments on the Final Regulation Text for SB 54, Plastic Pollution Prevention and Packaging Producer Responsibility Act (the "proposed final regulations"). Our member companies are involved in the distribution and sale of over-the-counter nonprescription drug products, cosmetics, toiletries, fragrances, and ingredients in California, and therefore have a strong interest in the rulemaking and implementation of SB 54. PCPC remains supportive of extended producer responsibility (EPR) programs that allow for stakeholder collaboration to ensure the program is structured for innovation and expanded waste reprocessing. PCPC recognizes and appreciates the ongoing effort by CalRecycle to revise and develop the regulations.

Response to O-46-1

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-46-2

PCPC commends CalRecycle and is supportive of several new revisions to the regulations that remain from the draft regulation text issued in May 2025 including:

1. Removal of barriers for new recycling technologies (§18980.3.6)
2. Change in Minimum Duration for Approved Exemption (§18980.2.4 (g))
3. Revisions to Refillable and Reusable Designs (§18980.2.1)

While PCPC appreciates and supports many of the improvements retained from the May 2025 draft regulations, PCPC and its members strongly recommend Cal Recycle consider the following changes to the proposed regulations.

Response to O-46-2

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Comment O-46-3

1. <u>Over-the-Counter (OTC) Drug Exclusion (Section 18980.2(a)(6)) is unnecessarily narrowed and not in compliance with the statute.</u>

The statutory text of SB 54 specifically states "covered material" does not include packaging for "[m]edical products and products defined as devices or prescription drugs, as specified in the Federal Food, Drug, and Cosmetic Act (21 U.S.C. Secs.

321(g), 321(h), and 353(b)(1)).” California Public Resources Code § 42041(2)(A)(i) (2025). In the regulations, section 18980.2(a)(6) provides an exclusion for OTC drugs, however, the OTC drug exclusion is unnecessarily narrowed by subparagraphs (A) and (B) and is not in accordance with SB 54’s statutory language.

State regulators must operate within the boundaries set by the statutes passed by the legislature. Agencies, like CalRecycle, are not directed to create or enforce rules that go beyond or contradict the statute’s language or intent. Regulations must be firmly rooted in the enabling legislation, ensuring that implementation remains faithful to the law, is transparent to the public, and does not exceed the scope of authority established by the legislature. This principle safeguards the integrity of the rulemaking process and reinforces the public’s trust in government. Unfortunately, sections 18980.2(a)(6) (A) and (B) are not in accordance with plain language of the statute.

The statutory text of SB 54 specifically states “covered material” does not include packaging for “[m]edical products and products defined as devices or prescription drugs, as specified in the Federal Food, Drug, and Cosmetic Act (21 U.S.C. Secs. 321(g), 321(h), and 353(b)(1)).” See California Public Resources Code § 42041(2)(A)(i) (2025. This creates three statutory exemptions: medical products, devices, and prescription drugs. The statue also provides three specific citations for the category types that should be excluded: 21 U.S.C. § 321(g), 21 U.S.C. § 321(h), and 21 U.S.C. § 353(b)(1).

First, 21 U.S.C. § 321(h) defines a "device" as any instrument or related article used for similar diagnostic or therapeutic purposes, which does not achieve its primary intended effect through chemical action or metabolism. Next, 21 U.S.C. § 353(b)(1) stipulates that certain drugs must be dispensed only via prescription. Finally, 21 U.S.C. § 321(g), defines a "drug" as any article recognized in official compendia or intended for use in diagnosing, curing, mitigating, treating, or preventing disease, or affecting the structure or function of the body, excluding food unless otherwise specified.

The plain language of the SB 54 statue provides that “medical products” includes those products defined by federal law in 21 U.S.C. § 321(g). OTC drugs are covered by 21 U.S.C. § 321(g) as they are intended for therapeutic use, are regulated by the FDA via a common statutory framework, and subject to strict safety, labeling, and manufacturing requirements. FDA’s classification of these products as drugs ensures that they are already subject to robust lifecycle regulation, including packaging standards, labeling requirements, and facility registration. Although CalRecycle has publicly stated it struggled with defining “medical product,” it cannot use the regulatory process as a way to circumvent the statutory text.

Subparagraphs (A) and (B) in Section 18980.2(a)(6) should be removed as they provide an unnecessary restriction on the definition of “medical products.” CalReycyle’s current interpretation and restrictions on “medical products” contradicts the clear language of SB 54 that was adopted to exclude all nonprescription drugs.

Additionally, maintaining the integrity, safety, and efficacy of OTC products requires packaging that meets rigorous, science-based standards that serve important public health functions and cannot be compromised by secondary considerations. For FDA-regulated OTC products, specific packaging may be essential to ensure the stability of active ingredients throughout the product's shelf life, whether in sunscreens, mouthwashes, or toothpastes. This necessitates robust barriers against moisture and vapor transmission—requirements that cannot be met through conventional plastic reduction methods without violating FDA regulations. Additionally, child-resistant packaging mandated by the Consumer Product Safety Commission under the Poison Prevention Packaging Act imposes further design constraints. These combined regulatory obligations make clear that for OTC products, packaging reduction targets must be approached with caution to avoid undermining essential safety and efficacy standards that protect consumers.

Response to O-46-3

CalRecycle rejects this comment for the reasons stated in response to comment B-11-3. CalRecycle also notes that the commenter's unsupported claim that the "plain language" of the SB 54 statute provides that 'medical products' includes those products defined by federal law in 21 U.S.C. § 321(g)" is untenable. The cited federal law does not use that term, and, contrary to the commenter's assertion, the "plain language" of Public Resources Code section 42041(e)(2)(A)(i) refers only to the goods "defined as devices or prescription drugs," with no reference to the more general definition of "drugs."

Comment O-46-4

2. Cosmetics are a federally regulated category not granted an opportunity to apply for an exemption pursuant to Section 18980.2 (a)(1)(2).

In the Categorically Excluded Materials Section (18980.2) (a)(1)(2) PCPC requests that CalRecycle add "cosmetic" to expand the determination of exclusion allowance for packaging or packaging components used within the food, agricultural and cosmetic industries. This section selectively favors the agriculture and food and beverage sectors while overlooking other industries subject to equally rigorous safety standards set forth by the FDA. FDA's Modernization of Cosmetics Regulation Act of 2022 (MoCRA) and the European Medicines Agency (EMA) also require microbial testing for cosmetics, including challenge tests to ensure products remain safe under normal use conditions. The cosmetics industry has strict protocols to prevent microbial contamination and ensure the integrity of product packaging. Packaging is fundamentally important in preserving the integrity and efficacy of personal care products. Its role in product protection cannot be emphasized enough.

For example, mascara, a cosmetic, is applied to the sensitive eye area and is susceptible to microbial proliferation. To mitigate these risks, mascara packaging is specifically designed to provide essential protection. It is engineered to be airtight and incorporates wiper systems that significantly limit oxygen exposure and reduce microbial transfer. This protective packaging design is absolutely critical for maintaining

the product's hygienic quality and preventing microbial contamination from repeated use. Similarly, spray bottles for sunscreen, setting sprays, and hair styling are designed and used to prevent direct hand contact with the bulk product. This reduces the risk of contamination from airborne bacteria, dust, or particles. Bottles with pump applications for liquid foundation dispense a precise amount of the product without exposing the remaining contents to the outside environment, further mitigating contamination risks from airborne bacteria, dust, or particles. Airless pumps eliminate air ingress, thereby reducing oxidation and preserving the efficacy of sensitive formulations. Dropped bottles for face oils and serums are designed and used to minimize contact with users' fingers, lowering the risk of microbial transfer. Squeeze tubes with application tips, commonly used in products like acne spot treatment and eye creams, limit product exposure to both consumer's hands and the air. These products are often sealed with tamper-evident caps to ensure product safety and integrity.

Including cosmetics in this subsection allows for the cosmetic industry to work towards incorporating protective packaging designs that align with CalRecycle's goals under SB54, while affording them the opportunity to apply for an exemption, if necessary, to minimize contamination, preserve product stability, and protect consumers.

Finally, PCPC asks that CalRecycle clarify who or what is an "entity" under Section 18980.2(a)(2)(A). As currently written, it is not explicitly clear if an "entity" like a trade association can notify CalRecycle on a producer's behalf.

Response to O-46-4

Comment rejected. The cosmetic industry's "strict protocols" are not laws, and the federal law cited by the commenter does not impose the same packaging restrictions as federal law does for food and agricultural products. To the extent legal restrictions render compliance challenging or impracticable, exemptions pursuant to Public Resources Code section 42060(a)(3) and (4) are available. CalRecycle also declines to revise section 18980.2(a)(2)(A) with respect to "entity," which is plain on its face.

Comment O-46-5

3. Definition of Plastic (Section 18980.1 (15))

The proposed regulations cite the definition of plastics contained in Section 42041. Public Resource Code Section 42041(t) states

(t) "Plastic" means a synthetic or semisynthetic material chemically synthesized by the polymerization of organic substances that can be shaped into various rigid and flexible forms, and includes coatings and adhesives. "Plastic" includes, without limitation, polyethylene terephthalate (PET), high density polyethylene (HDPE), polyvinyl chloride (PVC), low density polyethylene (LDPE), polypropylene (PP), polystyrene (PS), polylactic acid (PLA), and aliphatic biopolyesters, such as polyhydroxyalkanoate (PHA) and polyhydroxybutyrate (PHB). "Plastic" does not include natural rubber or naturally occurring polymers such as proteins or starches.

PCPC requests that CalRecycle remove or exclude “coatings and adhesives” from the definition of “plastic.” Including coating and adhesives in the definition makes it challenging for producers to determine and report for every single package material. Additionally, including coatings and adhesives raises questions on what a plastic component would be and estimating the weight for reporting to the PRO.

Response to O-46-5

CalRecycle rejects this comment because it requests that CalRecycle modify the definition of "plastic" in Public Resources Code section 42041(t). Regulations cannot revise statutes.

Comment O-46-6

4. Inconsistencies and the lack of harmonization between SB 54 and other existing laws create undue burdens on manufacturers and producers.

PCPC and its member companies reiterate that they are supportive of effective and well-designed EPR laws. Cosmetic products and OTC drugs are distributed worldwide and harmonization across states is crucial to reduce confusion and encourage the use of recyclable materials in products. The rapidly expanding framework of EPR laws both nationally and internationally, like the Packaging and Packaging Waste Regulation in Europe, will result in many more producer reporting categories, making compliance significantly more complex and costly for producers. Furthermore, without significant changes, the lack of harmonization with other states and other California laws will create obstacles that inhibit reasonable compliance and stifle innovation.

The existing patchwork of EPR laws in several states poses a significant challenge for manufacturers operating with a global supply chain - PCPC is concerned with the compliance challenges imposed on companies with SB 54, and California’s SB 343 (“Truth in Labeling” law) will exacerbate these issues. Recycling compliance in California is nearly impossible because California has passed two recycling laws that are complex, confusing, unharmonized, and in some instances, directly conflicting. The implementation of both laws has resulted in two separate covered material category lists regarding the recyclability of packaging in the state of California. SB 54 requires that by 2032, 100% of packaging is recycled or compostable in the state. Producers must consider both the SB 54 and SB 343 recyclable list and as these lists do not work in harmony, there will be limitations on what materials can be considered recyclable and thus sold in the state of California. For example, SB54 classifies the material types differently than SB343. SB343 categorizes glass into categories based on form and color, whereas SB54 classifies glass into categories based on form and size. As another example, the SB343 study indicates that 75% of California’s population has access to recycling facilities that accept LDPE clear beverage bottles and 73% accept LDPE clear single-use rigids. However, the SB 54 assessment indicates these containers as not recyclable.

Compounding this, the 2025 Final Materialization and Characterization Study from SB 343 does not contain a final summarized report of what is considered recyclable in the state. Moreover, we also understand that CalRecyle is taking the position that its Final Materialization and Characterization Study does not provide binding guidance to industry on what can/cannot be labeled as recyclable. This makes it challenging and confusing for manufacturers, producers, and ingredient suppliers to assess their own packaging. Since CalRecycle's published SB 343 list is not definitive and thus subject to multiple interpretations, producers face the risk of increased litigation despite their well-intentioned efforts to comply with the regulation, especially when coupled with a lack of clarity from CalRecycle on enforcement dates. At a minimum, CalRecycle should analyze and harmonize its own data and report its conclusions on what is recyclable based on its own criteria outlined in SB 343 and SB 54.

Response to O-46-6

CalRecycle rejects this comment because, instead of recommending changes to the proposed regulations, it raises concerns over CalRecycle's authority under a separate law (SB 343) and CalRecycle publications that are outside the context of this rulemaking.

Comment O-46-7

5. Source Reduction

a. Establishing common-sense compliance measurement periods for source reduction (§18980.9.1) provides certainty for producers.

Neither SB54 nor its proposed regulations specify the reporting period to be used for measuring compliance against the source reduction requirements. It is imperative that producers know now when the compliance will be measured to understand what they must do to comply. PCPC proposes adding language to paragraph (2) of subdivision (d) to specify that source reduction requirements that are required as of January 1, 2027, 2030, and 2032, are based on producer source reduction reporting using the measurement period of the respective calendar years of 2027, 2030, and 2032.

Considering the lack of final regulations, finalized Covered Materials Categories (CMC) material description guidance, and an approved Producer Responsibility Organization (PRO) plan, producers do not and will not have the information necessary to implement source reduction compliance any earlier than calendar year 2027. Without finalized regulations and related guidance, producers cannot begin to implement packaging changes. Once the regulations are final, producers still need sufficient lead time to develop, test, and implement packaging changes. There are less than three months remaining until January 2026, which is far too short a timeline for compliance.

Response to O-46-7

CalRecycle rejects this comment, see responses to B-27-2, I-63-15, O-48-5, and O-41-4.

Comment O-46-8

b. Source reduction plan should allow for adjustment factors based on sales growth

The wholesale deletion of Section 18980.8.3 removes the PRO's express ability to utilize important, common sense adjustment factors in the development of its source reduction plan. The deleted section included adjustment factors for fluctuations in economic conditions and the change in number of producers participating in the PRO plan. This section should be restored, and PCPC proposes adding a third common sense adjustment factor for the PRO to incorporate into its source reduction plan: adjustments for product sales and company growth over time.

The adjustment factors in the deleted text protect against arbitrary shifts in economic conditions or the number of producers participating in the PRO plan. For example, without these adjustment factors, an economic decline that results in lower consumer consumption in a reporting year may result in the PRO achieving its source reduction targets without any producer changes to packaging.

PCPC's proposal to add a third adjustment factor to account for product sales growth over time allows the PRO to incorporate producer reporting of sales adjusted material usage into its source reduction plan to normalize for business growth. Without such an adjustment factor, the proposed regulations penalize sales growth by disproportionately forcing producers with growing sales to reduce plastic usage to compensate for additional products sold. An adjustment for sales growth ensures that a large, steadily growing company like many of PCPC's members, who may be doing everything possible to source reduce its packaging for individual products, is not subject to anticompetitive standards that require them to meet more rigorous requirements than a company with stagnant or declining sales. If kept as written, this potentially requires growing companies to cease or even reverse their sales growth in California to meet absolute source reduction requirements. A sales growth adjustment decouples growth from plastic usage longterm, thereby enabling fair and robust competition among businesses in California and allowing businesses whose innovation is rewarded by California's consumers to grow in the California market by focusing on source reduction by product sold versus absolute source reduction.

PCPC proposes restoring §18980.8.3 and adding the following language to §18980.8.3(a):

Subject to the limitations of this section, a source reduction plan developed pursuant to subdivision (f) of section 42057 of the Public Resources Code may utilize adjustments factors and methods to account for fluctuations in economic conditions and the increase or decrease in the number of producers participating in the PRO plan *and must utilize adjustments factors and methods to allow producer reporting of material usage to be adjusted by units of sale to normalize business growth over time, in each case* for determining whether the PRO has met its source reduction obligation relative to the baseline established by the Department under subdivision (b) of section 42057 of the Public Resources Code.

Response to O-46-8

CalRecycle rejects this comment for the reasons set forth in response to comment B-11-6.

Comment O-46-9

c. PCR Certification (§18980.3.4)

SB 54 specifies that the PRO may apply for a source reduction credit up to 8% through an alternative compliance formula that offers source reduction credit "on a sliding scale based on the ratio of virgin plastic to postconsumer recycled content plastic to producers who incorporate postconsumer recycled content into plastic covered material." Paragraph (1) of subdivision (b) of Section 18980.3.4 of the proposed regulations requires that the PRO measure the increase in absolute amount of postconsumer recycled content (PCR) used versus a 2023 baseline.

Many producers began incorporating PCR into packaging decades ago and had achieved significant amounts of PCR usage by 2023. Measuring producers' absolute volume increase of PCR based on a 2023 baseline does not recognize, and in fact penalizes, the proactive sustainability efforts of producers who voluntarily took early action to incorporate PCR into plastic packaging prior to 2023. Additionally, companies that have been doing source reduction for years may not be able to do additional source reduction and have the product remain fit for purpose. This also may prevent the PRO from being able to claim the full 8% source reduction credit. Necessarily, due to PCR already incorporated prior to 2023, the ability to incorporate more is limited.

Response to O-46-9

CalRecycle rejects this comment for the reasons stated in response to comment B-11-17.

Comment O-46-10

6. Restore recognition of physical recycling technology as an acceptable responsible end market technology, in addition to mechanical recycling.

PCPC recommends CalRecycle restore recognition of physical recycling technology as an acceptable responsible end market technology, in addition to mechanical recycling. CalRecycle has previously recognized physical recycling in earlier versions of the draft regulations.

Physical processes can be operated in tandem with mechanical processes to vastly improve the quality of output. This broadens the potential applications for recycled plastic and promotes continued circularity in similar types of applications, helping to reduce the amount of plastic that is downcycled.

Additionally, advanced recycling is a critical component of plastic packaging circularity, recovering it as a raw material at scale which can be utilized in high-quality plastic packaging that adheres to strict quality regulations for direct food contact and medical applications. Further, mechanical recycling can effectively sort some plastic polymers, such as HDPE and PET, but is less suited to address other categories of plastic waste. Advanced recycling technologies should complement mechanical and physical recycling processes by providing a sustainable end of life for a variety of difficult to recycle plastic materials, including low-density plastics such as films and flexibles.

By unnecessarily restricting and limiting certain recycling technologies, the proposed regulations will inadvertently hamper the very goal SB 54 seeks to achieve-building a circular economy-by disincentivizing innovation, banning the use of future innovations in those technologies, and reducing the volume of recyclable material entering the system.

Response to O-46-10

CalRecycle rejects this comment for the reasons set forth in response to comment B-11-8 and because the comment offers no explanation based on the generation of hazardous waste, despite the express purpose of the relevant statutory provision (Pub. Resources Code section 42041(aa)(5)) being the avoidance of significant amounts of such waste.

Comment O-46-11

<u>7. SB 54 proposed regulations text on detachable components and small format packaging should align with the Association of Plastic Recyclers Design Guide and not arbitrarily penalize producers for using a small, but otherwise recyclable, component.</u>

<u>a. Detachable Components</u>

In the draft rules additional language was added §18980.1(a)(40(C)(ii) to specify that a "detachable component" is defined by certain characteristic "regardless of whether the component is discarded attached to the other components." This additional language negatively impacts the recyclability determination for components that are made of recyclable material but are less than two inches by two inches in size, which on their own would not currently be considered recyclable due to their size but would be considered recyclable when reattached to the larger recyclable packaging. Additionally, this language is directly contrary to the Association of Plastic Recyclers (APR) Design Guide, which recommends leaving plastic caps on bottles and containers when recycling.2

APR specifically advocates that consumers reattach caps and lids prior to disposal. Doing so increases recyclability, enabling the plastic in the caps and lids to be recovered and recycled when they otherwise might be inaccurately sorted as small parts or other materials in processing, resulting in their disposal rather than recovery. APR also notes that reattaching lids prior to disposal reflects consumer practices, increasing compliance with recycling by making it easier to properly dispose of waste.

By requiring that reattached caps and lids are treated separately for categorization, the proposed regulation contradicts the approach set out by APR, preferred by recycling facilities, and adopted by consumers. This approach does not reflect actual collection and recycling practices and undercounts the amount of recycled material; caps and lids that are, in fact, recycled attached to bottles would be artificially categorized as non-recyclable small parts or non-recyclable materials. By artificially undercounting certain recycled materials, the system is likely to disincentivize designs and practices that would increase recycled material and to result in an inaccurate recycling rate for these materials. Taking a position contrary to the APR Design Guide, as the proposed regulations do, negatively impacts both the calculation of actual recycling rates for components and the recyclability determination for components in a way that does not match current recycling practices.

For the calculation of actual recycling rates for components, under the proposed regulations a recycling rate is calculated using the covered material category applicable to each component standing on its own, regardless of whether the component is designed to be reattached to the primary packaging. The APR Design Guides instruct components to be reattached, and current material recovery facilities process the packaging as a whole and sort it into a single recycling stream. Understanding this guidance, a single recycling rate should be calculated for the covered material category applicable to component and the packaging to which it is reattached. PCPC proposes adding language to Section 18980.1. and Section 18980.3.2. to ensure that such components are properly considered together with the packaging to which they are designed to be reattached prior to disposal.

Finally, when recycling is made easier, participation in recycling programs increases. Consumers have already adopted the habit of keeping caps and labels on packaging before disposal after years of education to increase the practice, and it would be counterproductive to change this approach now given the high recovery rate of attached caps and labels by material recovery facilities. To ensure the correct recyclability determination of components that are intended to be reattached to a recyclable packaging, PCPC proposes adding language to Section 18980.1 to ensure that such components are properly considered together with the packaging to which they are designed to be reattached prior to disposal.

b. Small Format Packaging

PCPC has consistently advocated for clarification on the recyclability of small packaging (two inches by two inches). Packaging plays a vital role in ensuring the safety of cosmetic products as discussed earlier. It is the first critical step to protecting product formulas from contamination and degradation. Packaging material and structure are critical to maintaining product integrity. Material selection, including small packaging, is dependent on “fit for use,” a metric that determines the effectiveness and functionality of a packaging material. Plastics specific to cosmetic and personal care products provide benefits that other types of packaging materials may not be able to achieve and do not pose the hazard and environmental issues caused by other materials. Companies must

consider a wide variety of technical specifications when determining packaging designs, including helping consumers dispense and apply products appropriately, continuing to overall consumer safety and satisfaction, often resulting in smaller packaging. Increasing minimum size thresholds or restrictions may disproportionately affect cosmetic brands, especially those already investing in recyclable designs.

For recyclability determinations for components that are less than two inches by two inches in size may not be considered recyclable due to their small size and current processing limitations with material recovery facilities. However, these same components are recyclable when designed to be reattached to the larger recyclable packaging, pursuant to APR Design Guides.

In the Draft Covered Material Categories Reporting Guidelines, released in June 2025, CalRecycle included a “size sorting potential” assessment for small packaging which referenced the APR Design Guide as a technical standard. This incorporation is both appropriate and aligned with best practices, as the APR Design Guide reflects the operational realities and equipment capabilities of modern materials recovery facilities (MRFs). Specifically, this methodology provides a function-based assessment of sortability, accounting for packaging form and construction, rather than relying solely on arbitrary physical dimensions such as size thresholds. By considering the actual performance of materials within automated sortation systems, this approach enables a more accurate classification of covered materials based on their real-world potential for recovery and market viability.

PCPC encourages CalRecycle to formally adopt and consistently apply the APR design guide standards throughout the implementation of SB 54. Doing so would promote regulatory clarity, incentivize packaging design for recyclability, and reduce the risk of misclassification that could limit the capture of recoverable materials. The use of technically grounded and operationally validated criteria—such ss those found in the APR Design Guide—is essential to ensuring that the regulatory framework supports both environmental outcomes and practical feasibility for producer. The cosmetic and personal care product industry is directly impacted by the recyclability determination of small packaging, as many products fall into this category (lipstick, eyeliners, mascara, etc.). If the covered material list states and the regulations penalize small packaging by either declaring they are potentially not recyclable or not providing exemptions, then by 2032 numerous cosmetic and personal care product producers will not be able to sell these products into the state of California.

Small-format categorization should reflect current best practices in recycling design. Where small packaging can be demonstrably sorted and captured, the regulations should allow a performance-based pathway rather than relying solely on dimensional cutoffs. The Association of Plastic Recyclers’ SORT-S-02 “sorting potential” method provides a validated procedure to assess capture of small items. If CalRecycle intends the defining criterion to be functional performance in MRFs, SORT-S-02 is the appropriate test to determine inclusion of small packaging that can be sorted and recovered. CalRecycle should incorporate use of SORT-S-02 in the regulations, for

example in Section 18980.2.5, so that small items proven sortable can be deemed recyclable and categorized into the appropriate CMCs. This approach improves capture, aligns with technological advances in sortation, and avoids excluding sortable items based solely on size.

Conclusion

PCPC appreciates the opportunity to provide feedback on the proposed regulations for SB 54. We look forward to continuing to engage with CalRecycle to support the success of SB 54 implementation. We welcome the opportunity to discuss our comments and share relevant information with CalRecycle.

Response to O-46-11

CalRecycle rejects this comment for the reasons stated in response to comment O-39-5 and B-11-4.

Comment O-46-12

Exhibit 1: **APR Discussion Brief** on "How Plastic Components are Recycled with Plastic Packaging & Requested Changes to SB54 Detachable Component Definition

HOW PLASTIC COMPONENTS ARE RECYCLED WITH PLASTIC PACKAGING & REQUESTED CHANGES TO SB 54 DETACHABLE COMPONENT DEFINITION

The Association of Plastic Recyclers (APR) represents over 80% of the processing capacity for post-consumer plastic packaging in North America. Our members include the businesses that recycle most of the PET, HDPE, LDPE, and PP plastic packaging after it has been collected by California's curbside and CRV recycling programs. This includes five California-based processors (reclaimers) of post-consumer recycled plastics, as well as dozens of California-based businesses throughout the value chain of plastics recycling.

APR has spent 30 years working with recyclers, producers, and the entire supply chain to design plastic packaging, including plastic packaging components, to be compatible with recycling processes. When components are designed to be recyclable and recycled, we can create a system where residents can simply put the entire plastic package into the recycling bin and the entire package--including attached plastic components--can be effectively sorted and recycled by MRFs and plastic reclaimers.

As the voice of plastic recyclers, APR is focused on how the SB 54 requirements can effectively and efficiently drive higher recycling rates for plastic packaging to reduce plastic pollution. Unfortunately, APR is deeply concerned that the proposed definition of detachable components under the SB 54 revised rules (released August 2025) will treat all components as distinct parts, and not as part of the base packaging. This will lead to lower recycling rates. **APR requests CalRecycle amend the definition of detachable component to recognize that some plastic components are best recycled as part of the base packaging and should be categorized as part of the base**

packaging. This includes differentiating when the component is routinely removed by the consumer and routinely re-attached by the consumer prior to recycling.

PROBLEM: If all plastic components are put in separate EPR fee categories than the base plastic packaging, this will • Conflict with design standards and best practices • Lower recycling rates • Distort the producer fees • Create more consumer confusion • Promote poor design choices

Examples of plastic components on plastic packaging

The following table identifies common examples of how plastic components are used by consumers and how the consumer may recycle these components. The components in the green rows are commonly recycled today as part of the base packaging. In other cases, components are more likely to be recycled separately from the base packaging. There are still some cases in which it is unclear if there is sufficient data to know how consumers are recycling these components.

Examples of plastic components on plastic packaging and how they are commonly recycled by the consumer*

Plastic component types Plastic product examples Typical recycling pathway Components not typically removed for use Shampoo bottle cap or pump Body lotion cap or pump Cleaner bottle sprayer Rigid container with hinged lid (e.g. salad box) Bucket handle Adhered label Recycled with original packaging Components typically removed and re-attached for recycling Screw-on bottle caps Screw-on jar lids Screw-on detergent cap Recycled with original packaging Components typically removed entirely from package and not reattached Tear-away pouch top Yogurt foil lid Recycled separately Components that may be removed and may be re-attached Snap-on lids Non-screw on dispenser cup To-go cup lids More data needed on consumer behavior and MRF sorting

** Please note these examples only apply to plastic packaging with plastic components. This is not reflective of plastic components used on non-plastic packaging such as straws attached to drink cartons.*

The above examples illustrate that there are many common plastic packaging components that are recycled today along with the base packaging. **It is critical that the Covered Material Categories reflect how consumers are actually recycling the products.** This is why the definition of detachable components must differentiate when components are attached or re-attached by the consumer for recycling.

CONCERN 1: CONTRADICTS BEST PRACTICES OF DESIGNING COMPONENTS TO BE RECYCLABLE WITH ENTIRE PACKAGE

Plastic components can and should be designed to be recyclable when attached or reattached to the base packaging. CalRecycle already recognizes the importance of

product design for plastic packaging in SB 54. Further, SB 343 (Allen, Chapter 507, Statues of 2021) specifically references the APR Design® Guide as the tool to address how components affect the recyclability of plastic products:

PRC 42355.51: "(3)A product or packaging shall not be considered recyclable in the state unless the product or packaging meets all of the following criteria, as applicable: (A) For plastic packaging, the plastic packaging is designed to not include any components, inks, adhesives, or labels that prevent the recyclability of the packaging according to the APR Design® Guide published by the Association of Plastic Recyclers…"

Statute requires producers to be compliant with the APR Design® Guide because the Design® Guide evaluates components as part of the entire packaging. See the diagram below to demonstrate how the APR Design® Guide assesses all the product design features including components, inks, colors, sizes, additives, and more. This means it would be contradictory for CalRecycle to use the current definition of detachable components because it would classify all components as distinct parts when best practices look at these components as part of the base packaging. **This current definition is at odds with the leading design standards already recognized in California law.** The definition of detachable component must recognize that some components are successfully recyclable and recycled as part of the base packaging.

Figure 1: APR Whole Package Assessment includes product components

CONCERN 2: LOWERS RECYCLING RATES

In addition to the examples in the chart on page two, here are two common ways plastic components can be effectively recycled as part of the plastic product when properly designed for recyclability.

Example 1: Caps on plastic bottles. APR's model bale specs have endorsed caps on bottles since 2011. APR Design standards ensure that the caps can either be separated from bottles during the recycling process and recovered for recycling (e.g., caps on PET bottles), or are sufficiently compatible with the main bottle packaging (e.g., caps on HDPE bottles). Please see more information on caps in the plastics recycling process here.

Data shows that California consumers are in fact putting caps back on the bottles. In 2025, the PET Recycling Corporation of California (PRCC) conducted a bale sort that found that over 78% of bottles collected through the CRV program had the cap attached, and 57% of bottles processed at MRFs had caps on bottles prior to baling.

Example 2: Design-compatible pumps and sprayers. Pumps and sprayers often contain a small metal spring that is very problematic to sort out during the plastic recycling process. APR's Design Guide recommends plastic-only pumps and sprays, and there are over 60 variations of APR approved designs for sprayers and pumps that

a company can use to ensure the entire container and pump/sprayer are fully recyclable. Proper design eliminates the need for the consumer to remove any pump or sprayer, and instead, allows the consumer to simply put the entire container in the recycling bin. Plastic recyclers can then fully recycle the container and pump, leading to higher recycling rates.

CONCERN 3: DISTORTS EPR FEES

The statute requires the PRO to set fees that reflect the *"Costs to collect, sort, avoid or remove contamination, aggregate, and transport the covered material into defined streams to support the viable responsible end markets for the remanufacturing of the covered material…."* This means producer fees, as based on the Covered Material Categories (CMCs), are required to reflect the actual costs of recycling and should reflect how plastic components are currently managed. For example, plastic caps on PET plastic bottles are collected and recycled today as part of the PET bottles. The costs collect and sort PET bottles are based on recycling all of the components together as a single unit. Similarly, the plastic reclaimers' costs to recycle a bale of PET bottles include the routine operational steps of separating the caps for recycling, along with any other non-PET "floatable" material.

To base the EPR fees on the actual costs, the PRO must consider how products are actually recycled, which means differentiating between components that are attached or re-attached for recycling. **Treating attached and re-attached components as part of the entire packaging unit is the most accurate reflection of the actual recycling costs of managing these components based on how they are recycled today.**

CONCERN 4: INCREASES CONSUMER CONFUSION

When all the attached or re-attached plastic components are designed to be recyclable with the product, recycling is easier for California residents. One of the overarching principles of SB 54 is to streamline, standardize, and simplify plastics recycling for residents to increase participation. This means **moving toward a future where there is less onus on the resident to intentionally remove any plastic components prior to recycling.** The role of the resident is to simply put the plastic package into the recycling bin, and then, with proper packaging design, the full product can be effectively recycled into new products.

If components are all considered separately, then it may lead to more cases of when the resident is instructed to remove parts for recycling. This moves in a contrary direction to the statute goals. Components that are already recyclable when attached or re-attached should be incentivized, not treated the same as components that must be removed and recycled or disposed separately. There are too many nuances around how components are handled by consumers and how they flow in the recycling to simply set one baseline for all materials. **APR strongly recommends CalRecycle differentiate between component types in its definition and CMC guidance and incentivize those that can be recycled as part of the base package.**

CONCERN 5: PROMOTES POOR DESIGN CHOICES

APR anticipates several significant problems caused by charging EPR fees based on separate components with two examples provided here:

Scenario 1: Counting separate components may result in larger lids that use more plastic
If a producer must consider the screw-on lid as a separate and distinct component, then the producer may need to design the lid to be recycled separately from the container. Since smaller format plastics are more challenging to recycle, the producer would be incentivized to make the lid larger so it could be more effectively sorted by the MRFs. For example, a plastic jar lid (e.g., peanut butter jar) could be expanded to 3" or 4" width, or increased in height to 3" or more, to increase recyclability as a standalone component. This change in lid size will increase the amount of plastic being used in product design, which is contrary to the statutory goals.

Scenario 2: Moving to metal caps will result in less recycling.
If the plastic cap is considered a separate category and has a different fee than the plastic container, then producers will look for ways to reduce their fees on the cap itself. Because metal typically has lower EPR fees than plastics, producers would have a financial incentive to move toward metal caps. While this might sound like a good way to reduce the number of plastic components, it has many unintended consequences. Metal components are the number one contaminant on PET containers. Small pieces of metal are extremely problematic in the plastic recycling system because they are extremely challenging to separate and degrade the quality of the recycled content. If more companies move to metal caps, it will have several negative impacts, including less recycled plastic and lower quality of recycled content. In addition, small metal caps are challenging to recycle because of their size and because they contain a plastic lining on the inside of the cap. By contrast, plastic caps are recyclable today on bottles. Moving toward more plastic-lined metal caps would be a huge step backward and would create more problems rather than solve problems.

Moving forward

APR recognizes that one of the goals of SB 54 is to reduce plastic waste from small components, and the subsequent need to quantify the number and types of plastic components. However, the goal to count all components should not undermine recycling efforts, and we believe there is a way for the state to set the definitions to both quantify the number of components and ensure components are effectively recyclable and recycled.

APR requests CalRecycle amend the definition of detachable component to recognize that some plastic components are best recycled as part of the base packaging and should be categorized as part of the base packaging.

Response to O-46-12

CalRecycle rejects this comment for the reasons stated in response to comment O-39-5.

O-47: RethinkWaste (i.e. South Bayside Waste Management Authority) (Noam Elroi)

Comment O-47-1

On behalf of RethinkWaste, we appreciate opportunity to participate in CalRecycle's regulatory process to aid the implementation of Senate Bill 54 (Allen), also known as the Plastic Pollution Prevention and Packaging Producer Responsibility Act (SB 54). Below are comments on Draft Regulations released August 19, 2025. Some of the comments listed below we mentioned in our letter submitted in June of 2025, in response to draft regulations released in May of 2025. Several of our concerns persist, in addition to new issues that have come to our attention.

RethinkWaste (i.e. South Bayside Waste Management Authority) is a joint powers authority of eleven public agencies (Belmont, Burlingame, East Palo Alto, Foster City, Hillsborough, Menlo Park, Redwood City, San Carlos, San Mateo, the County of San Mateo and West Bay Sanitary District) in San Mateo County. Currently, we serve approximately 420,000 residents and 11,000 businesses and have been a leader in the delivery of innovative waste reduction and recycling programs since our formation in 1982. Additionally, we own and manage the 16-acre Shoreway Environmental Center facility, located in San Carlos, which receives, handles and transfers all the collected trash, recyclable and compostable materials in our service area (about 440,000 tons per year).

Response to O-47-1

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process. To the extent other portions of the submission do suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-47-2

1. <u>Risks to Revenue and Problematic Reimbursements from Producers to Local Jurisdictions</u>

a. §18980.1 (a)(2)

i. RethinkWaste has a unique perspective on this issue as public agency that also operates a materials recovery facility (MRF). The definition of alternative collection risks undermining the existing legal framework around the exclusivity of our franchise agreements and the right of our franchised hauler to charge generators to collect discarded franchised material. If alternative collection is allowed to interfere with the

current stream of material flowing through curbside collection to our MRF, it would undermine the entire economic structure upon which our MRF was financed.

RethinkWaste receives fees for each ton of material entering our Shoreway facility, in addition to revenue made from selling recyclable material. Alternative collection interferes with or draws material away from our current curbside collection risks decreasing our revenue from franchise fees, material sales, and accurate diversion numbers. This decreased revenue would have to be made up in garbage collection rates. There are pre-existing diversion rates we are mandated to hit, which is much harder to track if collection is dispersed without centralized coordination. Finally with alternative collection, we would have no methods to track those tonnages and materials to ensure they are properly recycled or disposed of. This process would also directly undermine the financial bond covenant responsibilities our agency has made in our facility's debt financing which could put us out of compliance. Managing our current (presumed future) debt obligations is a critical component of our core financing planning, and we cannot allow this to happen.

To ensure that local government collection programs are not disrupted, alternative collection programs should not be implemented without approval of the relevant local government. Local governments should retain the right to be the primary sponsor of an alternative collection program, or to designate that responsibility, if desired. Otherwise, lack of coordination with the current local government offerings jeopardizes the revenue streams that fund operations, shifting costs to ratepayers.

Response to O-47-2

CalRecycle rejects this comment for the reasons provided in response to comment B-29-2. Also, regarding local jurisdictions' right to be the primary sponsor of an alternative collection program, CalRecycle rejects that suggestion because Public Resources Code section 42051.1(c)(3) and, by extension, section 18980.8(a) of the proposed regulations already plainly require PRO plans to explain how plans will leverage, rather than disrupt, existing solid waste infrastructure and collection programs. Similarly, PRC section 42051.1(c)(4) requires plans to be consistent with restrictions under state and local laws and existing franchise agreements. Those restrictions on PRO plans reflect the Legislature's intent that PRO plans account for the commenter's concerns over alternative collection programs. Moreover, CalRecycle necessarily will consider those plan requirements when deciding whether to approve plans and assessing compliance with the Act. Therefore, the requested changes are neither necessary nor appropriate.

Further, the statute does not support a rule under which local jurisdictions could prevent implementation of alternative collection by withholding their consent. To the contrary, PRC section 42051.1(l) provides the conditions under which the PRO must rely on curbside collection. Under section 42051.1(l)(1)(C), the curbside collection provider's agreement is one of those conditions, so that the lack of such agreement would mean implementation of non-curbside collection is

appropriate pursuant to PRC section 42051.1(k). The suggested change to the proposed regulations would read the local jurisdiction's agreement into section 42051.1(k) as a condition precedent to alternative collection. In combination with section 42051.1(l), that interpretation would effectively empower local jurisdictions to overrule a PRO's plan for ensuring that materials get collected despite not being collected by a local jurisdiction. That is not a reasonable interpretation of statute. Moreover, the Legislature's choice to refer to the curbside collection provider's consent in PRC section 42051.1(l), but not 42051.1(k), makes clear that it did not intend consent to be an element of the latter.

Comment O-47-3

b. **§18980.8(g)(1)**

i. The proposed regulation adds a date (January 1, 2023) before which costs would not need to be reimbursed; however, adding a date without further context and clarification is counter to the intent of SB 54, which is to make local governments whole for the investments they have made in diverting the packaging and foodware waste stream.

We do not expect the Producer Responsibility Organization (PRO) to fund every investment our local jurisdiction has made. However, there are many instances in which existing and previous capital investments, such as trucks and sorting systems, will need to be leveraged to implement new SB 54 requirements. For example, a portion of an existing sorting line should be covered if that sorting line is processing new SB 54 materials that it wasn't before. There are established mechanisms to apportion such costs. If this is not addressed, well-meaning early adopters like RethinkWaste are penalized and actual costs related to covered material collection, transporting, and sorting will not be reimbursed.

Response to O-47-3

Comment rejected. The commenter asserts that certain costs incurred before January 1, 2023, are among the costs to be funded by the PRO. For the following reasons, no change is appropriate in response to this comment. To the extent the commenter recommends that costs incurred before passage of SB 54 be reimbursed, that contravenes the plain text of the statute and the Legislature's intent. It is not possible for costs incurred before passage of SB 54 to have been made for the purpose of complying with it. As the following provisions make clear, the statute only concerns those costs, not earlier ones:

• PRC section 42040(b)(2)(B): "It is the intent of the Legislature in enacting this chapter to ensure that local jurisdictions will be made financially whole for any new costs incurred associated with the implementation of this chapter and its implementing regulations."

• PRC section 42051(b)(2)(B)(ii): "[Independent Producers are responsible for] [f]ully cover[ing] the costs associated with implementing this chapter to the same

extent as any other producer participating in a PRO based on the producer's share of covered material."

• PRC section 42051.1(g)(1): "The plan shall include a process for determining and paying the costs that will be incurred by local jurisdictions . . . and others under this chapter."

• PRC section 42051.1(j)(1)(B): "[The plan must fund] [c]osts associated with this chapter incurred by local jurisdictions."

These statutory provisions, in particular the Legislature's statement in section 42040(b)(2)(B) that SB 54 was intended to make local jurisdictions whole for "new costs," consistently relate only to costs incurred for purposes of SB 54. Those purposes did not exist before the law's enactment, so no costs incurred before then could possibly be relevant. CalRecycle therefore rejects this suggestion.

Comment O-47-4

c. **§18980.8(g)(4)**

i. Local jurisdictions do not have the financial flexibility to assume debt under the vague guarantee of "reasonable" periods for making determinations of covered costs and issuing payments. Bond market investors require more specificity in this language. Especially if we are required to begin collection of Covered Material Category (CMC) materials so promptly, we need more certainty as to when these costs will be reimbursed so that we can begin the transparent and structured process of public fiscal planning. Because of this, we strongly request that reimbursement timelines should be established in regulation.

Response to O-47-4

CalRecycle rejects this comment for the reasons stated in response to comment B-29-3.

Comment O-47-5

d. **§18980.8(g)(6)**

i. The establishment of performance-based reimbursement only stands to hurt operators like ourselves and those that have already made the investments that enable circularity. SB 54 clearly states that haulers and local governments are to be fully reimbursed for the costs associated with implementing increased diversion, not that they are to be reimbursed based on their ability to fulfill the ambitions of the PRO.

Allowing payment based on performance risks haulers and MRF operators making good faith investments in improved systems and then not being made fully whole because unrealistic diversion rates were not hit, likely because of factors out of their control. Performance-based reimbursement should either not be allowed or should clearly be

separated in regulation as an option that haulers and local governments can opt in to. Overall, reimbursement should be based on the cost of investments, as SB 54 itself states.

Response to O-47-5

Comment rejected. Section 18980.3.2(g)(6) unambiguously states that a performance-based approach must be optional. They must be in addition to a claims-based approach described in the preceding paragraphs.

Comment O-47-6

2. <u>Compostability</u>

a**. §18980.3.3, § 18980.4.**

i. Article 4, § 18980.4 suggests that bioplastics may only be sent to end markets where they completely breakdown. Along with the clarifications in Article 11, §18980.11.1, recent changes seem to suggest that if there are no viable composting end markets that can break down bioplastics in their current system, then local jurisdictions can apply for an exemption. We greatly appreciate this newly noted flexibility, should that be the case.

We also appreciate the update to the standards for products labeled compostable. The connection to the standards of the National Organics Program (NOP) through the Public Resources Code is very important for the realities of the California compost market. However, we would like to emphasize that products that are not made of NOP-compliant inputs do not have responsible end markets in California, as almost all commercial composting operations adhere to the NOP standards. This should be considered when giving exemptions for a lack of end markets.

Response to O-47-6

Comment rejected. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process. To the extent this comment urges CalRecycle to consider the NOP standards and commercial composting operations when giving exemptions, such comment does not relate to the proposed regulations or present rulemaking process; as such, no response is necessary.

Comment O-47-7

3. <u>Arbitration Costs</u>

a. **§18980.8 (h)(4)(E)**

i. The current proposed language states that arbitration costs are split evenly and attorney's fees are paid individually. This creates a very unlevel playing field, allowing the PRO to make unfair reimbursement determinations because of public agencies' lack of financial ability to see lengthy and expensive arbitration through. Jurisdictions simply

do 4. 5. i. not have a profit margin out of which they can pay for extensive legal fees. The goal of SB 54 was to make governments whole for their processing of materials made by producers. The proposed regulation language splitting arbitration cost is contrary to the spirit of SB 54,

Response to O-47-7

CalRecycle rejects this comment. Section 18980.8(h)(4)(E) ensures that local jurisdictions and recycling service providers can never be burdened with paying more than half of the arbitration fees. Because the PRO and Independent Producers can only achieve the requirements of statute if local jurisdictions and recycling service providers undertake the necessary steps to improve collection and other infrastructure to achieve the requirements of PRC section 42050, there is adequate incentive for them to ensure that binding arbitration results in those necessary steps being taken. Furthermore, given that incentive, there is corresponding incentive for the PRO to agree to a different fee split for binding dispute resolution that the parties mutually consider appropriate; the parties would be free to agree, for example, that the PRO will reimburse all dispute resolution fees, provided that the local jurisdiction or recycling service provider take certain actions, along with the other reimbursed costs. Taken together, these mechanisms disincentivize unreasonable cost disputes, minimize the need to engage in dispute resolution processes to begin with, and protect against the commenter's concerns. While, as a general matter, the investments and costs incurred pursuant to SB 54 are to be covered by the PRO, disputes over what those costs are cannot reasonably be characterized as those costs themselves. Without clear instruction from the Legislature to insulate a party from the costs of resolving disputes, CalRecycle cannot interpret statute as authorizing it to shift all such costs on to the PRO.

CalRecycle further rejects the implied suggestion to shift attorney's fees to the PRO because, as a matter of statutory interpretation, the intent by the Legislature to shift such fees onto either party generally cannot be inferred.

Comment O-47-8

4. <u>Clarification on Compliance Definitions and Responsibility</u>

a. **§18980.11(a)&(b), §18980.11.1**

i. The current regulations still lack clarity as to what would count as a violation; would a jurisdiction be considered compliant if a website or brochure indicates collection acceptability but a cart/bin decal or graphic, which takes more resources and time to update, still shows the material as not accepted? Section 18980.11(b) simply states that a covered material is considered included in a local jurisdiction's program if the jurisdiction "collects the covered material and transfers it to responsible end markets directly or to intermediate supply chain entities." How is "collects" defined?

Additionally, this section states that a jurisdiction shall not be required to establish a viable end market. We deeply appreciate this delineation. However, additional clarity in the penalties and enforcement section stating no penalty can be imposed on a local jurisdiction or recycling service provider for the lack of a viable end market would go a long way to assuage fears of fines and violations for conditions that recyclers and jurisdictions did not create.

Response to O-47-8

Comment rejected. The phrase "the local jurisdiction or recycling service provider collects the covered material" is plain on its face, and "collect" cannot reasonably be interpreted as anything but the act of physically obtaining materials from those who discard them. Moreover, the proposed regulation is clear that the obligation of a local jurisdiction or recycling service provider is to physically collect and transfer certain covered materials for the recycling purposes, not merely educate the public on how to discard the covered materials. In other words, the local jurisdiction or recycling service provider must facilitate physical collection and then transfer them for processing, not for disposal in a landfill. This provision does not address the predicate acts necessary to maximize efficiency of the program. Statute contemplates the latter being addressed through the PRO plan, which must fund education efforts "to improve the preparation and sorting of covered material" and "improvements to collection . . . and other infrastructure necessary to achieve recycling rates." Lastly, no clarification is needed concerning penalties and enforcement because section 18980.11 cannot reasonably be interpreted to state that a local jurisdiction or recycling service provider could face penalties merely because there is a lack of viable end market. The statute and the proposed regulations make it unambiguous that the requirement is to include covered material categories that must be included pursuant to the covered material category list that CalRecycle publishes, and section 18980.11(b) makes clear that satisfying that requirement does not require transferring collected material to responsible end markets directly. When including the material (as that concept is described in section 18980.11(a)) is not possible, the local jurisdiction or recycling service provider would qualify for an exemption, and there would be no violation.

Comment O-47-9

5. <u>Date Local Jurisdictions Must Collect Recyclable and Compostable Covered Materials</u>

a. **§18980.11(a)**

i. We appreciate clarifications in section 18980.11 regarding the date by which jurisdictions are required to collect materials on the Covered Material Categories (CMC) list and the timeline for compliance in response to future CMC updates. However, the timeline for when jurisdictions must begin collecting materials under the PRO plan (beginning upon its approval) does not acknowledge that jurisdictions will need, and are entitled to under SB 54, funding to implement changes to align with the plan. We may

need agreed-upon funding from the PRO plan to even begin necessary upgrades for increased collection. Additionally, we will not know exactly which materials on the CMC we are responsible for, as opposed to other PRO-run programs being responsible for, until the plan has been approved. We recommend providing a one-year phase in of the collection requirement, or at least the enforcement of it, to allow time for jurisdictions to adjust acceptability lists and add required messaging and infrastructure to sort those new materials. A one-year phase in would align with Section 18980.11(c) which gives one year for jurisdictions and service providers to collect materials when there is a change to the CMC list.

Response to O-47-9

Comment rejected. Delaying the effectiveness of PRC section 42060.5(a) statewide would overcompensate for the compliance challenges that that provision imposes. Instead, statute (PRC section 42060.5(b)) and the proposed regulations (section 18980.11.1) address the commenter's concerns more efficiently, through the availability of exemptions: To the extent complying with section 42060.5(a) is impracticable because of delay in funding to which the local jurisdiction or recycling service provider is entitled, the local jurisdiction may obtain an exemption. Moreover, because of the ambitious statutory requirements placed on the PRO, it has significant incentive to establish efficient means for providing adequate funding. Accordingly, a statewide delay in effectiveness of PRC section 42060.5(a) is unwarranted.

Comment O-47-10

6. <u>Enforcement, Compliance, and Corrective Actions</u>

a. **§18980.13 (b), §18980.13.1, PRC §42081 (a)(1)**

i. The current proposed regulations subject local jurisdictions and recycling service providers to SB 54 enforcement, including penalties of up to $50,000 per day for each covered material category that is not included in a local collection program. We greatly appreciate the work that has been done on the extension and exemption process; nonetheless, the scale of the proposed penalties is extreme – five times higher than those included in SB 1383 – and local jurisdictions are not the target for responsibility nor enforcement under SB 54. This is in direct conflict with the intention of SB 54 to make jurisdictions whole for the costs to recycle and compost covered materials.

We recommend that CalRecycle clarify that any fines to local jurisdictions would be graduated, meaning that the upper fine amount is the maximum that would be assessed and implemented only after other compliance assistance steps and smaller fines were imposed by the department.

Response to O-47-10

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements set forth in the Act, including in sections 42060, 42060.5, and

42081 of the Public Resources Code, and the recommended change is not necessary to the implementation or enforcement of the Act. Section 42081(a)(1) provides that CalRecycle may issue a notice of violation to, and impose an administrative civil penalty not to exceed fifty thousand dollars ($50,000) per day per violation on, any entity not in compliance with the Act or any of the regulations adopted to implement the Act. Section 18980.13.2(a) of the proposed regulations implements this statutory provision by specifying that any entity, including a local jurisdiction or recycling service provider, not in compliance with the Act is subject to penalties pursuant to section 42081(a). However, section 18980.13.2(c) further clarifies that penalty determinations will be made by the CalRecycle director or the director's designee based on evidence presented in hearings conducted pursuant to section 18980.13.4 addressing, at a minimum, the factual factors identified in section 42081(c). Therefore, while section 18980.13.2(a) preserves flexibility for CalRecycle to assess penalties of up to $50,000 per day per violation against a noncompliant local jurisdiction or recycling service provider consistent with statutory authority, that is a maximum amount and CalRecycle will always make its penalty determinations based on the factual factors and evidence identified in section 18980.13.2(c). The penalties assessed against a noncompliant local jurisdiction or recycling service provider will necessarily often be far less than the maximum amount of $50,000 per day per violation that is allowed under section 42081(a)(1). No further changes to the proposed regulations are necessary to the implementation or enforcement of the Act.

Comment O-47-11

We take very seriously our mission to provide innovative waste reduction and diversion management through responsible and cost-effective programs that promote environmental sustainability in our communities. We understand how important these regulations are to the successful implementation of SB 54, and the comments made above are done so in the spirit of helping all parties achieve those goals. We greatly appreciate your consideration of our comments, which were all made with the ratepayers of our service area in mind.

Response to O-47-11

Comment rejected. No response specific to the commenter's submission is necessary. This closing paragraph summarizes the commenter's recommendations, to which CalRecycle has responded separately.

O-48: California Retailers Association (Sarah Pollo Moo)

Comment O-48-1

October 7, 2025
Submitted Electronically via CalRecycle’s Public Comment Portal

Csilla Richmond
SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act Regulations
California Department of Resources Recycling and Recovery (CalRecycle)
Regulations Unit
1001 I Street, MS-24B
Sacramento, CA 95814

Re: Senate Bill 54: Plastic Pollution Prevention and Packaging Producer Responsibility Act

Dear Director Heller:

The California Retailers Association (CRA) appreciates the opportunity to provide comments on CalRecycle's proposed regulatory text in the formal rulemaking period for California's SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act.

CRA is the only statewide trade association representing all segments of the retail industry including general merchandise, department stores, mass merchandisers, on-line marketplaces, restaurants, convenience stores, supermarkets and grocery stores, chain drug and specialty retail such as auto, vision, jewelry, hardware and home stores. The California Retailers Association works on behalf of California's retail industry, a driving force of California's economy, with over 400,000 retail establishments, an annual gross domestic product of $330 billion and one fourth of California's total employment.

The retail industry is committed to the goals of SB 54, has made investments in sustainable practices and appreciates the opportunity to participate in the rulemaking process for SB 54. The California Retailers Association's President and CEO Rachel Michelin is an appointee to the SB 54 Advisory Board and serves as an ex-officio member of the Circular Action Alliance (CAA) Producer Responsibility Organization (PRO) board furthering the retail industry's commitment to moving towards a circular economy. As such, retailers are deeply invested in ensuring this groundbreaking extended producer responsibility (EPR) program for creating a more circular economy for plastics and packaging is successful both for producers, local governments and, most importantly, consumers.

Below, CRA summarizes our continued appreciation for the work CalRecycle has done on the regulations to date as well as some areas of concern and questions remaining as the regulations get close to their final form.

We look forward to ongoing dialogue and we are happy to make our subject matter experts available to answer specific questions or provide additional information that may be useful as CalRecycle moves forward with finalizing the SB 54 regulations.

Regulations Continue to Move in the Right Direction

The California Retailers Association supports and appreciates CalRecycle's consideration of the impact on affordability that these regulations will have on everyday consumers, especially given the ongoing uncertainty with the Trump Administration's tariffs and myriad of extended producer responsibility and product stewardship programs that exist in California, nationwide and tglobally. The most recent version of the SB 54 regulations reflects these concerns. We thank the entire CalRecycle team's ongoing collaboration with all stakeholders on this important issue. Similar to the last version, this latest draft of the regulations continues to show vast improvement in streamlining and ensuring affordability is a top priority.

As was included in our June 2025 comments letter to CalRecycle, key components of the regulations that make the SB 54 statute implementable for business without greatly raising costs include the provisions for advanced recycling, which is critical for the future success of EPRs in California including SB 707, the Responsible Textile Recovery Act of 2024, which mandates that apparel and textile producers participate in a recycling and recovery program, making them responsible for managing their products throughout their lifecycle, including collection, repair and recycling. This is the nation's first EPR law specifically for textiles and its success depends on the ability to utilize advanced recycling technologies.

CRA members are committed to the environmental goals of SB 54 and appreciate the time taken to craft a collaborative and effective regulatory framework. This demonstrates California's leadership in addressing plastic pollution and advancing sustainable recycling practices.

Remaining Concerns with Draft of SB 54 Regulations

I. Definition of Producer – The definition of Producer remains overly complex and could lead to a lack of clarity by the regulated community as to which party should be considered the Producer. Most importantly, to simplify reporting obligations, **all single-use food service ware, regardless of whether it is unfilled / empty, should be the responsibility of the food service ware manufacturer**.

Otherwise, it adds significant complexity because food service ware suppliers do not know how their items will eventually be used. That may already be the intent of the regulations, but it's not clear based on the organization of the Producer definition. A proposed redline of Subsection 17(B) of 18980.1 that would make the distinction clearer is proposed below.

Proposed redline:

(17)(B)
(i) For Packaging, t~~T~~he terms "product that uses covered material" and "product using the covered material" refer to a good that uses covered material. Empty packaging materials not yet used by a good are not "single-use packaging" ~~or otherwise "covered~~

~~material"~~ under the Act, such that a person is not a producer merely because they manufacture, sell, offer for sale, or distribute such materials.
(ii) For Plastic Food Service Ware, ~~A~~ product ~~good~~ uses covered material if ~~its packaging is covered material or if~~ the good itself is plastic single-use food service ware and thus constitutes covered material. ~~Empty packaging materials not yet used by a good are not "single-use packaging" or otherwise "covered material" under the Act, such that a person is not a producer merely because they manufacture, sell, offer for sale, or distribute such materials.~~

Response to O-48-1

Comment rejected. CalRecycle declines to adopt the commenter's proposed change because it would not be a substantive change and would not add clarity to the regulation. With or without the proposed change, it is equally clear that the regulation states nothing with respect to food service ware that is sold unfilled or empty. Nor would the change have the effect the commenter intends (that "all single-use food service ware . . . should be the responsibility of the food service ware manufacturer"). Statute would not permit that outcome, in any event, because manufacturers are not necessarily producers under Public Resources Code section 42041(w).

Comment O-48-2

II. Compostability Definition – SB 54 looks to AB 1201 (Ting – 2021) for the definition of compostability. While we appreciate your decision to delay the implementation deadline by 18 months for compostable material to meet the National Organic Standards (NOP) under AB 1201, the California Retailers Association needs confirmation that SB 54's definition of compostable will track AB 1201, as extended by CalRecycle.

Response to O-48-2

Comment rejected. No change to the proposed regulations is necessary to address the commenter's concern because any reference to Public Resources Code section 42357(g)(1)(B) necessarily encompasses the recognition in that provision that CalRecycle may delay its effective date. In other words, Public Resources Code section 42357(g)(1)(B) governs eligibility to be labeled "compostable," and the proposed regulations do not purport to give that provision legal effect in the SB 54 context that it doesn't have standing alone (i.e., in the labeling law context).

Comment O-48-3

III. USDA/FDA exclusion – The California Retailers Association supports an outright exclusion for **raw protein packaging**. Rather than requiring a separate exemption application to be submitted, packaging for raw protein should be explicitly excluded under the proposed SB 54 regulations due to the food safety considerations.

Response to O-48-3

Comment rejected. The statute does not grant CalRecycle general authority to single out types of packaging and grant per se exemptions in the regulations. Nor would codifying such an exemption in a regulation be prudent; in the event that a material-specific exemption becomes no longer necessary or appropriate, it could not be withdrawn without the extraordinary effort of a formal rulemaking. Lastly, even if there is not a federal law or regulation that would, pursuant to section 18980.2(a)(2), result in raw protein packaging not being considered "covered material," applying for an exemption pursuant to Public Resources Code section 4060(a)(3) or (4) does not present an unreasonable barrier, especially considering CalRecycle can grant such exemptions on a class-wide basis.

Comment O-48-4

Additionally, in Section 18980.2.1. Exclusion of Reusable and Refillable Packaging and Food Service Ware (a) (4) (A-B): Convenience Standard puts unnecessary financial and administrative burden on retailers to manage statewide reuse collection and distribution for all producers. The California Retailers Association requests CalRecycle provide clarity on the basis for the distance requirements and a cost/benefit consideration for determining the distance. CRA recommends CalRecycle consider alternatives based upon population density/return volumes. Retailers delivering other producers covered reusable materials by delivering directly to consumers should not be responsible (logistically or financially) to recover other producers reusable packaging.

Response to O-48-4

CalRecycle rejects this comment. The only suggested change to the proposed regulations is to revise 18980.2.1(a)(4)(A) and (B) so that it is based on "population density/return volumes." Regarding population density, the commenter does not explain how the proposed regulations might be based on them. In any event, declines to take an approach considering population density because it is unrealistic to expect businesses (those that would be "producers" under Public Resources Code section 42041(af) with respect to packaging or plastic food service ware if it were single-use) to conduct demographic evaluations to determine how to establish reusability. With respect to "return volumes, the commenter does not explain how the proposed regulations might be based on them, such as what threshold might be used and how "return" is relevant at all to 42041(af)(2), which concerns reuse by consumers. Moreover, the statute does not require any particular mandatory rate of return, nor does it clearly authorize CalRecycle to establish one or set forth any considerations for CalRecycle to do so. Lastly, the commenter's assertions that the regulations place burdens on retailers to recover "other producers [sic] reusable packaging" is unfounded. Neither the statute nor the proposed regulations purport to require retailers or any entity at all to participate in reuse systems.

Comment O-48-5

IV. Baseline – The baseline concept in CalRecycle's proposed SB 54 regulations is confusing. There seems to be an inherent conflict between setting a static baseline using 2023 data and the statutory provision that acknowledges that businesses will continue to grow and that further reductions may be needed (Section 42057(b) and (h). The California Retailers Associations requests clarity from CalRecycle on this issue.

Response to O-48-5

CalRecycle rejects this comment. This comment asserts that a "baseline concept proposed" in the proposed regulations is confusing but points only to statutory provisions, not regulatory ones, as presenting a conflict. The comment, therefore, raises an objection to statutory provisions, not regulatory ones. Moreover, the cited statutory provisions are unambiguous, and the commenter fails to explain what "inherent conflict" they present. The "static baseline" based on 2023 is a statutory requirement under Public Resources Code section 42057(b), not one CalRecycle proposes or can modify via regulation, and section 42057(h) is a statutory provision that, by its nature, cannot be implemented via regulation currently. The latter has no effect until 2030, when CalRecycle must assess whether new source reduction requirements are necessary to ensure that the source reduction requirement under Public Resources Code section 42057(a) (25 percent by 2032) will be satisfied while allowing business growth. To the extent setting those new requirements must be implemented via regulations, it is not possible to do so currently, and the commenter does not explain its implied suggestion to the contrary.

Comment O-48-6

V. Malus Fees – Section 42053(e)(6) allows malus credit if producers include on-pack recycling / disposal instructions. The California Retailers Associations requests clarification from CalRecycle that a QR code is sufficient to qualify as "clear and accurate disposal, recycling ... instruction."

Response to O-48-6

Comment rejected. The comment does not address the regulations themselves, suggest changes to them, or raise objections related to the rulemaking process. Instead, the comment requests that CalRecycle respond to a question about specific statutory terms not addressed in the regulations, so no response is required. Even if the comment could be construed as concerning any proposed regulation, CalRecycle declines to make any change because the cited statutory text is clear on its face: Public Resources Code section 42053(e)(6) unambiguously refers to actions that improve consumer sorting and disposal. The language cited by the commenter is plain on its face, and presents an example of such actions, not an express limitation on what such actions may be.

Comment O-48-7

VI. State Audit – The California Retailers Association requests clarity on the rights for the State of California to conduct an audit. Is it typical for regulations not to specify a timeframe with constraints on how far back CalRecycle can audit. Specifically, in Article 13 of the proposed SB 54 regulations: Enforcement Oversight by the Department and Administrative Civil Penalties, Section 18980.13.

Compliance Evaluation and Determination

- *Can clarification on the audit timeline be added? Ex: CalRecycle has authority to audit anything from the past XX years? This way, the regulated community can ensure there is access to all data going back to a certain date and make sure a third party is keeping producers' data aligned as well.*

Response to O-48-7

CalRecycle rejects this comment. To the extent this comment poses questions to CalRecycle, as opposed to making any recommendation or objection that is specifically directed at CalRecycle's proposed regulations, no response is required. To the extent this comment recommends clarifying the timeline for audits by CalRecycle, no further clarification is necessary. The proposed regulations are consistent with the requirements of the Act, and no change is necessary to the implementation or enforcement of the Act. PRC section 42080(a) authorizes CalRecycle to perform audits of producers and a PRO. Sections 18980.6.8 and 18980.7.7 of the proposed regulations implement this requirement in part by specifying the recordkeeping requirements of producers and a PRO. In particular, sections 18980.6.8(d) and 18980.7.7(d) of the proposed regulations provide that all required records must be available for inspection by CalRecycle and maintained by the producer or PRO for at least three years. Therefore, the proposed regulations are already sufficiently clear as to the timeline of records that must be maintained and made available for an audit by CalRecycle. No further change is necessary.

Comment O-48-8

VII. Categorically Excluded Materials – The California Retailers Association recommends amending Section 18980.2 to reduce unnecessary administrative burdens to individual producers when packaging formats/applications run into federal preemption or requirements that would make the packaging out of scope. Class wide exemptions should not need individual producer submissions, which would only emphasize duplication and add excess cost to producers with no added benefit, which will also only increase the costs on consumers.

VIII. Exclusion of Certain Types of Packaging – The California Retailers Association requests CalRecycle ensure in section 18980.2.2 that intended use is considered for the durability and reuse exemptions. Commercial users and consumer users are two different use standards. Five years of use for consumers may not translate to five years

of industrial use. Warranties for consumer use do not need to stand up to industrial/commercial use.

Response to O-48-8

Comment rejected. To the extent the comment concerns any provision of section 18980.2 other than (a)(2) no change is necessary because those provisions impose no "submission" is requirements; they concern express exclusions in statute from the definition of "covered material" and are self-executing.
Regarding section 18980.2(a)(2), CalRecycle rejects the assertion that requiring a submission from producers is an "unnecessary administrative burden." The burden is narrowly circumscribed and is consonant with the significant effect of any determination that packaging is not covered material, including the risk that such determinations are incorrect.
Regarding section 18980.2.2, CalRecycle rejects the proposal, which is only vaguely stated. It is not clear what change the commenter proposes so that "intended use is considered for the durability and reuse exemptions." That section does not create a "durability exemption" or a "reuse exemption," anyway. It concerns packaging used for long-term storage described in Public Resources Code section 42041(e)(2)(F) and components that are of de minimis weight or volume. Regarding long-term storage, the durability requirement (18980.2.2(a)(3)(A)) expressly does consider intended use, and a warranty is identified as sufficient, but not necessary, for satisfying it. The reference to a "reuse exemption" is inexplicable because section 42041(e)(2)(F) is not about reuse, which is achieved pursuant to criteria listed in Public Resources Code section 42041(af) and is addressed in section 18980.2.1 of the proposed regulations. The long-term storage packaging exclusion concerns packaging that would otherwise be considered "single-use" and "covered material" because it is used only with the good with which it was acquired.

Comment O-48-9

IX. Evaluations of Covered Material and Covered Material Categories; Section 18980.3.4. Independent Third-Party Validation for Postconsumer Recycled (PCR) Content – The California Retailers Association recommends CalRecycle ensure that if and when testing or certification bodies are required that the most possible options for the global supply chain are allowed. CRA recommends CalRecycle start broad and only narrow if entities prove they are not satisfactory. The speed at which this process is moving does not allow for perfection. CalRecycle should consider defining the industry standard testing methodology and lab certifications requirements as opposed to specifying a single entity and their partners as the only option.

Response to O-48-9

Comment rejected. The commenter's proposal does not appear responsive to the substance of section 18980.3.4, which does not concern when or if "testing or certification bodies are required." Instead, it establishes parameters that an independent party entity must meet if a producer responsibility plan proposes

relying on it, instead of the Association of Plastic Recyclers (APR), as the "similar third party approved by the department" described in Public Resources Code section 42057(a)(2)(B)(i). Given that function, CalRecycle cannot discern what it would mean to implement the recommendation to "start broad and only narrow if entities prove they are not satisfactory." The commenter also recommends that the proposed regulation does not "specif[y] a single entity and their partners as the only option," but the proposed regulation does not do so. The proposed regulation recognizes APR as mandated by statute but otherwise does not specifically limit any other options.

Comment O-48-10

X. Remaining General Concerns

The California Retailers Association requests that CalRecycle allow producers to rely on certifications or letters of guarantee from raw material suppliers, packaging manufacturers and vendors for a near-to mid-term compliance and evidence of Chemical, Design for Recyclability and PCR content compliance. Testing and Certification schemes need time to develop within the global packaging industry to moderate duplicative testing and certification costs to California consumer products.

CRA also continues to be concerned about California's inconsistencies with EPR and product stewardship program fee requirements on receipts.

Under the proposed SB 54 regulations, retailers in California are not permitted to list an EPR fee as a separate line item on receipts or invoices for packaging. This is inconsistent with other EPR and EPRlike programs in the state and throughout the country creating a confusing patchwork of receipt requirements for consumers and business as well as compliance burdens, which will ultimately increase costs that could trickle down to consumers.

SB 54 specifically prohibits companies from passing EPR fees directly to consumers as a separate line item on receipts or invoices. This means retailers and producers must absorb the cost of EPR fees into their overall pricing, rather than itemizing it for the consumer at the point of sale. SB 54 includes a unique provision not found in other EPR laws including Colorado, Oregon and Main.

With other EPR Programs in California such as the Covered Electronic Waste Recycling Fee or the Mattress Recycling Charge, the law does require or allow these fees to be listed separately on receipts. For example, with the e-Waste Recycling Fee retailers must collect and may list the fee separately on receipts for covered electronic devices. Under California's mattress recycling program, the recycling fee must be shown as a separate line item on invoices and receipts.

While this fee requirement under SB 54 is in statute and cannot be changed within the regulatory process, the California Retailers Association would like to highlight these inconsistencies that will create more compliance costs that both businesses and

consumers will have to bear. In some programs, retailers and producers must add the fee on the receipt for "educational purposes" for the consumer while SB 54 requires the opposite. Education is important and we should be educating consumers in a myriad of ways on SB 54 and the other EPR and stewardship programs that are currently operating for various products being sold in the state, but we need to find harmonization and consistency in California so businesses and ultimately consumers do not pay the price for a burdensome and ultimately costly patchwork of laws governing California's product recycling goals.

Finally, the California Retailers Association continues to be concerned about the need for harmonization of material class, type and covered materials across the states and the corresponding liability concerns without that harmonization. Colorado is the model for most retailers having to comply with different packaging EPRs across the country. CRA requests an exemption of materials where it is difficult to change the material type due to the material being regulated or needing specific packaging designs. We support the exemption of any materials covered by any other EPR type program and encourage consistency on producer liability definitions. Legislation varies in language relative to "sell it into the state" or "sell it to the consumer" as well as import status. Harmonizing across in scope materials and across states relative to responsibility would ensure more accurate compliance. We also ask for producer liability for retailers not extend to national brands where retailers have limited ability to influence.

We appreciate the opportunity to share our comments on the proposed regulatory framework for SB 54 in the formal rulemaking stage of California's landmark packaging EPR Program as well as concerns and suggestions to improve certain sections for retailers to ensure affordability and the effective implementation of the law. We remain ready to work with CalRecycle to implement SB 54 and lead the nation and world, as this monumental policy decreases plastic waste and moves California closer towards a circular economy and sustainable waste management system.

Response to O-48-10

CalRecycle rejects this comment. First, CalRecycle rejects the commenter's proposal concerning certifications and guarantees because it cannot discern what the commenter means by "chemical, design for recyclability and PCR content compliance." Covered material must be "recyclable" (or compostable) by 2032 under Public Resources Code section 42050(b) according to the standards set forth in Public Resources Code section 42355.51(d). The concept of "design for recyclability" does not appear in statute. Likewise, a producer need not incorporate PCR to comply with their obligations under the statute. To the extent the commenter intended to propose that certifications issued by independent third-parties or guarantees by manufacturers and venders should temporarily excuse a producer from their compliance obligations, CalRecycle rejects that proposal. That proposal is, in effect, a request for a new exemption. The exemptions provided pursuant to Public Resources Code section 42060(a)(3) and (4) (addressed in 18980.2.4)—in particular, 42060(a)(3), which allows for a phase-in plan—are sufficient to address scenarios where a producer asserts

"new-to [sic] mid-term compliance" with any statutory requirement

Furthermore, to the extent this comment makes general recommendations concerning the EPR structure and fees, the proposed regulations are consistent with the requirements of the Act, including in PRC sections 42051.1, 42053, and 42060, and no change is necessary to the implementation of the Act. First, this comment objects to the prohibition on fees being passed on to consumers as a separate item on a receipt or invoice. However, as recognized by the commenter, this prohibition is explicitly established and required by the Act itself. See PRC section 42053(a)(1). Therefore, CalRecycle has no authority to modify or waive this requirement in the proposed regulations. Second, this comment recommends that the implementation of the Act be harmonized with other states. However, this comment does not recommend any specific changes to the proposed regulations that are within CalRecycle's authority. The comment recommends broad exemptions for certain materials and all materials that are covered by any other EPR program, but it does not identify any way in which the proposed regulations' implementation of the existing exclusions set forth in PRC section 42041(e)(2) and exemptions set forth in PRC section 42060(a)(3) through (5) are insufficient. Rather, the proposed regulations, including sections 18980.2 through 18980.2.4, already clearly and adequately implement the various exclusions and exemptions established by the Act in a manner that is consistent with the relevant statutory provisions. CalRecycle does not have any authority to exclude or exempt materials beyond those exclusions and exemptions that are established under the Act. Finally, this comment recommends preventing producer liability for retailers from extending to national brands. PRC section 42041(w) establishes the tiered criteria for identifying a producer under the Act, and CalRecycle has no authority to impose a limitation on PRC section 42041(w)(3) that otherwise has no basis in the text of the Act. Therefore, no change is appropriate or necessary.

O-49: Oceana (Ashley Blacow)

Comment O-49-1

As California residents, we strongly support the state's 2022 landmark single-use plastic and packaging reduction law, Plastic Pollution Prevention and Packaging Producer Responsibility Act (SB 54), and call on you to ensure the law is implemented in accordance with its intended ambitions. You must ensure that implementing regulations do not undermine the letter and spirit of the law by excluding packaging for over-the-counter drugs and food and agricultural products and allowing harmful and polluting chemical recycling technologies to meet the law's recycling mandates. The growing plastic pollution crisis harms not only our coasts and marine wildlife, but also threatens our health, climate, and communities. SB 54 is an unapologetically bold step to address this plastic pollution and hold producers accountable for the rising costs of managing their waste. If properly implemented, SB 54 will dramatically overhaul how single-use

packaging and single-use plastic foodware will be offered, sold, distributed, and imported in California, and tackle plastic pollution at the source.
California communities spend more than $428 million annually in efforts to clean up and prevent plastic and other litter from entering oceans and waterways. Even a robust recycling system cannot keep pace with the growing production of plastics, particularly single-use plastics, which are often difficult to recycle. SB 54 refocused California's efforts on reduction and reuse while continuing to improve recycling and mitigating harm to vulnerable communities that have long shouldered the health and environmental burdens of plastic production and pollution. As written, SB 54 will spur packaging and foodware innovation in ways that will allow industry growth while reducing single-use plastic pollution in our state.

Unfortunately, the draft regulations conflict with plain language in the law, stifle innovation in packaging design, and undermine the goals of SB 54 to reduce plastic pollution and hold producers accountable for the cost of managing their waste. We are particularly concerned that the draft regulations illegally:
• Propose to exclude packaging for over-the-counter drugs as covered materials with only narrow exceptions.
• Propose to exclude packaging for food and agricultural commodities instead of using the existing exemption process.
• Shift the focus on excluding alternative recycling technologies from hazardous waste production to hazardous waste management and risk-based assessments.

We call on you to ensure packaging for over-the-counter drugs and food and agricultural commodities are fully covered by the regulations and that producers are prohibited from using harmful chemical recycling technologies to meet recycling mandates.

California is at a pivotal moment in the global fight against plastic pollution. California is the fourth largest economy in the world, and the impacts of SB 54 are likely to ripple across the country and around the globe. How the state implements these policies is critical to the law's success. California must not squander this opportunity to lead the way and must not undercut the progress in other states.

Response to O-49-1

CalRecycle partially rejects and partially accepts this comment.

The commenter incorrectly asserts that three features of the proposed regulations are unlawful. Regarding over-the-counter drugs, CalRecycle rejects this comment because section 18980.2(a)(6) correctly interprets PRC section 42041(ee)(2)(A) as not exempting those that are cosmetics. As explained in greater detail in the Initial Statement of Reasons, inclusion of three distinct terms to describe the excluded packaging ("medical products," "devices," and "prescription drugs") establishes that the Legislature intended to exclude medical goods other than just prescription drugs and "devices" (a defined term under the Federal Food, Drug, and Cosmetic Act). Any other interpretation would give no effect to the term "medical products," and a reasonable interpretation of that term

is one that aligns with its common, colloquial understanding: that products that serve cosmetic purposes are not considered "medical products," but items that serve only medical purposes are.

Regarding packaging for food and agricultural goods, the commenter incorrectly asserts that section 18980.2(a)(2) generally excludes such packaging. It only excludes packaging for which there exists an intractable conflict with federal law. CalRecycle accepts this comment, however, to the extent it alleges that section 18980.2(a)(2) was unclear in scope or effect, was insufficiently clear regarding what renders it "not reasonably possible" to resolve conflicts with federal laws, or would have been overbroad in effect due to the potential for the exclusion to be applied despite the conflicts being avoidable. See CalRecycle's response to comment I-19-1, explaining the revisions responsive to this and similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2).

Regarding the proposal to rely on the "existing exemption process," CalRecycle rejects that suggestion for the reasons provided in response to comment I-59-2. Regarding "alternative recycling technologies" and hazardous waste production, CalRecycle rejects this comment for the reasons stated in response to comment O-62-1.

O-50: Beta Analytic (Benjamin Kling)

Comment O-50-1

This comment is specifically intended to recommend that the proposed SB 54 implement a definition of the term “biobased” which directly requires the carbon-14 testing method following ASTM D6866 Method B to determine the share of biobased carbon embodied in materials seeking recognition under the program. Biobased content measurements following standards such as ASTM D6866 Method B currently provide critical value to similar existing programs and can play a key role in achieving SB 54’s objectives.

Included here you will find:

Recommendations for SB 54 1
What is Biogenic Testing (Carbon-14)? 5

Recommendations for SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act

Our recommendation for SB 54 is to incorporate a definition of the term “biobased,” which is consistent with the definition used by ASTM D6866 and requires direct biobased content testing following ASTM D6866 Method B for any biobased materials seeking recognition under the law. This would create consistency with similar initiatives throughout the federal government, particularly the USDA’s BioPreferred® Program, and would help CalRecycle achieve SB 54’s goals of reducing petrochemical pollution from plastics and packaging.

Since SB 54 includes “aliphatic biopolyesters” in its definition of the term plastic (42040 (t)), it chooses not to regulate biobased materials and bioplastics separately from traditional plastics. By doing so, CalRecycle fails to make the decarbonization benefits of biobased plastics available to California’s transition away from petrochemicals. This decision benefits traditional petrochemical plastic producers by failing to make more sustainable alternatives available to consumers, and even further by communicating to California consumers that CalRecycle considers fossil and biobased materials to be equally sustainable. This directly compromises SB 54’s ability to achieve its intended outcomes.

Beta recommends that SB 54 should include a specific definition of the term “biobased,” following the ASTM D6866 definition. Including the ASTM D6866 definition would guarantee that only products containing renewable content benefit from the biobased label because it relies on direct testing to verify claims. Products which can prove they embody biobased content should be recognized as a pathway to achieving SB 54’s goals for displacing petrochemicals. Even further, the use of direct testing in this definition would allow CalRecycle to exclusively incentivize the biobased portion of these products. This would also create consistency with the USDA BioPreferred® Program’s 20-year accepted definition of biobased that is sustained by direct product testing under ASTM D6866. 2

The USDA recently issued a major update to the BioPreferred Program, combining the federal procurement and voluntary labeling portions of the program into one unified pathway, which relies on direct testing following ASTM D6866 to demonstrate biobased content. This is an important rule to 3 consider because USDA upheld the importance of the ASTM D6866 definition of biobased, specifically responding to commenters who advocated for the introduction of calculation-based approaches such as mass balance. USDA’s response to those comments said, “The Agency notes that products produced by mass balance methods are not Biobased Products as defined by this final rule. To maintain the integrity of the Label and to prevent diluting public understanding of what the Label means, the Agency must maintain a consistent definition of what it means for a product to be biobased.” It is critical to follow 4 this approach of a consistent definition to make the term biobased meaningful to consumers and guarantee that biobased products are truly providing the decarbonization benefits the term is intended to promote.

The BioPreferred definition of “biobased” should specifically be used to inform Section 18980.6.7(j) on developing a credit for producers who use plastic-covered material derived from renewable materials (included below). Since the goal would be to give this credit only to the renewable portion of products and not materials of mineral or fossil origin, ASTM D6866 testing should be required to demonstrate the renewable content.

(j) Pursuant to paragraph (7) of subdivision (e) of section 42053 of the Public Resources Code, a PRO shall provide a credit for producers who use plastic-covered material derived from renewable materials.
(1) “Renewable materials,” for the purposes of paragraph (7) of subdivision (e) of section 42053 of the Public Resources Code, means materials that are wholly derived from natural resources that are not of mineral or fossil fuel origin, without resulting in the net depletion of any of the resources. Examples of potentially renewable material include those derived from wood, mycelium, algae, or plants such as cotton, corn, sugar cane, or wheat

Direct biobased testing requirements are the established best practice for determining renewable content under leading public and private incentive programs for biobased products. For reference, ASTM D6866 is required for reporting the biobased content of renewable chemicals, bioplastics and other biobased products under the following prominent programs (please see specific rules hyperlinked):

- The USDA BioPreferred Program requires ASTM D6866 Method B testing for any biobased products, including renewable chemicals, seeking recognition of renewable content. 5
- The EU’s Policy Framework for Biobased, Biodegradable and Compostable Plastics recommends direct Carbon-14 testing as its preferred method for determining biobased products. 6
- Four US states have Renewable Chemicals Act laws which provide incentives for biobased chemical production requiring ASTM D6866 testing: Iowa, Kentucky, Minnesota and Maine. The 2024 bill for a federal Renewable Chemicals Act also proposed to require ASTM D6866 testing, as have several previous versions of the bill.
- The leading biobased product certification programs in the market require Carbon-14 testing to verify biobased content, including TUV Ok Biobased, DIN CERTCO Biobased, UL 9798 biobased content validation, SGS Green Mark, Nordic Swan Ecolabel, Germany’s Blue Angel Ecolabel, Braskem I’m Green™, Leadership in Energy and Environmental Design (LEED) and CertiPUR-US®.
- ASTM D6866 was also the proposed methodology for identifying biobased practices in the 2024 Biomanufacturing and Jobs Act.

In addition to the USDA BioPreferred® Program, we encourage CalRecycle to review the EPA’s proposed Label Program for Low Embodied Carbon Construction Materials.7

This proposed program further demonstrates the importance of recognizing and incentivizing biobased content as an approach to displacing petrochemicals. By failing to recognise biobased materials as a distinct category and incentivizing their use, the proposed draft text of SB 54 would continue to promote the use of petrochemical plastics in these long-term embodied materials. This is particularly relevant to consider because while many of the materials the proposed EPA label would address are difficult to decarbonize and may not be feasible for compostability yet, SB 54 can incentivize the transition away from petrochemicals in these products by including a definition of the term “biobased”.

If SB 54 incorporates a definition of the term biobased, it is critical that materials receiving this designation be required to submit routine direct testing, rather than allow calculation-based approaches such as mass balance. These calculations allow producers to assume that all of their biomass inputs end up in their facilities’ outputs, despite it being well understood in the industry that the input of renewable feedstocks is not the same as the output. Renewable feedstocks will often have different activity than their fossil counterparts and won’t necessarily produce the same quantity of outputs. By basing their 8 calculations solely on production inputs rather than outputs, these methods systematically over-report the renewable share of fuels.

Even further, mass balance calculations allow producers to freely attribute the renewable content of feedstocks among end products, making these operations extremely difficult to audit and creating an environment ripe for greenwashing and fraud. The risk of allowing the mass balance approach can be 9 seen in the case of fraudulent ISCC mass balance certified biofuels, which plummeted the value of European biofuels in June of 2023. Beta Analytic urges CalRecycle to ensure that SB 54 reflects the 10 integrity of the term “biobased” by including direct product testing under ASTM D6866 in its definition.

In August 2024, the US Environmental Protection Agency (EPA) launched a federal action against the mass-balance methodology used in the recycling sector. The Agency notably highlighted concerns about this methodology being used to assess the recycled content of plastics, as it routinely overestimates the actual recycled content of bioplastics, which misleads consumers and does not contribute to the circular economy and decarbonisation goals. This methodology can be used to artificially inflate the recycled content of products to take advantage of incentives and to sell their products at a higher price for the recycled content incorporated into their process. A ProPublic investigation published in June 2024 found that products advertised as 30% recycled through mass balance often contained less than 1% recycled content. Similar concerns were shown by the US EPA as early as 2023, which described the mass-balance methodology as deceptive and advised against promoting it. Following the publication of the federal 11 case, the US EPA updated the methodology for its Safer Choice label, requiring the recycled content to be determined by weight post-consumer, effectively prohibiting the mass-balance methodology from being used to certify products under the Safer Choice program.

This led California Attorney General Rob Bonta to file a lawsuit against ExxonMobil in September 2024, claiming that the oil major "deceptively" promoted chemical recycling as a solution to the plastic crisis, citing their use of mass balance calculations such as ISCC Plus. That lawsuit directly challenges the 12 13 standard's use of ISCC's free allocation method as a system designed to enable greenwashing. This is the same issue facing the biobased products industry from ISCC certifications and associated terminology like "bio-attributable" and "biomass balanced," which are being promoted in other comments for this update to SB 54. The New York Times also recently published a relevant article on the challenges that mass balance presents to the recycling industry, which aligns with the challenges experienced in the renewable products industry. 14

Based on these challenges, ISCC and other calculation-based certifications should not be eligible to apply for designation as third-party certifications under SB 54. The role of major oil and petrochemical companies on the organisation's board of directors should be considered a direct conflict with Section 15 18981 (b)(2), which requires that approved third-party certifications, "[m]ust be independent, impartial, and not have any conflict of interest with respect to granting the certification." This conflict led the New York Times article discussed above to refer to ISCC as a "self-certification system," designed by these influential corporations in the industry. Especially given that the state is suing ExxonMobil, citing the 16 ISCC Plus certification as a deceptive practice, this scheme should not be approved for any purpose, whether for recycled or biobased content.

The issue of free attribution has led industry proponents of mass balance to propose the use of broad terms such as "bio-attributable," and "mass balance biobased," which are specifically intended to allow commercial interests to avoid compliance with the ASTM D6866 definition. By failing to include a 17 definition of biobased, which is tied to direct testing, this draft of SB 54 creates consumer confusion to the benefit of these competing definitions designed to enable greenwashing of fossil-based products. Including the ASTM D6866 definition would clearly communicate to consumers that only the portion of products directly derived from biomass should be considered renewable.

One other important policy to consider for SB 54 in this connection is the EU's Policy Framework for Biobased, Biodegradable and Compostable Plastics. The framework states that, "It is also important to ensure that biobased content is measured precisely. Radiocarbon-based methods should be preferred as their results are robust and their use is widely accepted. Documenting the use of biomass through a chain of custody and attributing a share to end-products through mass balance accounting is a method which is not considered suitable for confirming the actual share of biobased content."18 Even further, under its Packaging and Packaging Waste Directive (PPWD) the European Commission is required to complete a review of the state of bio-based plastic packaging, and to propose legislation by 2028 to create a biobased label, in which radiocarbon verification should be the preferred method to measure their renewable content. SB 54 should use this same approach when incorporating biobased content to

19 ensure products seeking the designation provide real decarbonization benefits and avoid greenwashing from calculations like mass balance.

In summary, Beta urges CalRecycle to include a definition of the term biobased in SB 54, which is tied to routine biobased content testing. Direct test results following ASTM D6866 Method B will be the most effective tool for the program to validate and track the decarbonization of plastics and packaging achieved by the use of biobased content under this policy.

What is Biogenic Testing (Carbon-14)?

Carbon-14 analysis is a reliable method used to distinguish the percentage of biobased carbon content in a given material. The radioactive isotope carbon-14 is present in all living organisms and recently expired material, whereas any fossil-based material that is more than 50,000 years old does not contain any carbon-14 content. Since Carbon-14 is radioactive, the amount of carbon-14 present in a given sample begins to gradually decay after the death of an organism until there is no carbon-14 left. Therefore, a radiocarbon dating laboratory can use carbon-14 analysis to quantify the carbon-14 content present in a sample, determining whether the sample is biomass-based, fossil fuel-derived, or a combination.

The analysis is based on standards such as ASTM D6866 and its international equivalents developed for specific end uses, such as the European standard ISO 16620. ASTM D6866 is an international standard developed for measuring the biobased carbon content of solid, liquid, and gaseous samples using radiocarbon dating. There are also many specific international standards based on the use of direct 20 carbon-14 testing, such as ISO 16620 which is an international standard that measures the biobased carbon content of plastic products, polymers, and additives. 21

Carbon-14 analysis yields a result reported as % biobased carbon content. If the result is 100% biobased carbon, this indicates that the sample tested is completely sourced from biomass material such as plant or animal byproducts. A result of 0% biobased carbon means a sample is only fossil fuel-derived. A sample that is a mix of both biomass sources and fossil fuel sources will yield a result that ranges between 0% and 100% biobased carbon content. Carbon-14 testing has been incorporated into several regulations as the recommended or required method to quantify the biobased content of a given material.

ASTM D6866 Method B - The Most Reliable Method

Carbon-14 is a very well-established method which has been in use by many industries (including the fossil fuel industry) and academic researchers for several decades.

Carbon-14 measurements done by commercial third party testing is robust, consistent, and with quantifiable accuracy/precision of the carbon-14 amount under **ASTM D6866**

method B. The EN 16785 is the only standard that allows a variant of the Mass Balance (MB) method of 'carbon counting' under EN 16785-2. The EN 16785-1 requires that the biocarbon fraction be determined by the carbon-14 method. However, when incorporating this EN 16785 method, certification schemes like the "Single European Bio-based Content Certification" **only** allow the use of EN 16785-1 due to its reliability and the value of a third-party certification. http://www.biobasedcontent.eu/en/about-us/

In ASTM D6866 method B, the carbon-14 result is provided as a single numerical result of carbon-14 activity, with graphical representation that is easily understood by regulators, policy makers, corporate officers, and more importantly, the public. The overwhelming advantage of carbon-14 is that it is an independent and standardized laboratory measurement of any carbon containing substance that produces highly accurate and precise values. In that regard, it can stand alone as a quantitative indicator of the presence of biobased vs. petroleum feedstocks. When carbon-14 test results are challenged, samples can be rapidly remeasured to verify the original reported values (unlike mass balance).

The quantification of the biobased content of a given product can be as low as 0.1% to 0.5% (1 relative standard deviation – RSD) based on Instrumental error for Method B (AMS). This error is exclusive of indeterminate sources of error in the origin of the biobased content, and manufacturing processes. As such a total error of +/-3% (absolute) has been assigned to the reported Biobased Content to account for determinate and indeterminate factors. 22

It is also important that the program should always require ASTM D6866 Method B, rather than allow Method C for any use. Where ASTM D6866 Method B uses the AMS Instrument to measure 14C, Method C uses Liquid Scintillation Counting (LSC). In Method B, the AMS Instrument directly measures the 14C isotopes. However, in Method C, scintillation molecules indirectly absorb the beta molecules that release with the decay of 14C and convert the energy into photons which are measured proportionally to the amount of 14C in the sample. Since Method B directly measures the 14C isotopes and Method C measures them indirectly, Method B is significantly more precise and should be prioritized in regulations. LSC 23 measurements, like those used in Method C, are commonly used as an internal testing tool when samples are limited and accuracy does not need to be extremely high.

About Beta Analytic

Beta Analytic was among the originators of the use of Accelerator Mass Spectrometry (AMS) for the ASTM D6866 biobased / biogenic testing standard using Carbon-14 to distinguish renewable carbon sources from petroleum sources. Beta began testing renewable content in 2003 at the request of United States Department of Agriculture (USDA) representatives who were interested in Beta's Carbon-14 capabilities for their BioPreferred® Program (www.biopreferred.gov). At their request, Beta joined ASTM under subcommittee D20.96. Beta's previous president, Darden Hood, was positioned as a technical contact for the USDA and within 3 months completed the ASTM D6866-

04 standard. The Carbon-14 technique is now standardized in a host of international standards including ASTM D6866, CEN 16137, EN 16640, ISO 16620, ISO 19984, BS EN ISO 21644:2021, ISO 13833 and EN 16785. Carbon-14 analysis can be used on various types of samples (gas, liquids and solids). Beta Analytic continues to be a technical contact for ASTM D6866 with current president Ron Hatfield and is involved with all their latest ASTM D6866 versions.

The Carbon-14 standardized method is also incorporated in a variety of regulatory programs including the California AB32 program, US EPA GHG Protocol, US EPA Renewable Fuels Standard, United Nations Carbon Development Mechanism, Western Climate Initiative, Climate Registry's Greenhouse Gas Reporting Protocol and EU Emissions Trading Scheme.

We are currently technical experts on Carbon-14 in the following committees:

ASTM D6866 (D20.96) Plastics and Biobased Products (Technical Advisor)
ASTM (D02.04) Petroleum Products, Liquid Fuels and Lubricants (Technical Advisor)
ASTM (061) US TAG to ISO/TC 61 Plastics (Technical Expert)
USDA BioPreferred® Program TAC (Technical Advisor)
ISO/TC 61/SC14/WG1 Terminology, classifications, and general guidance (Technical Expert)
CEN/TC 411 Biobased Products
CEN/TC 411/WG 3 Biobased content
CEN/TC 61/SC 14/WG 1 Terminology, classifications, and general guidance (Technical Expert)

ISO/IEC 17025:2017 Accredited Laboratory

To ensure the highest level of quality, laboratories performing ASTM D6866 testing should be ISO/IEC 17025:2017 accredited or higher. This accreditation is unbiased, third party awarded and supervised. It is unique to laboratories that not only have a quality management program conformant to the ISO 9001:2008 standard, but more importantly, have demonstrated to an outside third-party laboratory accreditation body that Beta Analytic has the technical competency necessary to consistently deliver technically valid test results. The ISO 17025 accreditation is specifically for natural level radiocarbon activity measurements including biobased analysis of consumer products and fuels, and for radiocarbon dating.

Required tracer-free facility for Carbon-14

For carbon-14 measurement to work, be accurate, and repeatable, the facility needs to be a tracer-free facility, which means artificial/labeled carbon-14 is not and has never been handled in that lab. Facilities that handle artificial carbon-14 use enormous levels relative to natural levels and it becomes ubiquitous in the facility and cross contamination within the facility, equipment and chemistry lines is unavoidable. Results from a facility that handles artificial carbon-14 would show elevated renewable contents

(higher pMC, % Biobased / Biogenic values), making those results invalid. Because of this, Federal contracts and agency programs (such as the USDA BioPreferred® Program) require that AMS laboratories must be 14C tracer-free facilities in order to be considered for participation in solicitations.

Areas where cross-contamination might occur include but are not limited to; biomedical or nuclear reactors, isotope enrichment / depletion columns, water, soil, plant, or air samples collected near or at biomedical / nuclear reactor sites, medical, industrial, or hazardous waste sites, samples specifically manipulated to study the uptake / fractionation of stable isotopes due to biological or metabolic processes. To learn more about the risks associated with testing natural levels Carbon-14 samples in a facility handling artificially enhanced isotopes please see the additional information provided after this comment.

Response to O-50-1

Comment rejected. The commenter requests modifications to the statute itself, not to the regulations. In particular, the commenter requests that the statute include a definition of the term "biobased." CalRecycle does not have statutory authority to change the statute, however. To the extent the commenter intended to suggest that the proposed regulations include a definition "biobased," CalRecycle declines to do so because, as the commenter acknowledges, the statutory definition of "plastic" (Public Resources Code section 42041(t)) already encompasses material that would be defined as such. In the commenter's own words, the statute "chooses not to regulate biobased materials and bioplastics separately from traditional plastics."

CalRecycle also rejects this comment because the commenter mistakenly asserts that the statute authorizes CalRecycle to regulate whether products can be labeled as "biobased." The statute does not authorize CalRecycle to enforce any California law prohibiting deceptive labeling, and how products are labeled is not a consideration for determining whether covered material complies with any SB 54 requirement. The commenter also appears to suggest that CalRecycle has general authority to "incentivize" products to use certain materials for the purpose of "achieving SB 54's goals for displacing petrochemicals." CalRecycle does not have such open-ended authority.

CalRecycle also rejects this comment because it does not provide the text of the proposed definition of "biobased" for CalRecycle's consideration. Rather, the commenter only refers to another publication (ASTM D6866), which presumably contains that text.

O-51: International Foodservice Distributors Association (IFDA) (Joe Kalmin)

Comment O-51-1

To Whom It May Concern:

The International Foodservice Distributors Association (IFDA) appreciates the opportunity to submit these comments in response to the California Department of Resources Recycling and Recovery's (CalRecycle) proposed regulations implementing CA SB 54, the "Plastic Prevention and Packaging Producer Responsibility Act." (Stats. 2022, ch.75)

IFDA is a non-profit trade association representing businesses in the foodservice distribu-tion industry. Our $400+ billion industry delivers approximately 33 million cases of food and related products to more than one million professional kitchens across America every day. IFDA counts many of its members as leaders in sustainable solutions to plastic and packaging waste.

Foodservice Packaging Overview

The nature of foodservice packaging, or business to business (B2B) packaging, is substantially different from business to consumer facing (B2C) packaging. Foodservice packaging is inherently minimal and optimized only to ensure food safety and prevent food waste. There is no need for additional packaging for product marketing as with B2C packaging. Given these factors in foodservice packaging, the proposed regulations in SB 54 could have the unintended consequence of increasing food waste by risking the structural integrity of the packaging, as producers could look to remove more costly packaging that is necessary to prevent spoilage and damage. This would inevitably lead to an increase in food waste across the State of California at a time when food insecurity is of concern.

Under California's SB 54, foodservice distributors would be required to pay EPR fees on the packaging materials they distribute, even though many companies manage these materials through commercial recycling and diversion programs rather than entering public waste streams. This creates a risk that the industry could be required to pay twice for recycling—once through commercial waste management contracts and again through state-mandated EPR fees—unless the regulations are clarified to exempt B2B packaging or packaging already diverted from municipal systems.

Response to O-51-1

Comment rejected. No response to this portion of the commenter's submission is necessary because it is preface to the commenter's substantive comments and does not suggest a specific change to the proposed regulations or raise an objection to the rulemaking process. To the extent that following portions of the submission suggest specific changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-51-2

Recommendation #1: Exempt Non-Consumer-Facing Sales from Producer Obligations

SB 54 places compliance obligations on “producers,” broadly defined to include brand owners, manufacturers, and, in some cases, wholesalers and retailers. This expansive definition risks unintentionally capturing distributors engaged in B2B transactions—entities that do not control packaging design, branding, or production decisions. These businesses serve as intermediaries, supplying food and related products between manufacturers and commercial buyers such as restaurants and institutional foodservice providers.

Including B2B distributors in the definition of “producer” imposes compliance burdens on entities that lack the operational control necessary to influence packaging choices. This misalignment could divert resources from meaningful sustainability efforts and create unnecessary administrative complexity.

Accordingly, we respectfully request that CalRecycle:

Exclude pure B2B transactions from the definition of “sale” for the purposes of SB 54 compliance (Section 18980.1.1), recognizing that these transactions do not represent final consumer-facing packaging decisions.

This approach aligns with the revised draft regulations’ intent to streamline compliance and reduce administrative burdens. It also reflects the practical realities of the supply chain and ensures that SB 54 targets the entities most capable of driving packaging innovation.

Response to O-51-2

Comment rejected. The commenter suggests that CalRecycle ignore the plain meaning of the word "sale" and narrowly construe it to exclude an enormous range of what plainly constitute "sales," thereby severely restricting the scope of the statute. The commenter offers no basis in statute for that interpretation other than that the definition of "producers" is broad and imposes burdens on certain types of businesses. That definition, however, is set in statute; CalRecycle's interpretation of that statutory definition cannot narrow its scope. See, also, CalRecycle's response to comment O-38-1, which makes similar proposals.

Comment O-51-3

Recommendation #2: Provide Greater Consistency Across State EPR Programs

To reduce complexity and cost for nationally operating producers, we urge CalRecycle to align key definitions and obligations with other state programs—particularly Colorado’s HB 22-1355. These programs appropriately exclude B2B packaging, which typically does not enter residential waste streams and is already managed efficiently through commercial recycling systems.

The current exemption for Specific Material with Demonstrated Recycling Rates (Section 18980.2.3) is difficult for distributors to substantiate, as they are often several steps removed from the recycling process and end markets. Harmonizing California’s

approach with other states will reduce redundant reporting and administrative burdens while maintaining environmental integrity. We encourage CalRecycle to prioritize consistency to support compliance and efficiency across jurisdictions.

Accordingly, we respectfully request that CalRecycle:

a. Align material definitions and scope—particularly with programs like Colorado's HB 22-1355. Doing so would streamline compliance, reduce reporting complexity, and enable producers to make consistent packaging changes that support environmental goals.

b. Exclude B2B transport and tertiary packaging—such as pallet wrap, shipping cartons, and insulated containers—from full reporting obligations. These materials are essential for maintaining food safety and preventing spoilage, which is a critical sustainability priority. IFDA members and their suppliers continually optimize these packaging types for efficiency and reuse, using systems like pallets, totes, and reusable plastic containers (RPCs) to minimize material use and maximize recovery. These materials typically do not enter residential waste streams and are already managed through commercial recycling systems. A simplified reporting approach, consistent with other state programs, would reflect their distinct lifecycle and recovery pathways.

c. Provide clear guidance to delineate producer responsibility for private label versus branded products. Without clarification, there is a risk of double counting or misattribution of obligations. Aligning with national best practices will help ensure fair and accurate implementation.

Response to O-51-3

CalRecycle rejects this recommendation for the reasons stated above and for the reasons stated in response to comment O-38-1, which makes similar proposals. Moreover, the commenter recommends that the proposed regulations "[a]lign material definitions and scope" according to other state laws. However, the only law identified is Colorado's HB 22-1355, without any specific reference to the definitions requiring alignment or how that alignment can be achieved within the confines of the California statute, which CalRecycle cannot ignore or change. CalRecycle notes, moreover, that that Colorado law defines "covered material" very generally as "packaging material," but with a set of exclusions, some of which mirror those in Public Resources Code section 42041(e)(2). To the extent the commenter intended to suggest that CalRecycle incorporate those exclusions, CalRecycle rejects that proposal because it lacks authority to add categorical exclusions with no basis in California's own statute.
Lastly, regarding the request for "clear guidance to delineate producer responsibility for private label versus branded products," the statute and proposed regulations already provide such clarity. As explained in section 18980.1.1, the first step is to designate which brand or trademark as the one relevant under Public Resources Code section 42041(w)(1) and (2). The commenter's suggestion that "private label" products are not "branded products"

is wrong on its face; a "private label" product is necessarily sold under a particular brand and enters the stream of commerce under that brand. Accordingly, section 18980.1.1(c) or (d) would designate that brand as the relevant one. Moreover, even if both manufacturer's brand and private label brand are both associated with the covered material when it is first sold or distributed, 18980.1.1(e) provides the clear framework for how to identify the relevant brand or trademark, including via agreement between the manufacturer and private label owner.

Comment O-51-4

Recommendation #3: Remove Onerous Justification Requirements for Exemption Requests for "Covered Materials"

IFDA supports the inclusion of Section 18980.2(a)(2) in the SB 54 implementing regulations, which categorically excludes from the definition of "covered material" any packaging or packaging components used by a food or agricultural commodity when it is not reasonably possible to use alternatives that comply with federal regulations, rules, or guidelines issued by the U.S. Department of Agriculture (USDA) or the U.S. Food and Drug Administration (FDA).

This exclusion is consistent with the plain language of SB 54, which prohibits imposing any requirement—including recycled content mandates—that conflicts with federal law. The statute explicitly references USDA and FDA regulations relevant to packaging agricultural commodities, microbial contamination, and packaging safety and integrity.

SB 54, through PRC § 42060(b)(2), clearly contemplated the categorical exclusion of packaging governed by USDA and FDA standards. These federal agencies have long-established rules for packaging certain commodities—such as meat, poultry, and produce—that require specific materials to ensure food safety.

Accordingly, we respectfully request that CalRecycle:

Remove the requirement for repeated justification when requesting a "covered materials" exemption (Section 18980.2(a)(2)(B)). Requiring producers to repeatedly justify exclusions for packaging already governed by federal law would be unnecessarily burdensome and disruptive. It could also pose serious risks to public health if producers, distributors, or retailers are forced to use inadequate or unapproved packaging alternatives.

Response to O-51-4

Comment rejected. In effect, the commenter proposes that once material is claimed to be excluded pursuant to 18980.2(a)(2), that exclusion should be permanent, even when CalRecycle determines that the material does not qualify for it. That approach is obviously nonsensical and would reduce section 18980.2(a)(2) to a loophole. The suggestion is also untenable because federal law is subject to change, and materials and packaging technologies, and thus

the means for complying with state and federal law simultaneously, are constantly evolving.

Comment O-51-5

Recommendation #4: Provide More Practical and Achievable Reporting Enforcement Timelines

To support the dual regulatory goals of ensuring compliance while minimizing business disruption, we respectfully urge CalRecycle to reconsider the enforcement start dates and fee reporting timelines for producers under SB 54.

IFDA members have undertaken a comprehensive review of their “covered materials” across California facilities. This process has required significant effort, particularly given the absence of a finalized fee structure, which limits their ability to accurately assess cost impacts. For a low-margin industry like foodservice distribution, understanding these costs is essential to maintaining competitiveness and continuing to serve a diverse customer base—including small independent restaurants, K–12 schools, healthcare providers, and government institutions.

The retroactive cost implications (“look-back” costs) of the current plan will directly affect future-year sales. Additional time is needed to properly evaluate these impacts and make informed strategic decisions that align with both regulatory compliance and members’ commitment to foodservice customer needs.

We appreciate CalRecycle’s ongoing engagement and urge consideration of a phased approach or extended timeline to ensure thoughtful implementation.

Accordingly, we respectfully request that CalRecycle:

Provide earlier visibility into fee rates by material class to help foodservice distributors plan effectively, mitigate cost uncertainty, and avoid abrupt price increases (Section 18980.6.7). Setting and charging fees for products sold more than a year in advance presents significant financial planning challenges.

Conclusion

IFDA appreciates CalRecycle’s consideration of these comments and respectfully requests that the recommendations provided herein be included in the final regulations, recognizing the unique perspectives of various entities within the regulated community.

Response to O-51-5

Comment rejected. The commenter's proposal is that CalRecycle delay enforcement and fee reporting "[p]rovide earlier visibility into fee rates by material class." The commenter does not state what timeline for such visibility they would consider sufficient. In any event, timely reporting is essential for implementation of a producer responsibility plan; delaying reporting would effectively require

pausing implementation of the statute as a whole. To the extent the commenter intended to request that CalRecycle do so, including delaying enforcement of the statute generally, CalRecycle rejects that request because CalRecycle does not have the authority to effectively abrogate the timelines the Legislature established in statute. Moreover, to the extent that compliance presents special challenges, exemptions pursuant to Public Resources Code section 42060(a)(3) and (4) may provide relief and are addressed in section 18980.2.4 of the proposed regulations.

O-52: Nixon Peabody LLP (Chris Schlag)

Comment O-52-1

1. The Small Producer Exemption is Insufficient to Exempt or Accommodate Larger Nonprofit and Charitable Organizations Under SB 54

In enacting SB 54, California's Legislature sought to impose EPR responsibilities broadly on entities with the greatest control over products and their associated packaging.1 Reflecting this intent, SB 54 has limited producer exceptions and identifies a single express exemption for "small producers," in language stating" the department shall exempt producers, retailers, or wholesalers that, in the most recent calendar year, had gross sales of less than one million dollars ($1,000,000) in the state."2

CalRecycle's Proposed Regulations adopt a similarly restrictive approach.3 To qualify as a small producer, an entity must submit an application to CalRecycle demonstrating that its gross sales for the most recent calendar year fell below the $1,000,000 threshold.4 "Gross sales" is defined broadly to include all revenue from business activity conducted in California, not just sales of products containing covered materials.5 This includes retail, wholesale, online, and in-person transactions, as well as other California-based revenue streams. Applicants must also provide detailed supporting documentation (e.g., tax returns, financial statements, or sales reports) to verify their California-specific gross sales.6 If granted, the exemption relieves the producer of EPR obligations for a two-year period, subject to reapplication and updated sales documentation showing maintained eligibility. However, if a producer's California gross sales exceed $1,000,000 at any point, the exemption is immediately revoked, and full compliance is required.7

While this framework is designed to ensure that each covered material has an identifiable, responsible producer, the absence of any exemption or tailored accommodation for charitable, nonprofit, and faithbased organizations presents significant challenges. As currently drafted, the regulations risk subjecting large-scale charitable, nonprofit, and faith-based organizations to the same compliance burdens as major commercial producers, without regard to the fundamental differences in their missions, operating structures, and packaging control.

In particular, the generalized definition of gross sales creates unique difficulties for large charitable organizations. Many such organizations operate at significant scale, distributing food, hygiene products, clothing, and other essential items to Californians in need but do so free of charge or at nominal cost. The first difficulty in assuming that all charities will fall within the small producer exemption is given California's significant population of 39+ million persons, charitable distributions at a nominal or de minimis cost to 39+ million persons can potentially result in "gross sales" over the $1 million threshold, despite no or negative profit to the charity. The second difficulty relates to the definition of "gross sales," as it may include the aggregate value of goods being donated. Either of these difficulties alone may result in these organizations inadvertently exceeding the exemption threshold despite engaging in noncommercial, humanitarian activity. In such cases, high volumes of charitable activity, not business income, could trigger compliance requirements under SB 54.

As yet a third difficulty, nonprofit, and charitable distribution models differ significantly from those of commercial retail and food service establishments. Nonprofit and charitable organizations, particularly faith-based entities, may produce food products or receive donated consumer products, which are then distributed at no or de minimis cost through humanitarian channels to underserved populations. These products may contain packaging that qualifies as "covered material" under the statute, but the nonprofit entity likely had no role in designing, sourcing, or selecting that packaging. The organization acts solely as a conduit, ensuring the goods reach individuals in need.

Assigning producer responsibility to nonprofit entities in such circumstances is inconsistent with SB 54's legislative intent, which is to place environmental accountability on the entities that have decision-making authority over packaging choices and material composition. Imposing EPR obligations on these organizations will also divert resources from charitable missions, while also failing to further the Act's core environmental objectives. For these vary reasons, several other states with EPR programs recognize the unique role of charitable organizations and explicitly exempt them from EPR producer obligations. For instance, Maine expressly excludes 501(c)(3) nonprofit organizations from the definition of a "producer," thereby exempting them from the state's EPR requirements.8 Similarly, Colorado's EPR statute identifies nonprofit organizations as exempt producers,9 and Oregon includes nonprofits within the regulatory definition of "small producer," effectively exempting them as well.10

In California, the potential adverse impact of reporting requirements on nonprofit organizations has also been acknowledged in other regulatory contexts. The California Air Resources Board, for example, has proposed exempting nonprofits from the greenhouse gas ("GHG") emissions disclosure requirements under Senate Bill 253, and the climate-related financial risk disclosure requirements under Senate Bill 261.11 Notably, these exemptions are being considered despite the absence of explicit statutory carveouts for nonprofits—underscoring a broader recognition of the disproportionate burden such requirements could impose on mission-driven organizations. These regulatory approaches reflect a consistent intent to protect

charitable and nonprofit entities from obligations that could divert resources from their core mission and public service objectives.

To ensure SB 54 is implemented in a manner that is both equitable and consistent with its statutory purpose, we recommend that CalRecycle establish a specific exemption or alternative compliance pathway for charitable, nonprofit, and faith-based organizations that distribute goods free of charge or at nominal cost for charitable purposes, regardless of gross sales volume. Such an exemption should apply where the organization is not involved in the production or packaging decision-making process and is either a distributor of donated or humanitarian aid items or is providing items to individuals in need either free of charge or at a de minimis cost.

2. EPR Obligations Should Not Deter Donation Programs

The Proposed Regulations adopt a multifactorial approach to identifying the “producer” responsible for EPR compliance.12 This approach considers a range of factors, including whether the covered material is branded or unbranded, whether it is subject to licensing or intellectual property rights, and the physical location of the manufacturer, brand owner, or licensee. Where no producer can be clearly identified through these criteria, the regulations assign responsibility to the importer or distributor of the material into California.13

While this framework may function in conventional commercial settings, it does not account for the distinct operational realities of nonprofit and faith-based organizations engaged in charitable sales or distribution. These organizations, particularly those with multi-state operations, often rely on complex and donation-based supply chains that differ substantially from traditional manufacturing and retail models. Donated goods, such as hygiene kits, food items, clothing, and emergency supplies, may be produced in one state, stored in another, and ultimately sold, either at reduced or de minimis costs, or freely distributed in California by nonprofits or charitable organizations serving vulnerable populations. These goods frequently pass through a series of non-commercial transfers, with separate entities responsible for manufacturing, repackaging, storage, and transportation at distinct stages of the supply chain. For example, a national nonprofit may receive hygiene kits assembled and packaged by volunteers in one state, which are then collected and shipped in bulk to California and then distributed by various local partners to people in need either for free or at minimal cost.

Crucially, in these models, the nonprofit or faith-based organization that ultimately distributes the goods in California may have no control over packaging design or material selection and similarly may have no legal or commercial relationship with the upstream entities responsible for those decisions. In some cases, additional packaging may also be applied, or the packaging may be modified throughout the supply chain, such as during bulk shipment or localized repackaging, to facilitate final distribution to individuals in need.

Given this operational structure, the fact-intensive nature of the producer identification process and default to the last entity selling or distributing a product with covered material poses a significant compliance burden for charitable organizations. These entities are often unable to trace or verify the origin, branding, or material content of donated packaging, nor are they positioned to assume producer responsibilities under the framework envisioned by SB 54. Nonetheless, under CalRecycle's Proposed Regulations, nonprofits may be deemed the "producer" solely because they are the final entity to handle, sell, or distribute the product within the state. The lack of clarity surrounding the Proposed Regulations' definitions of "producer" and "covered material" within the donation and charitable sales context further exacerbates this challenge. Without explicit exemptions or tailored compliance pathways for nonprofit and charitable organizations, or clear considerations for donated items, charitable organizations face substantial regulatory uncertainty. The prospect of being deemed a producer could also discourage participation in donation-based programs or lead to the reduction or elimination of critical aid operations in California.

The potential impact of these regulations is not theoretical. Many nonprofit organizations operate on limited budgets, rely heavily on volunteer labor, and prioritize service delivery over administrative infrastructure. Imposing the full weight of SB 54 compliance on such organizations may result in significant financial and operational strain. This could, in turn, diminish the availability and reach of charitable assistance, particularly at a time when demand for such services remains high due to ongoing social, economic, and environmental pressures. It is essential that CalRecycle recognize the substantial public benefits these programs provide to Californians. Faith-based and nonprofit organizations are vital partners in delivering food security, disaster response, hygiene services, and other forms of emergency and humanitarian assistance. Ensuring that SB 54 implementation does not inadvertently undermine these services will be critical to advancing both environmental and social equity objectives.

3. Reporting Metrics Do Not Fit Charitable Models

The Proposed Regulations require producers to report detailed metrics, including sales volume, market share, and material types, as part of their compliance obligations. These metrics are structured for conventional commercial supply chains and are fundamentally misaligned with nonprofit and humanitarian distribution models. Unlike commercial entities, nonprofit organizations often do not track the movement of goods using sales-based metrics. Donations are distributed at minimal costs or free of charge and are typically not accompanied by transactional data systems designed to monitor packaging materials, weight, or composition in the manner contemplated by the regulations.

Moreover, nonprofit entities, especially those operating at scale and across multiple states, may not have access to upstream packaging information, and frequently do not control the selection, design, or labeling of the products they receive. As such, they are not positioned to collect or report the kind of granular packaging data required by SB 54's implementing framework. Imposing these requirements on charitable organizations

would create significant administrative burdens, without yielding the type of actionable or accurate information the statute seeks to capture.

It is important to recognize that charitable and faith-based organizations are already committed to environmental stewardship as an integral part of their humanitarian missions. Many have adopted voluntary sustainability practices, including responsible sourcing, waste reduction, and packaging minimization, as a matter of principle. These organizations function as responsible partners in both environmental and social welfare, serving populations that often fall outside the reach of traditional commercial infrastructure. Imposing additional administrative and financial requirements—such as registration, detailed reporting, and Producer Responsibility Organization ("PRO") fees—would necessarily divert limited resources away from charitable programs and toward regulatory compliance and would not necessarily improve packaging material outcomes in this context.

Every dollar spent on compliance is a dollar not spent on food, shelter, hygiene, or emergency relief for
California residents in need. At a time when economic and environmental pressures are increasing demand
for aid, it is critical that California's EPR framework support, not undermine, the delivery of these essential
services. We therefore encourage CalRecycle to revise the Proposed Regulations in a way that alleviates
the compliance burden and administrative on nonprofit and charitable organizations to ensure they are
able to continue distributing goods to populations in need in California and can focus their resources on
supporting vulnerable populations.

4. Requested Clarifications and Adjustments

To address the concerns outlined above and preserve the integrity of California's nonprofit and faith-based relief programs, we respectfully request the following clarifications and regulatory adjustments:

 Exempt Nonprofits and Offer Alternative Compliance Pathways. CalRecycle should explicitly exempt nonprofit, charitable and faith-based organizations from producer designation. Alternatively, at a minimum, CalRecycle should also develop alternative compliance pathways with reduced or waived fees and reduced reporting requirements for nonprofit , charitable and faith-based entities that do not generate profit from the sale of covered materials or lack control or access to upstream packaging data.

 Provide Clarification of EPR Requirements for Donated Goods and Charitable Distribution. CalRecycle should also confirm that goods distributed free of charge through nonprofit or charitable channels are exempt from producer designation under SB 54, particularly when no commercial transaction occurs. This approach is consistent

with the charitable exemptions adopted in other states' EPR programs. In doing so, CalRecycle should clarify that the distribution
of donated goods does not, in itself, trigger producer responsibilities, especially where the distributing non-profit or charitable entity is not engaged in the production, branding, or commercial sale of the item.

- **Consider the Environmental Contributions Already Made by Nonprofit Organizations.** CalRecycle's EPR Program and regulations should acknowledge the value of nonprofit organizations' voluntary sustainability initiatives, including the benefits of donation pathways in meeting goal EPR objectives, and avoid duplicative or excessive reporting compliance obligations that offer minimal additional environmental benefit and may inadvertently result in decreased charitable support for those in need.
- **Producer Assignment Flexibility.** In cases where multiple entities may be involved in the
provision or distribution of donated goods, CalRecycle should allow for flexible producer assignment and explicitly permit nonprofits and charitable organizations to assign producer
responsibility to upstream commercial entities.
- **Grace Period and Technical Assistance.** Nonprofits should be provided with a reasonable grace
period before enforcement of any applicable obligations, along with access to technical assistance
and guidance materials designed specifically for the charitable sector.

We urge CalRecycle to ensure that SB 54 implementation supports both environmental and humanitarian goals, preserving the capacity of nonprofits to serve California's most vulnerable residents. Clarifying exemptions, creating flexible compliance options, and supporting nonprofit participation in a manner consistent with their missions will ensure SB 54 is implemented in an equitable and effective manner.

We remain committed to supporting the successful implementation of SB 54 and believe that clarifying these foundational issues is essential to a fair, effective, and sustainable program. We welcome continued engagement on these matters through public meetings or direct dialogue with CalRecycle to help shape a regulatory approach that aligns with SB 54's intent and supports long-term success.

Response to O-52-1

CalRecycle rejects this comment as the requested changes for additional exemptions and requirements are beyond the scope of the Department's rulemaking authority, and both exceed and conflict with the statutory text and requirements for qualifying as a small producer. See also response to comment O-61-3.

O-53: National Association of Wholesaler-Distributors (Brian Wild)

Comment O-53-1

About NAW and the Wholesale Distribution Industry

NAW is the "national voice of wholesale distribution," an association comprised of employers of all sizes and national, regional, state, and local line-of-trade associations spanning the $8 trillion wholesale distribution industry that employs over 6 million workers in the United States. Approximately 35,000 enterprises with almost 150,000 places of business in all 50 states and the District of Columbia are affiliated with NAW. Wholesale distribution is a vital business-to-business industry. Wholesaler-distributors purchase inventory (generally from manufacturers), store it in warehouses, break it down into the quantities their customers—generally retailers—require, and repackage and ship the products. Unlike warehouse logistics companies, which simply transport another party’s products, wholesaler distributors purchase inventory, take title to it, and then resell it. Most wholesaler-distributors are small- to mid-sized private companies with limited in-house legal or compliance resources. While they may not be consumer-recognized brand names like their manufacturing and retail partners, they play an essential role in the supply chain. Wholesale distribution contributes roughly one-third of U.S. gross domestic product, making it an irreplaceable link in our economy.

NAW’s Comments in Response to CalRecycle Proposed Action

In March 2025, Governor Newsom declined to adopt CalRecycle’s initial draft regulations citing concerns that the proposed action would impose excessive costs on

businesses and consumers. Instead, the Governor called on CalRecycle to restart the regulatory process on SB 54. CalRecycle's revised draft of the regulations does not resolve these concerns. The issues of complexity and cost presented by SB 54 and the draft regulations remain the same today, which is why instead of finalizing regulations, CalRecycle should recommend that Governor Newsom and the California legislature reconsider SB 54.

There are seven states to date that have passed packaging Extended Producer Responsibility (EPR) laws. As implementation of these laws has begun it is clear there are serious practical and legal concerns with the laws. NAW filed a lawsuit in the United States District Court for the District of Oregon in response to Oregon's law going into effect. NAW's lawsuit challenges the constitutionality of Oregon's Plastic Pollution and Recycling Modernization Act. In addition to the lawsuit in Oregon, regulated entities have raised practical concerns regarding the implementation of the law. Important questions remain as to how the law applies to businesses and the fees that they are being charged.

Similar problems exist with SB 54, and CalRecycle's revised regulations do not solve those problems. This is why California needs to reconsider its approach to a circular economy. Wholesaler-distributors primarily serve the business-to-business marketplace. Wholesalerdistributors offer warehousing, logistics and shipping from manufacturers and producers to retailers, contractors, and other businesses, they should not be classified as "producers" in SB 54. The current SB 54 scheme shifts the burden away from the key decision-makers and instead imposes mandates and fines on parts of the supply chain—such as wholesalerdistributors—that have no control over product packaging decisions, including how packaging is designed, how much is used, or how it can be reduced, reused, or recycled.

Under SB 54, companies are subject to a penalty of up to $50,000 per day for noncompliance. Even more concerning is the Circular Action Alliance (CAA), the recognized Producer Responsibility Organization (PRO) in California, is moving forward with collecting reporting information from employers even though the implementing regulations have not been finalized and a draft program plan is not expected until 2026. While CAA's reporting portal did not open on time, businesses are still required to report their 2023 data by November 15, 2025. This data will be used as a baseline for source-reduction goals and fees for future years. Imposing reporting obligations before regulations are finalized undermines accuracy, unnecessarily burdens businesses with vague standards, including wholesaler-distributors, and risks establishing arbitrary and faulty baselines that could hinder CalRecycle's long-term program objectives.

NAW urges California to reconsider SB 54, while we are generally supportive of the goals of a circular economy this is not the solution.

Response to O-53-1

CalRecycle rejects this comment. The comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

Rather, this comment urges California to "reconsider" the Act. Such reconsideration is beyond CalRecycle's authority. Pursuant to PRC section 42060(a), CalRecycle is required to adopt regulations necessary to implement and enforce the Act and to ensure its requirements are met. The proposed regulations are consistent with this statutory requirement, and CalRecycle has no authority to reconsider a bill that has been passed by the California Legislature, signed by the Governor, and chaptered. Indeed, the commenter appears to acknowledge that such reconsideration is outside of CalRecycle's authority, recognizing elsewhere in the letter that CalRecycle should recommend that the "Governor . . . and . . . Legislature reconsider SB 54." The proposed regulations are consistent with the requirements of the Act and no further change to the proposed regulations is necessary.

O-54: American Forest & Paper Association (Shoshana Micon)

Comment O-54-1

Submitted via SB 54 Plastic Pollution Prevention & Packaging Producer Responsibility Act Regulations Public Comment Form

October 07, 2025

RE: Comments related to SB 54 Plastic Pollution Prevention & Packaging Producer Responsibility Act Permanent Regulations Formal Rulemaking

On behalf of the American Forest & Paper Association (AF&PA), thank you for the opportunity to provide feedback concerning the proposed SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act permanent regulations.

AF&PA serves to advance public policies that foster economic growth, job creation and global competiveness for a vital sector that makes the essential paper and packaging products Americans use every day. The U.S. forest products industry employs more than 925,000 people, largely in rural America, and is among the top 10 manufacturing sector employers in 44 states. Our industry accounts for approximately 4.7% of the total U.S. manufacturing GDP, manufacturing more than $435 billion in products annually. AF&PA member companies are commited to making sustainable products for a sustainable future through the industry’s decades-long initiative — Better Practices, Better Planet 2030. In California, the industry employs more than 55,000 individuals in nearly 385 facilities, contributes $477 million in state and local taxes, and manufactures more than $23.6 billion in products.

Paper Recycling Works

Paper recycling is essential to our industry’s efforts to achieve important sustainability goals and build a more circular value chain. Paper is one of the most widely recycled materials in America, turning used paper into new, essential products Americans rely on. In fact, more than 2/3 of all paper recycled in the U.S. is turned into new products at

mills nationwide. In 2024, we recycled around 46 million tons, translating to an overall paper recycling rate of 60%-64%.

Paper recycling is also vital to our national supply chain. AF&PA members own and operate more than 100 materials recovery facilities across the country. About 80% of U.S. paper mills use some recycled paper to make new, sustainable products. Our industry is scaling up the use of recycled paper. U.S. mills used 1.29 million more tons of recycled paper to make new products in 2024 – that's 32.7 million tons compared to 31.3 million tons in 2023.

Our industry has prioritized recycling for over 30 years, and we are commited to continued progress. AF&PA members are not just participants in the recycling system, we are helping build and improve it through voluntary industry investments that use more recycled paper, create jobs, and innovate in our U.S. manufacturing processes. During 2019-2025, our industry invested in projects at paper mills that will use over 4.5 million additional tons of recycled paper. Companies built new mills, upgraded old ones, and modernized equipment.

We are concerned that the changes to the regulation do not introduce substantive enough modifications to alleviate the cost burden for consumers. Please find below our feedback regarding the SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act Permanent Regulations.

Response to O-54-1

Comment rejected. No response to this portion of the commenter's submission is necessary because it does not suggest a change to the proposed regulations, does not raise an objection concerning the rulemaking process, or refers to suggested changes or objections set forth in greater detail in other portions of the submission. To the extent other portions of the submission suggest changes or raise objections, CalRecycle has responded to those portions separately.

Comment O-54-2

Proposed Changes

Definitions

Plastic

The proposed definition of plastic will create unintended consequences when coupled with the commodity bale specifications for paper-based products and the practical realities of how materials are aggregated, sorted, processed, and remanufactured. In statute, the definition of plastics "means a synthetic or semisynthetic material ... that can be shaped into various rigid and flexible forms." This language should exclude materials that lack independent structural integrity and cannot exist as plastic components without being bonded to a fiber substrate. This includes coatings, inks, and adhesives.

The current definition is overly burdensome and will require manufacturers to meticulously track, document, and calculate the trace amounts of plastic coating, adhesive, or ink that comprises a fiber-based package, likely down to the thousandth of an ounce level. Additionally, this information may compromise proprietary formulations. Examples 6 and 7 from the Source Reduction Guidance published by CalRecycle this summer highlights the unreasonable burden currently in place. We recommend that CalRecycle grant an explicit de minimis exclusion for the trace use of these non-fiber elements.

Food Service Ware
AF&PA supports the Foodservice Packaging Institute's (FPI) comments on the definition of food service ware. The term should be defined as "plastic food service ware" rather than the broader term "food service ware" to ensure consistent interpretation and reduce confusion. The food service ware item should also not be referred to as a "good." This creates ambiguity and inconsistency between sections A and B of the definition.

Producer
We support the clarification in the producer definition that "empty packaging materials not yet used by a good are not 'single use packaging' or otherwise 'covered material' under the Act." Similar to the exclusions in Oregon (ORS 459A.863(6)(b)(D) and (E)), we encourage CalRecycle to explicitly mention unconverted paperboard rolls, other immediate substrates (e.g., corrugated sheets), and ancillary shipping materials (e.g., cores, roll wrap, pallets).

Reusable and Refillable
AF&PA agrees with FPI that the definition of "reusable" in Section 102(33)(b)(i) should be updated to reflect the ability of the packaging to be refilled for the same or similar general purpose. However, both definitions still lack criteria for comparing relative environmental performance of "reusable" and "refillable" materials against single-use but recyclable materials. This will create an unfair competitive environment that could result in unintended outcomes, including regrettable substitutions for single-use recyclable materials with a superior overall sustainability profile than "reusable" or"refillable" options. Regulations should strive to avoid overtly picking winners and losers among materials.

Covered Material
The current definition of Covered Material references "substances." The term "substance" is not defined within the draft regulations, and the lack of a clear definition for this term creates significant confusion, especially when applied to end-of-life management. For greater clarity and regulatory certainty, the regulation should either formally define "substance" as it pertains to end-of-life scenarios or, alternatively, replace the term with language that clearly specifies the intended scope such as "material," or "component."

Response to O-54-2

Comment rejected. Regarding the definition of "plastic," the definition is established in Public Resources Code section 42041(t), and the commenter's proposal that it should exclude materials that "lack independent structural integrity and cannot exist without being bonded to a fiber substrate" would require modifying that statutory provision, which regulations cannot do.
Regarding the commenter's proposal for a "de minimis exclusion for the trace use of these non-fiber elements," no change to the proposed regulations are required because they already set forth the criteria that producers may use to determine whether such trace use constitutes a de minimis weight or amount of plastic.
Regarding the definition of "reusable," the commenter refers to "section 102(33)(b)(i)," which is not identifiable in the proposed regulations. Nevertheless, to the extent the commenter's proposal is that items refilled by consumers need not be refilled with the same good, CalRecycle rejects that proposal because the statute expressly permits the good to be different for items refilled by producers (Public Resources Code section 42041(af)(1)(A)) but not for those refilled by consumers (section 42041(af)(2)(A)). Regarding criteria for comparing environmental performance, no change is appropriate because CalRecycle does not have statutory authority to add independent criteria to those set forth in section Public Resources Code section 42041(af).
Regarding the definition of "covered material," no change is appropriate because the term "substance" has a readily discernible denotation and does not introduce any ambiguity in 18980.1(a)(5). The commenter provides no explanation of its claim to the contrary.

Comment O-54-3

Producer Identification

More clarity is needed in the updated Producer Identification section 18980.1.1 (c) on the definition of a manufacturer. The manufacturing of paper relies on complex, cross-border, circular supply chains. Mills create the base pulp and paper for many different products and then that material goes on to one or several converting facilities to become the end packaging product. To comply with reporting of supply data, it is imperative that our members understand to whom in the supply chain "manufacturers" refers. We are concerned that in 18980.1.1(c)(1) "The person who manufactured the goods is the producer, provided that the person is in the state and either owns the designated brand or trademark or is licensed to manufacture the goods" will lead to producer obligation lying with the mills.

As highlighted by FPI, there is significant inconsistency between the producer identification framework for packaging and food service ware. As currently written, the producer identification process for food service ware shifts the designation of producer to the manufacturer of the packaging, rather than to the brand owner associated with the food service ware. This inconsistency will cause confusion and complications for producer reporting and does not align with the legislative intent of SB 54. For both definitions, more clarity is needed on how to appropriately identify the brand owner.

Response to O-54-3

Comment rejected. The proposed regulations use the term "manufacturer," which is used in the statute, in its ordinary sense, which is universally understood (and defined in dictionaries) to refer to the entity that makes a finished good. Regarding the asserted inconsistency between packaging and food service ware with respect to identifying producers, CalRecycle declines to make changes to the relevant provisions for the reasons stated in response to comment O-76-6. Regarding "clarity . . . on how to appropriately identify the brand owner," the identify of the owner of any particular brand is a straightforward legal question requiring no regulatory framework. If the commenter intended to suggest that it is unclear which brand owner is the producer, section 18980.1.1(b) through (e) contains lengthy provisions explaining how to designate the brand as the relevant one for purposes of identifying the producer. The commenter does not explain in what ways that explanation might be unclear, so no further response is required.

Comment O-54-4

Exclusion of Reusable and Refillable Packaging and Food Service Ware

Section 18980.2.1(a) states that packaging and food service ware that meet the requirements to be deemed "reusable" or "refillable" are not covered material under the Act. The goal of this program is to reduce landfilled materials and otherwise manage the end of life of products. There should be a plan for the end of life of the packaging and food service ware that is not single-use but nonetheless will reach an end of use whether through deterioration, obsolescence, safety, rebranding, or other reasons. Without a plan, these products may be landfilled, and the producers should pay dues representative of the burden on the system once the packaging and food service ware meets its end of life.

Response to O-54-4

CalRecycle rejects this comment for the reasons provided in response to comments B-38-3 and B-6-2. Items that are not single-use are not "covered material" regulated pursuant to the Act.

Comment O-54-5

De Minimis

Section 18980.2.2 (b) currently lacks the clarity our industry needs to understand how this addresses the minimal use of adhesives and coatings on packaging that are primarily composed of recyclable paper materials. We urge the department to continue to refine this language, provide additional explanation to the de minimis use of adhesives and coatings, and reflect that clarity within the definition of plastics.

We appreciate the ability of the PRO to request that the Department deem certain components to be of de minimis weight or volume. However, it is important that this determination does not lie with the PRO alone as the arbiter. The de minimis use of

adhesives and coatings should be determined in the regulation. More clarity is required in Section 18980.2.2 (b) (4) on how a notice of violation could lead to a component or groups of components to be determined as de minimis.

Industry wide exemptions should be allowed for de minimis materials. Each company having to prove they qualify adds significant costs and is overly burdensome. If a packaging type receives a de minimis exemption, it should no longer be classified as plastic. Furthermore, we suggest that where there are industry standards, the de minimis threshold should align with that standard.

Response to O-54-5

CalRecycle rejects this comment. Regarding the proposal that CalRecycle provide "additional explanation," the proposed regulations provide detailed criteria that are sufficient to be applied consistently to packaging components; to the extent that stakeholders would benefit from CalRecycle providing illustrative examples of such applications, no revision of the proposed regulations is necessary for CalRecycle to do so. Regarding the "definition of plastics," CalRecycle cannot discern what change to that definition the commenter proposes.

Regarding the request that determinations of when components are considered of "de minimis weight or volume" not be left to the "PRO alone," no change is necessary because the proposed regulations do not have that effect. To the contrary, section 18980.2.2(b)(4) establishes that CalRecycle makes such determinations, regardless of PRO requests submitted to it. Moreover, the commenter's suggestion is internally inconsistent: It both acknowledges that the Department can "deem certain components to be of de minimis weight or volume" but then requests that "this determination does not lie with the PRO alone as the arbiter." The proposed regulations cannot have those effects simultaneously.

The commenter's reference to notices of violation is also unclear; no explanation is necessary because it is self-explanatory that CalRecycle could deem meritorious a defense, in response to CalRecycle's identification of a violation, asserting that components are of de minimis weight or volume.

Regarding industry-wide exemptions, no change is necessary because nothing in 18980.2.2(b) prevents CalRecycle from making determinations applicable industry-wide. In particular, paragraph (4) does not state that CalRecycle's list of "components and groups of components" must refer to those of a particular producer.

Regarding considering "de minimis" components no longer be "classified as plastic," a regulation to that effect would be a nullity because materials exempt under the de minimis exclusion are not packaging and thus not covered material; whether they are classified as "plastic" is irrelevant to complying with the statute.

Lastly, regarding industry standards, regulatory provisions cannot account for them unless they exist, and the commenter identifies no such standard. In any event, the commenter's proposal has the function of law and regulations backwards: An industry standard would only be appropriate if they aligned with

the statute, as interpreted by CalRecycle in 18980.2.2(b). The commenter offers no explanation of why regulations should instead yield to what industry decides what standards appropriately implement statutory provisions.

Comment O-54-6

Exemptions for Specific Materials with Demonstrated Recycling Rates

We have concerns that the current application process laid out in Section 18980.2.3 and 2.4 lacks the flexibility needed to address industry-wide exemption requests. For example, if an exemption is sought for the adhesive lining in cardboard boxes, the process as currently outlined could be read to require each individual company to submit separate applications, resulting in unnecessary duplication of effort and administrative burden. To prevent these inefficiencies and support a more effective implementation of the program, industry associations or the PRO should be able to submit a single exemption application on behalf of all impacted producers for a given material. The ability to make collective exemption requests based on material category should be clarified as permissible under the regulations. The current approach in the regulations makes the exemption process so burdensome as to devalue the exemptions, which is contrary to the legislative intent. The exemptions were a critical piece of the final legislation.

The criteria to qualify for an exemption in Section 18980.2.3(a)(3)(B) that "after being collected, none of the items are commingled with unsorted material collected by curbside programs" is unnecessary. Clean sorted material would not be combined with unsorted material during curbside collection. We suggest that these regulations instead use the statutory language from SB 54 that states that "the covered material does not undergo separation from other materials at a commingled recycling processing facility."

Response to O-54-6

Comment rejected. Regarding flexibility to address industry-wide exemption requests, CalRecycle rejects that proposal because section 18980.2.7 provides for the exact flexibility that the commenter seeks.

Regarding section 18980.2.3(a)(3)(B), that provision is not focused on combination during curbside collection itself but rather generally addresses commingling at any time by programs operated by local jurisdictions or recycling service providers (which are, by definition, are the entities that conduct "curbside collection"). The proposed regulation is CalRecycle's restatement, in clearer terms, of the statutory limitation in PRC section 42041(e)(2)(H). That limitation means that the material must always remain separate from unsorted material from curbside collection.

Comment O-54-7

Evaluations of Covered Materials and Covered Material Categories

Recyclability

Section 18980.3 (a) restricts covered material categories' ability to be considered "recyclable" by requiring that it must satisfy the categorical requirements in SB 343. While we agree with the intent - to ensure that materials considered recyclable have a reasonable probability of being recycled - a careful balance is required. SB 343 is already tipping the scales toward landfilling of recyclable material by placing excessively restrictive requirements on recyclability claims. In the latest "How2Recycle Guidelines for Use" there were significant changes to how fiber-based packaging is being labeled due to SB 343. Several fiber-based packaging formats have been downgraded from "widely recyclable" to "check locally" even though these packaging types pass technical repulpability tests, such as our Voluntary Standard, and are accepted by most mills throughout the U.S. This loss of a label will lead to fiber-based packaging having a higher likelihood of landfilling. Even worse, it could prevent these materials from being sold within the state if they are not determined to be recyclable by 2032. This has far-reaching implications outside of CA. Brand owners and manufacturers will not create packaging specific just for products sold in CA. Instead, CA has a big enough market share that all packaging created for the US market, whether sold in CA or not, will comply with CA requirements. This will lead to the loss of the "Widely Recyclable" label for all impacted fiber-based packaging throughout the U.S., an increase in landfilling of fiber-based packaging, and the loss of a currently robust recovered fiber market for U.S. mills.

Methodology for Recycling Rate Determinations
The weight of fiber is heavily impacted by moisture in a way that other covered materials are not. We recommend that the recycling rate for paper or non-plastic fiber be modified to account for the significant distortion caused by non-fiber elements such as moisture, food contamination, and other materials that increase the weight of fiber. Paper is an unusual material in its capacity for absorbing non-fiber elements in its environment, and without adjustment, the supply of fiber potentially available for recycling would be exaggerated and could introduce substantial inaccuracies in the recycling rate calculations. For example, the ISRI Scrap Specifications Circular (an internationally accepted resource) sets the maximum moisture level of linerboard at 12 percent, meaning one-tenth of the weight of the material could be moisture. More clarity is needed in Section 18980.3.2 (b) (2) (A) how "the weight recycled shall be adjusted to exclude the proportion of the recycled content feedstock derived from materials other than covered material." It is necessary for the fiber industry that moisture, food contamination, and other materials are included in "materials other than covered materials."

It is imperative that the recycling rate is based on the weight of the covered materials sent to be recycled, not on the incoming material weight at a responsible end market. Currently, the language "at the point that the material is sold or transferred by a responsible end market as feedstock" used throughout Section 18980.3.2 lacks the clarity needed to ensure that this is a recycling rate calculation. Without this clarity and as currently written, the recycling rate calculation could instead be a recycling yield calculation. The concept of yield is separate and distinct from the calculation of recycling. Subdivision (ab) of Section 42041 in SB 54 defines the calculation of the

recycling rate as "the amount of covered material that is recycled in a given year divided by the total amount of covered material disposed of, as defined in subdivision (b) of Section 40192." To ensure clarity and accuracy in reporting, CalRecycle should use the statutory language of recycling rate from SB 54. dra

Response to O-54-7

Comment rejected. Regarding recyclability, the commenter appears to object to "requiring that [covered material categories] must satisfy the categorical requirements of SB 343" to be considered "recyclable." The commenter offers no legal basis for that objection, which is frivolous: The statute (section 42061(c)) unambiguously incorporates the requirements of Public Resources Code section 42355.51(d) as those that govern whether covered material is "recyclable." The commenter also erroneously suggests that the proposed regulations can cause "loss of a label." How a product is labeled is not relevant to whether any covered material violates the statute's restrictions, and CalRecycle determinations concerning recyclability will not purport to assess liability for deceptive labeling.
Regarding recycling rate determinations, the commenter requests more clarity than provided in section 18980.3.2(b)(2)(A) of the proposed regulations and urges CalRecycle to "use the statutory language of recycling rate from SB 54." Section 18980.3.2(b) does implement that statutory language, which, in any event, expressly authorizes CalRecycle to adopt a "new methodology for calculating the recycling rate by regulation." Also, the commenter misdescribes the recycling rate calculation methodology described in 18980.3.2(b). That methodology does not assess the "incoming material weight at a responsibility end market." Rather, it considers the weight of the feedstock produced by the recycling process as the "weight recycled "(i.e., the "amount recycled" referred to in Public Resources Code section 42041(ab)). No change to the proposed regulation is necessary to address the commenter's concern because 18980.3.2(b)(2)(A), (b)(3)(B), and 18980.3.2(g) provide exactly the flexibility the commenter seeks. Added moisture, contamination, and "other materials" obviously are not covered material from which recycled feedstock was derived (assessed per (b)(2)(A)), nor are they "covered material disposed of" (assessed per (b)(3)(B)), and a producer responsibility plan can propose an appropriate manner of accounting for them.
Regarding the assertion that recycling rate should be based on "the weight of the covered materials sent to be recycled," see CalRecycle's response to comment O-76-21.

Comment O-54-8

Responsible End Markets

Responsible End Market Criteria

Markets for recycled materials are complex and dynamic. Manufacturers in proximity to each other can work together to use each other's waste or by-products, i.e. "incompatible materials," as raw materials to reduce their environmental impact and create a more circular economy. However, the provision in Section 18980.4(a)(3)

requiring an entity to send incompatible materials for further processing assumes that these materials can be processed further and that there is always a cost-effective process to collect, sort, and send the incompatible material to a viable end market. Not all incompatible material may be suitable for further sortation. The current definition of incompatible materials as "covered material that a receiving responsible end market is not designed, permitted, or authorized to recycle, as defined in subdivision (aa) of section 42041(aa) of the Public Resources Code, or does not recycle for any other reason" lacks the clarity that the paper industry needs to meet the requirements of SB 54. It would be helpful to receive further detail on specific materials that meet the definition of "incompatible materials," and if it is facility-based, how and by whom the decision is made. This provision should be removed or edited to include language that appreciates the complexities of the separation requirements and logistics for shipping materials. If this provision is not removed or edited, further information is needed on how Cal Recycle will help develop markets for these "incompatible materials" so that REMs are not penalized.

End Market Identification
We ask that in all requests for information to REMs, such as applications, that the rules to comply with Section 18980.14 "Designation of Trade Secrets and other Non-Disclosable Information" be included.

End Market Compliance Audits and Verification
We are concerned that the requirement in 18980.4.2 (c) (1) that "information that demonstrates a REM met or exceeded its average yield threshold" will be included in the Annual Report pursuant to subdivision (c) of section 18980.9.1. Sharing individual facility yield information negatively impacts each facility's strategic advantage in the marketplace. Instead, we support reference to existing industry standards for recyclability and repulpability. In the Approved Program Plan for the State of Oregon, Circular Action Alliance granted domestic paper mills an exemption for paper yield verification. They came to this conclusion based on input from us, the Technical Association of the Pulp and Paper Industry, and Moore & Associates that overall yield performance in the U.S. is never below 60%. We suggest that CalRecycle adopt a similar yield exemption for domestic paper mills.

The proposed annual compliance audits by an independent third-party in Section 18980.4.2 (a) is excessive and would be prohibitively costly with no corresponding benefit. If audits do occur, they should be prioritized on an "as-needed" basis.

We are concerned by the requirement in 18980.4.2 (b) that a "PRO or Independent Producer shall include the findings of any compliance audit in the annual report. It is imperative that these compliance audits do not include any trade secret or sensitive information.

End Market Development
As currently drafted, there is no limit to the potential investment needed to support end markets. This puts the PRO at unlimited financial liability. There should be limitations

placed on the extent to which a PRO needs to support end markets. We suggest that this limitation be based on the definition of viability in SB 1335 that states that "material is recycled in sufficient quantity, and is of sufficient quality, to maintain a market value." The PRO should not subsidize material that fails to meet this test for market viability. Oregon, for example, has stated a limit of societal benefit: "The benchmark for average societal benefit of recycling is $2,017 per ton expressed in 2021 dollars, and will be adjusted for inflation no more frequently than once per year." This would be the maximum that could be spent, in total, on recycling a ton of any material type. This will help ensure that SB 54 is "economically efficient and practical."

Response to O-54-8

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including PRC sections 42041, 42051.1, and 42060, and no change is necessary to the implementation of the Act.

CalRecycle rejects this comment to the extent it recommends removing or otherwise revising section 18980.4(a)(3) of the proposed regulations. See the response to comment O-55-4.

To the extent this comment recommends including the rules to comply with section 18980.14 of the proposed regulations in all requests for information to responsible end markets, no change to the proposed regulations is necessary. This recommendation relates to future requests for information and not to the proposed regulations or present rulemaking process. As such, no response is necessary. In any event, section 18980.4.1(c) of the proposed regulations is clear that section 18980.14 will always apply when a responsible end market provides CalRecycle with records and CalRecycle will continue to communicate that to responsible end markets.

CalRecycle also rejects this comment to the extent it recommends adopting a yield exemption for domestic paper mills. For the reasons described in response to comment O-7-5, the required achievement of the yield requirement is consistent with the definition of responsible end markets and CalRecycle's authority under PRC section 42041(ad). A material-specific exemption from this requirement is not necessary, and it could result in the inaccurate identification of responsible end markets. To the extent this comment is concerned with the release of confidential information, PRC section 42063(c) and section 18980.14 of the proposed regulations adequately ensure that any confidential information will be protected from public release.

To the extent this comment recommends revising the annual compliance audit requirement in section 18980.4.2(a) to an "as-needed" basis, no change is necessary. CalRecycle, in consultation with its Audits Office, has determined that compliance audits should be conducted annually to ensure entities remain compliant with applicable requirements, including those established in PRC section 42041(ad) and implemented in section 18980.4(a) of the proposed

regulations.

To the extent this comment is concerned with the annual report requirement of section 18980.4.2(b) of the proposed regulations, no change is necessary. Such findings can be sufficiently generalized such that no trade secret or sensitive information is revealed and are additionally subject to the protections of sections 18980.6.6(b) and 18980.14(b) of the proposed regulations.

Finally, CalRecycle rejects this comment to the extent it recommends placing limitations on the PRO's need to support end markets. Pursuant to PRC section 42051.1(c)(1), the PRO must describe in its plan how it will meet the requirements of the Act, including how it will, in an economically efficient and practical manner, provide for the necessary infrastructure and viable responsible end markets to ensure the covered material will achieve the requirements of Section 42050. Therefore, the Act already requires the PRO to describe to CalRecycle how it will maintain low costs in its development of responsible end markets, while still reserving significant discretion to the PRO. The PRO's plan is then subject to CalRecycle's reivew and approval. Section 18980.4.3 of the proposed regulations implements this requirement by further clarifying the scope of the PRO's obligations in terms of financial support as described in PRC section 42051.1(c)(1). Therefore, the proposed regulations strike an appropriate balance between providing the PRO with the necessary discretion to establish and develop its plan pursuant to PRC section 42051.1(c)(1) while still preserving sufficient opportunity for review and oversight by CalRecycle, all in a manner consistent with the intent of the Act. No further change is necessary.

Comment O-54-9

Producer Compliance

We are concerned that the requirements in 18980.5 (d) are too restrictive on producers. Producers that become a participant pursuant to subdivision (b) of that section should have an appropriate amount of time to gather and submit their supply data for CY 2023 rather than needing to supply that data at the time of application.

Response to O-54-9

CalRecycle rejects this comment for the reasons stated in I-62-4, I-62-8, and B-1-1.

Comment O-54-10

Fee Schedule

The charges to participant producers to cover the costs of the environmental mitigation requirements of section 42064 of the Public Resources Code should only be applied to participant producers that produce materials that are targeted by the mitigation requirements. Section 18980.6.7 (a) (1) should be updated to reflect that.

We suggest that the base fee calculation described should include the addition of "non-exempt" as shown below in Section 18980.6.7:

"Article 6 (e)(2)(A) A PRO shall first calculate the base fee for each covered material category applicable to the producer. The base fee for a covered material category shall be equal to the [base fee rate of a covered material category (BFRCMC)] times the [weight of non-exempt covered material of that covered material category sold, distributed, or imported in or into the state within the previous calendar year (WCMSDI)]: BFRCMC x WCMSDI = Base Fee."

Additionally, we suggest deleting "or requires test results" from 18980.6.7 (h) as the requirement for testing seems to imply the material has detrimental environmental impacts. A material might have superior environmental attributes but require testing in a recycling or composting system to ensure compatibility.

The credits to producers in 18980.6.7 (j) (1) should apply to all covered materials, not just plastic. Additionally, "renewable" should be associated with a timeframe of replenishment and credit should only be given to sustainably sourced renewable material.

Response to O-54-10

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including PRC sections 42051.1, 42053, 42060, and 42064, and no change is necessary to the implementation of the Act. To the extent this comment recommends revising section 18980.6.7(a)(1) of the proposed regulations to provide that the environmental mitigation surcharge only applies to producers that produce materials that are targeted by the mitigation requirements, no such change is appropriate. PRC section 42064(f) makes clear that the environmental mitigation surcharge must be imposed on all "participants who produce plastic covered material subject to Section 42057"; as such, no further limitation is appropriate or within CalRecycle's authority. To the extent this comment recommends updating the proposed regulations to include the "non-exempt" qualifier in the base fee calculation, no such change is appropriate. As clarified in section 18980.2.4(a) of the proposed regulations, an exemption under that section does not change the obligations of producers with respect to the covered material, such as payment of PRO fees. To the extent this comment recommends deleting "or requires test results" from section 18980.6.7(h), see the response to comment B-47-4. Finally, to the extent this comment recommends applying section 18980.6.7(j)(1) to all covered materials, and not just plastic covered materials, no change is appropriate. The reduced fee established in PRC section 42053(e)(7) is explicitly limited to plastic covered materials. As such, it is neither appropriate nor within CalRecycle's authority to expand the scope of the fee credit awarded under this section to all covered materials.

Comment O-54-11

Source Reduction Baseline Report

We request that the July 1, 2026 deadline for the Source Reduction Baseline Report in Section 18980.9 be extended 12 months to July 1, 2027. Companies need sufficient

time to submit their initial supply reports to provide accurate and reliable data at the level of detail required around plastic components to comply with SB 54. As noted in our De Minimis comments above, producers don't have precise data on the trace amounts of non-fiber elements incorporated into their products. Gathering this information requires extensive coordination across multiple tiers of the supply chain. Additional time enables companies to better understand, interpret, and report on the data required.

Response to O-54-11

CalRecycle rejects this comment, see responses to B-27-2, I-63-15, O-48-5, and O-41-4.

Comment O-54-12

ISO/IEC 17025: 2017 Accreditation

The draft regulations require ISO 17025 accreditation for several different sections: 18980.1, 18980.3, and 18981. While we recognize that ISO 17025 accreditation ensures analytical quality and consistency, it is important to acknowledge that such accreditation is not currently available for a number of industry-developed analytical methods and certification schemes. As a result, mandating ISO 17025 accreditation for all analyses may inadvertently exclude well-established industry protocols and create unnecessary barriers to compliance.

To address this, we strongly recommend that the regulations provide for a reasonable grandfathering period for data generated under existing, non-accredited methods, as well as a phased implementation timeline for the accreditation requirement. This approach would enable producers and laboratories to adapt to the new standards without disrupting ongoing operations or invalidating valuable historical data. Furthermore, the regulations should allow for the continued use of industry-recognized testing schemes where ISO 17025 accreditation is not feasible.

Response to O-54-12

Comment rejected. The accreditation at issue, ISO 17025, is not an accreditation of "analytical methods and certification schemes," but rather an accreditation for testing laboratories that would conduct laboratory analyses. Moreover, even assuming that, as the commenter asserts, the proposed regulations could allow use of "existing, non-accredited methods" and "industry-recognized testing schemes," the commenter does not support that assertion or identify any such methods and testing schemes, so CalRecycle cannot evaluate the appropriateness of incorporating them.

With respect to section 18981, CalRecycle also rejects the more general suggestion of a "phased implementation timeline for the accreditation requirement" for the reasons provided in response to comment B-36-8.

Comment O-54-13

Governance Concerns

As a general matter, our industry has significant concerns about the potential for anti-competitive behavior under the auspices of authority CalRecycle grants to the PRO. It is incumbent upon CalRecycle to exercise diligent oversight, require the highest standards of transparency, and provide for an adequate process and opportunity for stakeholder input on key PRO decisions. Extended producer responsibility is a unique policy concept that allows economically powerful competitors to collaborate and exercise consequential, quasi-governmental powers such as fee-setting, creating barriers to entry and other restraints on market access, and making environmental marketing claims.

Response to O-54-13

Comment rejected. The comment does not address any particular provision in the proposed regulations and only generally asserts discomfort with the EPR model.

Comment O-54-14

Standardized Regulatory Impact Assessment (SRIA)

We are concerned that the results of "Alternative 1: Less Stringent Classification of Plastic Covered Materials" are based on incorrect assumptions. In the reason for rejecting, it is mentioned that "robust recycling infrastructure does not exist for packaging such as plastic-lined mailing pouches and bakery boxes with plastic windows. .... and it is likely they would be disposed due to how difficult they are to recycle." This statement does not reflect the recyclability of polycoated fiber-based packaging and fiber-based packaging with plastic components. We encourage a re-assessment of this alternative that includes the correct assumptions about polycoated.

The following linked data supports the strong and growing market for polycoated fiber-based packaging, via paper cups as an example. A number of large cities, including San Francisco, are accepting paper cups in their recycling bins.
1. FAQs on Recycling Paper Cups for Paper Mills
2. End Markets for Post-Consumer Paper Cups
3. Paper Mill Commitment More resources can be found on the Foodservice Packaging Institute's Paper Cup Resource page, linked here.

Thank you for your consideration of our comments. We appreciate the ongoing collaboration between AF&PA and CalRecycle to advance a sustainable recycling system. We remain available to discuss the feedback herein in greater detail and look forward to your response. Please contact Shoshana Micon, Manager, Recycling and Packaging Sustainability, at shoshana_micon@afandpa.org or Julie Landry, Vice President, Government Affairs, at Julie_landry@afandpa.org if you have any further questions.

Response to O-54-14

CalRecycle rejects this comment. The quoted portion of CalRecycle's justification for rejecting Alternative 1 in the Standardized Regulatory Impact Assessment

(SRIA) leaves out the context provided by the preceding sentence: "There are already systems in place throughout California to recycle plastic containers such as soft drink bottles and milk jugs." Those sentences, taken together, are correct as written. This was recently supported by data presented in CalRecycle's SB 343 Material Characterization Study Final Findings 2023/2024 report, published in April 2025, which concluded that Composite Food Service Paper and Packaging, which includes polycoated fiber-based foodservice packaging, is not collected by jurisdiction recycling programs or sorted into a defined stream by large volume transfer/processing facilities in California.
Regarding the broader packaging category ("fiber-based foodservice packaging") to which the comment refers, no response is necessary because the commenter only provides specific analyses with respect to polycoated packaging.

O-55: Carol Patterson (Carol Patterson)

Comment O-55-1

Electronic submittal: SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act 45-Day Comment Period

October 7, 2025

Thank you for the opportunity to provide feedback concerning the proposed SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act permanent regulations.

Founded in 1933, the Foodservice Packaging Institute (FPI) is the leading authority on foodservice packaging in North America. FPI supports the responsible use of all foodservice packaging, while advocating for an open and fair marketplace for all materials. Our core members include raw material and machinery suppliers as well as packaging manufacturers, representing approximately 90 percent of the industry. Additionally, a number of distributors and purchasers of foodservice packaging are part of FPI's affiliate membership.

FPI has several members with facilities in California, and many that import foodservice packaging into the state. Our 2021 economic impact study of the foodservice packaging industry estimates that our industry was responsible for $2.1B in direct economic impact and $6.8B in total economic impact within the state.

The foodservice packaging industry is committed to reducing the impact of its products on the environment and is dedicated to increasing their recovery. FPI has several special interest groups that bring together the supply chain to develop and promote economically viable and sustainable recovery solutions for foodservice packaging. These special interest groups include the Paper Recovery Alliance, Plastic Recovery Group, Paper Cup Alliance and Foam Recycling Coalition. More information on these groups and their efforts can be found here.

We appreciate the time and effort CalRecycle staff have dedicated to preparing the proposed SB 54 permanent regulations. However, we continue to have foundational concerns, particularly regarding the definitions and the proposed approach to food service ware, as well as other areas we have previously addressed in our submitted comments to the Department.

Below is FPI's feedback in response to the proposed SB 54 permanent regulations, focused on the areas of greatest impact to the foodservice packaging industry and intended to support the effective implementation of the law.

Article 1: Definitions

§ 18980.1. Definitions

(a)(8) "Food service ware"

We continue to believe it would be more consistent with the statutory language to define "plastic food service ware" rather than the broader term "food service ware." This approach would more accurately 1 | P a g e Comment box continued from above reflect the terminology used in SB 54 and help support consistent interpretation and application of the definition.

Next, as we understand it, the proposed language in (8)(A) seeks to connect the good and its function as follows: "To be a food service ware item, the good must either necessarily directly contact food when used to serve or consume food or be designed specifically for use in conjunction with food service items when the items are used to serve or consume food." However, by referring to the food service ware items as a "good" rather than a type of packaging associated with direct food contact, the definition still appears to remove the party filling/using the "food service ware" as the producer in (A). On the other hand, the definition under (B) refers to where the covered materials listed are used (per the law) which may obligate the party filling/using the food service ware. This approach creates ambiguity and inconsistency across covered materials and their obligated producer.

To resolve these concerns, we offer the following changes to the definition of "food service ware" below in red.

(a)(8) "Plastic food service ware" *means the ~~goods~~ items identified in subparagraphs (A) and (B) that are added at the point of sale by food service, or other service entities to serve, store, handle, protect, or market food and facilitate the consumption of prepared food. Plastic single-use food service ware is covered material and shall not be considered "packaging" for purposes of this chapter.*

(A) Trays, plates, bowls, clamshells, lids, cups, utensils, stirrers, hinged or lidded containers, straws, and other ~~goods~~ items typically used with food, provided that such

covered materials ~~goods are intended or marketed to be~~ are used, or are customarily used, in the act of consuming food or providing to consumers food or beverages that require no further preparation or packaging prior to consumption. ~~A good~~ An item expressly marketed or labeled as not intended for such uses shall not be considered customarily put to such use. To be a food service ware item, the ~~good~~ item must either necessarily directly contact food when used to serve or consume food or be designed specifically for use in conjunction with food service items when the items are used to serve or consume food. Examples of ~~goods~~ items designed specifically for such use include a cup sleeve or cup tray used with cups that contact beverages, trays used with liners that contact food, or a lid or cover that fits securely atop a tray that touches food.

Further, to support this definition and distinction between plastic food service ware and single use packaging, all references to *"food service ware"* should be changed to *"plastic food service ware."*

(a)(15) "Plastic"

The current definition of "plastic" does not reflect how materials are recovered or move through the recycling system. FPI recommends incorporating a weight-based threshold or de minimis standard, either within the definition of "nonplastic" or through a separate definition for "partially made of plastic." This would clarify when trace amounts of plastic are exempt, align definitions with real-world recovery pathways, and reduce the administrative burden on the Department by minimizing case-by-case evaluations.

(a)(17) "Producer"

To accurately interpret the intent of SB 54 concerning the definition of "producer" and whether that intent is reflected in the proposed permanent regulations, it is essential to review and consider the provisions outlined in Section 42041, subdivision (w)(1) and (2), which states:

(w) (1) "Producer" means a person who manufactures a product that uses covered material and who owns or is the licensee of the brand or trademark under which the product is used in a commercial enterprise, sold, offered for sale, or distributed in the state.

(2) If there is no person in the state who is the producer for purposes of paragraph (1), the producer of the covered material is the owner or, if the owner is not in the state, the exclusive licensee of a brand or trademark under which the covered product using the covered material is used in a commercial enterprise, sold, offered for sale, or distributed in the state. For purposes of this subdivision, a licensee is a person holding the exclusive right to use a trademark or brand in the state in connection with the manufacture, sale, or distribution of the product packaged in or made from the covered material.

In our view, the law does not distinguish between producers for packaging and those for food service ware, nor does it contemplate treating the covered material itself as the "product." Rather, all covered material is defined uniformly. This is especially relevant in the context of plastic food service ware, where the current drafting appears to treat the covered material as a "good," thereby shifting producer responsibility in a way that may not align with the legislative intent of SB 54.

Based on the law and our understanding, we suggest the following change to (a)(17)(B):

(17)(B) The terms "product that uses covered material" and "product using the covered material" refer to a ~~good~~ product that uses covered material. ~~A good uses covered material if its packaging is covered material or if the good itself is plastic single-use food service ware and thus constitutes covered material~~. Empty packaging and plastic single-use food service ware materials not yet used by a ~~good~~ product are not "single-use packaging" or otherwise "covered material" under the Act, such that a person is not a producer merely because they manufacture, sell, offer for sale, or distribute such materials.

With respect to the definition of (a)(17)(F) "Distribution" and "distribute", we are seeking clarification on how the definitions apply to producers. For instance, if a manufacturer sells items to distributors within the state who then sell those items to customers outside California, we would like confirmation on whether such items would be considered covered materials.

Also, (a)(17)(F)(ii) states that "*the mere transportation of products on behalf of another person shall be deemed conducted by that person, not the transporter.*" While this language seeks to offer some clarity, it also raises questions in certain circumstances. For instance, in a scenario where a manufacturer produces an item but ships it to California at the request of a retailer, who would be considered the producer? To lessen ambiguity, the department may wish to consider substituting "another person" with "producer" to make it clear that transportation does not change a producer's obligations.

(25) "Reusable," "refillable," "reuse," and "refill"

FPI continues to believe that reuse and refill are two separate concepts, where "refillable" includes packaging designed to be refilled by consumers multiple times for the same or similar purpose in its original format.

(a)(5) "Covered Material"

The definition of "*covered material*" includes the phrase: "*In the context of end-of-life handling and processing, if a substance comprises both materials that are covered material because they originated from such items and materials from other origins, only the portions originating from covered material items shall be considered covered materials*." However, the term "substance" is not defined in the regulation and is typically used elsewhere to refer to chemicals or mixtures, which may cause confusion.

We suggest that the term “substance” should be clearly defined or replaced with a more appropriate term, such as “material,” to avoid misinterpretation.

§ 18980.1.1. Producer Identification

We continue to have concerns with the proposed producer identification frameworks. While the Department may be seeking to clarify producer obligations by establishing distinct approaches for “covered material other than food service ware” and “food service ware,” we believe this framework diverges from the legislative intent of SB 54. As per Section 42041, subdivision (w)(1) and (2) noted above, we believe the producer hierarchy should apply consistently across all covered materials.

Although the producer identification hierarchies in subdivisions (c) and (d) may appear structurally similar, the application of the term “manufacturer” differs significantly in subdivision (d). Under subdivision (c), “manufacturer” typically refers to the entity placing the product inside the covered material. However, when this same language is applied to food service ware in subdivision (d), it shifts the designation of “producer” to the manufacturer of the item itself.

From our perspective, this shift introduces inconsistency in how producer responsibility is defined and does not reflect the legislative intent of SB 54. Furthermore, we are concerned that the current drafting of subdivision (d) may unintentionally penalize in-state manufacturers, creating a potentially inequitable regulatory landscape.

FPI continues to observe references under both (1)(c) and (d) indicating that the obligation occurs when covered materials are *“first sold or distributed or used”* “*regardless of where such use occurs*.” We maintain that there needs to be certainty as to where the obligation occurs and suggest that this language be clarified.

Additionally, we note that (d) includes a reference to “*the brand or trademark referred to in paragraphs (1) and (2) of subdivision (w) of section 42041 of the Public Resources Code*” while (c) does not include the same reference to section 42041.

We are also concerned that the “most prominently used” standard in subdivision (e)(3) for identifying obligated brands or trademarks could lead to inconsistent interpretations. To address this, it may be preferable to grant the PRO the authority to develop standardized guidelines for determining brand or trademark prominence. Similarly, in subdivision (e)(1), which addresses food service ware, the PRO should be empowered to provide clear guidance on identifying the appropriate brand owner.

Response to O-55-1

Regarding 18980.1(a)(8), CalRecycle rejects the proposed change for the reasons provided in response to comment O-76-2. The objection to defining "food service ware" instead of "plastic food service ware" is unfounded because "plastic" and "plastic component" is already defined in statute, so defining the additional phrase "food service ware" is appropriate; including the qualifier "plastic" would be redundant and provide no additional clarity.

Regarding the suggestion that food service ware be considered "a type of packaging, that interpretation is untenable. Food service ware is fundamentally different from packaging, and the producer cannot feasibly always be the party that uses it in food service. Under the latter scenario, there would be no producer of items sold separately from food directly to consumers and only used by them. The Legislature did not intend SB 54 to have the meaning proposed by the commenter (that food service refers to a "type of packaging used in food service environments").
Second, the commenter is incorrect that the proposed regulations would "exclude the party filling or using the 'food service ware' from responsibility." PRC section 42041(w)(3) would apply to such persons, and nothing in the proposed regulations suggests otherwise. Nor is there any reason why a party who is the producer under section 42041(w)(1) and (w)(2) could not also be the party "filling/using" food service ware; nothing in the proposed regulations would disqualify such a party from producer status.

Even worse, the commenter's proposal creates an intractable barrier to identifying a producer for a potentially enormous range of items. Identifying producers under PRC section 42041(w)(1) and (w)(2) depends on the brand of a product. If the food service ware itself is not that product, the identity of the producer of a single food service ware item would depend on the brand of the food or food service with which it ultimately is used. In other words, there frequently would simultaneously be an unlimited range of persons who might be the producer of a single food service ware item. That approach is obviously untenable and would make it impossible for any one person to report any data regarding the item other than one who is a producer under PRC section 42041(w)(3) (i.e., the person selling or distributing the item), even though there are many persons clearly within the definition provided in (w)(1) and (w)(2). That outcome would contradict PRC section 42041(w)(1) through (3) as a whole because (w)(3) can apply only where there is no producer under (1) or (2) due to there being no person described in those paragraphs "in the state." The proposed approach is therefore clearly an incorrect application of statute.
CalRecycle rejects the recommendation to strike "intended or marketed to be" from the text. Taken as a whole, that scope of that phrase is readily understandable, and it is not credible to claim that it cannot be consistently determined whether items are used, marketed to be used, or customarily used as a food. Notably, the commenter provides no examples of items where such a determination would be difficult.

The specific edits included in the comment are rejected for the reasons stated above, which fully address all the edits other than the addition of "prepared" food. CalRecycle rejects that addition because clause (ii) under (a)(8)(B) is easier to understand and properly sets the scope of what is commonly understood as a "food service establishment." If food is packaged before an establishment acquires it and remains packaged until after it is provided to consumers, then it could not have been prepared by that establishment and falls

outside clause (ii). But, if an establishment removes food from packaging before providing it to consumers, the act of doing so is sensibly considered "food service."

Regarding the definition of "plastic," CalRecycle rejects the proposed change. First, the definition of "plastic" is established in statute, and the definition of "plastic component" in statute makes clear that any amount of plastic must render a component plastic (Public Resources Code section 42041(t) and (u). Plastic" is specifically defined in PRC section 42041(t), and CalRecycle does not have authority to rewrite that definition or the general authority to create new exemptions from it or from the definition of "covered material" in PRC section 42041(e). Rather, statute provides specific exemptions that CalRecycle can grant: for materials that present "unique challenges" (PRC section 42060(a)(3)); for materials presenting health and safety risks (PRC section 42060(a)(4)); and for local jurisdictions (PRC section 42060.5(b)). Also, accurately identifying small amounts of plastic as "plastic" does not imperil the potential for components of items containing that plastic to continue to be processed by recyclers who can do so.

Regarding the prosed changes to 18980.1(a)(17)(B), that change is rejected because it would result in circular definition: the phrases "product that uses covered material" and "product using the covered material" would be defined as "a product that uses covered material." The definition would be a verbatim repeat of the phrase defined. The deletion of the second sentence is also untenable for the reasons stated in response to comment O-76-2 and because it would leave ambiguity in the statute unresolved. Not considering plastic single-use food service ware, by itself, to be the product referred to in Public Resources Code section 42041(w) would mean that the statute would either not encompass large swaths of single-use plastic food service ware or would render every person who acquires items like utensils, plates, and straws and uses them in private a "producer." That is obviously absurd and could not have been intended.

Regarding the contention that "reuse and refill" are two separate concepts, the commenter suggests no revision to address that contention. In any event, the statute expressly provides a single definition for both those terms jointly (Public Resources Code section 42041(af)). Moreover, the contrast between 42041(af)(1)(A) and 42041(af)(2)(A) requires rejection of the commenter's assertion that consumer-refill can be for a "similar purpose"; the former expressly states that reuse or refill may be for "the same product, or for another purposeful packaging use, while the latter only refers to "the same product."

Regarding the definition of "covered material," no change is appropriate because the term "substance" has a readily discernible denotation and does not introduce any ambiguity in 18980.1(a)(5).

Regarding section 18980.1.1, the commenter's assertion that the proposed regulation "shifts the designation of 'producer' the manufacturer of the item itself" is incorrect for the reasons stated in response to comment O-77-4.

The commenter's assertion that "the obligation occurs when covered materials are 'first sold or distributed or used" is also incorrect. As section 18980.1.1(c)

and (d) plainly state, that moment is used to designate the relevant brand, not when the obligation accrues.
Regarding the difference between 18980.1.1(d) and (c), the difference is superficial only and does not require revision. In both instances, the "brand or trademark" is unambiguously the same one referenced throughout the rest of the section.
With regard to the phrase "most prominently used" and the terms of 18980.1.1(e)(1), CalRecycle rejects the commenter's proposals for the reasons stated in response to comment O-76-5.

Comment O-55-2

Article 2: Covered Material and Covered Material Categories

§ 18980.2.2. Exclusion of Certain Types of Packaging

As currently proposed, this section does not include plastic food service ware alongside packaging as eligible for the outlined exclusions. We recommend consistently using the term “covered materials” throughout the proposed regulations, including in the title of this section, rather than limiting references to “packaging.”

This recommendation is supported by subdivision (s)(4)(A) of section 42041 of the Public Resources Code, which addresses de minimis exclusions and explicitly includes both packaging and food service ware (emphasis added):

(A) An element of the packaging or food service ware with a de minimis weight or volume, which is not an independent plastic component, as determined by the department.

We believe this language indicates legislative intent to treat food service ware as part of the broader category of covered materials for the purposes of de minimis.

Further with respect to de minimis, as noted in our comments above, we recommend incorporating a de minimis threshold within the definition of “nonplastic,” or introducing a separate definition for “partially made of plastic.” This would provide clearer guidance for stakeholders and help reduce the Department’s administrative burden in evaluating exemption requests.

Response to O-55-2

Comment rejected. The statute's de minimis provision is nested within Public Resources Code section 42041(s), which defines "packaging" only, and (s)(4), which unambiguously concerns only "packaging components and ancillary elements integrated into packaging." Those provisions cannot reasonably be interpreted as establishing an exclusion from the definition of any term other than "packaging." Regarding the suggestion that the regulations should establish a threshold for what renders a component "plastic" or separately define "partially

made of plastic," CalRecycle rejects that proposal for the same reasons stated in response to comment O-82-7 and O-55-1.

Comment O-55-3

Article 3: Evaluations of Covered Material and Covered Material Categories

§ 18980.3.1. Recyclability of Certain Covered Material Categories Identified by the Department

The Department's authority to allow for a pathway for certain material categories to meet specific recycling requirements under SB 54 over time, while ensuring adherence to the recyclability standards of SB 343, remains crucial to bridging the two laws to allow for the continued growth of recycling systems of those materials demonstrating progress towards recyclability. The need for CalRecycle to use this authority cannot be overstated as failure to do so will impact consumer education and engagement and the overall success of California's recycling systems.

We continued to be concerned with the proposed language under (c)(1) below, which states the timeline for the likelihood of satisfying requirements is "before the next mandatory update to the material characterization study". It is important to recognize that integrating recyclable materials into recycling systems is a complex and time-intensive process. The proposed timeline may not provide equal opportunity for all materials, particularly those under consideration closer to the next mandatory update of the material characterization study. Therefore, we recommend establishing a standardized timeframe as follows:

(c)(1) The likelihood that the covered material category will satisfy the requirements of paragraph (2) of subdivision (d) of section 42355.51 of the Public Resources Code within the subsequent five years ~~before the next mandatory update to the material characterization study.~~

Response to O-55-3

Comment rejected. Changing the text in section 18980.3.1(c)(1) to "within the subsequent five years," would create a contradiction between the criterion in (b)(3), which refers to the next mandatory study update, not a five-year period, and (c)(1). In contrast, changing both of those criteria to incorporate a five-year duration would be nonsensical because that duration would not necessarily align with the next time that CalRecycle would be able to assess whether the "trending" designation was appropriate to begin with. Also, because CalRecycle likely would not finalize an identification until there are less than five years before the next mandatory study update, the effect of a five-year period, in most instances, would be that materials could not be evaluated with respect to the "trending" requirements until several years after that update, when another mandatory update becomes due. Under those circumstances, the effect of the "trending" designation until that next update would be uncertain at best and not

subject to any scrutiny. CalRecycle declines to undermine the effect of statute and the proposed regulations in that manner.

Comment O-55-4

Article 4: Responsible End Markets

§ 18980.4. Responsible End Market Criteria

With respect to (a)(3), which addresses requirements for incompatible materials, markets for recycled materials are complex and constantly evolving. These dynamics often create incentives for end markets to manage incompatible materials in various ways. Requiring entities to send incompatible materials for further processing assumes the existence of cost-effective methods for collection, sorting, and transportation, which may not always be feasible or environmentally preferable.

Additionally, post-recycling waste is frequently mixed with various incompatible materials, making separation virtually impossible with current technology. While it may be possible to sell incompatible materials individually, there are limited markets for mixed incompatible materials.

To address these concerns, this provision requires clearly assigning responsibility for assessing material compatibility and processability.

On the matter of responsible end markets for recycled organic products, FPI remains unclear on the rationale for differentiating between items "*partially or wholly constituting plastic*" and those "*comprised of fiber or paper substrates*." From our perspective, compostable plastics and those made of fiber or paper substrates should be held to the same standards.

Response to O-55-4

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42041(aa), 42041(ad), 42051.1, and 42060, and no change is necessary to the implementation of the Act. PRC section 42041(ad) defines a responsible end market as a materials market in which the recycling of materials or the disposal of contaminants is conducted in a way that benefits the environment and minimizes risks to public health and worker health and safety, and it further authorizes CalRecycle to adopt regulations identifying and establishing criteria for responsible end markets. Consistent with PRC section 42041(ad), section 18980.4(a) of the proposed regulations specifies the criteria that an end market must satisfy to be identified as a responsible end market, including the requirement concerning incompatible materials in section 18980.4(a)(3). PRC section 42051.1(c)(2) establishes that a PRO is responsible for describing in its plan how it will support and achieve the collection, processing, recycling, composting, and the development of responsible end markets for covered materials to meet the requirements of the Act, including the requirements for responsible end markets

as implemented in section 18980.4(a) of the proposed regulations. Section 18980.4(a)(3) of the proposed regulations is sufficiently clear and consistent with these requirements of the Act.

Additionally, to the extent this comment suggests that section 18980.4(a)(3) should apply only to cost-effective methods for processing incompatible materials, no change is appropriate or necessary. This recommended change is inconsistent with the intent and purpose of the Act because it would permit and encourage the disposal of covered materials that are otherwise recyclable. Consistent with the waste hierarchy established in section 40051 of the Public Resources Code, section 18980.4(a)(3) of the proposed regulations is designed to prioritize recycling whenever possible and to prevent the disposal of covered materials. Moreover, to the extent incompatible materials cannot be further processed and recycled, section 18980.4(a)(3)(B) already permits a responsible end market to dispose of the materials, so long as such disposal is conducted in a way that minimizes significant effects on the environment and risks to public health and safety.

Finally, to the extent this comment recommends subjecting materials identified in sections 18980.4(a)(4)(B) and (C) to the same standard, see the response to comment B-6-5. No further change is necessary.

Comment O-55-5

Article 5: Requirements for Producers

§ 18980.5. Producer Compliance

We suggest revising the requirements in Section 18980.5(d) to allow greater flexibility for producers. Specifically, producers who become participants under subdivision (b) should be granted sufficient time to collect and submit their calendar year 2023 supply data, rather than being required to provide it at the time of application.

Response to O-55-5

CalRecycle rejects this comment for the reasons stated in I-62-4, I-62-8, and B-1-1.

Comment O-55-6

Article 6: Requirements for the Producer Responsibility Organization

§ 18980.6.7. Eco-Modulated Fee and Fee Schedule

Based on our reading of the proposed language in (h), it appears that fees may be applied when recycling or composting is deemed “more difficult” due to the inclusion of specific elements, as referenced in the PRO design guide or when testing is required.

We are concerned that this may mean that the mere requirement for testing could trigger a malus fee, even if test results ultimately show that the material is readily

recyclable and/or compostable. Testing is often necessary to validate the recyclability and/or compostability of new or innovative materials and should not be equated with increased difficulty.

It may be helpful to clarify that a malus fee should only apply when test results demonstrate that a material is difficult to recycle or compost. This distinction is critical to support innovation while maintaining fair and evidence-based assessments.

Response to O-55-6

CalRecycle rejects this comment. See the response to comment B-47-4.

Comment O-55-7

Article 8: Producer Responsibility Plan Requirements

FPI continues to recommend including language that allows the PRO to incorporate adjustment factors into source reduction planning. Such a provision is necessary to establish a framework for accounting for economic variability and changes in PRO participation. Without this language, it is unclear how real-world fluctuations will be reflected in source reduction requirements.

Response to O-55-7

CalRecycle rejects this comment for the reasons set forth in response to comment B-11-6.

Comment O-55-8

Additional Comments

FPI recommends revisiting the assumptions underlying "Alternative 1: Less Stringent Classification of Plastic Covered Materials" in the Standardized Regulatory Impact Assessment. The rationale for rejecting this alternative includes the claim that "*robust recycling infrastructure does not exist for packaging such as plastic-lined mailing pouches and bakery boxes with plastic windows,*" and that such materials are likely to be disposed of due to recycling challenges. In our view, this generalization does not accurately reflect the recyclability of fiber-based foodservice packaging, including polycoated items.

There is growing evidence of viable and increasing recycling pathways and end markets for polycoated packaging, including items such as paper cups. For example, communities around the country, including San Francisco, accept paper cups and other polycoated foodservice packaging in their curbside recycling programs. Additionally, over 40 paper mills and end markets have publicly committed to accepting and processing post-consumer polycoated paper cups, demonstrating a current and expanding market for these materials.

To support the reassessment of Alternative 1, which incorporates accurate data and market developments related to polycoated fiber-based foodservice packaging, we suggest the following resources:

• Confirmed Markets for Paper Cups
• Paper Mill Commitment
• Foodservice Packaging End Markets Map

Additional resources are available on FPI's website dedicated to foodservice packaging recovery.

Thank you for considering our comments. FPI appreciates the Department's ongoing efforts to improve clarity through these proposed regulations. We look forward to continued collaboration to further refine the language and to ensure the regulations align with the intent of SB 54.

Response to O-55-8

CalRecycle rejects this comment. The quoted portion of CalRecycle's justification for rejecting Alternative 1 in the Standardized Regulatory Impact Assessment (SRIA) leaves out the context provided by the preceding sentence: "There are already systems in place throughout California to recycle plastic containers such as soft drink bottles and milk jugs." Those sentences, taken together, are correct as written. This was recently supported by data presented in CalRecycle's SB 343 Material Characterization Study Final Findings 2023/2024 report, published in April 2025, which concluded that Composite Food Service Paper and Packaging, which includes polycoated fiber-based foodservice packaging, is not collected by jurisdiction recycling programs or sorted into a defined stream by large volume transfer/processing facilities in California.
Regarding the broader packaging category ("fiber-based foodservice packaging") to which the comment refers, no response is necessary because the commenter only provides specific analyses with respect to polycoated packaging.

O-56: Rural County Representatives of California (John Kennedy)

Comment O-56-1

October 7, 2025

Zoe Heller
Director, Department of Resources Recycling and Recovery
1001 I Street
Sacramento, CA 95814

RE: SB 54 Proposed Regulation Comments

Dear Director Heller:

On behalf of the Rural County Representatives of California (RCRC), we are pleased to provide comments on the proposed SB 54 regulation text.

RCRC is an association of forty rural California counties and the RCRC Board of Directors is comprised of elected supervisors from each of those member counties. RCRC represents all 19 California counties that qualify as “rural counties” under Public Resources Code (PRC) Section 42649.8(h). RCRC was extensively engaged in the SB 54 development process and advocated for its passage.

RCRC appreciates the opportunity to provide comments on the proposed SB 54 regulation text. RCRC welcomes several changes included in the last few drafts of the regulation that are responsive to issues that we and other local agencies have raised. At the same time, we remain deeply concerned with other aspects of the proposal. Several revisions are necessary to avoid unintended consequences and align the regulations with the text and spirit of SB 54.

Restrictions on disposal of covered material preclude the use of compost for its intended purpose as compost.

RCRC remains concerned that the draft regulations preclude the use of compost for its intended purpose as a soil amendment.

As drafted, Proposed Section 18980.3.5(d) deems the land application of covered materials disposal. Section 18980.1(a)(5) defines “covered material” to include “materials that originated from covered material items.” Compost is a recycled organic product produced from organic waste and compostable materials. The finished product is intended to be land applied to improve soil health, water retention, and carbon sequestration.

Since compost *originates from* compostable covered materials, it is still considered “covered material” under the proposed regulations. Logically, Section 18980.3.5(d) precludes finished compost from being applied to land, as that would constitute “disposal” of covered materials. California has spent a great deal of time and effort to promote and mandate the procurement of compost; however, we fear the regulations would undermine all those efforts by deeming land application of compost to constitute disposal. We strongly urge refinements to the text or Final Statement of Reasons to clarify that this section does not prohibit the land application of finished compost.

To address this issue, we suggest modifying Section 18980.3.5 as follows: 18980.3.5 ***(e) Nothing in this section shall preclude the land application of finished compost or the beneficial use of overs from compost operations consistent with existing law.***

Response to O-56-1

Comment rejected. Under section 18980.3.5, the use of covered material as alternative daily cover is disposal of that material, not recycling of it. But that is not relevant to the use of finished compost, which is recycled organic product (i.e., a new material altogether), not "covered material." Because the proposed

regulations, as written, do not have the effect about which the commenter is concerned, no change is necessary.

Comment O-56-2

Broad categorical exclusions for food packaging undermine the program's intended goals, create free rider issues, and will confuse consumers

Proposed Section 18980.2(a)(2) creates a broad categorical exemption for covered materials that are used as packaging for a food or agricultural commodity if it is not possible to use other types of packaging to comply with USDA or FDA rules, regulations, or guidelines related to microbial contamination, safety, or structural integrity of packaging.

We understand exemptions related to microbial contamination and food safety; however, allowing exemptions based on "structural integrity" will merely create an easy pathway for manufacturers to avoid having to participate in SB 54.

RCRC is deeply concerned that this exemption is far broader than necessary to avoid conflicts with federal food safety laws. The ISOR notes that this exemption merely exempts packaging from SB 54 when it is not possible to comply with both SB 54 and those federal laws and guidelines; however, the regulation is not constructed so narrowly. Instead, the regulations exempt any food or agricultural packaging where it is not reasonably possible to use other packaging.

It is unclear how this exemption will work for producers seeking an exemption when the packing is necessary for structural integrity. Will fruit and vegetable manufacturers claim that cardboard is unsuitable because it will fail due to the inherent moisture of the commodity? Wood was widely used for the packaging and sale of agricultural commodities decades ago, but has largely given way to heavy cardboard and plastic materials. Cereal manufacturers may claim that cardboard is necessary to maintain the structural integrity of the packaging. While plastic could theoretically be used for cereal, plastic is still a covered material and even less recyclable than cardboard. Will CalRecycle deny an exemption request for cereal packaging because it could be made with another material (albeit one that is less recyclable)?

We fear that these provisions create loopholes for some of the nation's largest companies to seek exemptions for things like cardboard cereal and pasta boxes, readily recyclable plastic fruit and vegetable containers, and other goods. Such exemptions would cause widespread consumer confusion as to what should be recycled, leave local governments unreimbursed for the costs of managing materials consumers believe are "covered materials", and leave unexempt manufacturers to shoulder a higher proportion of program implementation (and mitigation fund) costs.

To avoid an unnecessarily broad universe of exemptions, CalReycle should strike the exemption pathway contained in proposed Section 18980.2(a)(2) based on structural integrity, as follows:

(2) In accordance with paragraphs (1) and (2) of subdivision (b) and with subdivision (d) of section 42060 of the Public Resources Code, packaging or packaging components used by a food or agricultural commodity (without regard to its origin) if it is not reasonably possible to use other packaging or packaging components to comply with regulations, rules, or guidelines issued by the United States Department of Agriculture or the United States Food and Drug Administration. A determination of exclusion pursuant to this paragraph may consider standards to prevent microbial contamination or to maintain the safety ~~or structural integrity~~ of packaging under the Food, Drug, and Cosmetic Act; the FDA Food Safety Modernization Act; the Poultry Products Inspection Act; the Federal Meat Inspection Act; the Egg Products Inspection Act; or other applicable food or agricultural regulations, rules, or guidelines.

Response to O-56-2

Comment partially accepted and partially rejected. CalRecycle accepts the comment with respect to the commenter's concern over the clarity of section 18980.2(a)(2) and the potential for it to have an effect broader than intended (to avoid conflicts with federal law). See CalRecycle's response to comment I-19-1, explaining the revisions responsive to this and similar comments. See, also, CalRecycle's response to comment B-3-1, submitted in response to the second draft of the proposed regulations (the 15-Day Changes). That response further explains how the proposed regulations, as revised, address concerns over the scope and effect of section 18980.2(a)(2). CalRecycle declines to adopt the commenter's suggestion to delete the phrase "or structural integrity" from 18980.2(a)(2), however, because the revisions CalRecycle has made resolve the commenter's concern. The revisions clarify that the only "requirements for . . . structural integrity" that can justify exclusion under 18980.2(a)(2) are those imposed under mandatory regulations, rules, or guidelines. In other words, structural integrity requirements can only justify the exclusion when those requirements are mandated under federal law and there is no alternative packaging that can be used to avoid violating them. See, also, CalRecycle's response to comment I-59-2 regarding the term "guidelines."

Comment O-56-3

Regulations improperly restrict the scope of local costs eligible for reimbursement and create a reimbursable state mandate

While the proposed regulations attempt to provide clarity as to what types of local government and recycling service provider costs are reimbursable by the PRO, RCRC is concerned that it appears to improperly restrict the scope of local costs eligible for reimbursement beyond what is provided under SB 54. SB 54 is clear in that the Legislature intended to “ensure that local jurisdictions will be made financially whole for any new costs incurred associated with the implementation of this chapter and its implementing regulations.”1 Furthermore, SB 54 intended for this new framework to “shift the burden of costs to collect, process, and recycle materials from the local jurisdictions to the producers of plastic products.”2

SB 54 is quite expansive in terms of the types of local costs that are reimbursable by the PRO or independent producer. RCRC objects to language in proposed Section 18980.8(g)(2) that limits the scope of "covered costs" by the PRO or independent producer. That section includes an exhaustive list of covered costs, so the PRO could decline to reimburse any costs that it argues are outside of the scope of those three categories, potentially including legitimate claims for educational expenses or covered material collection and recycling activities.

1Public Resources Code Section 42040(b)(2)
2Id.

The effort to narrow the costs of reimbursable expenses to exclude costs that are of the same nature as those that would ordinarily exist fails to recognize that SB 54 itself removed local discretion and converted all those voluntary collection efforts into mandates.

A PRO or independent producer could try to avoid costs for collecting and getting covered materials to market simply because the local jurisdiction previously *voluntarily* collected those materials before SB 54 was signed into law. This ignores the fact that while a local agency previously had the ability to include or exclude any materials from its collection program, SB 54 removes any local discretion and *compels* the entity to include in its program all covered materials CalRecycle determines are recyclable or compostable. Any bale of covered materials collected under SB 54 is a ***NEW, required*** cost and is in furtherance of helping producers achieve SB 54's mandates, so any expenses incurred in collecting, processing, or transporting those materials are eligible for reimbursement under SB 54. Troublingly, this provision most disadvantages those communities that have gone above and beyond the AB 939 50% diversion mandate, penalizing good actors.

A PRO or independent producer could reject claims to pay for local educational campaigns under the argument that educational campaigns would ordinarily exist anyway even in the absence of SB 54. Even if a local agency's educational materials are focused on SB 54 implementation, the PRO may be able to argue that the publication was similar in nature to others that had previously been published by the agency and so is no different in nature than ordinarily expected costs. This is clearly contrary to SB 54's intent that the PRO cover local implementation costs, including education.

Because of its narrow construction, the proposed regulations create a reimbursable state mandate because SB 54 and CalRecycle require local governments to provide a higher level of service, and the proposed regulations preclude recovery of those costs from the PRO and independent producers. To the extent that a PRO or independent producer rejects local reimbursement claims, it is reasonable to assume local governments will seek to recover those SB 54 implementation costs through the Commission on State Mandates, thereby significantly increasing state liabilities.

Response to O-56-3

Comment rejected. Although the commenter does not propose any alternative text for CalRecycle to consider, CalRecycle interprets the comment as suggesting that section 18980.8(g) be revised so that all expenses incurred in the end-of-life management of covered materials be considered costs for which the PRO and Independent Producers are responsible. That change would result in section 18980.8(g) failing to impose the reasonable limitations that the express wording statute places on the costs the PRO is required to reimburse or pay for (referred to as "covered costs" in the proposed regulations). Multiple provisions of the statute make clear that covered costs do not encompass costs associated with managing covered material that would have been incurred regardless of enactment of SB 54.

The costs activities listed in PRC section 42051.1(j)(1)(B) are those that a PRO's budget must fund, but that funding is circumscribed by the limitation that eligible costs are those "associated with implementing the plan." The commenter's approach would ignore that limitation, reading 42051.1(j)(1)(B) so broadly that all acts that "help[s] producers achieve SB 54's mandates . . . are eligible for reimbursement." That interpretation is implausible because practically every single act related to managing waste would fit that description, such that SB 54 would relieve local jurisdictions of any financial burden with respect to handling single-use packaging and plastic single-use food service ware. If the Legislature had intended SB 54 to have that expansive effect, the complexity of the statute's funding-related provisions would be unnecessary: The Legislature could simply have stated that the PRO "must fully fund all operations conducted by local jurisdictions and recycling service providers for managing covered materials." Public Resources Code section 42040(a) further proves that that was not what the Legislature intended. There, the Legislature expressly set forth its intent: "to ensure that local jurisdictions will be made financially whole for any new costs incurred associated with the implementation of [SB 54 and its regulation]." While costs do not necessarily need to be greater than previous, similar costs, they must be "new" and related to SB 54.

This comment also appears to rely on an incorrect interpretation of Public Resources Code section 42053(d)(1). That provision does not purport to define the range of costs that a PRO must cover. Rather, it merely states one factor the PRO must consider when exercising its discretion with respect to its fee schedule: "[t]he costs to ensure each covered material category meets the requirements of this chapter." But subparagraphs (A) through (E) do not state costs that the fees must be sufficient to cover in their entirety. To the contrary, paragraph (1) states that the costs to be considered "may include all of the following," including the costs identified in subparagraph (C): "[c]osts incurred by local jurisdictions . . . to process and transport covered material." By providing those costs as a categorical example of those that the PRO may consider, as opposed to identifying them as mandatory costs that the PRO must (or "shall") cover, this statutory text makes clear that the Legislature did not intend for funding by the PRO to cover the entirety of local jurisdictions' and recycling service providers' costs for handling covered materials. In effect, the Legislature

only authorized, but did not require, the PRO to base its fee schedule to some degree on those costs.

The commenter's concerns over the range of costs, such as those "previously voluntarily" assumed by local jurisdictions, might not be considered covered costs is based on an unduly narrow reading of 18980.8(g)(2)(B) of the proposed regulations, which do not preclude costs from being covered costs merely because they are the same nature as certain previous costs and not greater than those costs from being covered costs. Section 18980.8(g)(2)(B) is not limited to costs that are "of a different nature than ordinarily expected costs," but rather identifies those costs as only one example of a cost "that would not reasonably have been expected to be incurred in the absence of the Act." Circumstances may exist that establish that costs voluntarily incurred since before SB 54 passed are no longer voluntary—in other words, not reasonably expected to be incurred in the absence of the Act (section 18980.8(g)(2)(B))—and thus should be covered costs. Such circumstances could relate, for example, to costs that a local jurisdiction previously incurred but would not reasonably have continued to incur indefinitely in the absence of the act.

Regarding the local educational campaigns specifically, the commenter's concerns are also misplaced because provisions in the statute and the proposed regulations already ensure that local jurisdictions' costs related to technical assistance, education, and other outreach efforts are covered to the appropriate degree. Under PRC section 42051.1(e), the PRO must ensure coordination between its efforts and "existing educational and promotional efforts." Those "existing" ones logically must encompass, for example, those that jurisdictions likely would have undertaken regardless of SB 54. In other words, the statute requires that the PRO does not merely act in parallel with local jurisdictions or merely duplicate jurisdictions' ordinary efforts. That dynamic ensures that the PRO's program reduces the burden of ordinary, expected local educational campaigns. Section18980.8(d)(3) of the proposed regulations address that dynamic, requiring a process by which the PRO will coordinate efforts among the PRO, local jurisdictions and others. Together with the assurances in section 18980.8(g)(2)(B), these provisions reasonably address local jurisdictions' concerns that they may face increased burden with respect to those efforts.

Comment O-56-4

Dispute resolution process must be revised to protect local governments and preserve existing rights to pursue civil litigation

Local governments and ratepayers have long shouldered all the costs of managing and recycling waste, which is why SB 54's transformative approach is so appealing. Last year, RCRC and other stakeholders raised two important and interrelated questions – how will the reimbursement process work and how will disputes regarding reimbursement be resolved? Since that time, we and other stakeholders have engaged in informal discussions with the Circular Action Alliance about those topics. Those questions largely remain unanswered as the PRO works to figure out how to structure the program.

We recognize that CalRecycle has made many improvements to the dispute resolution framework, but important gaps remain that must be addressed. The proposed dispute resolution framework provides a pathway for the local jurisdiction or recycling service provider to request mediation, which would proceed to binding arbitration to resolve any remaining differences. Unfortunately, the regulation is silent on whether CalRecycle intends for this process to replace or supplement the parties' existing recourse to civil litigation. *At a minimum, CalRecycle must make clear in the regulations or Statement of Reasons that the dispute resolution process outlined in the regulations does not interfere with the parties' right to enforce through civil litigation the PRO's obligations to determine and pay costs incurred.*

Mediation and arbitration should not be the sole remedies available and must not infringe upon existing rights to civil litigation to enforce the PRO's obligation to determine and reimburse local jurisdictions and recycling service providers. Local jurisdictions and recycling service providers must retain the ability to resolve disputes with the PRO through civil litigation, including any disputes that may remain after mediation.

Additionally, RCRC strongly opposes any requirement for local jurisdictions to be compelled to use ***binding*** arbitration to resolve disputes with the PRO. While we believe mediation can be a useful dispute resolution tool, binding arbitration must not be compelled to resolve any remaining differences. ***Nor can binding arbitration be the only tool available if mediation fails.*** Arbitration is often criticized as being expensive, unwieldly, and prejudicial to less-resourced parties. Compelled arbitration is often exploited by large businesses to chill litigation from aggrieved parties who lack the resources or technical expertise to engage in that process. Simply speaking, the costs and complexity of binding arbitration will strongly disincentivize local jurisdictions and recycling service providers from seeking to resolve legitimate disputes with the PRO. We are also deeply concerned that binding arbitration is not reviewable in civil courts, thereby reducing the likelihood that local jurisdictions will avail themselves of the dispute resolution process.

To ensure these rights are protected, we suggest the following changes to Section 18980.8(h):

18980.8(h)(4) ***The obligations of a PRO or independent producer to determine and pay the costs incurred by local jurisdictions, recycling service providers, alternative collection systems, and others under Section 42051.1 are enforceable in a civil action between the affected entity and the PRO or independent producer. As an alternative to civil litigation, the dispute resolution*** ~~The~~ process must provide the option for the local jurisdiction or recycling service provider to require the dispute to be submitted to mediation and, if no agreement is reached through mediation, ***the matter may be submitted to*** binding arbitration…

(7) Nothing in this subdivision shall be construed to limit the ability of a local jurisdiction or recycling service provider to enforce the obligations of a PRO or

independent producer under Section 42051.1 through a civil action in a court of competent jurisdiction, or to otherwise seek judicial review of any determination made by a PRO or independent producer, unless the local jurisdiction or recycling service provider has voluntarily elected to submit the dispute to binding arbitration.

Response to O-56-4

Comment rejected. The proposed regulations do not require any local jurisdiction or recycling service provider to submit to binding arbitration or otherwise relinquish the right to pursue civil litigation; section 18980.8(h)(6) unambiguously states as such. Other than as framed in that provision, it would be improper for the proposed regulations to directly state whether any party has a right to pursue a remedy via litigation. Whether obligations are enforceable in civil actions is a substantive legal question that the proposed regulations cannot affect; CalRecycle's authority does not extend to dictating to courts what disputes are judiciable. Rather, CalRecycle has the authority to adopt regulations that interpret statute and govern CalRecycle's administrative enforcement. Lastly, the proposed regulations do not preclude any parties from voluntarily engaging in any form of dispute resolution, including binding arbitration on terms other than those offered pursuant to a producer responsibility plan. Accordingly, the proposed changes are not necessary to the implementation or enforcement of the Act.

Comment O-56-5

Regulations impermissibly allow use of recycling technologies that produce a significant amount of hazardous waste

Despite clear statutory direction to the contrary, the regulations allow a PRO to use non-mechanical recycling technologies that produce significant amounts of hazardous waste.

Public Resources Code Section 42041(aa)(5) requires CalRecycle to exclude plastic recycling technologies that produce significant amounts of hazardous waste. Surprisingly, Proposed Regulation Section 18980.4.1(d) seeks to allow recycling facilities to generate ANY amount of hazardous waste as long as it is handled and disposed of in compliance with an applicable permit. This clearly exceeds CalRecycle's regulatory authority and jeopardizes implementation of the law. SB 54 clearly prohibits the ***production*** of significant amounts of hazardous waste – it does not prohibit the ***unauthorized management of significant amounts of hazardous waste***, as outlined in the proposed regulations.

Simply stated, SB 54 is concerned with generation, not management or disposal, of hazardous waste. If the Legislature had wanted CalRecycle to ensure that hazardous waste was appropriately managed and disposed of, it could easily have done so. Instead, the Legislature focused restrictions on the ***production*** of hazardous waste.

The regulations also presuppose that materials will be managed domestically, where permits and laws regulate the management and disposal of hazardous waste. Foreign markets may not have hazardous waste disposal requirements commensurate with the Resource Conservation and Recovery Act. In the absence of an equivalent regulatory environment, the regulations would allow foreign chemical recycling facilities to manage hazardous waste as ordinary trash.

To align the regulations with existing statutory law, CalRecycle must strike proposed Section 18980.4.1(d)(1)(B):
~~(B) The production and management of hazardous waste that is handled and disposed of in compliance with an applicable permit does not present a substantial risk of harm to public health or of contamination of the environment, for purposes of the Act and this chapter. Minor technical violations or minor deviations from permit conditions that do not result in, or are not reasonably likely to lead to, actual environmental harm or harm to public health shall not, by themselves, be considered noncompliance for purposes of this section.~~

Regulations impermissibly restrict the definition of "hazardous waste"

Section 18980.4.1(d)(1) defines "hazardous waste" for purposes of SB 54 as hazardous waste defined under the federal Resource Conservation and Recovery Act (RCRA). This is a clear violation of existing law. Public Resources Code Section 40141 defines "hazardous waste" for purposes of Division 30 (Waste Management) of the Public Resources Code. That section defines "hazardous waste" to include, but does not limit the definition to, RCRA hazardous waste. It also cross-references Health and Safety Code 25117, which includes any wastes that meet criteria adopted by the Department of Toxic Substances Control (DTSC). As such, the Public Resources Code defines "hazardous waste" not as RCRA hazardous waste, but as a far broader class of hazardous wastes that are determined by DTSC.

SB 54, the Plastic Pollution Prevention and Packaging Producer Responsibility Act, is contained in Chapter 3 of Part 3 of ***Division 30*** of the Public Resources Code. While SB 54 did not itself define "hazardous waste", it did not need to because Section 40141 already supplied that definition. As such, the ISOR's claim that "the Act does not define hazardous waste" ignores the very foundations of statutory interpretation and statutory law. The Legislature understood the Public Resources Code definition of "hazardous waste" when it crafted SB 54 to include the larger universe of Californiadesignated hazardous waste, not just RCRA hazardous waste. While PRC 40100 allows the incorporation of alternate definitions if "the context otherwise requires", there is no clearly articulated context in SB 54 or the legislative record that would support the far narrower definition contained in the regulations. The ISOR's attempted justification for using the federal RCRA definition to align California law with those of other states where recycling facilities may be located misses the mark – the Legislature already defined "hazardous waste" more broadly than the regulations and the statute is controlling.

To address this issue, CalRecycle must modify proposed Section 18980.4.1(d)(1) as follows:
(1) For purposes of paragraph 5 of subdivision (aa) of section 42041 of the Public Resources Code, "significant amounts of hazardous waste" means hazardous waste as defined in ***Public Resources Code Section 40141*** ~~Title 40 of the Code of Federal Regulations Section 261.3~~ that presents a substantial risk of harm to public health, or of contamination of the environment.

Response to O-56-5

CalRecycle rejects this comment for the reasons provided in response to comment O-62-1.

Comment O-56-6

Local jurisdiction exemption pathway impermissibly imposes additional requirements beyond those included in the statute

Public Resources Code Section 42060.5(b) allows CalRecycle to grant an extension or exemption from requirements to include all covered materials in a jurisdiction's collection and recycling program if the jurisdiction shows that compliance is not practicable for that covered material because of specific local conditions, circumstances, or challenges. CalRecycle seeks to build upon this in proposed regulation Section 18980.11.1(c)(4) by also requiring the applicant to include documentation about the effects on the environment, environmental justice, worker health and safety, public health, and hazardous waste generation. As such, the regulations would allow CalRecycle to deny a requested exemption or extension unless it provides documentation of all of these impacts that are outside the scope of what the Legislature clearly contemplated in SB 54 – impracticability based on specific local conditions, circumstances, or challenges. If the Legislature intended to impose additional procedural hurdles or substantive criteria to qualify for an exemption or extension, it could have done so.

To address this issue, we suggest amending proposed Section 18980.11.1(c)(4) as follows:
(4) A description, with supporting documentation, of the specific local conditions, circumstances, and challenges that make it impracticable for the local jurisdiction or recycling service provider to include the specified covered material or covered material categories in their collection and recycling programs. The description must demonstrate that the identified material cannot practicably be included in the collection and recycling programs. The description must also address, at a minimum, the necessity of the exemption with respect to the following considerations: program efficacy; technological or economic limitations; legal restrictions or requirements; ~~effects on the environment, environmental justice, worker health and safety; public health; hazardous waste generation;~~ and transportation safety.

Response to O-56-6

Comment rejected. The commenter erroneously asserts that an exemption request must "include documentation about the effects on the environment, environmental justice, worker health and safety, public health, and hazardous waste generation." To the contrary, section 18980.11(c)(4) merely requires an application to "address" those, and it states that doing so is with respect only to "the necessity of the exemption." If any of the listed factors do not underly such necessity to begin with, simply stating as such would necessarily be sufficient to address them. By listing the factors that must at least be "addressed," the proposed regulation ensures that local jurisdictions and recycling service providers consider all the dimensions that CalRecycle, without limitation, considers potentially relevant to the impracticability of compliance considering local conditions, circumstances, and challenges.

Comment O-56-7

Regulations should include an opportunity for stakeholders to provide feedback when a producer recommends changes to the covered material category list.

Proposed Section 18980.2.6 establishes a pathway through which a PRO, participant producer, or independent producer may recommend changes to the current Covered Material Category (CMC) list. As part of that process, the entity making the request must discuss financial implications and impact of the recommended changes on responsible end markets and intermediate supply chain entities. A PRO or independent producer may significantly underestimate the potential financial impacts of adding a new material to the CMC list so they can sell it in the state. Given the potentially significant impact that changes to the CMC list may have on the solid waste industry and local governments, it is imperative that those entities be given an opportunity to provide feedback on the change and be able to comment on the accuracy of the supporting information.

To address this concern, RCRC suggests adding a new subdivision (e) to proposed Section 18980.2.6 as follows:

18980.2.6 ***(e) The department shall provide an opportunity for public engagement and allow public comment and submission of relevant information and evidence, including, but not limited to, responding to the estimated financial implications and impacts of those changes on local jurisdictions and recycling service providers.***

Response to O-56-7

CalRecycle rejects the comment. A formal process of soliciting responses in response to every recommendation submitted to CalRecycle, no matter how minor and without regard to their merit as CalRecycle may initially determine, would be impracticable and would prevent CalRecycle from effectively maintaining the CMC list. Moreover, nothing in statute or the proposed regulations restricts interested parties from collaborating with a PRO or individual producers concerning CMC list recommendations. Importantly, the proposed

regulations do not generally prohibit any person from submitting information to CalRecycle. While CalRecycle's consideration of specific recommendations submitted to it is subject to the limitations stated in section 18980.2.6, section 18980.2.5(f) explains that, subject to minimal restrictions, it will consider information submitted by any person when updating the CMC list. This level of participation reasonably accommodates interested persons who are not directly subject to the Act but wish to provide relevant information for CalRecycle to consider.

Comment O-56-8

Local government exemption process is unnecessarily lengthy and producer review should be compressed

RCRC remains concerned that the process outlined to review a local jurisdiction or recycling service provider exemption request is far too lengthy and will inhibit effective implementation of SB 54.

PRC 42065.5(b) allows local jurisdictions or recycling service providers to seek an exemption from the requirement to collect specific covered materials because local conditions, circumstances, or challenges make collection impracticable. As part of this process, the local jurisdiction or recycling service provider must notify the PRO and independent producers, who can object and arrange for alternative means for collection, processing, storage, and transportation of those covered materials.

The proposed regulations allow the PRO and independent producer 90 days to review an exemption application before a local jurisdiction or recycling service provider can submit it to CalRecycle for consideration. It should be noted that the PRO and Independent Producers are under no obligation to respond to an exemption request under PRC 42060.5. As such, the proposed regulation puts the applicant in purgatory for three full months while waiting to see if the PRO or independent producer even cares enough about the request to respond. This timeframe is unnecessarily lengthy and could easily be exploited by a PRO or independent producer to drag out the process. Rather than provide 90 days for the PRO or independent producer to review an application, the regulations should reduce that period to 30 days. Similarly, the regulations should reduce the review period for renewal notices from 30 days to 14 days.

To address these concerns, RCRC suggests the following changes to Section 18980.11.1(d):
18980.11 (d) No exemption application or renewal request shall be submitted to the Department until after the local jurisdiction or recycling service provider has provided all PROs and Independent Producers the application or advance notice of the renewal request. All PROs and Independent Producers shall have ~~**90**~~ ***30*** days to review an application, and ~~**30**~~ ***14*** days to review a notice of a renewal request. During the review period

Response to O-56-8

CalRecycle rejects this comment, which requests that PROs and Independent Producers be given only 30 days to review applications and provide comments and only 14 days to review renewal requests. No change to the timeframe is appropriate because section 18980.13(i)(3) and (j) provide that penalties will not accrue while a request for an exemption under Public Resources Code section 42060.5(a) remains pending. Section 18980.11(c) provides extra clarity. That provision delays the effectiveness of new obligations pursuant to Public Resources Code section 42060.5(a) for a year and explains that, if an application is submitted during that period, those obligations are further delayed until CalRecycle decides whether to grant or deny the application. More generally, in the event that an applicant is prejudiced by delays beyond their control, that extenuating circumstance would necessarily affect the appropriateness of penalties, if any, that may be imposed. See PRC section 42081(c). These features of statute and the proposed regulations adequately protect against harm to local jurisdictions and recycling service providers, especially given the absence of clear incentive for a PRO or Independent Producer not to review an application or only to do so at the expiration of the 90-day (or 30-day, for renewals) period.

Comment O-56-9

Enforcement scheme for local jurisdictions is unsupported by SB 54's statutory construction and can be better accomplished through other enforcement pathways

CalRecycle's proposed regulations impermissibly seek to impose SB 54's enforcement regime on local jurisdictions and recycling service providers. This approach is unsupported by SB 54's statutory construction and local compliance can be better accomplished through other existing enforcement pathways.

SB 54's enforcement authority is clearly limited to imposing penalties on producers and the PRO. CalRecycle's proposed regulations are predicated on the assumption that the term "any entity" in PRC 42081(a)(1) broadens the scope of its enforcement authority; however, that term should be defined in context of the other provisions included in Article 5 of SB 54. PRC 42081 seeks to interpret and implement PRC 42080 and does not vest CalRecycle with additional authority to determine what constitutes a violation of SB 54 beyond the scope of PRC 42080.

PRC 42080 establishes what constitutes a violation of SB 54 and provides that failure to comply with the requirements of SB 54 will subject a PRO, producer, wholesaler, or retailer to penalties for those violations or revocation of an approved plan. PRC 42081 in turn:

• Sets the amount of penalties;

• Provides that they shall not accrue against a producer or PRO until 30 days after notification of the violation;

• Allows a producer or PRO to submit a corrective action plan to CalRecycle for approval detailing how and when it will come into compliance with SB 54; and,
• Sets forth various factors CalRecycle shall consider when determining the penalty amount, including whether the violation was beyond the reasonable control of the producer or PRO, the size and economic condition of the producer or PRO, etc.

PRC 42083 and 42084 also allow CalRecycle to impose additional requirements on a producer or PRO for failure to meet various requirements of SB 54.

Neither PRC 42080 nor PRC 42081 contemplate penalties against local governments or recycling service providers. Furthermore, the proposed regulations inappropriately subject local jurisdictions and recycling service providers to even more severe consequences for violations of SB 54 than apply to the PRO and producers since local governments and recycling service providers cannot avail themselves of a corrective action plan, as is available for the PRO and producers. It is difficult to imagine the Legislature providing a more lenient compliance pathway for a producer or PRO than that which would be available to a local jurisdiction or recycling service provider, given that the law is intended to shift the burden of solid waste recycling AWAY from local jurisdictions and onto producers who introduce packaging into the marketplace.

Local jurisdictions are subject to AB 939's diversion requirements and must develop source reduction and recycling elements outlining how they will achieve the state's solid waste and recycling requirements. Under AB 939, CalRecycle is required to regularly review jurisdictions and determine whether they have made a good faith effort to implement their source reduction and recycling element, with penalties of up to $10,000/day for noncompliance. Therefore, a local jurisdiction's failure to comply with SB 54 should be considered a violation of their existing requirements to implement diversion programs through AB 939 and subject them to these penalties exclusively. *At worst, penalties for local jurisdictions should be capped at the maximum $10,000/day AB 939 limit.*

Response to O-56-9

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements set forth in the Act, including in sections 42060, 42060.5, and 42081 of the Public Resources Code, and the recommended change to cap the maximum penalty at $10,000 for a local jurisdiction is not necessary to the implementation or enforcement of the Act. Section 42081(a)(1) provides that CalRecycle may issue a notice of violation to, and impose an administrative civil penalty not to exceed fifty thousand dollars ($50,000) per day per violation on, any entity not in compliance with the Act or any of the regulations adopted to implement the Act. Section 18980.13.2(a) of the proposed regulations implements this statutory provision by specifying that any entity, including a local jurisdiction or recycling service provider, not in compliance with the Act is subject to penalties pursuant to section 42081(a). However, section 18980.13.2(c) further clarifies that penalty determinations will be made by the CalRecycle director or the director's designee based on evidence presented in hearings

conducted pursuant to section 18980.13.4 addressing, at a minimum, the factual factors identified in section 42081(c). Therefore, while section 18980.13.2(a) preserves flexibility for CalRecycle to assess penalties of up to $50,000 per day per violation against a noncompliant local jurisdiction or recycling service provider consistent with statutory authority, that is a maximum amount and CalRecycle will always make its penalty determinations based on the factual factors and evidence identified in section 18980.13.2(c). The penalties assessed against a noncompliant local jurisdiction or recycling service provider will necessarily often be far less than the maximum amount of $50,000 per day per violation that is allowed under section 42081(a)(1). No further changes to the proposed regulations are necessary to the implementation or enforcement of the Act.

Comment O-56-10

Regulations do not actually require recycled covered materials to be used in new products

Proposed Section 18980.4 defines what constitutes the “end market” to which covered materials must be sent and recycled. The regulations define end markets as those that produce glass, metal, paper, or plastic feedstock that meets quality standards necessary to be used in lieu of virgin materials, including facilities that produce cullet (glass), ingots/sheets/coils (metal), pulp (paper), or pellets (plastic).

While these are crucial steps in the recycling process, there is no guarantee that any of these materials produced at a “responsible end market” will ultimately be used by manufacturers to produce a new commodity. Instead, the regulations are indifferent as to whether the recycled feedstock is used, stockpiled, etc.

While Section 18980.3.5 prohibits “disposal” of “covered materials” (which includes products derived from covered materials), there is still no requirement that those materials be used for anything. This creates a significant risk that the regulations will merely result in the stockpiling of recycled feedstock that may or may not eventually be incorporated into new products depending on the cost of recycled vs. virgin feedstock. These concerns will be particularly acute if compostable plastics are ultimately considered “compostable” under the Act, as there are virtually no markets for the use of those products.

Response to O-56-10

Comment rejected. The statutory definition of "recycling" requires that the recycling process be considered complete upon the return of materials into the "economic mainstream in the form of recovered material for new, reused, or reconstituted products . . . that meet the quality standards necessary to be used in the marketplace." Consistent with that definition, section 18980.4(b) requires that, to be a responsible end market, an end market must be one that "produces and sells or transfers recycled organic product or recycled content feedstock that meets the quality standards necessary to be used for the creation of new or

reconstituted products." If the end market simply stores or disposes the recycling output, it would not be considered a responsible end market for the covered material inputs. Accordingly, no change to the proposed regulation is appropriate.

Comment O-56-11

RCRC appreciates various changes made throughout the regulatory process in response to issues raised by local governments

We acknowledge and greatly appreciate many of the changes that CalRecycle has made throughout the regulatory process to address concerns raised by local governments and recycling service providers. Some of those changes include: • Specifying that the date by which local jurisdictions and recycling service providers must collect and recycle covered materials aligns with CalRecycle's final approval of the PRO's stewardship plan.
• Providing local jurisdictions and recycling service providers one year to incorporate new covered materials into their collection and recycling programs.
• Establishing a presumption that covered materials are considered to be included in a jurisdiction's collection and recycling program if the provider collects the material and transfers it to a responsible end market or intermediate supply chain entity.
• Clarifying that local jurisdictions and recycling service providers are not required to establish the availability of a responsible end market that ultimately recycles the covered material.
• Deeming the absence of a responsible end market to be a local condition, circumstance, or challenge for which a local jurisdiction or recycling service provider can seek an exemption.
• Clarifying that the PRO's dispute resolution process must be made available if the PRO or independent producer unreasonably delays determinations of whether a particular cost is reimbursable.
• Modifying "chain of custody" requirements to greatly ease administration and reduce implementation costs by initiating tracking with the processing and subsequent transfer of covered materials rather than the point at which those materials are collected.
• Ensuring that a local jurisdiction has a choice to be reimbursed based upon its actual program implementation costs or through a "performance-based" funding model offered by the PRO.
• Providing an opportunity for local jurisdictions and recycling service providers to cure violations within 30 days of notice.
• Specifying that penalties shall not accrue against a jurisdiction or recycling service provider during the pendency of an exemption or extension request.
• Eliminating the ability for CalReycle to impose penalties on a local jurisdiction regardless of the reason for a violation.

While these changes are helpful, they do not address our underlying concerns that: 1) Local jurisdictions and recycling service providers will not be made whole for program implementation costs; 2) Jurisdictions will not have adequate or truly accessible pathways to effectively resolve reimbursement disputes with the PRO; 3) Categorical

exclusions for food and agricultural commodity packaging will undermine the intent of the law and impose additional burdens on local jurisdictions, recycling service providers, and nonexempt manufacturers. *For these reasons, it is essential that CalRecycle carefully and scrupulously review and oversee development and implementation of the PRO plan and reimbursement process and ensure that categorical exclusions are only approved in circumstances where there is a clear and unavoidable conflict between SB 54 and federal law.*

Conclusion

RCRC appreciates your consideration of these comments. If you should have any questions, please do not hesitate to contact me at jkennedy@rcrcnet.org.

Response to O-56-11

Comment rejected. No response to this portion of the commenter's submission is necessary because it identifies provisions of the regulations of which the commenter approves and recaps objections and proposed changes discussed in earlier portions of the submission. No response to comments expressing approval of the regulations is necessary, and CalRecycle has addressed the commenter's objections and proposed changes in response to the portions discussing them in detail.

O-57: California Council for Environmental & Economic Balance (CCEEB) (Dawn Koepke)

Comment O-57-1

Business-to-Business & Producer Clarity

CCEEB urges the Department to provide additional clarity and guidance on business-to-business related packaging for producers. While CCEEB's members are fairly sophisticated and up to speed on their regulatory compliance obligations, our members continue to struggle with a lack of clarity as to whether they are considered a producer for packaging that they may not manufacture but use in business-to-business transactions. Further, many are national and international companies who may ship business-to-business products in relevant packaging to California sites and through California, but trying to maintain granular data on what material is in scope for this Regulation may be challenging. The Regulation notes if a producer is not clearly identified then any entity that distributes covered material acts as a producer. A great deal of ambiguity remains for companies who do not manufacture the packaging but use it in business-to-business transactions. As such, it will be critical to provide added clarity through additional guidance, frequently asked questions (FAQ), and more to ensure all entities that could have compliance obligations understand their obligations.

Response to O-57-1

Comment rejected. Neither the statute nor the proposed regulations suggest that the identity of the manufacturer of covered material is directly relevant for

determining the producer. Rather, the only manufacturer that is relevant is the manufacturer of products that use covered material (Public Resources Code section 42041(w)(1)). Regarding application of the statute in the "business-to-business" setting, see CalRecycle's responses to comments O-38-1 and O-103-2. In any event, the commenter's only proposal is that CalRecycle publish an "FAQ" and other resources to help entities understand their obligations. No change to the proposed regulations are necessary because CalRecycle can create such resources outside the formal rulemaking process.

Comment O-57-2

Article 1. Definitions.

Section 18980.1(a)(2) – Alternative collection.

CCEEB urges the Department to further revise the definition of "Alternative Collection." As currently drafted, the definition would authorize the collection of covered materials, including discarded materials, at curbside by a provider other than an exclusive franchise provider under contract with a municipality. We are disappointed this has not been resolved after a number of requests for revision to ensure franchise agreements are upheld. Negotiations on SB 54 never intended to undermine franchise agreements through SB 54 and yet this definition could result in that very outcome. Fortunately, producers seem focused on utilizing the current system of recycling service providers to achieve the goals of SB 54. In that regard, any alternative management of materials is likely to be rare and should be clear that franchise agreements shall be upheld via revision to the definition of "Alternative Collection" in the draft permanent Regulation.

"(2) "Alternative collection" means a program that collects covered materials~~, regardless of whether the covered material is discarded or considered solid waste and regardless of the manner and location of collection,~~ and that is not "curbside collection," as defined in subdivision (g) of section 42041 of the Public Resources Code~~, because it is not conducted by a local jurisdiction or recycling or composting service provider under contract with a local jurisdiction~~.

Response to O-57-2

CalRecycle rejects this comment for the reasons provided in response to comments B-40-2, B-42-1 and O-47-2.

Comment O-57-3

Article 4. Responsible End Markets

Section 18980.4(b)(4) – Responsible End Markets & REM Plastics

CCEEB supports the revisions made to the Regulation related to whether material recovery facilities creating flake or pellet are considered End Markets. Although CCEEB and its members do not believe a facility creating flake or pellet should be considered an end market, the revisions to the Regulation only address the concern in part by

removing the term “flake” and only referring to the pellet facilities as an end market. To fully resolve the concerns, CCEEB recommends further clarifying the issue by removing “but not limited to” from the section so the language is not interpreted to mean that end markets could potentially include facilities creating flake. Notably, the change in this version of the Regulation clearly intended to remove facilities creating flake from being considered an end market, but the text of the Regulation with this phrase creates ambiguity to this point.

Response to O-57-3

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42041(aa), 42041(ad), and 42060, and no change is necessary to the implementation of the Act. PRC section 42041(aa) defines recycling as the process of collecting, sorting, cleansing, treating, and reconstituting materials that would otherwise ultimately be disposed of, and returning them to, or maintaining them within, the economic mainstream in the form of recovered material for new, reused, or reconstituted products that meet the quality standards necessary to be used in the marketplace. PRC section 42041(ad) defines a responsible end market as a materials market in which the recycling and recovery of materials or the disposal of contaminants is conducted in a specified manner and authorizes CalRecycle to identify responsible end markets. Section 18980.4(b) of the proposed regulations implements these requirements by clarifying the types of facilities, by material type, that are considered end markets, consistent with the definition of recycling in PRC section 42041(aa), such that, if they satisfy the criteria of section 18980.4(a) of the proposed regulations, they may be considered responsible end markets. The proposed regulations necessarily cannot anticipate or address an example of every possible facility or operation that would appropriately constitute the end market for plastic covered material. Therefore, the current language of section 18980.4(b)(4)—defining the overall stage of the recycling process that is appropriately deemed an end market ("the entity that first produces plastic feedstock that meets the quality standards necessary to be used in lieu of virgin material for the creation of new or reconstituted products") and providing a non-exhaustive example (Such end markets include, but are not limited to, entities that create pellet")—therefore strikes an appropriate balance between offering regulated parties sufficient guidance on complying with the requirements of the Act while still preserving sufficient flexibility for facility- or operation-specific conditions. CalRecycle declines to adopt the recommended change because deletion of "but not limited to" would unnecessarily limit and prevent otherwise appropriate end market facilities from being deemed a responsible end market for plastic covered material. No change is necessary.

Comment O-57-4

Article 8. Producer Responsibility Plan

Section 18980.8(g)6 – Producer Responsibility Plan

This section indicates that the PRO may include in its PRO Plan a mechanism for addressing cost-based claims that is “performance-based.” However, a review of the statute reveals no reference to cost recovery being tied to performance. The statute clearly states that the PRO is responsible for covering the costs incurred by local governments and recycling service providers in implementing the program. It does not suggest that these stakeholders’ compensation should depend on meeting performance criteria that were not contemplated by the statute.

While additional detail will be provided in the PRO Plan, we recommend that the regulations avoid being overly prescriptive on this point. Such an approach would ensure consistency with the clear intent of the statute.

Response to O-57-4

Comment rejected. Section 18980.3.2(g)(6) unambiguously states that a performance-based approach must be optional. They must be in addition to a claims-based approach described in the preceding paragraphs. Accordingly, to the extent any compensation "depend[s] on meeting performance criteria that were not contemplated by the statute," that would only be by mutual consent between the stakeholder and the PRO. Nothing in statute precludes such arrangements.

Comment O-57-5

Article 11. Requirements, Exemptions, and Extensions for Local Jurisdictions and Recycling Service Providers

Section 18980.11(c) – Exemptions and Extensions for Local Jurisdictions and Recycling Service Providers

The Regulations state that local jurisdictions’ and recycling service providers’ obligations to collect material on the CMC list do not take effect while CalRecycle is deciding on an application for an extension or exemption. The ISOR explains that this requirement is “necessary to ensure that the statutory exemption or extension serves its express purpose of preventing imposition of additional obligations caused by the change to the CMC list that are impossible to fulfill.”1,2 The Regulations also establish in 18980.11.1 a process a local jurisdiction or recycling service provider must follow as part of preparing an application for CalRecycle’s review. The proposed process is described in the ISOR as necessary to ensure adequate notice to stakeholders and allow for discussions between local governments, recycling service providers, and the PRO/independent producers.

To align these two sections, the Final Statement of Reasons should clarify that a “request” to the Department pursuant to this section is a notification of the intent to file an application. That application would meet the criteria in 18980.11.1 and be considered by CalRecycle for approval or denial. This clarification would ensure that the consultation process with the PRO required in Section 18980.11.1(d) serves its

intended purpose and local jurisdictions and recycling service providers are not subject to penalties during that consultation process, which the PRO has discretion to extend.

1Department of Resources Recycling and Recovery. 2025. SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act Permanent Regulations: Initial Statement of Reasons. p 252.
2We note the Act uses the term “practicable,” not possible, as the ISOR would suggest at page 252. The ISOR correctly assesses the framework of practicability on page 254 pertaining to Section 18980.11.1(c)(4).

Response to O-57-5

Comment rejected. CalRecycle is only required to respond to comments regarding the current regulation text. To the extent the commenter's request to revise the Final Statement of Reasons can be construed as a request to revise the regulation text, comment rejected for the same reasons stated in response to comment B-42-3.

O-58: Independent Beauty Association (Akemi Ooka)

Comment O-58-1

The Independent Beauty Association (IBA), a non-profit trade association, respectfully submits the following comments in response to CalRecycle's review request of the **SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act Permanent Regulations**, dated August 22, 2025.

INTRODUCTION TO IBA AND OUR PURPOSE

The Independent Beauty Association, a non-profit trade association, has been the voice of small and independent cosmetics companies since 1974. IBA represents 600 organizations in the indie beauty and personal care industries. We submit these comments on behalf of small- to medium- sized businesses operating in the overlap between OTC monograph drugs and cosmetics.

Understanding the overlap between OTC monograph drugs and cosmetics is essential to understanding the impact of SB54 on businesses in the beauty sector. We intend to highlight the impact that SB54's provisions have on IBA member companies, other small, entrepreneurial businesses, as well as the ripple effects which may lead to increased cost and/or reduced product choice available to diverse populations of California consumers.

IBA offers observations of industry impact from SB54 with the intention to address policy concerns and improve regulatory language to clarify compliance for businesses operating under federal OTC monograph rules. Below, we highlight a distinct subset of OTC monograph drug categories and their role in the independent and small business sector of the beauty and personal care products industry, as well as the regulation's inevitable impact on market accessibility, innovation, and consumer choice.

IMPACTED PRODUCT CATEGORIES

Certain over-the-counter drug products sit at the interface of OTC and cosmetic classification and play an important role in the beauty and personal care product industry. The following product categories are examples that sit at this nexus: sunscreen, anti-acne, anti-dandruff, skin protectants, topical analgesics, oral health care, and anti-perspirants. These products make significant contributions to the US economy and meet consumer over-the-counter needs. Notably, OTCs provide relief from medical ailments without the need for a prescription and are widely available to consumers. For example, topical analgesics provide pain relief to many consumers suffering from muscle and joint pain, whether from arthritis, aging, menstrual discomfort, or fitness workout recovery. Additionally, the cosmetic nature of these types of OTC drug products serves as a significant source of innovation. For example, the inclusion of sunscreens into skincare products allows for consumer-friendly options that go well beyond the occasional beach day use. By expanding sun protection options for consumers, innovative cosmetic OTCs have enabled daily application, leading to increased protection from harmful UV exposure. Additionally, anti-acne facewash, anti-dandruff shampoo, skin protectant lotion, oral care toothpaste, and anti-perspirants are all OTC monograph drugs that consumers use as part of their daily routines to address basic health and hygiene. These are not products used infrequently for occasional treatment or for an intermittent need**. It is important that US consumers continue to have access to a selection of safe, effective, useful, pleasing, innovative, and affordable products that are suitable for all skin and hair types.**

PRACTICAL BUSINESS CONSIDERATIONS

The Modernization of Cosmetics Regulation Act of 2022 (MoCRA), which amended the Food Drug and Cosmetic Act of 1938, defaults cosmetic product classification to the highest regulatory product standard. This means products sitting at the nexus of OTC drug and cosmetic classification are viewed solely as OTC drugs by the FDA. Furthermore, businesses incorporating and claiming OTC monograph active ingredients in their products are required to register these products and their manufacturing locations with the FDA in accordance with OTC drug requirements outlined in MoCRA. The delineation in SB54 of OTC drugs and "medical product" definitions outlined in subsections (a)(6)(A) and (a)(6)(B) of *"ARTICLE 2: Covered Material and Covered Material Categories, Section 18980.2. Categorically Excluded Materials"* to exclude cosmetics is inconsistent with the federal definition of products at the interface of cosmetic and OTC drug classification.

OTC monograph drug manufacturing requires appropriate equipment, systems, and highly trained personnel to meet specific quality and regulatory compliance laws throughout development and manufacturing. As such, many small- to medium-sized brands selling OTC monograph drugs use *expert* contract manufacturers ("contract manufacturing organization facilities" or "CMO facilities") to produce their products. These brands and businesses are expected to follow strict testing and manufacturing protocols (many of which are similar to pharmaceutical drug manufacturing) that document and ensure monograph compliance. These include, but are not limited to, active ingredient stability testing under a variety of conditions, heavy metals testing, ingredient and batch release quality and conformity through each stage of blending and filling, final product release quality and conformity, and appropriate

finished goods labeling, lot coding, and expiration dating. It is a very costly and detailed process which requires years of testing and recordkeeping. Additionally, contract manufacturers who produce OTC products must also pay annual user fees to the FDA that assist in the agency's oversight of OTC drugs. These fees are not required for cosmetics-only manufacturers.

Importantly, the packaging used for OTC products must be able to protect the integrity of the formulated product and active ingredients throughout the manufacturing, supply, retail, and consumer environments until the expiration date of the product. It may not be possible to find alternative packaging materials that properly protect and preserve these formulated OTC products and meet the requirements of SB54. It is also very difficult to create reuse or refill solutions for OTC products, given the strict manufacturing and testing protocols needed to meet required hygiene and quality standards. As a consequence, it is difficult for Producers to participate in eco-modulation programs which could lower fees on these products.

BUSINESS IMPACT and ACCESSIBILITY

IBA is concerned that the exclusion of cosmetic OTCs from the Covered Product exemption and the lack of access to reduced fees will cause confusion for Producers. The inconsistent definition relative to the Federal classification may lead to misinformed compliance strategies, as cosmetic OTCs are clearly classified as drugs in FDA guidelines.

The unbalanced classification will also lead to higher compliance hurdles and fees for cosmetic OTCs compared to prescription drugs, which may result in cost pass-throughs, a decision not to sell in the state, or discontinuation of the product altogether for cosmetic OTC products. For California consumers who rely on cosmetic OTC drugs—and especially those who cannot afford prescription solutions—this may represent a significant cost increase or an availability challenge to treat common medical conditions.

The consolidation of added costs for cosmetic OTCs may drive Producers to remove FDA monograph ingredient actives from their formulations, backtracking on innovation and losing OTC drug benefits that have been incorporated into everyday cosmetics. For example, in products like skin creams or color cosmetics that include sunscreen actives or acne treatments, this may mean that consumers would lose the protection or treatments they rely on as part of their daily routine.

Finally, a reduction in cosmetic OTC production coupled with higher fee requirements could drive cosmetic contract manufacturers to refrain from producing OTC products. This could lead to CMO facilities exiting OTC manufacturing, which may result in a reduction in the number of compliant, responsible, and viable CMO facilities that can accommodate businesses of a wide variety of sizes and scale. Continued reduction in the number of qualified CMO facilities—especially those who can accommodate low minimum order quantity production runs needed by small businesses—are likely to lead to further reduced product choice for the consumer. A significant reduction in the number of OTC monograph drug manufacturers could also create supply bottlenecks and reduce redundancy if there is a limited number of CMO facilities making these products. Furthermore, small entrepreneurial brands with cosmetic/OTC products may not be able

to find applicable CMO facilities or may be locked out of production if larger customers take precedence in the production schedule. This will effectively reduce the variety of new products that offer innovation and serve smaller markets, diverse skin and hair types, or niche consumer needs.

CONCLUSION

IBA respectfully requests that the concerns of small and medium beauty businesses producing cosmetic OTC products are taken into account in the finalization of the text for **SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act Permanent Regulations.** Inclusion of cosmetic OTCs, including those with sunscreens, in the SB54 definition of OTC drugs, along with the associated covered product exemption, would alleviate definitional confusion, mitigate business exits from OTC monograph drug manufacturing, slow the increasing costs for cosmetic OTC products, and maintain choice for the consumer.

In addition to the matters discussed above that are tailored to the cosmetics and OTC drug product categories, IBA would like to reiterate our support of the coalition letter submitted by the Household & Commercial Products Association (HCPA) on behalf of industry organizations, including IBA. IBA would like to urge CalRecycle to give full consideration to the points raised in that letter, which IBA believes accurately represents the views of the broader industry.

IBA appreciates the opportunity to present this information. IBA remains a resource for CalRecycle at any time for insights and information regarding SB54 impact for small- to medium- sized businesses in the overlap between cosmetics and OTC monograph drugs. We would welcome further discussion at your convenience.

Response to O-58-1

CalRecycle rejects this comment for the reasons provided in response to comment B-11-3.

O-59: City of Los Angeles, LA Sanitation and Environment (Christine Batikian)

Comment O-59-1

Article 1: Definitions

Section 18980.1 Definitions

18980.1 (a)(2) - Definition of "Alternative Collection"

• Comment 1a: According to the Integrated Waste Management Act of 1989 (Public Resources Code 40000 et seq.), local jurisdictions have the authority to determine aspects of solid waste handling and the means those services are provided within their jurisdiction. As such, when it comes to SB 54 implementation, local jurisdictions should play a central role in decision-making around solid waste programs and services operating in their jurisdiction. As a result, we recommend that language be added to the regulations that all "alternative collection" programs should be implemented in consultation and with the consent of the local jurisdiction. We want to ensure that we limit risk of consumer confusion as well as impact on local government costs and

revenues. The presence of these "alternative collection" programs often come with an additional cost to our ratepayer, which is not the intent of the statute.
• Comment 1b: Current definition of "curbside collection" in Public Resources Code 42041(g) does not specify the location of collection, although curbside is used in the defined term. This creates confusion on whether collections done by local jurisdictions using alternate means, potentially not at curbside, is included. We recommend that language be added to the regulations to clarify that this collection by a local jurisdiction or recycling or composting service provider is regardless of the location of collection. This will acknowledge that local jurisdictions, or their designee(s), retain the right to sponsor or establish collections for covered materials that are using alternate means, other than at curbside, if desired.

Response to O-59-1

CalRecycle rejects this comment for the reasons provided in response to comments B-40-2 and B-42-1. Also, regarding the location of collections by local jurisdictions, no clarification is needed in the proposed regulations because statute clearly defines "curbside collection" broadly, with no limitation as to the location of the collection. The definition of "alternative collection" in section 18980.1(a)(2) of the proposed regulations reflect that breadth by reinforcing that the only requirement to be defined as "curbside collection" is that it is conducted by or local jurisdiction or pursuant to a contract with a local jurisdiction.

Comment O-59-2

Article 2: Covered Material and Covered Material Categories
Section 18980.2. Categorically Excluded Materials
• Comment 2a: Public Resources Code Section 42041 (e)(2) lists packaging that are not considered "covered material" under the statute. This list does not specifically state packaging or packaging components used for products that comply with the United States Department of Agriculture or the United State Food and Drug Administration. As such, Section 18980.2 (a) (2) should be removed, and instead any applicable products shall have to go through the exemption process outlined in Section 18980.2.4 (Exemptions for Certain Covered Materials), which is not indefinite and is valid for only a specified period of time allowing for innovation to take place. This will ensure that local jurisdictions and ratepayers do not bear the burden to manage that waste.
Section 18980.2.1 Exclusion of Reusable and Refillable Packaging and Food Service Ware
• Comment 2b: Section 18980.2.1 (a)(4)(A) does not take into account collection at curbside by local jurisdictions. With the reuse sector being nascent, we do not want to rule out this method of collection. Currently, there are various investments being made and pilot programs exploring this option. We recommend adding language to the regulations to clarify that the requirements in paragraph (4) of subdivision (a) of Section 18980.2.1 would be satisfied if collection at curbside were made available either through a "curbside collection" or "alternative collection" program.

Response to O-59-2

Comment rejected. Regarding the proposal labeled "Comment 2a," CalRecycle rejects that proposal because it mischaracterizes both the statute and section 18980.2(a)(2) of the proposed regulations. That section is not based on Public Resources Code section 42041(e)(2). Rather, it is authorized under Public Resources Code section 42060(b), which requires CalRecycle to ensure that there is no conflict with U.S. Food and Drug Administration and U.S. Department of Agriculture regulations and that the regulations do not impose any requirement in direct conflict with any federal law or regulation. Moreover, the commenter appears to interpret 18980.2(a)(2) as applying to "components . . . that comply" with certain laws. That is not the effect of 18980.2(a)(2); rather, that provision applies to packaging for which no alternative is available to comply with those laws. Regarding the proposal to rely on the exemptions described in section 18980.2.4 instead, CalRecycle rejects that proposal for the reasons provided in response to comment I-59-2.

Regarding the proposal labeled "Comment 2b," CalRecycle rejects the proposal for the reasons stated in response to comment O-84-3.

Comment O-59-3

Article 8: Producer Responsibility Plan Requirements

Section 18980.8. Producer Responsibility Plan

• Comment 8a: Section 18980.8 (g)(2) identifies new or increased costs as eligible covered costs. However, this language is ambiguous and requires further clarification. We respectfully urge CalRecycle to provide clarity on what constitutes an "increased cost," and how the PRO will make such determinations consistently and fairly. The revised regulation defines an increased cost as one that is "of the same nature as one that would ordinarily exist, or be expected to exist, but is greater due to the requirements of the Act." It further states, "only the amount of the increase caused by such requirements is a covered cost." This raises several concerns for jurisdictions that have already made significant investments in programs and infrastructure aligned with SB 54's goals. As written, it may exclude costs that many local jurisdictions currently incur to support proper sorting and increase recovery of recyclable and compostable materials, including covered materials. Many local jurisdictions, including ours, are already engaged in collection, public education, technical assistance, and other essential services aimed at improving material recovery and reducing contamination. While the type of cost may not be new, the content, scope, or delivery of these programs may change significantly as a result of SB 54 implementation. Furthermore, there are many instances in which previous capital investments, such as collection vehicles and curbside bins/carts, will need to be leveraged to implement new SB 54 requirements. Without clearer guidance on eligible covered costs, early-implementing jurisdictions risk being penalized for their leadership. Costs associated with the collection, transport, sorting, and public education efforts that align with SB 54 could be deemed ineligible simply because they are not deemed "new" or "additional" by the PRO. This runs contrary to the equitable cost-shifting model envisioned by the legislation. We strongly recommend that CalRecycle clarify what constitutes an

"increased" cost, particularly for programs or services already in place but modified due to the Act, and clarify what direct and indirect costs are the responsibility of producers and what remains the responsibility of local jurisdictions and ratepayers. Currently, the PRO has all the discretion to determine eligible covered costs. Without these clarifications, the regulations risk failing to make local jurisdictions whole and may lead to costly, time-consuming disputes. Clear, consistent, and equitable cost treatment is essential to fulfilling SB 54's intent and ensuring successful implementation.
• Comment 8b: Section 18980.8(g)(4) states that the process for determinations on covered costs and issuing payment should be done through reasonable periods. We recommend CalRecycle add specificity to describe what constitutes a "reasonable period." Local jurisdictions in particular need clear expectations and timelines due to their required administrative processes.
• Comment 8c: Section 18980.8(g)(8) states that the PRO will notify the local jurisdiction of costs identified as those incurred by a recycling service provider acting on behalf of that jurisdiction. To prevent duplicative payments and to protect ratepayers, ensuring that recycling service providers are not compensated for services already funded through local rates, we recommend strengthening this section. Specifically, we propose adding language requiring the PRO to not only notify the local jurisdiction when a cost covering request is received, but also to consult with the jurisdiction prior to approving the reimbursement. This consultation will help confirm that the requested costs are not already being covered by ratepayer funding, thereby ensuring transparency and fiscal accountability.

Response to O-59-3

Regarding section 18980.8(g)(2), CalRecycle rejects this comment for the reasons stated in response to comment O-56-3. Also, the commenter is incorrect that the "PRO has all the discretion to determine eligible covered costs." To the contrary, all determinations are subject to dispute, including pursuant to section 18980.8(g), with an arbitrator empowered to make ultimate decisions. No further clarification is necessary with respect to "direct" versus "indirect costs" because nothing in the proposed regulations or statute suggest that distinction is relevant.
Regarding section 18980.8(g)(4), CalRecycle rejects this comment for the reasons provided in response to comments B-29-3 and O-37-2.
Regarding section 18980.8(g)(8), CalRecycle rejects this comment for the reasons provided in response to comment I-51-1.

Comment O-59-4

Article 10: Registration and Data Reporting Requirements
Section 18980.10.1 Data Reporting Submission
• Comment 10a: Section 18980.10.1 mentions "reporting entities". However, it is unclear whether local jurisdictions are included within this definition or if they will have any direct reporting responsibilities to CalRecycle. We respectfully request that CalRecycle clarify whether local jurisdictions will be required to submit any reports or data as part of the implementation of SB 54. If local jurisdictions are expected to provide information, please specify the nature, frequency, and scope of these reporting requirements.

Response to O-59-4

Comment rejected. The definition of "reporting entity" is clearly established in section 18980.1(a)(22). Additionally, the nature, frequency, and scope of the reporting requirements for "reporting entities" in section 18980.10.1 is sufficiently clear. Therefore, no change is necessary to the implementation or enforcement of the Act as the term in question already clearly addressed. and aligned with sections 42020 through 42100 of the PRC..

Comment O-59-5

Article 11: Requirements, Exemptions, and Extensions for Local Jurisdictions
Section 18980.11. Requirements for Local Jurisdictions and Recycling Service Providers

• Comment 11a: Section 18980.11(a) states that local jurisdictions must include recyclable and compostable covered materials in their collection and recycling programs "no later than the date the Department first approves a PRO's plan." Since this date could occur any time prior to January 1, 2027, and is not fixed, local jurisdictions face uncertainty and potentially insufficient time to prepare for the required changes. Given that the next update to the Covered Material Category (CMC) list is expected by January 1, 2026, jurisdictions may have less than one year to incorporate any newly designated recyclable or compostable materials into their programs. In contrast, Section 18980.11(c) allows one year from the date of a change to the CMC list for jurisdictions to come into compliance for later CMC list updates. We recommend revising the language in Section 18980.11(a) to read: "No later than one year after the date the Department first approves a PRO's plan." This change would provide consistency with Section 18980.11(c) and allow local jurisdictions sufficient time to update acceptability lists and adjust collection practices. Importantly, implementing these changes requires both time and resources, and funding from the PRO must be available before such modifications can be reasonably expected.

• Comment 11b: Section 18980.11(b) states that a local jurisdiction is compliant if their collection and recycling programs "collects the covered material and transfers it to responsible end markets directly or to intermediate supply chain entities." However, additional clarification is needed regarding the terms "collect" and "transfer" to ensure jurisdictions clearly understand what constitutes compliance and how it will be evaluated by the Department. Specifically, the definition of "collect" is ambiguous. Does it mean that the material is listed as accepted in some public education materials, or must it appear in all outreach materials, including printed guides, websites, and cart/bin graphics (which can take years to update)? Furthermore, the covered material categories are quite broad and can encompass many materials. We request that CalRecycle provide specific and practical guidance on these definitions, including how collection and transfer activities will be assessed for compliance purposes. Clear direction will help ensure jurisdictions can make necessary adjustments in a reasonable timeframe and avoid unintended enforcement or funding issues due to interpretive differences.

Response to O-59-5

Comment rejected. Regarding comment 11a, the requested change (delaying effectiveness of Public Resources Code section 42060.5(a) until one year after the approval of a PRO plan) contravenes statute, which contains no provision allowing CalRecycle to universally pause obligations under Public Resources Code section 42060.5(a). The delay would unreasonably interfere with the PRO's accomplishment of its statutory obligations, such as achieving a 30 percent recycling rate for plastic covered material by January 1, 2028, as required under Public Resources Code section 42050(c). It would also be incongruous with the statutory requirement that CalRecycle publish the covered material categories list far in advance of that date. Lastly, Public Resources Code section 42060.5(b) exemptions (addressed in section 18980.11.1 of the proposed regulations) fully address the commenter's concern over compliance challenges. Local jurisdictions can initiate the process for obtaining an exemption at any time.

Regarding comment 11b, the assertion that "collect" is ambiguous is not credible. That word cannot reasonably be read to require anything short of physically collecting materials, which must happen for a local jurisdiction or recycling service provider to do what section 18980.11(b) describes: They must transfer the covered material to responsible end markets or intermediate supply chain entities. Likewise, the word "transfers" is not ambiguous. It has a plain meaning and cannot reasonably be read in context of 18980.11(b) to refer to anything short of physically providing the covered materials to the responsible end market or intermediate supply chain entity.

Regarding the request for "specific and practical guidance," no revision to the proposed regulations are necessary because CalRecycle can provide additional resources, such as FAQs and demonstrative examples of applications of the proposed regulations, outside the formal rulemaking process.

Comment O-59-6

Article 13: Enforcement Oversight by the Department and Administrative Civil Penalties
Section 18980.13. Compliance Evaluation and Determination

• Comment 13a: SB 54 does not reference local jurisdictions or recycling service providers as entities subject to enforcement. Article 5 of the statute consistently refers to producers and Producer Responsibility Organizations (PROs) in connection with violations. Given this, it is inappropriate and contrary to the intent of the law for local jurisdictions to be subject to administrative penalties of up to $50,000 per day, per violation. This level of enforcement applied to jurisdictions undermines the central purpose of SB 54, as stated in Section 42040(a) of the statute, to shift the financial burden of managing packaging and food service ware away from local governments and ratepayers and onto producers. Local jurisdictions are not the primary subject of responsibility or enforcement under SB 54, and applying identical penalties to them as the PRO and producers is inconsistent with both the letter and the spirit of the law. We strongly recommend that CalRecycle either remove local jurisdictions from the scope of administrative enforcement actions, or substantially reduce the maximum daily penalties applicable to local jurisdictions.

Response to O-59-6

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements set forth in the Act, including in sections 42060, 42060.5, and 42081 of the Public Resources Code, and the recommended change to remove local jurisdictions from the scope of administrative enforcement actions, or substantially reduce the maximum daily penalties applicable to local jurisdictions, is not necessary to the implementation or enforcement of the Act. Section 42081(a)(1) provides that CalRecycle may issue a notice of violation to, and impose an administrative civil penalty not to exceed fifty thousand dollars ($50,000) per day per violation on, any entity not in compliance with the Act or any of the regulations adopted to implement the Act. Section 18980.13.2(a) of the proposed regulations implements this statutory provision by specifying that any entity, including a local jurisdiction or recycling service provider, not in compliance with the Act is subject to penalties pursuant to section 42081(a). However, section 18980.13.2(c) further clarifies that penalty determinations will be made by the CalRecycle director or the director's designee based on evidence presented in hearings conducted pursuant to section 18980.13.4 addressing, at a minimum, the factual factors identified in section 42081(c). Therefore, while section 18980.13.2(a) preserves flexibility for CalRecycle to assess penalties of up to $50,000 per day per violation against a noncompliant local jurisdiction or recycling service provider consistent with statutory authority, that is a maximum amount and CalRecycle will always make its penalty determinations based on the factual factors and evidence identified in section 18980.13.2(c). The penalties assessed against a noncompliant local jurisdiction or recycling service provider will necessarily often be far less than the maximum amount of $50,000 per day per violation that is allowed under section 42081(a)(1). No further changes to the proposed regulations are necessary to the implementation or enforcement of the Act.

Comment O-59-7

General Comment: Contamination Standards and Sorting Quality

• To uphold the intent of Public Resources Code Section 42041(aa)(4)(A), CalRecycle should define uniform contamination thresholds and sorting efficiency standards across the state. This consistency will improve recycling outcomes, reduce processing costs, and ensure accurate reporting of materials truly diverted from landfill.

Response to O-59-7

Comment rejected. Public Resources Code section 42041(aa)(4)(A) authorizes, but does not require, CalRecycle to adopt regulations addressing covered material out of state and exported to other countries. In any event, that provision is expressly not about material processed within the state, so it is not relevant to the proposal to set uniform contamination thresholds and efficiency standards "across the state." For materials within the state, even assuming CalRecycle has authority to set contamination and sorting efficiency standards, setting rigid

standards is unnecessary because market actors already have incentive to achieve the greatest efficiency and lowest costs possible. The PRO's mandate to satisfy the requirements of Public Resources Code section 42050 incentivizes the PRO to further efforts to improve efficiency and lower costs, and the statute, the proposed regulations, and other laws applicable to solid waste handlers already require the PRO and others to achieve accurate reporting.

O-60: Consumer Brands Association (Erin Raden)

Comment O-60-1

On behalf of a broad range of producers of healthy, nutritious, California-grown products, who are committed to food safety and quality, we appreciate the opportunity to provide feedback on California's Department of Resources Recycling and Recovery's ("CalRecycle") SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act Permanent Regulations. We are committed to supporting the goals of SB 54 and appreciate CalRecycle's continued stakeholder engagement throughout this rulemaking process.

We are encouraged to see the categorical exclusions for FDA and USDA regulated products maintained in the most recent version of the permanent regulations. The statute clearly recognizes the fact that some producers will have challenges in complying with SB 54, and that among the most significant of these challenges are potential conflicts with federal law. This is especially true regarding food packaging which must meet rigorous safety and technical standards required by laws including but not limited to, the Food, Drug, and Cosmetic Act, the Federal Meat Inspection Act, and the Poultry Products Inspect Act. The Legislature therefore rightly recognized that exclusions are warranted for producers that would otherwise have to choose between compliance with state or federal law.

As you finalize these regulations, please consider the functional impact of these packaging types for food safety, quality, and shelf-life, the importance of minimizing organic waste, and the need to minimize increased cost to consumers, and maintain the categorical exemptions. Thank you again for your willingness to engage with us on this important issue. We look forward to continuing to work with you ensure the safety of and consumer confidence in the food supply while meeting the goals of SB 54.

Response to O-60-1

This comment must be rejected, and no response is required, because the comment does not suggest changes to the proposed regulations or raise objections related to the rulemaking process.

O-61: Can Manufacturers Institute (Greg Hurner)

Comment O-61-1

October 7, 2025

Ms. Csilla Richmond
SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act
Permanent Regulations
Department of Resources Recycling and Recovery,
Regulations Unit
1001 “I” St., MS-24B
Sacramento, CA 95814

VIA Public Comment Form

RE: August 2025 Proposed SB 54 Regulations

The Can Manufacturers Institute (CMI) appreciates the opportunity to comment on the proposed regulations for the Plastic Pollution Prevention and Packaging Producer Responsibility Act Regulations Division of Circular Economy.

CMI is the U.S. trade association of the metal can industry and its suppliers. Our members employ 28,000 workers in 33 states and produce more than 135 billion steel and aluminum cans annually for the food, beverage, aerosol, and general packaging markets.

The metal can industry hopes our responses and insights will ensure CalRecycle does not inadvertently hinder robust metal can recycling and circularity systems. The law intends to increase recycling and reduce the use of plastic packaging. The suggested changes, specifically the need to amend the definition of “plastic,” add a definition of “plastic packaging,” and will prevent potential harm.

CMI’s comments are focused explicitly on metal cans subject to SB 54, which include product categories such as human and pet food, as well as aerosol products. It's important to note that aluminum beverage cans are exempt from our comments as they are already subject to the California Beverage Container Recycling & Litter Reduction Act.

Sections 18980.2.2. Exclusion of Certain Types of Packaging and 18980.2.6. Covered Material Category List Recommendations
CMI requests that “trade associations representing covered materials” be listed along with the PRO or Independent Producer on pages 29 (3), page 35 (a)(b), page 44 (h), page 45 (h)(1) (2), and page 47.

Section 18980.2.2. Exclusion of Certain Types of Packaging
In subparagraph (b), CMI supports the description of de minimis and the criteria for being considered de minimis. However, it may improve clarity to provide the example of

a metal can (similar to how a box for a board game is provided for meeting the 5-year storage requirement in subparagraph (a) of Section 18980.2.2. As de minimis and associated criteria was discussed in various workshops, the metal can was the most frequent example that had broad agreement from stakeholders and the Advisory Committee. This is because non-CRV metal packaging is easily sorted from the recycling stream, doesn't require the removal of coatings, labels or nondetachable components to be recycled, and has robust end markets.

Response to O-61-1

Comment rejected. Regarding the definition of "plastic" and "plastic packaging," the commenter alludes to suggested changes, but those suggestions do not appear anywhere in the submission, so CalRecycle cannot respond to them. CalRecycle rejects the commenter's proposal regarding section 18980.2.2 because it is vague. CalRecycle cannot discern what it would mean for a trade association to "represent covered materials." If the commenter's suggestion is that a trade association should be considered an agent of a group of producers, there is no need for a regulation to that effect because a producer's agent is, as a matter of law, one authorized to act on behalf of the producer; the proposed regulations do not restrict CalRecycle's flexibility to recognize a trade association submitting requests or applications on behalf of specific entities that authorize the association to act on their behalf. CalRecycle rejects the commenter's section suggestion regarding section 18980.2.2 because it, in effect, requests a categorical exemption for metal cans. But "metal cans" do not constitute a ubiquitous category and, in any event, are not themselves of "de minimis weight or volume." At most, metal cans are an example of a type of packaging that might incorporate components having de minimis weight of volume. In that sense, metal cans are a useful example for CalRecycle to highlight when explaining how section 18980.2.2(b) applies in various circumstances, but a regulation is not necessary for CalRecycle to do so.

Comment O-61-2

Section 18980.6.7. Eco-Modulated Fee and Fee Schedule

Eco-Modulation Fee Schedule

In subdivision (b) on page 97, CMI urges CalRecycle to implement the eco-modulation fees immediately, rather than delaying for two years. Doing so will encourage companies to adopt more recyclable packaging immediately, rather than postponing investments. It also unfairly punishes producers who switched packaging early in anticipation of a lower fee under the program.

Malus Fee Inappropriately Applies Proposition 65 Listings Without Considering Exposure Thresholds.

In subdivision 18980.6.7(i), on page 100, the proposed language requires Producer Responsibility Organizations (PROs) to assign malus fees to producers based solely on the presence of chemicals listed under Proposition 65. This approach disregards the fundamental legal structure of Proposition 65, which is explicitly exposure-based, not presence-based. As such, this regulatory approach is inconsistent with state law,

undermines scientific standards for risk assessment, and could lead to penalties for materials that pose no significant risk as determined by the California Office of Environmental Health Hazard Assessment (OEHHA). Subdivision 18980.6.7(i) of the SB 54 regulations fails to reflect this essential statutory structure. Specifically, it proposes that malus fees be assessed based on the presence of Proposition 65-listed chemicals in covered material, regardless of whether actual exposure would occur at levels that exceed OEHHA's established safety thresholds.

CMI supports the Consumer Brands Association's recommended solution of ensuring alignment with California law and sound risk-based regulatory principles. CMI urges CalRecycle to revise Section 18980.6.7(i) to conform with Proposition 65's exposure-based framework. The following language is recommended:

(h) Pursuant to paragraph (4) of subdivision (e) of section 42053 of the Public Resources Code, a PRO shall charge a malus fee to producers who use covered material that contains a chemical listed on the list established pursuant to section 25249.8 of the Health and Safety Code at levels that result in exposure to consumers in excess of the No Significant Risk Level (NSRL) for carcinogens or the Maximum Allowable Dose Level (MADL) for reproductive toxicants, as established by the Office of Environmental Health Hazard Assessment (OEHHA).

This revised language ensures that the regulatory structure of SB 54 remains consistent with the statutory and scientific framework underpinning Proposition 65. It respects the role of OEHHA as the expert agency in toxicological risk assessment, avoids duplicative or unjust penalties for compliant businesses, and maintains public trust in California's rigorous but science-based approach to chemical safety and environmental health.

Response to O-61-2

CalRecycle rejects this comment. The proposed regulations are consistent with the requirements of the Act, including in PRC sections 42051.1, 42053, and 42060 of the Act, and no change is necessary to the implementation of the Act. To the extent this comment recommends implementing the eco-modulated fees immediately, see the response to comment B-6-6. To the extent this comment recommends revising section 18980.6.7(i) of the proposed regulations to incorporate an exposure-based framework, see the response to comment B-11-9.

Comment O-61-3

Additional Comments for Consideration

Include Exemptions for Charitable Organizations

CMI and Consumer Brands reiterate the importance of an exemption for nonprofit organizations that meet the terms of Section 501(c)(3) of the U.S. Internal Revenue Code. Within the existing regulation language, a nonprofit organization that produces goods under its own brand or purchases goods from other for-profit organizations for the sake of donation would be required to financially contribute to the state's extended producer responsibility program, though the products are distributed to low-income

individuals and families through food banks and other charitable organizations. These products are crucial for low-income families in California and throughout the United States. Requiring a charitable organization to fund an EPR program creates an undue burden on these nonprofit entities, ultimately constraining the resources available to support the individuals they serve. Other states' extended producer responsibility programs, including those established in Maine and Oregon, currently exempt nonprofit organizations.

Solution: We recommend that CalRecycle adopt exemptions within its proposed regulations for nonprofit charitable organizations that meet the criteria of Section 501(c)(3) of the U.S. Internal Revenue Code, thereby avoiding the exhaustion of valuable resources that support low-income families and individuals within the state.

CMI hopes our responses and insights will ensure the proposed regulatory text does not inadvertently disadvantage metal cans. Unlike other material types, metal cans are not a problematic package. Metal cans bring value to recycling programs and have healthy and robust end markets. The law must recognize these attributes, and their use should be encouraged to help California reduce the amount of plastic and non-recyclable packaging used in the state.

Response to O-61-3

CalRecycle rejects this comment as the requested changes for additional exemptions and requirements are beyond the scope of the Department's rulemaking authority, and both exceed and conflict with the statutory requirements for qualifying as a small producer.

O-62: NRDC (Renee Sharp)

Comment O-62-1

Zoe Heller, Director
Department of Resource Recycling and Recovery
1001 I Street | Sacramento, CA 95814

Submitted electronically on October 7, 2025, via CalRecycle Public Comment form.

Subject: NRDC Comments on SB 54 Proposed Permanent Regulations for Plastic Pollution Prevention and Packaging Producer Responsibility Act

Dear Director Heller:

The Natural Resources Defense Council (NRDC) respectfully submits the following comments in response to CalRecycle's Proposed Permanent Regulations for SB 54 Plastic Pollution Prevention and Packaging Producer Responsibility Act.

As noted in our previous comments, some of the proposed changes since the February 27 draft of regulations are highly problematic and even in conflict with the law. The last set of proposed permanent regulations were submitted to the Office of Administrative Law (OAL) on February 27, 2024, and published in the California Regulatory Notice Register on March 8, 2024. However, they were not finalized, and a new rulemaking period was initiated. New permanent regulations were submitted to the Office of Administrative Law (OAL) on August 12, 2025, and published in the California Regulatory Notice Register on August 22, 2025.1 Significant changes to the current Proposed Regulations are required for them to be aligned with both the spirit and the letter of SB 54.

Thank you for your consideration of our comments as detailed below.

1) Proposed language addressing "chemical recycling" is inconsistent with the law and undermines the statute's legislative intent.

Dramatically changed language in the proposed regulations weakens protections against "chemical recycling," compared with the October 14, 2024 proposed regulations, which were clear that these technologies would be prohibited if they generated more hazardous waste than mechanical recycling. These changes to the language are inconsistent with the statute and with legislative intent.

The statute requires CalRecycle to exclude technologies that generate significant amounts of hazardous waste; the proposed regulations fail to do so and are in conflict with the statute. The proposed regulations concerning hazardous waste fall short in a number of other ways that should also be addressed.

To address these shortcomings and to provide clarity on the requirements, we recommend that the regulations should set a categorical prohibition on "chemical recycling" technologies, including gasification, pyrolysis, and solvent-based technologies. Such a categorical prohibition would satisfy the statute's directive to exclude plastic recycling technologies that produce significant amounts of hazardous waste; its limitations on technologies that involve combustion, incineration, fuel production, or energy generation; and its requirement that "[t]he department's regulations shall encourage recycling that minimizes generation of hazardous waste, generation of greenhouse gases, environmental impacts, environmental justice impacts, and public health impacts." As we have noted in previous comments, there is significant and strong legislative history that makes clear that the statute's definition of recycling excludes these "chemical recycling" technologies.

A) Defining "significant amounts" of hazardous waste based on the concept of "risk" and "waste management" conflicts with the intent and statutory language of SB 54.

The definition of "significant amounts of hazardous waste" in proposed Section 18980.4.1(d)(1) is contrary to statute. The proposed language reads as follows:

‘“[S]ignificant amounts of hazardous waste” means hazardous waste as defined in Title 40 of the Code of Federal Regulations Section 261.3 that presents a substantial risk of harm to public health, or of contamination of the environment.’ However, SB 54’s language refers to the quantitative amount of hazardous waste, not the subjective “risk” associated with it; the added wording introduces new considerations not in the SB 54 statutory language and is inconsistent with the statute, and it fails to grapple with the concept of “amounts” that’s actually in the statute.

“Risk” introduces additional considerations that are not fairly encompassed within "amounts," which is focused on quantity. This is contrary to statute. This applies equally to proposed Section 18980.4.1(d)(1)(B) which also focuses on these factors of risk of harm to public health or the environment2 in defining “significant *amounts*.” (Emphasis added.) Harm to public health and the environment are separate factors in the definition, independent of amount, which is specifically and separately articulated.3

2 “The production and management of hazardous waste that is handled and disposed of in compliance with an applicable permit *does not present a substantial risk of harm to public health or of contamination of the environment*, for purposes of the Act and this chapter. Minor technical violations or minor deviations from permit conditions that do not result in, or are not reasonably likely to lead to, actual environmental harm or harm to public health shall not, by themselves, be considered noncompliance for purposes of this section.” (Emphasis added.)

Equating these separate factors renders “amount” redundant, and CalRecycle may not ignore statutory language or erase its application. Shifting the standard for what is considered a viable technology from the amount of hazardous waste produced to how and the extent to which that waste is managed only addresses waste that is improperly managed, which is inconsistent with the statute’s explicit consideration of the amount of hazardous waste generated.

In addition, the proposed regulations shift the emphasis from production of hazardous waste to its management, as noted by Senator Ben Allen, the author of SB 54, and many of his colleagues in a letter to CalRecycle, 4 explaining how the agency is violating the statute in its interpretation of the meaning and intent of “significant amounts of hazardous waste”:

SB 54’s statutory language specifically prohibits the use of plastic recycling technologies that generate significant amounts of hazardous waste by directing that: ‘the regulations shall include criteria to exclude plastic recycling technologies that produce significant amounts of hazardous waste.’ (emphasis added). The draft regulations fail to comply with this requirement on multiple counts. First, the criteria enable — not exclude — technologies that produce significant amounts of hazardous waste. The regulations unlawfully shift the standard from the production of hazardous waste (as required by the statute) to its management. Therefore, the threshold of avoiding only those technologies where hazardous waste is improperly managed and ‘presents an imminent and substantial risk of harm to public health or to the

contamination of the environment' does not achieve the statutory mandate. Further, the draft regulations state that any hazardous waste handled and disposed of in 'substantial compliance with an applicable permit' does not pose an imminent and substantial risk. This, too, conflicts with statutory guidance and legislative intent to exclude technologies based on the generation, not management, of hazardous waste.

B) The exemption for compliance with permits further exacerbates these conflicts with the law.

Section 18980.4.1(d)(1)(b) effectively states that if a producer is in compliance with an applicable permit to produce and dispose of hazardous waste, then that producer is not generating a "significant amount of hazardous waste," meaning that that technology is allowed under the regulations no matter how much hazardous waste is produced. This language negates a provision in statute which requires CalRecycle to establish criteria "to exclude plastic recycling technologies that produce significant amounts of hazardous waste," and therefore this language on compliance with a permit should not be included in the regulations. If it were sufficient to comply with existing laws, the phrase "significant amounts of hazardous waste" would be rendered superfluous or made redundant and would have no meaning in the statute, as facilities are already required to comply with the law. Moreover, compliance with permitting may be different in different jurisdictions and this provision applies to end markets, which may be outside California. This would, in effect, impose unequal requirements concerning the amount of hazardous waste allowed for the same technology in different jurisdictions. This illogical result not only creates inconsistent requirements for the same technology, but it is also contrary to the statute's focus on amounts of hazardous waste produced as a marker of whether a technology should be allowed to count as recycling.
3 "The department's regulations shall encourage recycling that minimizes generation of hazardous waste, generation of greenhouse gases, *environmental impacts*, environmental justice impacts, and *public health impacts.* The regulations shall include criteria to exclude plastic recycling technologies that produce significant *amounts* of hazardous waste." (Emphasis added.)

4 Attached and available at:
https://cawrecycles.sharepoint.com/:b:/s/CaliforniansAgainstWaste/Eewm9LW5GwNHjZVgT4PxIysBP_Y nBopphpthLTOBVSA-cQ?e=rD3ft8.

C) Using the federal definition of hazardous waste rather than California definition does not comport with the law.

The proposed definition of hazardous waste is reliant on the federal definition of hazardous waste and not the California state definition. While federal thresholds can be useful in certain contexts and for certain purposes, here the use of federal thresholds negates part of the scope of SB 54. The SB 54 statute does not specify compliance with a federal definition of hazardous waste; given that SB 54 is a California law and it refers to "hazardous waste," it follows that law refers to the California state definition given that this is a California law and program. The statute does not exclude California hazardous

waste nor otherwise narrow the scope of “hazardous waste.” Therefore, the Agency has no authority to exclude the consideration of California hazardous waste. Because the California definition of hazardous waste is more stringent than the federal definition and has been so for decades, using the federal definition would illegally allow technologies that generate wastes that are not considered federally hazardous but that are hazardous based on the California definition to count as recycling. CalRecycle has suggested that the reason that the federal definition should be used is that facilities and end markets may be located outside of California and are subject to federal reporting requirements which are different from state reporting requirements. However, this is contrary to the plain language of the statute. In addition, even the policy argument that CalRecycle puts forward is not persuasive given that many other California-based specifications must be complied with under this legislation.

D) The definition of recycling for technologies other than mechanical recycling relies inappropriately on ISO standard 59014:2024.

The Statement of Reasons bases the reference to the ISO standard on the language in the statute that states that the “department’s regulations shall encourage recycling that minimizes generation of hazardous waste, generation of greenhouse gases, environmental impacts, environmental justice impacts, and public health impacts.” However, ISO 59014:2024 does not address the majority of these criteria and is extremely weak even for those that are addressed in the standard.

Proposed Section 18980.4.1(d)(2) states that in order to be considered recycling, a technology that is not a mechanical recycling technology must operate in a manner consistent with ISO 59014:2024. However, ISO 59014 is not specific to recycling, nor does it define recycling. Instead, the standard proposes optional qualitative guidelines for material recovery facility operators (e.g. recommendations on types of data to collect and on types of policies to include) and is non-binding. The standard contains several problematic elements, including characterization of energy recovery as something other than a form of disposal, as well as promotion of the use of a narrow lifecycle analysis scope which omits consideration of specific environmental safety, toxic materials, and human health impacts. Even the suggestion of allowing incineration with energy recovery would be explicitly contrary to the statute’s definition of recycling which excludes combustion, incineration, energy generation, fuel production, and other forms of disposal (Public Resources Code § 42041(aa)(2)).

Thus, Section 18980.4.1(d)(2) does not help cure the other shortcomings identified in our comments and does not speak to the statutory criteria that the Statement of Reasons relies upon.

E) Infrequent reporting of facility level information could allow skirting of thresholds for “significant amounts of hazardous waste.”

Under the proposed regulations, the PRO approves “chemical recycling” technologies, with review by CalRecycle. The proposed method whereby “chemical recycling”

technologies get approved is by submitting facility-level information about hazardous waste generation (among other information) to the Producer Responsibility Organization (PRO). Assuming CalRecycle rectified the other unlawful, extrastatutory, proposed provisions noted above, it is conceivable that the current proposed language (Section 18980.4.1(d)(4)(D)) would enable a pilot facility to submit data showing minimal hazardous waste generation, and if the technology is approved, would grant it allowance for up to 5 years (i.e. the window between approvals under the proposed regulations). During this time, a plant could massively scale up in size and come to produce significant quantities of hazardous waste, which it may not have been doing at a sufficient threshold in its nascency to justify exclusion of the technology from "recycling" previously. It is also not clear if the submitted information would be provided to the public, which undermines the deliberative democratic process contemplated by SB 54.

To avoid the skirting of limits on significant amounts of hazardous waste, the regulations must be more stringent about technologies needing to re-enter the approval process if facilities substantially increase in size or scale, change or add technologies, or begin processing different covered material types. Further, this information must be made available to the public for transparency on the issue of costs, hazardous wastes, and climate impacts.

F) CalRecycle should include a definition of "Recycling" in the regulations that categorically excludes specified chemical recycling technologies and reflects SB 54 language and legislative history.

CalRecycle can address some of the shortcomings above by explicitly including a definition of "recycling" in the regulations and categorically excluding specified chemical recycling technologies because this would reduce the weight placed on the criteria for "significant amounts of hazardous waste." While the definition of recycling in SB 54 is referenced in the proposed regulations, little additional guidance is provided. Given the law's directive to the agency and the significant legislative history on this definition, we urge CalRecycle to include provisions defining the term in light of the legislative history, clearly identifying which technologies do not count as recycling.

Such clarity is important because these provisions of the law will be implemented in practice by producer responsibility organizations that will need clear rules of the road. That need for clarity will be even greater for certifiers that will be required to ensure compliance with the law's direction that: "For any mixture of plastic waste exported to other states or countries, the PRO or producer shall certify to the department that the recycling technology used meets the requirements of this subdivision."5

The Senate Floor Analysis states that "[t]he definition of recycling specifically excludes combustion, incineration, energy generation, fuel production, and other forms of disposal. Additionally, CalRecycle is required to develop regulations that exclude plastic recycling technologies that generate significant amounts of hazardous waste. *This definition is intended to exclude technologies, such as gasification, pyrolysis, and*

*solvent-based technologies."*6 (Emphasis added.) The Assembly Floor Analysis has identical language.7

In addition, a Letter to the Journal from the author states:

Pursuant to proposed California Public Resources Code Section 42041(aa) in SB 54, "recycling" is intended to only include technologies that return or maintain plastic materials within the circular economy. SB 54 specifically states that recycling does not include incineration or combustion of plastic waste (Section 42041(aa)(2)) and requires the regulations to exclude from recycling the technologies that generate significant hazardous waste (Section 42041(aa)(5)). Technologies using pyrolysis, gasification, solvolysis, and similar technologies that involve combustion and incineration, as well as the generation of hazardous waste, are therefore prohibited from being considered 'recycling' under SB 54.

Furthermore, proposed Section 42021(aa)(2) excludes from the definition of "recycling," technologies that produce energy or fuels, and other forms of disposal, which includes technologies like pyrolysis and gasification.

In addition, by referencing the definition of disposal in PRC 40192(b), the proposed definition of "recycling rate" (Section 42041(ab) of SB 54) provides specific direction to consider transformation and engineered solid waste management (ESWM) conversion of covered material as disposal. Transformation, as defined by Public Resources Code Section 40201, means incineration, pyrolysis, distillation, or biological conversion other than composting.8

5 Public Resources Code § 42041(aa)(4)(C).

7 Assembly Floor Analysis, 06/29/22, available at https://leginfo.legislature.ca.gov/faces/billAnalysisClient.xhtml?bill_id=202120220SB54.

This legislative history is further bolstered by the fact that pyrolysis facilities were at the time of SB 54's passage, and still are, regulated as incinerators under the federal Clean Air Act and are recognized to involve combustion,9 and that pyrolysis and gasification facilities are often engaged in fuel production or energy generation, produce significant amounts of hazardous waste, and are associated with significant health community impacts, particularly in environmental justice communities.10 The floor analyses for SB 54 recognize these impacts: "Chemical recycling technologies have significant environmental impacts, particularly on the surrounding communities, including toxic air emissions, GHG emissions, and hazardous waste generation."11

Given the directives in the law and the legislative history, we urge CalRecycle to include a definition of recycling in the regulations. We propose the following language at a minimum, but encourage CalRecycle to consider additional criteria to exclude plastic recycling technologies that produce significant hazardous waste and to encourage

technologies that minimize the other listed impacts: *"Recycle" or "Recycling" has the same meaning as section 42041(aa) and excludes technologies such as pyrolysis, gasification, solvolysis, solvent-based technologies, and similar technologies.*

(This definition should additionally be reflected in the methodology for recycling rate determination proposed in Section 18980.3.2 and in the criteria for responsible end markets outlined in Section 18980.4. Currently, the recycling rate determination considers material "recycled" if the material is accepted by a responsible end market, but neither section references the statutory definition of recycling, particularly the certifications and documentation required by that definition, creating gaps that could undermine the law.)
